2. INSTALL RH AND LH SEAT CUSHION LOWER SHIELDS

3. INSTALL RH AND LH LOWER RECLINING ADJUSTER INSIDE COVERS

- (a) Install the LH lower reclining adjuster inside cover with the screw.
- (b) Perform the same procedure on the other side.

4. INSTALL RH AND LH UPPER RECLINING ADJUSTER INSIDE COVERS

- (a) Install the LH upper reclining adjuster inside cover with the screw.
- (b) Perform the same procedure on the other side.

5. INSTALL SEAT CUSHION COVER

Install the seat cushion cover to the seat cushion pad with the hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

6. INSTALL SEAT CUSHION COVER AND PAD

- (a) Install the seat cushion cover with seat cushion pad, and latch the seat cushion cover hooks.

- (b) Install the hog rings to the seat cushion cover.

- (c) Install the clip.
- (d) Perform the same procedure on the other side.

7. INSTALL SEATBACK COVER

- (a) Install the seatback cover to the seatback pad.
- (b) Install the 2 headrest supports.

- (c) Turn up the seatback cover and install the hog rings.

8. INSTALL SEATBACK COVER AND PAD

- (a) Install the seatback cover and pad to the seat frame assembly.

- (b) Install the hog rings to the seat frame assembly.

- (c) Install the hog rings to the seat frame assembly.

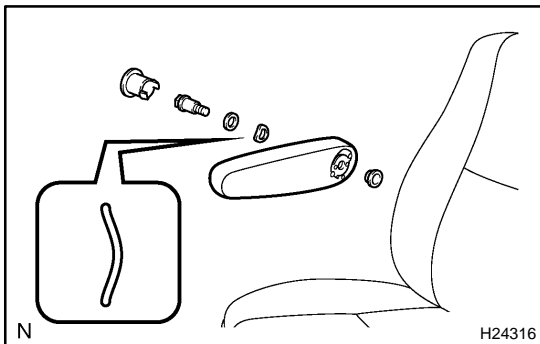

- (d) w/ Side airbag:
Connect the seatback cover bracket to the seat frame assembly with the nut.

Torque: 5.5 N·m (56 kgf-cm, 49 in.-lbf)

- (e) Close the fastener.

- (f) Install the hog rings to the seat frame assembly.

9. INSTALL ARMREST ASSEMBLY

- (a) Install the spacer to the armrest assembly.
(b) Install the armrest assembly, armrest lock plate and armrest spacer with the bolt.

Torque: 37 N·m (380 kgf-cm, 27 ft-lbf)

HINT:

Install the armrest lock plate as shown in the illustration.

- (c) Install the armrest cap.

10. INSTALL FRONT SEAT INNER BELT.

- (a) Install the front seat inner belt with the nut.

Torque: 42 N·m (430 kgf-cm, 32 ft-lbf)

- (b) Connect the connectors and wire harness clamps.

11. INSTALL SEAT CUSHION INNER SHIELD

Install the seat cushion inner shield with the screw.

**12. INSTALL VERTICAL ADJUSTER HANDLE**

- (a) Install the vertical adjuster handle with the 2 screws.
- (b) Install the vertical adjuster handle cap.

13. INSTALL RECLINING ADJUSTER RELEASE HANDLE**14. INSTALL SEAT CUSHION OUTER SHIELD**

Install the seat cushion outer shield with the screw.

15. INSTALL HEADREST

INSTALLATION

HINT:

The procedures listed below are for the LH side.

1. INSTALL FRONT SEAT

- (a) Mount the front seat to the vehicle.

NOTICE:

Be careful not to damage the vehicle body.

- (b) w/ Side airbag:
Connect the airbag connector.
- (c) Connect the connectors.
- (d) Slide the front seat to the rearmost position.
- (e) Tighten the bolts on the front side temporarily, starting from the bolt on the inner side.
- (f) Tighten them completely.

Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)

- (g) Slide the front seat to the foremost position.
- (h) Tighten the bolts on the rear side temporarily, starting from the bolt on the inner side.
- (i) Tighten them completely.

Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)

2. INSTALL SEAT TRACK COVERS

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

4. Passenger's seat:

PERFORM PASSENGER OCCUPANT CLASSIFICATION SYSTEM ZERO POINT CALIBRATION
(See page [DI-1849](#))

FRONT SEAT (Bench Type) COMPONENTS

BO0JS-08

H24307

REMOVAL

1. REMOVE FRONT SEAT

- (a) Remove the 4 bolts.
- (b) Disconnect the connectors.
- (c) Remove the front seat.

NOTICE:

Be careful not to damage the vehicle body.

DISASSEMBLY**CAUTION:**

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

Tape the screwdriver tip before using it to remove the parts.

1. REMOVE HEADRESTS**2. REMOVE SEAT HINGE COVER LH**

Remove the 2 screws and seat hinge cover LH.

3. REMOVE SEAT HINGE COVER RH

Remove the 2 screws and seat hinge cover RH.

**4. REMOVE SEATBACK ASSEMBLY**

Remove the 4 bolts and seatback assembly.

**5. REMOVE CENTER ARMREST ASSEMBLY**

(a) Remove the hog rings and turn the seatback cover over.

(b) Remove the 2 nuts and center armrest assembly from the seatback frame.

6. REMOVE SEATBACK FRAME

(a) Remove the 6 headrest supports from the seatback assembly.

(b) Remove the 2 screws and shoulder belt guide.

- (c) Remove the hog rings from the seatback frame.
- (d) Remove the seatback frame from the seatback pad and cover.

- (e) Disconnect the clamp.
- (f) Loosen the adjusting nuts.

HINT:

When loosening the nuts, hold one and loosen the other.

- (g) Perform the same procedure on the other side.
- (h) Remove the reclining adjusting cables.

**7. REMOVE SEATBACK COVER**

Remove the hog rings and seatback cover.

**8. REMOVE SEAT POSITION SENSOR
(See page RS-1 18)****9. REMOVE 2 SEAT TRACK LOWER REAR BRACKETS**

- (a) Remove the 2 nuts and seat track lower rear bracket.
- (b) Perform the same procedure on the other side.

**10. REMOVE LH OUTER TRACK ASSEMBLY**

- (a) Slide the LH outer track assembly until the torx® screws on the rear side can be seen.
- (b) Using a torx® socket wrench, remove the 2 torx® screws from the LH outer track assembly rear side.

- (c) Slide the LH outer track assembly until the torx® screws on the front side can be seen.
- (d) Using a torx® socket wrench, remove the 2 torx® screws from the LH outer track assembly front side, and remove the LH outer track assembly.

11. REMOVE RH OUTER TRACK ASSEMBLY

HINT:

Perform the same procedure on the other side.

**12. REMOVE SEAT TRACK HANDLE LH**

- (a) Disconnect the seat track control cable.

- (b) Remove the spring.

- (c) Remove the nut and seat track handle LH.

**13. REMOVE SEAT TRACK HANDLE RH**

(a) Loosen the adjusting nuts.

HINT:

When loosening the nuts, hold one and loosen the other.

(b) Disconnect the seat track control cable.

(c) Remove the spring.

(d) Remove the nut and seat track handle RH.

**14. REMOVE SEAT CUSHION FRAME**

Remove the hog rings and seat cushion frame from the seat cushion pad and cover.

**15. REMOVE SEAT CUSHION COVER**

Remove the hog rings and seat cushion cover from the seat cushion pad.

16. REMOVE BELT WARNING OCCUPANT DETECTION SENSOR

Detach the belt warning occupant detection sensor from the seat cushion pad.

REASSEMBLY

CAUTION:

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

A bolt without a torque specification is shown in the standard bolt chart (See page [SS-2](#)).

1. INSTALL BELT WARNING OCCUPANT DETECTION SENSOR

Peel the coated paper off the back of the new sensor. Attach the sensor along with the marking on the pad surface as shown in the illustration.

2. INSTALL SEAT CUSHION COVER

Install the seat cushion cover with the hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

3. INSTALL SEAT CUSHION FRAME

Install the seat cushion frame to the seat cushion pad and cover with the hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

4. INSTALL SEAT TRACK HANDLE RH

- (a) Install the seat track handle RH with the nut.
- (b) Install the spring.
- (c) Connect the seat track control cable.
- (d) Tighten the adjusting nuts.

HINT:

When tightening the nuts, hold one and tighten the other.

5. INSTALL SEAT TRACK HANDLE LH

- (a) Install the seat track handle LH with the nut.

- (b) Install the spring.

- (c) Connect the seat track control cable.

6. INSTALL LH OUTER TRACK ASSEMBLY

- (a) Slide the LH outer track assembly until the torx® screws on the front side can be seen.

- (b) Using a torx® socket wrench, install the 2 torx® screws to the LH outer track assembly front side.

Torque: 20 N·m (204 kgf-cm, 15 ft-lbf)

- (c) Slide the LH outer track assembly until the torx® screws on the rear side can be seen.

- (d) Using a torx® socket wrench, install the 2 torx® screws to the LH outer track assembly rear side.

Torque: 20 N·m (204 kgf-cm, 15 ft-lbf)

7. INSTALL RH OUTER TRACK ASSEMBLY

HINT:

Perform the same procedure on the other side.

**8. INSTALL 2 SEAT TRACK LOWER REAR BRACKETS**

(a) Install the seat track lower rear bracket with the 2 nuts.

Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

(b) Perform the same procedure on the other side.

9. INSTALL SEAT POSITION SENSOR(See page [RS-122](#))**10. INSTALL SEATBACK COVER**

Install the seatback cover with the hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

**11. INSTALL SEATBACK FRAME**

(a) Temporarily install the reclining adjusting cables.

(b) Tighten the adjusting nuts.

HINT:

When tightening the nuts, hold one and tighten the other.

(c) Perform the same procedure on the other side.

(d) Connect the clamp.

(e) Install the seatback frame to the seatback pad and cover.

(f) Install the hog rings to the seatback frame.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

(g) Install the shoulder belt guide with the 2 screws.

(h) Install the 6 headrest supports to the seatback assembly.

12. INSTALL CENTER ARMREST ASSEMBLY

(a) Install the center armrest assembly to the seatback frame with the 2 nuts.

Torque: 18 N·m (185 kgf-cm, 13 ft-lbf)

(b) Install the hog rings to the seatback cover.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

13. INSTALL SEATBACK ASSEMBLY

Install the seatback assembly with the 4 bolts.

Torque: 42 N·m (430 kgf-cm, 32 ft-lbf)

14. INSTALL SEAT HINGE COVER LH

Install the seat hinge cover LH with the 2 screws.

15. INSTALL SEAT HINGE COVER RH

Install the seat hinge cover RH with the 2 screws.

16. INSTALL HEADRESTS

INSTALLATION

1. INSTALL FRONT SEAT

- (a) Mount the front seat to the vehicle.

NOTICE:

Be careful not to damage the vehicle body.

- (b) Connect the connectors.
- (c) Install the 4 bolts.

Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)

FRONT SEAT (Split Type: Driver's Side) COMPONENTS

BO4SB-04

REMOVAL

CAUTION:

Work must not be started until at least 90 seconds after the ignition switch is turned to the LOCK position and the negative (-) terminal cable is disconnected from the battery.

(The SRS is equipped with a back-up power source. If work is started within 90 seconds from disconnecting the negative (-) terminal cable of the battery, the SRS may deploy.)

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

Wait for 90 seconds after disconnecting the cable to prevent the airbag working.

2. REMOVE SEAT TRACK COVERS

Using a screwdriver, remove the seat track covers.

HINT:

Tape the screwdriver tip before use.

3. REMOVE FRONT SEAT

- (a) Remove the 4 bolts.
- (b) Disconnect the connectors.
- (c) w/ Side airbag:
Disconnect the airbag connector.
- (d) Remove the front seat.

NOTICE:

Be careful not to damage the vehicle body.

DISASSEMBLY**CAUTION:**

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

Tape the screwdriver tip before using it to remove the parts.

1. REMOVE HEADREST**2. REMOVE SEAT CUSHION OUTER SHIELD**

- (a) Remove the screw from the seat cushion outer shield.
- (b) Using a screwdriver, remove the seat cushion outer shield.

HINT:

Tape the screwdriver tip before use.

3. REMOVE RECLINING ADJUSTER RELEASE HANDLE**4. REMOVE VERTICAL ADJUSTER HANDLE**

- (a) Using a screwdriver, remove the vertical adjuster handle cap.

HINT:

Tape the screwdriver tip before use.

- (b) Remove the 2 screws and the vertical adjuster handle.

**5. REMOVE SEAT CUSHION INNER SHIELD**

- (a) Remove the bolt and front seat inner belt.
- (b) Remove the screw from the seat cushion inner shield.
- (c) Disconnect the front seat inner belt wire harness clamp from the seat cushion inner shield.
- (d) Using a screwdriver, remove the seat cushion inner shield.

HINT:

Tape the screwdriver tip before use.

- (e) Disconnect the connectors and clamps, and remove the front seat inner belt.

**6. REMOVE SEATBACK COVER AND PAD**

- (a) Remove the hog rings from the seat frame assembly.
- (b) Open the fastener.

- (c) w/ Side airbag:
Remove the nut and disconnect the seatback cover bracket from the seat frame assembly.

- (d) Remove the hog rings shown in the illustration from the seat frame assembly.

- (e) Remove the hog rings shown in the illustration from the seat frame assembly.
- (f) Remove the seatback cover and pad from the seat frame assembly.

7. REMOVE SEATBACK COVER

- (a) Turn up the seatback cover and remove the hog rings.
- (b) Remove the 2 headrest supports.
- (c) Remove the seatback cover from the seatback pad.

8. REMOVE SEAT CUSHION COVER AND PAD

- (a) Remove the clip.
- (b) Perform the same procedure on the other side.

- (c) Remove the hog rings from the seat cushion cover.
- (d) Unlatch the seat cushion cover hooks, then remove the seat cushion cover with seat cushion pad.

9. REMOVE SEAT CUSHION COVER

Remove the hog rings and seat cushion cover from the seat cushion pad.

10. REMOVE RH AND LH UPPER RECLINING ADJUSTER INSIDE COVERS

- (a) Remove the screw and LH upper reclining adjuster inside cover.
- (b) Perform the same procedure on the other side.

11. REMOVE RH AND LH LOWER RECLINING ADJUSTER INSIDE COVERS

- (a) Remove the screw and LH lower reclining adjuster inside cover.
- (b) Perform the same procedure on the other side.

12. REMOVE RH AND LH SEAT CUSHION LOWER SHIELDS

- (a) Using a screwdriver, disengage the claw and remove the LH seat cushion lower shield.

HINT:

Tape the screwdriver tip before use.

- (b) Perform the same procedure on the other side.

**13. REMOVE SEAT POSITION SENSOR
(See page [RS-1 18](#))**

REASSEMBLY

CAUTION:

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

A bolt without a torque specification is shown in the standard bolt chart (see page [SS-2](#)).

1. **INSTALL SEAT POSITION SENSOR
(SEE PAGE [RS-122](#))**
2. **INSTALL RH AND LH SEAT CUSHION LOWER SHIELDS**

3. **INSTALL RH AND LH LOWER RECLINING ADJUSTER INSIDE COVERS**

- (a) Install the LH lower reclining adjuster inside cover with the screw.
- (b) Perform the same procedure on the other side.

4. **INSTALL RH AND LH UPPER RECLINING ADJUSTER INSIDE COVERS**

- (a) Install the LH upper reclining adjuster inside cover with the screw.
- (b) Perform the same procedure on the other side.

5. **INSTALL SEAT CUSHION COVER**

Install the seat cushion cover to the seat cushion pad with the hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

6. **INSTALL SEAT CUSHION COVER AND PAD**

- (a) Install the seat cushion cover with seat cushion pad, and latch the seat cushion cover hooks.

- (b) Install the hog rings to the seat cushion cover.

- (c) Install the clip.
(d) Perform the same procedure on the other side.

7. INSTALL SEATBACK COVER

- (a) Install the seatback cover to the seatback pad.
(b) Install the 2 headrest supports.

- (c) Turn up the seatback cover and install the hog rings.

8. INSTALL SEATBACK COVER AND PAD

- (a) Install the seatback cover and pad to the seat frame assembly.

- (b) Install the hog rings to the seat frame assembly.

- (c) Install the hog rings to the seat frame assembly.

- (d) w/ Side airbag:
Connect the seatback cover bracket to the seat frame assembly with the nut.

Torque: 5.5 N·m (56 kgf·cm, 49 in.-lbf)

- (e) Close the fastener.

- (f) Install the hog rings to the seat frame assembly.

9. INSTALL SEAT CUSHION INNER SHIELD

- (a) Connect the front seat inner belt connectors and clamps.
(b) Install the seat cushion inner shield.
(c) Connect the front seat inner belt wire harness clamp to the seat cushion inner shield.
(d) Install the screw to the seat cushion inner shield.
(e) Install the front seat inner belt with the bolt.

Torque: 42 N·m (430 kgf·cm, 32 ft·lbf)

10. INSTALL VERTICAL ADJUSTER HANDLE

- (a) Install the vertical adjuster handle with the 2 screws.
(b) Install the vertical adjuster handle cap.

11. INSTALL RECLINING ADJUSTER RELEASE HANDLE

**12. INSTALL SEAT CUSHION OUTER SHIELD**

Install the seat cushion outer shield with the screw.

13. INSTALL HEADREST

INSTALLATION

1. INSTALL FRONT SEAT

- (a) Mount the front seat to the vehicle.

NOTICE:

Be careful not to damage the vehicle body.

- (b) w/ Side airbag:
Connect the airbag connector.
- (c) Connect the connectors.
- (d) Slide the front seat to the rearmost position.
- (e) Tighten the bolts on the front side temporarily, starting from the bolt on the inner side.
- (f) Tighten them completely.
- Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)**
- (g) Slide the front seat to the foremost position.
- (h) Tighten the bolts on the rear side temporarily, starting from the bolt on the inner side.
- (i) Tighten them completely.

Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)

2. INSTALL SEAT TRACK COVERS

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

FRONT SEAT (Split Type: Passenger's Side) COMPONENTS

BO4SW-02

H24541

REMOVAL

CAUTION:

Work must not be started until at least 90 seconds after the ignition switch is turned to the LOCK position and the negative (-) terminal cable is disconnected from the battery.

(The SRS is equipped with a back-up power source. If work is started within 90 seconds from disconnecting the negative (-) terminal cable of the battery, the SRS may deploy.)

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

Wait for 90 seconds after disconnecting the cable to prevent the airbag working.

2. REMOVE SEAT TRACK COVERS

Using a screwdriver, remove the seat track covers.

HINT:

Tape the screwdriver tip before use.

3. REMOVE FRONT SEAT

- (a) Remove the 4 bolts.
- (b) Disconnect the connectors.
- (c) w/ Side airbag:
Disconnect the airbag connector.
- (d) Remove the front seat.

NOTICE:

Be careful not to damage the vehicle body.

DISASSEMBLY**CAUTION:**

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

Tape the screwdriver tip before using it to remove parts.

1. REMOVE SEAT LEG INNER COVER

Remove the 3 screws and seat leg inner cover.

2. REMOVE HEADRESTS**3. REMOVE RECLINING ADJUSTER RELEASE HANDLE**

Using a screwdriver, remove the reclining adjuster release handle.

HINT:

Tape the screwdriver tip before use.

N

H24353

4. REMOVE RH SEAT CUSHION SHIELD

Disengage the claws and remove the RH seat cushion shield.

5. REMOVE SEAT CUSHION LOWER SHIELD

Remove the 2 screws and seat cushion lower shield.

N

○ : Claw

H24352

6. REMOVE SEATBACK ASSEMBLY

(a) Remove the hog rings from the seatback cover belt.

N

Hog Ring

H24354

(b) Remove the hog rings from the seatback cover.

(c) Open the fastener.

(d) Remove the bolt and center armrest assembly.

(e) Remove the 2 bushings.

N

H24355

- (f) Remove the hog rings from the seatback cover.

- (g) w/ Side airbag:
Remove the nut and disconnect the seatback cover bracket from the seatback frame.

- (h) Remove the hog rings from the seat cushion cover.

- (i) Remove the bolt and disconnect the front seat center belt from the seat cushion assembly.
(j) Remove the screw and RH seat cushion lower shield.
(k) Remove the 2 screws and RH reclining adjuster inside cover.

- (l) Remove the 3 nuts and disconnect the front seat center belt.

- (m) Remove the 3 bolts.
- (n) Using a torx® socket wrench, remove the 2 torx® screws and seatback assembly from the seat cushion assembly.
- (o) Remove the bushing from the seatback frame

7. REMOVE SEATBACK FRAME

- (a) Remove the 4 headrest supports from the seatback assembly.
- (b) Remove the seatback lock upper bezel.
- (c) Remove the seatback frame from the seatback pad.

8. REMOVE SEATBACK COVER

Remove the hog rings and seatback cover from the seatback pad.

9. REMOVE SHOULDER BELT COVER

10. REMOVE FRONT SEAT CENTER BELT

- (a) Disconnect the clamps.
- (b) Remove the bolt, nut and front seat center belt.

11. REMOVE RH CENTER SEAT HINGE COVER

Remove the 2 screws and RH center seat hinge cover.

12. REMOVE RH SEAT CUSHION INNER SHIELD AND SEAT CUSHION COVER

Remove the 2 screws, RH seat cushion inner shield and seat cushion cover.

13. REMOVE SEAT HINGE COVER

Remove the screw and seat hinge cover.

**14. REMOVE OUTER SEAT TRACK LOWER FRONT AND REAR BRACKET**

- (a) Remove the 2 nuts and outer seat track lower front bracket.
- (b) Remove the 2 nuts and outer seat track lower rear bracket.

15. REMOVE INNER SEAT TRACK LOWER FRONT AND REAR BRACKET

- (a) Remove the 2 nuts and inner seat track lower front bracket.
- (b) Remove the 2 nuts and inner seat track lower rear bracket.

**HINT:**

When removing the inner seat track lower rear bracket, slide the inner seat track as shown in the illustration.

**16. REMOVE OUTER SEAT TRACK****HINT:**

Slide the outer seat track until the torx® screws on the front and rear sides can be seen.

Remove the 4 torx® screws and outer seat track.

17. REMOVE INNER SEAT TRACK

Perform the same procedure on the inner seat track.

**18. REMOVE SEAT CUSHION FRAME**

Remove the hog rings and seat cushion frame from the seat cushion pad.

**19. REMOVE SEAT CUSHION COVER**

Remove the hog rings and seat cushion cover from the seat cushion pad.

20. REMOVE BELT WARNING OCCUPANT DETECTION SENSOR

Detach the belt warning occupant detection sensor from the seat cushion pad.

21. REMOVE FRONT SEAT INNER BELT

- (a) Disconnect the wire harness clamps.
- (b) Remove the bolt and front seat inner belt from the seat cushion frame.

**22. REMOVE SEAT TRACK ADJUSTING HANDLE**

- (a) Using a screwdriver, disengage the seat track cover spring.

HINT:

Tape the screwdriver tip before use.

- (b) Perform the same procedure on the other side.
 (c) Remove the seat track adjusting handle.

23. REMOVE RH AND LH SEAT TRACK HANDLE SUB-ASSEMBLY

- (a) Remove the nut and RH seat track handle sub-assembly.
 (b) Perform the same procedure on the other side.

**24. REMOVE RECLINING ADJUSTING CABLE**

- (a) Disconnect the clamp.
 (b) Loosen the adjusting nuts.

HINT:

When loosening the nuts, hold one and loosen the other.

- (c) Remove the reclining adjusting cable.

REASSEMBLY

CAUTION:

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

A bolt without a torque specification is shown in the standard bolt chart (see page [SS-2](#)).

1. INSTALL RECLINING ADJUSTING CABLE

- (a) Temporarily install the reclining adjusting cable.
- (b) Tighten the adjusting nuts.

HINT:

When tighten the nuts, hold one and tighten the other.

- (c) Connect the clamp.

2. INSTALL RH AND LH SEAT TRACK HANDLE SUB-ASSEMBLY

- (a) Install the RH seat track handle sub-assembly with the nut.

Torque: 10 N·m (102 kgf·cm, 7 ft·lbf)

HINT:

Apply MP grease to the sliding part of the seat track handle sub-assembly .

- (b) Perform the same procedure on the other side.

3. INSTALL SEAT TRACK ADJUSTING HANDLE

- (a) Install the seat track adjusting handle.
- (b) Using a screwdriver, engage the seat track cover spring.

HINT:

Tape the screwdriver tip before use.

- (c) Perform the same procedure on the other side.

4. INSTALL FRONT SEAT INNER BELT

- (a) Install the front seat inner belt to the seat cushion frame with the bolt.

Torque: 42 N·m (430 kgf·cm, 32 ft·lbf)

- (b) Connect the wire harness clamps.

**5. INSTALL BELT WARNING OCCUPANT DETECTION SENSOR**

Peel the coated paper off the back of the new sensor. Attach the sensor along with the marking on the pad surface as shown in the illustration.

**6. INSTALL SEAT CUSHION COVER**

Install the seat cushion cover to the seat cushion pad with the hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

**7. INSTALL SEAT CUSHION FRAME**

- (a) Install the seat cushion frame to the seat cushion pad.

- (b) Install the hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

**8. INSTALL OUTER SEAT TRACK****HINT:**

Slide the outer seat track until the torx® screws on the front and rear sides can be seen.

Using a torx® socket wrench, install the outer seat track with the 4 torx® screws.

Torque: 42 N·m (430 kgf·cm, 32 ft·lbf)

9. INSTALL INNER SEAT TRACK

Perform the same procedure on the inner seat track.

**10. INSTALL INNER SEAT TRACK LOWER FRONT AND REAR BRACKET****HINT:**

When installing the inner seat track lower rear bracket, slide the inner seat track as shown in the illustration.

(a) Install the inner seat track lower rear bracket with the 2 nuts.

Torque: 32 N·m (326 kgf·cm, 24 ft·lbf)

(b) Install the inner seat track lower front bracket with the 2 nuts.

Torque: 32 N·m (326 kgf·cm, 24 ft·lbf)

11. INSTALL OUTER SEAT TRACK LOWER FRONT AND REAR BRACKET

(a) Install the outer seat track lower rear bracket with the 2 nuts.

Torque: 32 N·m (326 kgf·cm, 24 ft·lbf)

(b) Install the outer seat track lower front bracket with the 2 nuts.

Torque: 32 N·m (326 kgf·cm, 24 ft·lbf)

12. INSTALL SEAT HINGE COVER

Install the seat hinge cover with the screw.

13. INSTALL RH SEAT CUSHION INNER SHIELD AND SEAT CUSHION COVER

Install the RH seat cushion inner shield and seat cushion cover with the 2 screws.

14. INSTALL RH CENTER SEAT HINGE COVER

Install the RH center seat hinge cover with the 2 screws.

15. INSTALL FRONT SEAT CENTER BELT

(a) Install the front seat center belt with the bolt and nut.

Torque:

Bolt: 8.5 N·m (87 kgf·cm, 75 in.-lbf)

Nut: 42 N·m (430 kgf·cm, 32 ft-lbf)

HINT:

Check that the seatback frame claws are securely engaged.

16. INSTALL SHOULDER BELT COVER

17. INSTALL SEATBACK COVER

Install the seatback cover to the seatback pad with the hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

18. INSTALL SEATBACK FRAME

(a) Install the seatback frame to the seatback pad.

(b) Install the seatback lock upper bezel.

(c) Install the 4 headrest supports to the seatback assembly.

19. INSTALL SEATBACK ASSEMBLY

(a) Install the bushing to the seatback frame.

(b) Using a torx® socket wrench, install the seatback assembly with the 2 torx® screws to the seat cushion assembly.

Torque: 42 N·m (430 kgf·cm, 32 ft-lbf)

- (c) Install the 3 bolts.

Torque:

Bolt A: 55 N·m (561 kgf·cm, 41 ft·lbf)

Bolt B: 21 N·m (214 kgf·cm, 15 ft·lbf)

- (d) Connect the front seat center belt with the 3 nuts.

Torque: 5.5 N·m (56 kgf·cm, 49 in.-lbf)

- (e) Install the RH reclining adjuster inside cover with the 2 screws.
- (f) Install the RH seat cushion lower shield with the screw.

- (g) Connect the front seat center belt with the bolt to the seat cushion assembly.

Torque: 42 N·m (430 kgf·cm, 32 ft·lbf)

- (h) Install the hog rings to the seat cushion cover.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

- (i) w/ Side airbag:
Connect the seatback cover bracket to the seatback frame with the nut.
Torque: 5.5 N·m (56 kgf-cm, 49 in.-lbf)

- (j) Install the hog rings to the seatback cover.
HINT:
When installing the hog rings, take as much care as possible to prevent wrinkles.
- (k) Install the 2 bushings.
- (l) Install the center armrest assembly with the bolt.
Torque: 20 N·m (204 kgf-cm, 15 ft-lbf)
- (m) Close the fastener.

- (n) Install the hog rings to the seatback cover.
HINT:
When installing the hog rings, take as much care as possible to prevent wrinkles.

- (o) Install the hog rings to the seatback cover belt.
- 20. INSTALL SEAT CUSHION LOWER SHIELD**
Install the seat cushion lower shield with the 2 screws.

- 21. INSTALL RH SEAT CUSHION SHIELD**
Engage the claws and install the RH seat cushion shield.
- 22. INSTALL RECLINING ADJUSTER RELEASE HANDLE**
- 23. INSTALL HEADRESTS**
- 24. INSTALL SEAT LEG INNER COVER**
Install the seat leg inner cover with the 3 screws.

INSTALLATION

1. INSTALL FRONT SEAT

- (a) Mount the front seat to the vehicle.

NOTICE:

Be careful not to damage the vehicle body.

- (b) w/ Side airbag:
Connect the airbag connector.
- (c) Connect the connectors.
- (d) Slide the front seat to the rearmost position .
- (e) Tighten the bolts on the front side temporarily, starting from the bolt on the inner side.
- (f) Tighten them completely.
- Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)**
- (g) Slide the front seat to the foremost position.
- (h) Tighten the bolts on the rear side temporarily, starting from the bolt on the inner side.
- (i) Tighten them completely.

Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)

2. INSTALL SEAT TRACK COVERS

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

REAR SEAT (Bench Type) COMPONENTS

B02FY-04

H24347

REMOVAL

REMOVE REAR SEAT

- (a) Release the rear seat lock and swing the seat cushions up.

- (b) Remove the 4 bolts.
(c) Lift up the rear seat and remove it.

DISASSEMBLY**CAUTION:**

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

Tape the screwdriver tip before using it to remove the parts.

1. REMOVE HEADRESTS**2. REMOVE REAR SEAT LOCK HANDLE**

(a) Using a screwdriver, remove the rear seat lock handle.

HINT:

Tape the screwdriver tip before use.

(b) Perform the same procedure on the other side.

**3. REMOVE REAR SEAT LOCK COVER**

(a) Remove the screw and rear seat lock cover.

(b) Perform the same procedure on the other side.

**4. REMOVE REAR SEAT CUSHION COVER**

(a) Remove the screw and rear seat cushion cover.

(b) Perform the same procedure on the other side.

**5. REMOVE SEAT CUSHION ASSEMBLY**

(a) Remove the 2 bolts.

(b) Remove the seat cushion assembly front the seat cushion hinge plate.

(c) Perform the same procedure on the other side.

**6. REMOVE LH SEAT CUSHION HINGE COVER**

Using a screwdriver, remove the LH seat cushion hinge cover.

HINT:

Tape the screwdriver tip before use.

**7. REMOVE RH SEAT CUSHION HINGE UPPER AND LOWER COVERS**

Using a screwdriver, remove the RH seat cushion hinge upper and lower covers.

HINT:

Tape the screwdriver tip before use.

**8. REMOVE SEAT CUSHION COVER**

- (a) Open the fastener.
- (b) Remove the hog rings and seat cushion cover.
- (c) Perform the same procedure on the other side.

**9. REMOVE SEAT CUSHION SIDE COVER**

Remove the screw and seat cushion side cover.

10. REMOVE SEAT CUSHION HINGE PLATE

Remove the 2 nuts and seat cushion hinge plate from the seat-back frame.

11. REMOVE SEATBACK ASSEMBLY

Remove the 4 bolts and seatback assembly.

12. REMOVE 4 CRS TETHER ANCHOR BRACKETS

- (a) Remove the bolt and CRS tether anchor bracket.
- (b) Perform the same procedure on the other CRS tether anchors.

**13. REMOVE CENTER ARMREST**

Remove the 2 nuts and center armrest from the seatback assembly.

14. REMOVE CUP HOLDER

Remove the 4 screws and cup holder from the center armrest.

**15. REMOVE CENTER ARMREST HINGE**

(a) Using a screwdriver, remove the center armrest hinge cover.

HINT:

Tape the screwdriver tip before use.

(b) Perform the same procedure on the other side.

(c) Remove the 2 bolts and center armrest hinge.

16. REMOVE HEADREST SUPPORTS**17. REMOVE SEATBACK COVER**

(a) Remove the hog rings from the rear side of the seatback assembly.

(b) Remove the hog rings and seatback cover.

REASSEMBLY

CAUTION:

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

A bolt without a torque specification is shown in the standard bolt chart (see page [SS-2](#)).

1. INSTALL SEATBACK COVER

(a) Install the seatback cover with new hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

(b) Install the new hog rings to the rear side of the seatback assembly.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

2. INSTALL HEADREST SUPPORTS

HINT:

Ensure that the button of the 3 LH headrest supports is installed to the left.

3. INSTALL CENTER ARMREST HINGE

(a) Install the center armrest hinge with the 2 bolts.

Torque: 5.0 N·m (51 kgf·cm, 44 in.-lbf)

- (b) Install the center armrest hinge cover as shown in the illustration, then perform the same procedure on the other side.

4. INSTALL CUP HOLDER

Install the cup holder with the 4 screws to the center armrest.

5. INSTALL CENTER ARMREST

Install the center armrest with the 2 nuts to the seatback assembly.

Torque: 21 N·m (215 kgf·cm, 16 ft·lbf)

6. INSTALL 4 CRS TETHER ANCHOR BRACKETS

- (a) Install the CRS tether anchor bracket with the bolt.

Torque: 9.0 N·m (92 kgf·cm, 80 in·lbf)

- (b) Perform the same procedure on the other CRS tether anchors.

7. INSTALL SEATBACK ASSEMBLY

Install the seatback assembly with the 4 bolts.

Torque: 21 N·m (215 kgf·cm, 16 ft·lbf)

8. INSTALL SEAT CUSHION HINGE PLATE

Install the seat cushion hinge plate with the 2 nuts to the seatback frame.

Torque: 21 N·m (215 kgf·cm, 16 ft·lbf)

9. INSTALL SEAT CUSHION SIDE COVER

Install the seat cushion side cover with the screw.

10. INSTALL SEAT CUSHION COVER

- (a) Install the seat cushion cover with new hog rings.

HINT:

When installing the hog rings, take as much care as possible to prevent wrinkles.

- (b) Close the fastener.

- (c) Perform the same procedure on the other side.

11. INSTALL RH SEAT CUSHION HINGE UPPER AND LOWER COVERS

Install the RH seat cushion hinge upper and lower covers.

12. INSTALL LH SEAT CUSHION HINGE COVER

Install the LH seat cushion hinge cover.

13. INSTALL SEAT CUSHION ASSEMBLY

- Install the seat cushion assembly to the seat cushion hinge plate.
- Install the seat cushion assembly to the seatback lock with the 2 bolts.

Torque: 21 N·m (215 kgf·cm, 16 ft·lbf)

- Perform the same procedure on the other side.

14. INSTALL REAR SEAT CUSHION COVER

- Install the rear seat cushion cover with the screw.
- Perform the same procedure on the other side.

15. INSTALL REAR SEAT LOCK COVER

- Install the rear seat lock cover with the screw.
- Perform the same procedure on the other side.

16. INSTALL REAR SEAT LOCK HANDLE

- (a) Install the rear seat lock handle.
- (b) Perform the same procedure on the other side.

17. INSTALL HEADRESTS

INSTALLATION

HINT:

A bolt without a torque specification is shown in the standard bolt chart (see page [SS-2](#)).

INSTALL REAR SEAT

- (a) Hook the rear seat to the body panel.
- (b) Install the 4 bolts.

Torque: 19 N·m (195 kgf-cm, 14 ft-lbf)

- (c) Release the rear seat lock and swing down the seat cushions.

HINT:

Before swinging down the seat cushion, store the inner belts in the rear seat.

REAR SEAT (LH) COMPONENTS

BO4R3-02

H23457

REMOVAL

1. FOLDING REAR SEAT LH

- (a) Lower the headrest to the lowest position. Pull the seat-back angle adjusting lever and fold the seatback down.
- (b) Unlock the seat legs by pulling up one of the lever on the seat legs, and swing the seat up and forward.

2. REMOVE REAR SEAT LH

- (a) Using a screwdriver, remove the 2 seat leg covers.

HINT:

Tape the screwdriver tip before use.

- (b) Remove the 4 bolts and rear No.1 seat.

Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)

DISASSEMBLY

CAUTION:

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

- ◆ Tape the screwdriver tip before using it to remove the parts.
- ◆ A bolt without a torque specification is shown in the standard bolt chart (see page [SS-2](#)).

1. REMOVE HEADREST

Remove the 2 headrests.

2. REMOVE RECLINING ADJUSTER RELEASE HANDLE

Remove the screw and release handle.

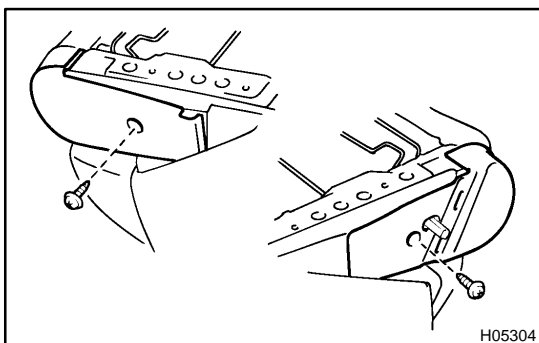

3. REMOVE NO. 1 RECLINING COVER LH

- (a) Unzip the seat cushion cover.
- (b) Remove the screw and No. 1 rear seat reclining cover.

4. REMOVE NO. 1 RECLINING COVER RH

- (a) Unzip the seat cushion cover.
- (b) Remove the screw and No. 1 rear seat reclining cover.

5. REMOVE SEAT CUSHION UNDER COVER (LH AND RH)

- (a) Remove the 2 screws and 2 seat cushion under covers.

BODY - REAR SEAT (LH)

- (b) Using a 5 mm hexagon wrench, remove the bolt and cushion.
- (c) Remove the 10 screws and seat cushion under cover.
- 6. REMOVE FOLD SEAT LOCK CONTROL CABLE NO. 1**
- (a) Tilt the seat forward.
- (b) Remove the clamp and fold seat lock control cable as shown in the illustration.

- 7. REMOVE SEATBACK ASSEMBLY**
- (a) As shown in the illustration, disengage the hook and open the seatback cover.

- (b) Remove the reclining connecting wire of the LH side edge.

- (c) Remove the reclining connecting wire of the RH side edge.
- (d) Remove the 4 bolts and the seatback assembly.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)

8. REMOVE ARMREST

9. REMOVE SEATBACK COVER

- (a) Using a screwdriver, disengage the 4 claws and remove the rear seat shoulder belt cover.

HINT:

Tape the screwdriver tip before use.

- (b) Remove the 4 headrest supports.
- (c) Disengage the hooks, and remove the seatback frame from the seatback cover with pad.
- (d) Remove the seatback cover from the seatback pad.
- (e) Remove the hog rings and seatback cover.

HINT:

At the time of reassembly, take as much care as possible to minimize wrinkles when installing hog rings.

10. REMOVE REAR SEATBACK BOARD

Using a clip remover, remove the 6 clips and seatback board.

11. REMOVE SEAT ADJUSTER CONTROL CABLE

Remove the 2 clamps and seat adjuster control cable.

**12. REMOVE REAR SEAT OUTER BELT**

(a) Remove the 2 bolts and rear seat shoulder belt guide.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)

(b) Remove the nut, rear seat outer belt.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)**13. REMOVE SEAT CUSHION COVER**

(a) Remove the seat cushion cover with pad from the seat cushion frame.

(b) Remove the seat cushion cover from the seat cushion pad.

HINT:

At the time of reassembly, take as much care as possible to minimize wrinkles when installing hog rings.

14. REMOVE REAR NO. 1 SEAT ADJUSTER

- (a) Remove the 2 bolts and rear No. 1 seat outer adjuster.
Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)
- (b) Remove the 2 bolts and rear No. 1 seat inner adjuster.
Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)
- (c) Remove the 4 screws and 2 hinges covers from the rear No. 1 seat outer and inner adjusters.
- (d) Remove the 2 screws and 2 reclining inner covers from the rear No. 1 seat outer and inner adjusters.

**15. REMOVE REAR SEAT STAY**

Remove the 2 bolts and rear seat stay.

16. REMOVE REAR SEAT CUSHION HINGE (LH AND RH)

- (a) Using a screwdriver, remove the spring nut and E-rings.
- (b) Remove the 2 hinge pins, 2 cushion spacers, 2 cushion support springs and 2 rear seat cushion hinges.

17. REMOVE LH REAR SEAT LOCK

Unfasten the bolt, then remove the inner belt and LH rear seat lock.

**18. REMOVE RH REAR SEAT LOCK**

- (a) Remove the screw and rear seat lock cover.
- (b) Remove the bolt, seat belt anchor and inner belt.
Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)
- (c) Remove the RH rear seat lock.

REASSEMBLY

Reassembly is in the reverse order of disassembly (see page [BO-214](#)).

INSTALLATION

Installation is in the reverse order of removal (see page [BO-213](#)).

REAR SEAT (RH) COMPONENTS

BO4R6-03

H23458

REMOVAL

1. FOLDING REAR SEAT RH

- (a) Lower the headrest to the lowest position. Pull the seat-back angle adjusting lever and fold the seatback down.
- (b) Unlock the seat legs by pulling up one of the lever on the seat legs, and swing the seat up and forward.

2. REMOVE REAR SEAT RH

- (a) Using a screwdriver, remove the 2 seat leg covers.

HINT:

Tape the screwdriver tip before use.

- (b) Remove the 4 bolts and rear No.1 seat.

Torque: 37 N·m (380 kgf·cm, 27 ft·lbf)

DISASSEMBLY**CAUTION:**

Wear safety gloves, because the sharp edges and surfaces of the seat frame may cause injury to the hands.

HINT:

- ◆ Tape the screwdriver tip before using it to remove the parts.
- ◆ A bolt without a torque specification is shown in the standard bolt chart (see page [SS-2](#)).

1. REMOVE HEADREST**2. REMOVE RECLINING ADJUSTER RELEASE HANDLE**

- (a) Remove the screw and release handle.

3. REMOVE NO. 1 REAR SEAT RECLINING COVER RH

- (a) Remove the screw and No. 1 rear seat reclining cover.

**4. REMOVE NO. 1 REAR SEAT RECLINING COVER LH**

- (a) Remove the screw and No. 1 rear seat reclining cover.

**5. REMOVE SEATBACK ASSEMBLY**

- (a) Tilting the seat forward.
 (b) As shown in the illustration, disengage the hook and open the seatback cover.
 (c) Remove the 4 bolts and the seatback assembly.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)

6. REMOVE SEATBACK COVER

- (a) Remove the headrest supports.
 (b) Disengage the hooks, and remove the seatback frame from the seatback cover with pad.

(c) Remove the seatback cover from the seatback pad.

HINT:

At the time of reassembly, take as much care as possible to minimize wrinkles when installing hog rings.

7. REMOVE REAR SEATBACK BOARD

Using a clip remover, remove the 5 clips and seatback board.

8. REMOVE REAR SEAT CUSHION UNDER COVER

(a) Using a 5 mm hexagon wrench, remove the bolt and cushion.

(b) Remove the 6 screws and rear seat cushion under cover.

(c) Remove the screw and fold seat stopper band.

9. REMOVE FOLD SEAT LOCK CONTROL CABLE ASSY NO. 1

Using a screwdriver, remove the control cable as shown in the illustration.

HINT:

Tape the screwdriver tip before use.

10. REMOVE LH REAR SEAT RECLINING ADJUSTER AND REAR SEAT LOCK

(a) Unfasten the bolt, then remove the rear No. 1 seat inner belt.

Torque: 42 N·m (430 kgf·cm, 32 ft·lbf)

(b) Remove the bolt, 2 nuts and LH rear seat reclining adjuster with rear seat lock.

Torque:

43 N·m (440 kgf·cm, 32 ft·lbf) for bolt

43 N·m (440 kgf·cm, 32 ft·lbf) for nut

- (c) Using a screwdriver, remove the E-ring, then remove the LH rear seat reclining adjuster from the rear seat lock.

11. REMOVE RECLINING CONNECTING PIPE

12. REMOVE RH REAR SEAT RECLINING ADJUSTER

Remove the 2 nuts and RH rear seat reclining adjuster.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)

13. REMOVE SEAT CUSHION COVER

- (a) Remove the seat cushion cover with pad from the seat cushion frame.
- (b) Remove the seat cushion cover from the seat cushion pad.

HINT:

At the time of reassembly, take as much care as possible to minimize wrinkles when installing hog rings.

14. REMOVE REAR SEAT CUSHION HINGE LH

- (a) Using a screwdriver, remove the E-ring.
- (b) Remove the pin, bushings, spring, collar and rear seat cushion hinge.
- (c) Remove the rear seat cushion hinge on the other side using the same procedures (a to b) described above.

INSPECTION

INSPECT RECLINING LOCK POSITION SLIPPING OFF

When reclining the seat, check that the RH and LH rear seat reclining adjusters are released at the same time.

HINT:

When the reclining lock position slips off, disassemble the seat to adjust the position.

REASSEMBLY

Reassembly is in the reverse order of disassembly (see page [BO-223](#)).

INSTALLATION

Installation is in the reverse order of removal (see page [BO-222](#)).

SEAT BELT COMPONENTS

N

H24330

INSPECTION

CAUTION:

Replace the seat belt assembly (outer belt, inner belt, bolts, nuts or sill-bar) if it has been used in a severe impact. The entire assembly should be replaced even if damage is not obvious.

1. Except manual type:

CONDUCT RUNNING TEST (IN SAFE AREA)

- (a) Fasten the front seat belts.
- (b) Drive the vehicle at 16 km/h (10 mph) and brake hard. Check that the belt locks and cannot be extended at this time.

HINT:

Conduct this test in a safe area. If the belt does not lock, remove the belt mechanism assembly and conduct the following static check. Also, whenever installing a new belt assembly, verify the proper operation before installation.

2. Driver seat belt (ELR): STATIC TEST

- (a) Make sure that the belt locks when pulled out quickly.
- (b) Remove the locking retractor assembly.
- (c) Tilt the retractor slowly.

- (d) Make sure that the belt can be pulled out at a tilt of 15 degrees or less, and cannot be pulled out over 45 degrees. If a problem is found, replace the assembly.

3. Except driver seat belt (ALR/ELR): STATIC TEST

- (a) Make sure that the belt locks when pulled out quickly.
- (b) Pull out the whole belt, then retract the belt slightly and pull it out again.
- (c) Make sure that the belt cannot be extended further. If a problem is found, replace the assembly.
- (d) Remove the locking retractor assembly.

HINT:

Front passenger's seat belt only:

Before removing the pretensioner connector, be sure to read the precautionary notice in the RS section.

- (e) Tilt the retractor slowly.

- (f) Retract the whole belt, then pull out the belt until 200 mm (7.87 in.) of belt remains retracted.
- (g) Tilt the retractor slowly.

- (h) Make sure that the belt can be pulled out at a tilt of 15 degrees or less, and cannot be pulled out at over 45 degrees.

If a problem is found, replace the assembly.

4. INSPECT REAR NO. 1 SEAT CENTER BELT

- (a) After extracting 300 mm (11.81 in.), check that the belt locks when suddenly extracted.
- (b) Check that the belt can be extracted 300 mm (11.81 in.) without being locked when the seat is reclined as shown in the illustration.
- (c) Check that the belt is locked when the belt is extracted by a certain amount under condition (a).

- (d) When folding down the seatback forward and extracting the seat belt slowly, check that the belt is locked after a certain length (approximately 500 mm (19.69 in.)) of the belt has been extracted.

SEAT BELT PRETENSIONER REMOVAL

BO4T3-02

NOTICE:

- ◆ If the wiring connector of the seat belt pretensioner is disconnected with the ignition switch ON, diagnostic trouble codes will be recorded.
- ◆ Never use a seat belt pretensioner from another vehicle. When replacing parts, replace them with new parts.

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

Disconnect the cable from the negative (-) battery terminal.

NOTICE:

If the cable is disconnected from the negative battery terminal, the preset AM and FM stations stored in memory are erased. Be sure to make note of them before disconnecting the cable.

CAUTION:

Work must be started at least 90 seconds after the ignition switch is turned to the LOCK position and the cable is disconnected from the negative (-) battery terminal.

(The SRS is equipped with a back-up power source. If work is started within 90 seconds of disconnecting the cable from the negative (-) battery terminal, the SRS may deploy.)

2. Standard cab:

REMOVE FRONT SEAT OUTER BELT

- (a) Remove the 5 screws and front door scuff plate.

- (b) Remove the front pillar garnish.

- (1) Using a screwdriver, remove the caps.

HINT:

Tape the screwdriver tip before use.

- (2) Using a torx® driver, remove the torx® screws and assist grip.

Torx® driver:

T30 (Part No. 09041-00030 or locally manufactured tool)

- (3) Using a screwdriver, remove the front pillar garnish.

HINT:

Tape the screwdriver tip before use.

- (c) Remove the room partition garnishes.

- (1) Using a screwdriver, remove the back panel trim covers.

HINT:

Tape the screwdriver tip before use.

- (2) Using a screwdriver, remove the room partition garnishes.

HINT:

Tape the screwdriver tip before use.

- (d) Remove the bolt and front seat outer belt floor anchor.

- (e) Remove the quarter trim.

- (1) Using a screwdriver, remove the quarter trim belt hole cover.

HINT:

Tape the screwdriver tip before use.

- (2) Using a screwdriver, remove the cap.

HINT:

Tape the screwdriver tip before use.

- (3) Remove the bolt and front seat outer belt shoulder anchor.

- (4) Using a screwdriver, remove the quarter trim.

HINT:

Tape the screwdriver tip before use.

- (f) Remove the retractor of the front seat outer belt.

CAUTION:

Never disassemble the front seat outer belt.

NOTICE:

When removing the retractor of the front seat outer belt, take care not to pull the seat belt pretensioner wire harness.

- (1) Disconnect the pretensioner connector as shown in the illustration.
- (2) Remove the 2 bolts and retractor of the front seat outer belt.

3. Access cab:**REMOVE FRONT SEAT OUTER BELT**

- (a) Remove the 4 screws and front door scuff plate.
- (b) Remove the 3 screws and rear door scuff plate.
- (c) Remove the bolt and front seat outer belt floor anchor.

- (d) Remove the front seat outer belt shoulder anchor.

- (1) Using a screwdriver, remove the cap.

HINT:

Tape the screwdriver tip before use.

- (2) Remove the bolt and front seat outer belt shoulder anchor.

- (e) Remove the roof side rail garnish.

- (1) Using a screwdriver, remove the caps.

HINT:

Tape the screwdriver tip before use.

- (2) Using a torx® driver, remove the 2 torx® screws and assist grip.

Torx® driver:

T30 (Part No. 09041-00030 or locally manufactured tool)

- (3) Using a screwdriver, remove the roof side rail garnish.

HINT:

Tape the screwdriver tip before use.

- (f) Remove the front door rear scuff plate and cover.

- (1) Remove the clip and cover.

- (2) Remove the clip and front door rear scuff plate.

- (g) Remove the retractor of the front seat outer belt.

CAUTION:

Never disassemble the front seat outer belt.

NOTICE:

When removing the retractor of the front seat outer belt, take care not to pull the seat belt pretensioner wire harness.

- (1) Disconnect the pretensioner connector as shown in the illustration.
- (2) Remove the 2 bolts and retractor of the front seat outer belt.

**4. Double cab:****REMOVE FRONT SEAT OUTER BELT**

- (a) Remove the front door scuff plate.
 - (1) Remove the 4 screws, disengage the claw and front door scuff plate.
 - (2) Remove the front door opening trim weatherstrip.

- (b) Remove the rear door scuff plate.
 - (1) Remove the 3 screws.
 - (2) Using a screwdriver, disengage the clip and remove the rear door scuff plate.

HINT:

Tape the screwdriver tip before use.

- (c) Remove the rear door opening trim weatherstrip.

- (d) Remove the lower center pillar garnish.
 - (1) Remove the front seat outer belt floor anchor.
 - (2) Using a screwdriver, remove the lower center pillar garnish.

HINT:

Tape the screwdriver tip before use.

- (e) Remove the front seat outer belt shoulder anchor.

- (1) Using a screwdriver, remove the cap.

HINT:

Tape the screwdriver tip before use.

- (2) Remove the bolt and front seat outer belt shoulder anchor.

- (f) Remove the retractor of front seat outer belt.

CAUTION:

Never disassemble the front seat outer belt.

NOTICE:

When removing the retractor of front seat outer belt, take care not to pull the seat belt pretensioner wire harness.

- (1) Using a screwdriver, pull the locking button of the pretension connector to your side to release the lock.

HINT:

Tape the screwdriver tip before use.

- (2) Disconnect the connector.
- (3) Remove the 2 bolts and the front seat outer belt assembly.

INSPECTION

1. PRETENSIONER IS NOT ACTIVATED

(a) Perform a diagnostic system check (see page [DI-1871](#)).

(b) Perform a visual check which includes the following items with the front seat outer belt removed from the vehicle.

- ◆ **Standard cab:**
Check the quarter trim for cuts, cracks or marked discoloration.
- ◆ **Access cab:**
Check for cuts and cracks in, or marked discoloration on the front door rear scuff plate.
- ◆ **Double cab:**
Check for cuts and cracks in, or marked discoloration on the front door rear scuff plate and front door rear scuff plate and center pillar garnish lower.
- ◆ Check for cuts and cracks in wire harness, and for chipping in connectors.

Standard cab:**Access cab:****Double cab:**H11399
H04116

H23510

- ◆ Standard cab:
Check for deformation of the quarter panel.
- ◆ Access cab:
Check for deformation of the ELR bracket.
- ◆ Double cab:
Check for deformation of the ELR bracket.

CAUTION:

For removal and installation of the front seat outer belt, see page [BO-236](#) and [BO-252](#) .

Be sure to follow the correct procedure.

Standard cab:

T

Access cab:

T

Double cab:

C H11400 H11401 H18975

H23512

- ◆ Check for cuts and miute cracks in wire harness or marked discoloration on the front seat outer belt.

CAUTION:

For removal and installation of the front seat outer belt, see page [BO-236](#) and [BO-252](#) .

Be sure to follow the correct procedure.

2. PRETENSIONER IS ACTIVATED

- (a) Perform a diagnostic system check (see page [DI-1871](#)).

- (b) Perform a visual check which includes the following items with the front seat outer belt removed from the vehicle.
- ◆ Standard cab:
Check for deformation of the quarter panel.
 - ◆ Access cab:
Check for deformation of the ELR bracket.
 - ◆ Check for damage on the connector and wire harness.

DISPOSAL

HINT:

When scrapping vehicles equipped with a seat belt pretensioner or disposing of a front seat outer belt (with seat belt pretensioner), always first activate the seat belt pretensioner in accordance with the procedure described below. If any abnormality occurs in the seat belt pretensioner operation, contact the SERVICE DEPT. of TOYOTA MOTOR SALES, U.S.A., INC. When disposing of a front seat outer belt (with seat belt pretensioner) activated in a collision, follow the same procedure given in step 1-(h) in "DISPOSAL".

CAUTION:

- ◆ Never dispose of a front seat outer belt which has an inactivated pretensioner.
- ◆ The seat belt pretensioner produces a sizeable exploding sound when it activates, so perform the operation out-of-door and where it will not create a nuisance to nearby residents.
- ◆ When activating the seat belt pretensioner, always use the specified SST (SRS Airbag Deployment Tool). Perform the operation in a place away from electrical noise.
SST 09082-00700, 09082-00740
- ◆ When activating a front seat outer belt (with seat belt pretensioner), perform the operation at least 10 m (33 ft) away from the front seat outer belt.
- ◆ Use gloves and safety glasses when handling a front seat outer belt with activated pretensioner.
- ◆ Always wash your hands with water after completing the operation.
- ◆ Do not apply water to a front seat outer belt with activated pretensioner.

1. SEAT BELT PRETENSIONER ACTIVATION WHEN SCRAPPING VEHICLE

HINT:

Have a battery ready as the power source to activate the seat belt pretensioner.

(a) Check the functioning of SST.

CAUTION:

When activating the seat belt pretensioner, always use the specified SST (SRS Airbag Deployment Tool.)

SST 09082-00700, 09082-00740

(1) Connect the SST to the battery.

Connect the red clip of the SST to the battery positive (+) terminal and the black clip to the battery negative (-) terminal.

HINT:

Do not connect the yellow connector which will be connected with the seat belt pretensioner.

(2) Check the functioning of the SST.

Press the SST activation switch, and check that the LED of the SST activation switch lights up.

CAUTION:

If the LED lights up when the activation switch is not being pressed, SST may be malfunctioning. Definitely do not use the SST.

(3) Disconnect the SST from the battery.

(b) Disconnect the negative (-) terminal cable from the battery.

CAUTION:

Work must be started at least 90 seconds after the ignition switch is turned to the LOCK position and the negative (-) terminal cable is disconnected from the battery.

(The SRS is equipped with a back-up power source. If work is started within 90 seconds of disconnecting the negative (-) terminal cable from the battery, the SRS may deploy.)

(c) Standard cab:

Disconnect the pretensioner connector.

- (1) Remove the front door scuff plate.
- (2) Remove the front pillar garnish.
- (3) Remove the back panel upper garnish.
- (4) Remove the front seat outer belt floor anchor.
- (5) Remove the quarter trim.
- (6) Disconnect the pretensioner connector as shown in the illustration.

- (d) Access cab:
Disconnect the pretensioner connector.
- (1) Remove the front door scuff plate.
 - (2) Remove the rear door scuff plate.
 - (3) Remove the front seat outer belt floor anchor.
 - (4) Remove the front seat outer belt shoulder belt.
 - (5) Remove the roof side rail garnish.
 - (6) Remove the front door rear scuff plate and cover.
 - (7) Disconnect the pretensioner connector as shown in the illustration.

- (e) Double cab:
Disconnect the pretensioner connector.
- (1) Remove the front door scuff plate.
 - (2) Remove the back door scuff plate.
 - (3) Remove the lower center pillar garnish.
 - (4) Disconnect the pretensioner connector as shown in the illustration.

- (f) Install the SST.
- (1) Buckle the front seat belt and check that there is no looseness and slack in the front seat inner belt and front seat outer belt.
 - (2) Connect the 2 SST, then connect them to the seat belt pretensioner.

SST 09082-00700, 09082-00740

NOTICE:

To avoid damaging the SST connector and wire harness, do not lock the secondary lock of the twin lock.

- (3) Move the SST to at least 10 m (33 ft) away from the front of the vehicle.
- (4) Close all the doors and windows of the vehicle.

HINT:

Do not close the window fully. Allow clearance for inserting the SST wire harness.

NOTICE:

Take care not to damage the SST wire harness.

- (5) Connect the SST red clip to the battery positive (+) terminal and the black clip to the negative (-) terminal.

- (g) Activate the seat belt pretensioner.

- (1) Confirm that no one is inside the vehicle or within 10 m (33 ft) area around the vehicle.
- (2) Press the SST activation switch and activate the seat belt pretensioner.

HINT:

The seat belt pretensioner operates simultaneously as the LED of the SST activation switch lights up.

- (h) Dispose of the front seat outer belt (with seat belt pretensioner).

CAUTION:

- ◆ The front seat outer belt is very hot when the seat belt pretensioner is activated. Leave it alone for at least 30 minutes after activation.
- ◆ Use gloves and safety glasses when handling a front seat outer belt with activated seat belt pretensioner.
- ◆ Always wash your hands with water after completing the operation.
- ◆ Do not apply water to a front seat outer belt with activated seat belt pretensioner.

HINT:

When scrapping a vehicle, activate the seat belt pretensioner and scrap the vehicle with activated front seat outer belt still installed.

2. ACTIVATION WHEN DISPOSING OF FRONT SEAT OUTER BELT ONLY

NOTICE:

- ◆ When disposing of the front seat outer belt (with seat belt pretensioner) only, never use the customer's vehicle to activate the seat belt pretensioner.
- ◆ Be sure to follow the procedure given on the next page when activating the seat belt pretensioner.

- (a) Disconnected the negative (-) terminal cable from the battery.

HINT:

Have a battery ready as the power source when activating the seat belt pretensioner.

NOTICE:

If the cable is disconnected from the negative battery terminal, the preset AM and FM stations stored in memory are erased. Be sure to make note of them before disconnecting the cable.

CAUTION:

Work must be started at least 90 seconds after the ignition switch is turned to the LOCK position and the cable is disconnected from the negative (-) battery terminal.

(The SRS is equipped with a back-up power source. If work is started within 90 seconds of disconnecting the cable from the negative (-) battery terminal, the SRS may deploy.)

- (b) Remove the front seat outer belt (see page [BO-229](#)).

HINT:

Cut the belt near the seat belt retractor.

- (c) Check the functioning of SST (see step 1-(a)).
SST 09082-00700, 09082-00740
(1) Disconnect the SST from the battery.

- (d) Install the SST.
(1) Connect the 2 SST, then connect them to the seat belt pretensioner.
SST 09082-00700, 09082-00740

NOTICE:

To avoid damaging the SST connector and wire harness, do not lock the secondary lock of the twin lock.

- (2) Place the front seat outer belt on the ground and cover it with the disc wheel with tire.

NOTICE:

Place the front seat outer belt as shown in the illustration.

- (3) Move the SST at least 10 m (33 ft) away from the disc wheel.

NOTICE:

Take care not to damage the SST wire harness.

- (e) Activate the seat belt pretensioner.
(1) Connect the SST red clip to the battery positive (+) terminal and black clip to the battery negative (-) terminal.
(2) Check that no one is within 10 m (33 ft) area around the disc wheel.
(3) Press the SST activation switch and activate the seat belt pretensioner.

HINT:

The seat belt pretensioner operates simultaneously as the LED of the SST activation switch lights up.

- (f) Dispose of the front seat outer belt (with seat belt pretensioner).

CAUTION:

- ◆ **The front seat outer belt is very hot when the seat belt pretensioner is activated. Leave it alone for at least 30 minutes after activation.**
- ◆ **Use gloves and safety glasses when handling a front seat outer belt with activated seat belt pretensioner.**
- ◆ **Always wash your hands with water after completing the operation.**
- ◆ **Do not apply water to a front seat outer belt with activated seat belt pretensioner.**
 - (1) Remove the disc wheel and SST.
 - (2) Place the front seat outer belt in a vinyl bag, tie the end tightly and dispose of it in the same way as other general parts.

REPLACEMENT

REQUIREMENTS FOR REPLACEMENT

In the following cases, replace the seat belt pretensioner.

- ◆ The seat belt pretensioner has been activated.
- ◆ The seat belt pretensioner has been found to be faulty during troubleshooting.
- ◆ The front seat outer belt has been found to be faulty while checking items 1-(b) or 2-(b) (see page [BO-241](#)).
- ◆ The front seat outer belt has been dropped.

CAUTION:

For removal and installation of the seat belt pretensioner, see pages [BO-236](#) and [BO-252](#) . Be sure to follow the correct procedure.

AC2810

AIR CONDITIONING SYSTEM PRECAUTION

AC001-14

1. **DO NOT HANDLE REFRIGERANT IN AN ENCLOSED AREA OR NEAR AN OPEN FLAME**
2. **ALWAYS WEAR EYE PROTECTION**

AC2811

3. **BE CAREFUL NOT TO GET LIQUID REFRIGERANT IN YOUR EYES OR ON YOUR SKIN**

If liquid refrigerant gets in your eyes or on your skin.

- (a) Wash the area with lots of cool water.

CAUTION:

Do not rub your eyes or skin.

- (b) Apply clean petroleum jelly to the skin.
- (c) Go immediately to a physician or hospital for professional treatment.

4. **NEVER HEAT CONTAINER OR EXPOSE IT TO OPEN FLAME**
5. **BE CAREFUL NOT TO DROP CONTAINER OR NOT TO APPLY PHYSICAL SHOCKS TO IT**

N11084

6. **DO NOT OPERATE COMPRESSOR WITHOUT ENOUGH REFRIGERANT IN REFRIGERATION SYSTEM**

If there is not enough refrigerant in the refrigerant system, oil lubrication will be insufficient and compressor burnout may occur. Necessary care should be taken to avoid this.

7. **DO NOT OPEN PRESSURE MANIFOLD VALVE WHILE COMPRESSOR IS OPERATING**

If the high pressure valve is opened, refrigerant flows in the reverse direction and could cause the charging cylinder to rupture, so open and close only the low pressure valve.

8. **BE CAREFUL NOT TO OVERCHARGE SYSTEM WITH REFRIGERANT**

If refrigerant is overcharged, it causes problems such as insufficient cooling, poor fuel economy, engine overheating, etc.

9. SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

The TOYOTA TUNDRA is equipped with an SRS (Supplemental Restraint System) such as the driver and front passenger airbags. Failure to carry out service operation in the correct sequence could cause the SRS to unexpectedly deploy during servicing, possibly leading to a serious accident. Before servicing (including removal or installation of parts, inspection or replacement), be sure to read the precautionary notices in the RS section.

ON-VEHICLE INSPECTION

1. Access cab, Standard cab: INSPECT REFRIGERANT VOLUME

Observe the sight glass on the liquid tube.

Test conditions:

- ◆ Running engine at 1,500 rpm
- ◆ Blower speed control switch at "HI" position
- ◆ A/C switch ON
- ◆ Temperature control dial at "COOL" position
- ◆ Fully open the doors

Item	Symptom	Amount of refrigerant	Remedy
1	Bubbles are present in sight glass	Insufficient*	(1) Check for gas leakage with gas leak detector and repair if necessary (2) Add refrigerant until bubbles disappear
2	No bubbles are present in sight glass	None, sufficient or too much	Refer to items 3 and 4
3	No temperature difference between compressor inlet and outlet	Empty or nearly empty	(1) Check for gas leakage with gas leak detector and repair if necessary (2) Add refrigerant until bubbles disappear
4	Temperature between compressor inlet and outlet is noticeably different	Correct or too much	Refer to items 5 and 6
5	Immediately after air conditioning is turned off, refrigerant in sight glass stays clear	Too much	(1) Discharge refrigerant (2) Evacuate air and charge proper amount of purified refrigerant
6	When air conditioning is turned off, refrigerant foams and then stays clear	Correct	-

*: Bubbles in the sight glass with ambient temperature higher than usual can be considered normal if cooling is sufficient.

HINT:

Double cab models do not have a sight glass. When inspecting, use a manifold gauge set.

2. INSPECT REFRIGERANT PRESSURE WITH MANIFOLD GAUGE SET

This is a method for checking the A/C system by using a manifold gauge set. Read the manifold gauge pressure when the following conditions are established.

Test conditions:

- ◆ Temperature at the air inlet with the switch set at RECURC is 30 to 35°C (86 to 95°F)
- ◆ Engine running at 1500 rpm
- ◆ Blower speed control switch at "HI" position
- ◆ Temperature control dial at "COOL" position

HINT:

Gauge indications may vary slightly due to ambient temperature conditions.

(1) Normally functioning refrigeration system.

Gauge reading:

Low pressure side:

0.15 to 0.25 MPa (1.5 to 2.5 kgf/cm²)

High pressure side:

1.37 to 1.57 MPa (14 to 16 kgf/cm²)

(2) Moisture present in refrigeration system.

Condition : Periodically cools and then fails to cool

Symptom seen in refrigeration system	Probable cause	Diagnosis	Remedy
During operation, pressure on low pressure side cycles between vacuum and normal	Moisture in refrigeration system freezes at expansion valve orifice and temporarily stops cycle, but normal state is restored after the ice melts	<ul style="list-style-type: none"> ◆Drier in oversaturated state ◆Moisture in refrigeration system freezes at expansion valve orifice and blocks circulation of refrigerant 	<ul style="list-style-type: none"> (1) Replace receiver (2) Remove moisture in cycle by repeatedly evacuating air (3) Charge proper amount of new refrigerant

(3) Insufficient cooling

Condition: Insufficient cooling

I01388

Symptom seen in refrigeration system	Probable cause	Diagnosis	Remedy
<ul style="list-style-type: none"> ◆ Pressure low on both low and high pressure sides ◆ Bubbles seen in sight glass continuously ◆ Insufficient cooling performance 	Gas leakage in refrigeration system	<ul style="list-style-type: none"> ◆ Insufficient refrigerant in system ◆ Refrigerant leaking 	<ol style="list-style-type: none"> (1) Check for gas leakage with gas leak detector and repair if necessary (2) Charge proper amount of refrigerant (3) If indicated pressure value is near 0 when connected to gauge, create the vacuum after inspecting and repairing the location of the leak

(4) Poor circulation of refrigerant

Condition: Insufficient cooling

I01389

Symptom seen in refrigeration system	Probable cause	Diagnosis	Remedy
<ul style="list-style-type: none"> ◆ Pressure low on both low and high pressure sides ◆ Frost on tube from receiver to unit 	Refrigerant flow obstructed by dirt in receiver	Receiver clogged	Replace receiver

(5) Refrigerant does not circulate

Condition: Does not cool (Cools from time to time in some cases)

I01449

Symptom seen in refrigeration system	Probable cause	Diagnosis	Remedy
<ul style="list-style-type: none"> ◆ Vacuum indicated on low pressure side, very low pressure indicated on high pressure side ◆ Frost or dew seen on piping on both sides of receiver/drier or expansion valve 	<ul style="list-style-type: none"> ◆ Refrigerant flow obstructed by moisture or dirt in refrigeration system ◆ Refrigerant flow obstructed by gas leakage from expansion valve 	Refrigerant does not circulate	<ol style="list-style-type: none"> (1) Check expansion valve (2) Clean out dirt in expansion valve by blowing with air (3) Replace receiver (4) Evacuate air and charge new refrigerant to proper amount (5) For gas leakage from expansion valve, replace expansion valve

(6) Refrigerant overcharged or insufficient cooling of condenser

Condition: Insufficient cooling

I01390

Symptom seen in refrigeration system	Probable cause	Diagnosis	Remedy
<ul style="list-style-type: none"> ◆ Pressure too high on both low and high pressure sides ◆ No air bubbles seen through the sight glass even when the engine rpm is lowered 	<ul style="list-style-type: none"> ◆ Unable to develop sufficient performance due to excessive refrigerant ◆ Insufficient cooling of condenser 	<ul style="list-style-type: none"> ◆ Excessive refrigerant in cycle → refrigerant overcharged ◆ Condenser cooling insufficient → condenser fins clogged or cooling fan faulty 	<ol style="list-style-type: none"> (1) Clean condenser (2) Check cooling fan with fluid coupling operation (3) If (1) and (2) are in normal state, check amount of refrigerant and charge proper amount of refrigerant

(7) Air present in refrigeration system

Condition: Insufficient cooling

NOTE : These gauge indications are shown when the refrigeration system has been opened and the refrigerant has been charged without vacuum purging.

I01392

Symptom seen in refrigeration system	Probable cause	Diagnosis	Remedy
<ul style="list-style-type: none"> ◆Pressure too high on both low and high pressure sides ◆The low pressure piping hot to the touch ◆Bubbles seen in sight glass 	Air in refrigeration system	<ul style="list-style-type: none"> ◆Air present in refrigeration system ◆Insufficient vacuum purging 	<ul style="list-style-type: none"> (1) Check compressor oil to see if it is dirty or insufficient (2) Evacuate air and charge new refrigerant

(8) Expansion valve malfunction

Condition: Insufficient cooling

I01450

Symptom seen in refrigeration system	Probable cause	Diagnosis	Remedy
<ul style="list-style-type: none"> ◆Pressure too high on both low and high pressure sides ◆Frost or large amount of dew on piping on low pressure side 	Trouble in expansion valve	<ul style="list-style-type: none"> ◆Excessive refrigerant in low pressure piping ◆Expansion valve opened too wide 	<ul style="list-style-type: none"> Check expansion valve Replace if defective

(9) Insufficient compressor compression

Condition : Does not cool

I01393

Symptom seen in refrigeration system	Probable cause	Diagnosis	Remedy
<ul style="list-style-type: none"> ◆ Pressure too high on both low and high pressure sides ◆ Pressure too low on high pressure side 	Internal leak in compressor	<ul style="list-style-type: none"> ◆ Low compression ◆ Leak from valve or broken sliding parts 	Repair or replace compressor

3. INSPECT IDLE-UP SPEED

- (a) Warm up the engine.
- (b) Inspect idle-up speed when the following conditions are established.
 - ◆ Warm up engine
 - ◆ Blower speed control switch at "HI" position
 - ◆ A/C switch ON
 - ◆ Temperature control dial at "COOL" position

Magnetic clutch condition	Idle-up speed
1GR-FE Engine	-
Magnetic clutch not engaged	700 ± 50 rpm
Magnetic clutch engaged	700 ± 50 rpm
2UZ-FE Engine	-
Magnetic clutch not engaged	750 ± 50 rpm
Magnetic clutch engaged	800 ± 50 rpm

If idle speed is not as specified, check the Idle control system.

4. INSPECT FOR LEAKAGE OF REFRIGERANT

- (a) Perform under the following conditions:
 - ◆ Stop the engine.
 - ◆ Secure good ventilation (If not, the gas leak detector may react to volatile gases which are not refrigerant, such as evaporated gasoline and exhaust gas.)
 - ◆ Repeat the test 2 or 3 times.
 - ◆ Make sure that there is some refrigerant remaining in the refrigeration system.
- When the compressor is OFF: approx. 392 to 588 kPa (4 to 6 kgf/cm², 57 to 85 psi)

- (b) Bring the gas leak detector close to the drain hose before performing the test.

HINT:

- ◆ After the blower motor stopped, leave the cooling unit for more than 15 minutes.
- ◆ Bring the gas leak detector sensor under the drain hose.
- ◆ When bringing the gas leak detector close to the drain hose, make sure that the gas leak detector does not react to the volatile gases.

If such reaction is unavoidable, the vehicle must be lifted up.

- (c) If gas leak is not detected on the drain hose, remove the blower motor linear controller from the cooling unit. Then insert the gas leak detector sensor into the unit and perform the test.
- (d) Disconnect the connector and leave the pressure switch for approx. 20 minutes. Then bring the gas leak detector close to the pressure switch and perform the test.
- (e) Bring the gas leak detector close to the refrigerant lines and perform the test.

EVACUATING

1. **CONNECT QUICK DISCONNECT ADAPTER TO CHARGING HOSES**
2. **REMOVE CAPS FROM SERVICE VALVES ON REFRIGERANT LINES**
3. **SET MANIFOLD GAUGE SET**
 - (a) Close both valves of the manifold gauge set.
 - (b) Connect the quick disconnect adapters to the service valves.

4. **EVACUATE AIR FROM REFRIGERATION SYSTEM**
 - (a) Connect the vacuum pump adapter to the vacuum pump.

- (b) Connect the center hose of the manifold gauge set to the vacuum pump adapter.
- (c) Open both the high and low side valves and run the vacuum pump.
- (d) After 10 minutes or more, check that the low pressure gauge indicates 750 mmHg (30 in. Hg) or more.

HINT:

If the reading is 750 mmHg (30 in. Hg) or more, close both valves of the manifold gauge set and stop the vacuum pump. Check the system for leaks and repair if necessary.

- (e) Close both the high and low side valves and stop the vacuum pump.
- (f) Leave the system in this condition for 5 minutes or more and check that there is no change in gauge indication.

CHARGING

1. INSTALL CHARGING CYLINDER

HINT:

When handling the charging cylinder, always follow the directions given in the instruction manual.

- (a) Charge the proper amount of refrigerant into the charging cylinder.
- (b) Connect the center hose to the charging cylinder.

CAUTION:

Do not open either the high or low side valve of the manifold gauge set.

- (c) Open the valve of the charging cylinder.
- (d) Press the valve core on the side of the manifold gauge and expel the air from the center hose.

2. INSPECT REFRIGERATION SYSTEM FOR LEAKS

- (a) Open the high pressure side valve and charge refrigerant.
- (b) When the low pressure gauge indicates 98 kPa (1 kgf/cm², 14 psi), close the high pressure side valve.
- (c) Using a gas leak detector, check the system for leakage.

CAUTION:

Use a refrigerant recovery/recycling machine to recover the refrigerant whenever replacing parts.

3. CHARGE REFRIGERANT INTO REFRIGERANT SYSTEM

If there is no leak after refrigerant leak check, charge the proper amount of refrigerant into the refrigeration system.

CAUTION:

- ◆ Never run the engine when charging the system through the high pressure side.
- ◆ Do not open the low pressure side valve when the system is being charged with liquid refrigerant.

- (a) Open the high pressure side valve fully.
- (b) Charge specified amount of refrigerant, then close the high pressure side valve.

HINT:

The system is fully charged if bubbles cannot be seen through the sight glass.

- (c) Partially charge the refrigeration system with refrigerant.
 - (1) Prepare the vehicle:
 - ◆ Running engine at 1,500 rpm
 - ◆ Single A/C: Front blower speed control dial at "HI" position
 - ◆ Dual A/C: Front and rear blower speed set at "HI" position
 - ◆ Single A/C: Front temperature control dial at "MAX. COOL" position
 - ◆ Dual A/C: Front temperature control dial at "MAX. COOL" position
Rear temperature control set at 18.5°C (65°F)
 - ◆ Air inlet control set at "RECIRC"
 - ◆ Fully open doors (Sliding roof: closed)
 - (2) Open the low pressure side valve.

CAUTION:

Do not open the high pressure side valve.

- (d) Access cab, Standard cab: Charge refrigerant until bubbles disappear and check the pressure on the gauge through the sight glass.

HINT:

Double cab models do not have a sight glass. When inspecting, use a manifold gauge set.

DRIVE BELT ON-VEHICLE INSPECTION

AC3SB-01

1. INSPECT DRIVE BELT'S INSTALLATION CONDITION

Check that the drive belt fits properly in the ribbed grooves.

2. 1GR-FE engine: INSPECT DRIVE BELT TENSIONER

Check that nothing gets caught in the tensioner by turning it clockwise and counterclockwise.

If a malfunction exists, replace the tensioner.

3. 2UZ-FE engine: INSPECT DRIVE BELT TENSION

Check that the tension is within the range A on the auto tensioner scale.

If the tension is not within the range A on the scale, replace the belt with a new one.

HINT:

When replacing the drive belt with a new one, the belt tension should be within range B on the belt tensioner scale.

REMOVAL

1. 1GR-FE engine:

REMOVE DRIVE BELT

- (a) Remove the engine under cover.
- (b) Loosen the belt tension by turning the belt tensioner counterclockwise, and remove the drive belt from the belt tensioner.

2. 2UZ-FE engine:

REMOVE DRIVE BELT

Loosen the drive belt tension by turning the drive belt tensioner counterclockwise, and remove the drive belt.

INSTALLATION

1. 1GR-FE engine:

INSTALL DRIVE BELT

- (a) While turning the belt tensioner counterclockwise, align the holes. Insert a 6 mm (0.24 in.) bar into the holes to fix the belt tensioner.
- (b) Install the drive belt.
- (c) While turning the belt tensioner counterclockwise, remove the bar.

- (d) If it is hard to install the drive belt, perform the following procedures:
 - (1) Wrap the drive belt around all the pulleys and idlers, except for the P/S pump, as shown in the illustration.
 - (2) While releasing belt tension by turning the belt tensioner counterclockwise, wrap the drive belt around the P/S pump.
- (e) Install the engine under cover.

2. 2UZ-FE engine:

INSTALL DRIVE BELT

- Turn the drive belt tensioner counterclockwise and install the drive belt.

MANIFOLD GAUGE SET SET ON

1. **CONNECT CHARGE HOSE TO MANIFOLD GAUGE SET**

Tighten the nuts by hand.

CAUTION:

Do not connect the wrong hoses.

2. **CONNECT QUICK DISCONNECT ADAPTERS TO CHARGING HOSES**

Tighten the nuts by hand.

3. **CLOSE BOTH VALVES OF MANIFOLD GAUGE SET**
4. **REMOVE CAPS FROM SERVICE VALVES ON REFRIGERANT LINE**

5. CONNECT QUICK DISCONNECT ADAPTERS TO SERVICE VALVES

HINT:

Push the quick disconnect adapter onto the service valve, then slide. Slide the sleeve of the quick disconnect adapter downward to lock it.

SET OFF

1. **CLOSE BOTH VALVES OF MANIFOLD GAUGE SET**
2. **DISCONNECT QUICK DISCONNECT ADAPTERS FROM SERVICE VALVES ON REFRIGERANT LINE**

HINT:

Slide the sleeve of the quick disconnect adapter upward to unlock the adapter and remove it from the service valve.

3. **INSTALL CAPS TO SERVICE VALVES ON REFRIGERANT LINE**

REFRIGERANT LINE

AC00C-03

ON-VEHICLE INSPECTION

1. INSPECT HOSE AND TUBE CONNECTIONS FOR LOOSENESS
2. INSPECT HOSES AND TUBES FOR LEAKAGE

Using a gas leak detector, check for leakage of refrigerant.

Double cab: 530 ± 50 g (18.69 ± 1.76 oz.)

5. INSPECT FOR LEAKAGE OF REFRIGERANT

Using a gas leak detector, check for leakage of refrigerant.

6. INSPECT AIR CONDITIONING OPERATION

COOLING UNIT ON-VEHICLE INSPECTION

AC271-03

1. INSPECT FOR LEAKAGE OF REFRIGERANT

- (a) Remove the glove compartment door.
- (b) Remove the lower No. 2 finish panel.
- (c) Remove the lower center cover.
- (d) Remove the lower LH finish panel.
- (e) Remove the lower cover (See page [BO-1 11](#)).

- (f) Remove the blower resistor.
 - (1) Disconnect the connector.
 - (2) Remove the 2 screws and blower resistor.

- (g) Using a gas leak detector, check for leakage.

If there is leakage, check the tightening torque at the joints or check the evaporator.

- (h) Install the blower resistor with the 2 screws.
- (i) Install the lower cover.
- (j) Install the lower LH finish panel.
- (k) Install the lower center cover.
- (l) Install the lower No. 2 finish panel.
- (m) Install the glove compartment door (See page [BO-120](#)).

2. INSPECT EXPANSION VALVE

- (a) Check quantity of gas during refrigeration cycle.
- (b) Set the manifold gauge set.
- (c) Run the engine.
 - (1) Run the engine at 1,500 rpm for at least 5 minutes.
 - (2) Then check that the high pressure reading is 1.37 to 1.57 Mpa (14 to 16 kgm/cm², 199 to 288 psi).

- (d) Check the expansion valve.

If the expansion valve is faulty, the low pressure reading will drop to 0 kPa (0 kgf/cm², 0 psi).

HINT:

When the low pressure reading drops to 0 kPa (0 kgf/cm², 0 psi), there is no difference in temperature between the IN and OUT sides of the receiver.

3. INSPECT THERMISTOR RESISTANCE

- (a) Disconnect the connector.
- (b) Measure the resistance between terminals.

Standard resistance: 1,500 Ω at 25°C (77°F)

If resistance is not as specified, replace the thermistor.

COMPONENTS

Access Cab, Standard Cab:

Double Cab:

I27029

REMOVAL

1. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM

HINT:

At the time of installation, refer to the following:

- ◆ Evacuate air from the refrigeration system.
- ◆ Charge system with refrigerant and inspect for leakage of refrigerant.

Specified amount:

Access cab, Standard cab:

600 ± 50 g (21.16 ± 1.76 oz.)

Double cab: 530 ± 50 g (18.69 ± 1.76 oz.)

2. DISCONNECT LIQUID AND SUCTION TUBE

- (a) Using SST, remove the piping clamp.
SST 09870-00025 (Liquid tube)

- (1) Install SST to the piping clamp.

HINT:

Confirm the directions of the piping clamp claw and SST using the illustration on the caution label.

- (2) Push down SST and release the clamp lock.

NOTICE:

Be careful not to deform the tubes, when pushing SST.

- (3) Pull SST slightly and push the release lever, then remove the piping clamp with SST.
(4) Remove the piping clamp from SST.
(b) Disconnect both tubes.

**NOTICE:**

- ◆ Do not use tools like a screwdriver to remove the tube.
- ◆ Cap the openings immediately to keep moisture or dirt out of the system.

**HINT:**

At the time of installation, refer to the following:

- ◆ Lubricate 2 new O-rings with compressor oil and install them to the tubes.
- ◆ After connection, check the claw of the piping clamp is securely engaged.

3. REMOVE GLOVE COMPARTMENT PARTS**4. REMOVE LOWER NO. 2 FINISH PANEL****5. REMOVE LOWER CENTER COVER****6. REMOVE LOWER LH FINISH PANEL****7. REMOVE LOWER COVER (See page [BO-1 11](#))****8. REMOVE NO. 4 HEATER TO REGISTER DUCT****9. REMOVE COOLING UNIT**

- (a) Disconnect the connectors.
- (b) Remove the 3 screws, bolt and the cooling unit.

DISASSEMBLY

1. REMOVE BLOWER RESISTOR

Remove the 2 screws and blower resistor.

2. SEPARATE UPPER AND LOWER UNIT CASES

- Disconnect the connector clamp from the upper unit case.
- Using a knife, cut off each packing.
- Remove the clip and 6 screws.
- Separate the upper and lower unit cases, then pull out the thermistor from the evaporator.

3. REMOVE EVAPORATOR FROM LOWER UNIT CASE

HINT:

At the time of reassembly, refer to the following:

If the evaporator is replaced, add compressor oil to the compressor.

Add 40 to 50 cc (1.4 to 1.7 fl.oz.)

Compressor oil: ND-OIL 8 or equivalent

4. REMOVE EXPANSION VALVE

Using a hexagon wrench (5.0 mm, 0.20 in.), remove the 2 bolts and separate the expansion valve, evaporator and tubes.

Torque: 5.4 N·m (55 kgf·cm, 48 in.-lbf)

HINT:

At the time of reassembly, refer to the following:

Lubricate 4 new O-rings with compressor oil and install them to the tubes and valve.

INSPECTION

1. CHECK EVAPORATOR FINS FOR BLOCKAGE

If the fins are clogged, clean them with compressed air.

2. CHECK FITTING FOR CRACKS OR SCRATCHES

If necessary, repair or replace.

3. INSPECT THERMISTOR RESISTANCE

(a) Remove the A/C evaporator temperature sensor (cooler thermister No.1).

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester connection	Condition	Specified condition
1 - 2	-10 °C (14 °F)	7.40 to 9.20 kΩ
1 - 2	-5 °C (23 °F)	5.65 to 7.00 kΩ
1 - 2	0 °C (32 °F)	4.35 to 5.40 kΩ
1 - 2	5 °C (41 °F)	3.40 to 4.20 kΩ
1 - 2	10 °C (50 °F)	2.68 to 3.30 kΩ
1 - 2	15 °C (59 °F)	2.10 to 2.60 kΩ
1 - 2	20 °C (68 °F)	1.66 to 2.10 kΩ
1 - 2	25 °C (77 °F)	1.32 to 1.66 kΩ
1 - 2	30 °C (86 °F)	1.05 to 1.35 kΩ

NOTICE:

- ◆ Even slightly touching the sensor may change the resistance value. Be sure to hold the connector of the sensor.
- ◆ When measuring, the sensor temperature must be the same as the ambient temperature.

HINT:

As the temperature increases, the resistance decreases (see the graph below).

If the result is not as specified, replace the sensor.

REASSEMBLY

The reassembly procedures are the disassembly procedures in reverse order (see page [AC-33](#)).

INSTALLATION

The installation procedures are the removal procedures in reverse order (see page [AC-31](#)).

HEATER UNIT COMPONENTS

AC3RU-02

Access Cab, Standard Cab:

◆ Non-reusable part

N

I11128

Double Cab:

◆ Non-reusable part

N

I27019

REMOVAL

1. REMOVE COOLING UNIT (See page AC-31)
2. DRAIN ENGINE COOLANT FROM RADIATOR

HINT:

It is not necessary to drain out all the coolant.

3. DISCONNECT WATER HOSES FROM HEATER RADIATOR PIPES

- (a) Using pliers, grip the claws of clips and slide the clips along the hoses.
- (b) Disconnect the water hoses.

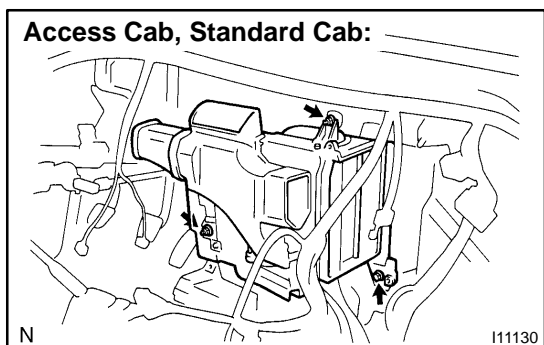

HINT:

At the time of installation, refer to the following:

- ◆ Push the water hose onto the heater radiator pipe up to the second ridge on the pipe.
- ◆ Install the hose clip to the position shown in the illustration.

4. REMOVE INSTRUMENT PANEL AND REINFORCEMENT (See page BO-1 11)
5. REMOVE DEFROSTER NOZZLE AND HEATER TO REGISTER DUCT

6. REMOVE HEATER UNIT

Remove the 3 nuts and heater unit.

DISASSEMBLY

1. REMOVE HEATER RADIATOR

- (a) Remove the 3 screws and 3 clamps.
- (b) Pull out the heater radiator.
- (c) Remove the 2 screws and 2 clips, then disconnect the heater radiator pipes.

2. REMOVE AIR VENT DUCT

Remove the 2 screws and duct.

INSPECTION

INSPECT FINS FOR BLOCKAGE

If the fins are clogged, clean them with compressed air.

REASSEMBLY

The reassembly procedures are the disassembly procedures in reverse order (see page [AC-41](#)).

INSTALLATION

The installation procedures are the removal procedures in reverse order (see page [AC-40](#)).

BLOWER UNIT COMPONENTS

AC3RW-02

Access Cab, Standard Cab:

N

111157
111132

N

111178

Double Cab:

N

I27021

REMOVAL

1. **REMOVE COOLING UNIT (See page AC-31)**
2. **REMOVE BLOWER UNIT**
 - (a) Double cab:
Remove the 2 screws and motor cover.
 - (b) Disconnect the connector from the blower motor.
 - (c) Disconnect the air inlet damper control cable from the blower unit.

HINT:

At the time of installation, refer to the following:

After connection, adjust the control cable.

- (d) Remove the nut, bolt and blower unit.

DISASSEMBLY

1. REMOVE BLOWER MOTOR

- (a) Double cab:
Remove the 2 screws and motor cover.
- (b) Remove the 3 screws and blower motor.

2. REMOVE AIR INLET SERVOMOTOR

Remove the 3 screws and servomotor.

INSPECTION

INSPECT AIR INLET SERVOMOTOR OPERATION

- (a) Connect the positive (+) lead from the battery to terminal 5 and the negative (-) lead to terminal 2.
- (b) Check the motor arm rotates counterclockwise and stops in the "FRESH" position.

- (c) Connect the positive (+) lead from the battery to terminal 5 and the negative (-) lead to terminal 1.
- (d) Check the motor arm rotates counterclockwise and stops in the "RECIRC" position.

REASSEMBLY

The reassembly procedures are the disassembly procedures in reverse order (see page [AC-48](#)).

INSTALLATION

The installation procedures are the removal procedures in reverse order (see page [AC-47](#)).

COMPRESSOR AND MAGNETIC CLUTCH (1GR-FE)

ON-VEHICLE INSPECTION

AC3SD-01

1. SET MANIFOLD GAUGE SET (See page AC-20)

2. START ENGINE

3. INSPECT COMPRESSOR FOR METALLIC SOUND

Check if a metallic sound can be heard from the compressor when the A/C switch is on.

If a metallic sound cannot be heard, replace the compressor assembly.

4. INSPECT REFRIGERANT PRESSURE

(See page AC-3)

5. STOP ENGINE

6. INSPECT VISUALLY FOR LEAKAGE OF REFRIGERANT FROM SAFETY SEAL

Using a gas leak detector, check for leakage of refrigerant.

If there is any leakage, replace the compressor assembly.

7. REMOVE MANIFOLD GAUGE SET

(See page AC-22)

8. CHECK FOR LEAKAGE OF GREASE FROM CLUTCH BEARING

9. CHECK FOR SIGNS OF OIL ON PRESSURE PLATE

If necessary, repair or replace the pressure plate.

10. INSPECT MAGNETIC CLUTCH BEARING FOR NOISE

(a) Start the engine.

(b) Check if abnormal noise is heard from near the compressor when the A/C switch is OFF.

If abnormal noise is being emitted, replace the magnetic clutch.

11. INSPECT MAGNETIC CLUTCH OPERATION

(a) Disconnect the connector.

(b) Connect the positive (+) lead from the battery to terminal 3 on the magnetic clutch connector and the negative (-) lead to body ground.

(c) Check that the magnetic clutch is energized.

If operation is not as specified, replace the magnetic clutch.

I28951

12. INSPECT COMPRESSOR LOCK SENSOR RESISTANCE

(a) Disconnect the connector.

(b) Measure the resistance between terminals 1 and 2.

Standard resistance:

165 to 205 Ω at 20°C (68°F)

If resistance is not as specified, replace the compressor.

I28951

COMPONENTS

REMOVAL

1. RUN ENGINE AT IDLE SPEED WITH A/C ON FOR APPROX. 10 MINUTES
2. STOP ENGINE
3. DISCONNECT NEGATIVE (-) TERMINAL CABLE FROM BATTERY
4. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM
5. REMOVE ENGINE UNDER COVER

6. DISCONNECT DISCHARGE HOSE

- (a) Remove the nut and disconnect the discharge hose sub-assy from the compressor and magnetic clutch.
- (b) Remove the O-ring from the discharge hose sub-assy.

NOTICE:

Seal the openings of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.

7. DISCONNECT SUCTION HOSE

- (a) Remove the nut and disconnect the suction hose sub-assy from the compressor and magnetic clutch.
- (b) Remove the O-ring from the suction hose sub-assy.

NOTICE:

Seal the openings of the disconnected parts using vinyl tape to prevent moisture and foreign matter from entering.

8. REMOVE COMPRESSOR AND MAGNETIC CLUTCH

- (a) Disconnect the connector.
- (b) Remove the 4 bolts and the compressor and magnetic clutch.

DISASSEMBLY

1. REMOVE MAGNET CLUTCH

- (a) Place the compressor and magnetic clutch in a vise.
- (b) Using SST, remove the bolt, the magnet clutch hub and the magnet clutch washer.

SST 09960-10010 (09962-01000, 09963-00500)

- (c) Using a snap ring expander, remove the snap ring and the magnet clutch rotor.

- (d) Remove the screw and disconnect the connector.

- (e) Using a snap ring expander, remove the snap ring and the magnet clutch stator.

REASSEMBLY

1. INSTALL MAGNET CLUTCH

- (a) Fit the parts as shown in the illustration, and install the magnet clutch stator.

- (b) Using a snap ring expander, install a new snap ring with the chamfered side facing up.

- (c) Install the screw and connect the connector.

- (d) Using a snap ring expander, install the magnet clutch rotor and a new snap ring with the chamfered side facing up.

- (e) Install the magnet clutch washer and the magnet clutch hub.

NOTICE:

Do not change the combination of the magnet clutch washers used before disassembly.

- (f) Using SST, install the magnet clutch hub and the magnet clutch washer with the bolt.

SST 09960-10010 (09962-01000, 09963-00500)

Torque: 18 N·m (183 kgf·cm, 13 ft·lbf)

2. INSPECT MAGNET CLUTCH CLEARANCE

- (a) Set the dial indicator to the magnet clutch hub.
- (b) Connect the positive battery lead to terminal 1 of the magnet clutch connector and the negative lead to the earth wire. Turn the magnet clutch on and off and measure the clearance.

Standard clearance:

0.35 to 0.60 mm (0.013 to 0.023 in.)

If the measured value is not within the standard range, remove the magnet clutch hub and adjust it with magnet clutch washers.

NOTICE:

Adjustment should be performed with 3 or less magnet clutch washers.

3. INSPECT COMPRESSOR OIL

When replacing the compressor and magnetic clutch with a new one, after gradually removing the refrigerant gas from the service valve, drain the following amount of oil from the new compressor and magnetic clutch before installation.

Standard:

(Oil capacity inside the new compressor and magnetic clutch: 120 + 15 cc (4.0 + 0.5 fl. oz.)) - (Remaining oil amount in the removed compressor and magnetic clutch) = (Oil amount to be removed when replacing)

NOTICE:

- ◆ When checking the compressor oil level, observe the precautions in the cooler removal/installation.
- ◆ Because compressor oil remains in the pipes of the vehicle, if a new compressor and magnetic clutch is installed without removing some oil inside, the oil amount becomes excessive, preventing heat exchange in the refrigerant cycle and causing refrigerant failure.
- ◆ If the remaining oil in the removed compressor and magnetic clutch is too small in volume, check for an oil leakage.
- ◆ Be sure to use ND-OIL 8 or equivalent for compressor oil.

INSTALLATION

1. **INSTALL COMPRESSOR AND MAGNET CLUTCH**
 - (a) Install the compressor and the magnetic clutch with the 4 bolts.

Torque: 24 N·m (245 kgf·cm, 18 ft·lbf)

- (b) Connect the connector.

2. **INSTALL SUCTION HOSE**

- (a) Remove the attached vinyl tape from the hose.
 - (b) Sufficiently apply compressor oil to a new O-ring and the fitting surfaces of the compressor and magnetic clutch.

Compressor oil: ND-OIL 8 or equivalent

- (c) Install the O-ring on the suction hose sub-assy.
 - (d) Install the suction hose sub-assy on the compressor and magnetic clutch with the nut.

Torque: 10 N·m (100 kgf·cm, 7 in·lbf)

3. **INSTALL DISCHARGE HOSE**

- (a) Remove the attached vinyl tape from the hose.
 - (b) Sufficiently apply compressor oil to a new O-ring and the fitting surfaces of the compressor and magnetic clutch.

Compressor oil: ND-OIL 8 or equivalent

- (c) Install the O-ring on the discharge hose sub-assy.
 - (d) Install the discharge hose sub-assy on the compressor and magnetic clutch with the nut.

Torque: 10 N·m (100 kgf·cm, 7 in·lbf)

4. **INSTALL AND CHECK DRIVE BELT**

(See page [AC-19](#) and [AC-17](#))

5. **INSTALL ENGINE UNDER COVER**

6. **CONNECT NEGATIVE (-) TERMINAL CABLE TO BATTERY**

7. **EVACUATE AIR FROM REFRIGERATION SYSTEM**

8. **CHARGE SYSTEM WITH REFRIGERANT**

Specified amount:

Access cab, Standard cab:

600 ± 50 g (21.16 ± 1.76 oz.)

Double cab:

530 ± 50 g (18.69 ± 1.76 oz.)

9. **INSPECT FOR LEAKAGE OF REFRIGERANT**

Using a gas leak detector, check for leakage of refrigerant. If there is leakage, check the tightening torque at the joints.

COMPRESSOR AND MAGNETIC CLUTCH (2UZ-FE) ON-VEHICLE INSPECTION

AC3SJ-01

1. SET MANIFOLD GAUGE SET (See page AC-20)

2. START ENGINE

3. INSPECT COMPRESSOR FOR METALLIC SOUND

Check if a metallic sound can be heard from the compressor when the A/C switch is on.

If a metallic sound cannot be heard, replace the compressor assembly.

4. INSPECT REFRIGERANT PRESSURE

(See page AC-3)

5. STOP ENGINE

6. INSPECT VISUALLY FOR LEAKAGE OF REFRIGERANT FROM SAFETY SEAL

Using a gas leak detector, check for leakage of refrigerant.

If there is any leakage, replace the compressor assembly.

7. REMOVE MANIFOLD GAUGE SET

(See page AC-22)

8. CHECK FOR LEAKAGE OF GREASE FROM CLUTCH BEARING

9. CHECK FOR SIGNS OF OIL ON PRESSURE PLATE

If necessary, repair or replace.

10. INSPECT MAGNETIC CLUTCH BEARING FOR NOISE

(a) Start the engine.

(b) Check if abnormal noise is heard from near the compressor when the A/C switch is OFF.

If abnormal noise is being emitted, replace the magnetic clutch.

11. INSPECT MAGNETIC CLUTCH OPERATION

(a) Disconnect the connector.

(b) Connect the positive (+) lead from the battery to terminal 3 and the negative (-) lead to body ground.

(c) Check that the magnetic clutch is energized.

If operation is not as specified, replace the magnetic clutch.

12. INSPECT COMPRESSOR LOCK SENSOR RESISTANCE

(a) Disconnect the connector.

(b) Measure the resistance between terminals 1 and 2.

Standard resistance:

65 to 125 Ω at 20 °C (68 °F)

If resistance is not as specified, replace the compressor.

COMPONENTS

N

128850

REMOVAL

1. RUN ENGINE AT IDLE SPEED WITH A/C ON FOR APPROX. 10 MINUTES
2. STOP ENGINE
3. DISCONNECT NEGATIVE (-) TERMINAL CABLE FROM BATTERY
4. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM
5. DISCONNECT DISCHARGE AND SUCTION HOSES

Remove the 2 nuts and disconnect both hoses.

NOTICE:

Cap the openings immediately to keep moisture or dirt out of the system.

6. REMOVE DRIVE BELT (See page [AC-18](#))
7. REMOVE COMPRESSOR
 - (a) Disconnect the connector.
 - (b) Remove the 4 bolts and nut.
 - (c) Remove the cooler bracket.
 - (d) Remove the compressor.

DISASSEMBLY

1. REMOVE PRESSURE PLATE

- (a) Using SST and a socket wrench, remove the shaft bolt.
SST 07112-76060
Torque: 13.2 N·m (135 kgf·cm, 9 ft·lbf)

- (b) Install SST on the pressure plate.
SST 07112-66040

- (c) Using SST and a socket wrench, remove the pressure plate.
SST 07112-66040, 07112-76060,

- (d) Remove the shims from the pressure plate.

2. REMOVE ROTOR

- (a) Using SST, remove the snap ring.
SST 95994-10020

NOTICE:

The snap ring should be installed so that its beveled side faces up.

(b) Using a plastic hammer, remove the rotor from the shaft.

NOTICE:

Be careful not to damage the pulley when tapping on the rotor.

3. REMOVE STATOR

(a) Disconnect the stator lead wire from the compressor housing.

(b) Using SST, remove the snap ring.

SST 95994-10020

NOTICE:

The snap ring should be installed so that its beveled side faces up.

(c) Remove the stator.

REASSEMBLY

Reassembly is in the reverse order of disassembly
(See page AC-62).

AFTER REASSEMBLY, CHECK MAGNETIC CLUTCH CLEARANCE

- (a) Set the dial indicator to the pressure plate of the magnetic clutch.
- (b) Connect the magnetic clutch lead wire to the positive (+) terminal of the battery.
- (c) Check the clearance between the pressure plate and rotor when connecting the negative (-) terminal to the battery.

Standard clearance:

0.5 ± 0.15 mm (0.020 ± 0.0059 in.)

If the clearance is not within the standard range, adjust the clearance using shims to obtain the standard clearance.

Standard thickness:

0.1 mm (0.004 in.)

0.3 mm (0.012 in.)

0.5 mm (0.020in.)

INSTALLATION

1. INSTALL COMPRESSOR

- (a) Install the compressor with the cooler bracket with the 4 bolts and nut.

Torque: 25 N·m (250 kgf·cm, 18 in.-lbf)

- (b) Connect the connector.

2. CONNECT DISCHARGE AND SUCTION HOSES

Connect both hoses with the 2 nuts.

Torque: 10 N·m (100 kgf·cm, 7 in.-lbf)

NOTICE:

Hoses should be connected immediately after the caps have been removed.

HINT:

Lubricate 2 new O-rings with compressor oil and install them to the hoses.

3. INSTALL AND CHECK DRIVE BELT (See page [AC-19](#) and [AC-17](#))

4. CONNECT NEGATIVE (-) TERMINAL CABLE TO BATTERY

5. EVACUATE AIR FROM REFRIGERATION SYSTEM

6. CHARGE SYSTEM WITH REFRIGERANT

Specified amount:

Access cab, Standard cab: 600 ± 50 g (21.16 ± 1.76 oz.)

Double cab: 530 ± 50 g (18.69 ± 1.76 oz.)

7. INSPECT FOR LEAKAGE OF REFRIGERANT

Using a gas leak detector, check for leakage of refrigerant.

If there is leakage, check the tightening torque at the joints.

RECEIVER

ON-VEHICLE INSPECTION

AC276-01

INSPECT FITTINGS FOR LEAKAGE

Using a gas leak detector, check for leakage.

If there is leakage, check the tightening torque at the joints.

REMOVAL

1. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM

HINT:

At the time of the installation, refer to the following:

- ◆ Evacuate air from the refrigeration system.
- ◆ Charge the system with refrigerant and inspect for leakage of refrigerant.

Specified amount:

Access cab, Standard cab:

600 ± 50 g (21.16 ± 1.76 oz.)

2. DISCONNECT 2 LIQUID TUBES FROM RECEIVER

Remove the 2 bolts and disconnect both tubes.

Torque: 5.4 N·m (55 kgf·cm, 48 in.-lbf)

NOTICE:

Cap the openings immediately to keep moisture or dirt out of the system.

HINT:

At the time of the installation, refer to the following:

Lubricate 2 new O-rings with compressor oil and install them to the tubes.

3. REMOVE RECEIVER

(a) Remove the holder bolt and pull the receiver downward.

HINT:

At the time of the installation, refer to the following:

If the receiver is replaced, add compressor oil to the compressor.

Add 20 cc (0.71 fl.oz.)

Compressor oil: ND-OIL 8 or equivalent

(b) Remove the bolt and holder.

INSTALLATION

The installation procedures are the removal procedures in reverse order (see page [AC-68](#)).

CONDENSER

AC08-01

ON-VEHICLE INSPECTION

1. INSPECT CONDENSER FINS FOR BLOCKAGE OR DAMAGE

If the fins are clogged, wash them with water and dry with compressed air.

NOTICE:

Be careful not to damage the fins.

If the fins are bent, straighten them with a screwdriver or pliers.

2. INSPECT CONDENSER AND FITTINGS FOR LEAKAGE

Using a gas leak detector, check for leakage of refrigerant.

If there is leakage, check the tightening torque at the joints.

REMOVAL

1. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM

HINT:

At the time of installation, refer to the following:

- ◆ Evacuate air from the refrigeration system.
- ◆ Charge the system with refrigerant and inspect for leakage of refrigerant.

Specified amount:

Access cab, Standard cab:

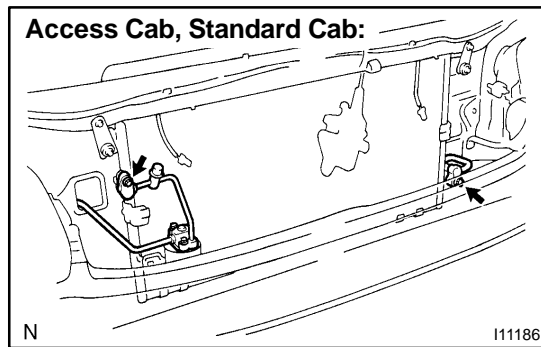

600 ± 50 g (21.16 ± 1.76 oz.)

Double cab: 530 ± 50 g (18.69 ± 1.76 oz.)

2. A/T models:
REMOVE A/T OIL COOLER
3. REMOVE HORN
4. REMOVE HOOD LOCK
5. REMOVE CENTER BRACE
6. REMOVE RECEIVER AND HOLDER
(See page [AC-68](#))

7. DISCONNECT LIQUID TUBE AND DISCHARGE HOSE

Remove the 2 bolts and disconnect both tube and hose.

Torque: 10 N·m (100 kgf·cm, 7 ft·lbf)

NOTICE:

Cap the openings immediately to keep moisture or dirt out of the system.

HINT:

At the time of installation, refer to the following:

Lubricate 2 new O-rings with compressor oil and install them to the tubes.

8. REMOVE CONDENSER

- (a) Remove the 2 bolts and 2 lower brackets.
- (b) Remove the 4 bolts and 2 upper brackets.
- (c) Pull the condenser forward and then upward.

HINT:

At the time of installation, refer to the following:

If the condenser is replaced, add compressor oil to the compressor.

Add 40 to 50 cc (1.4 to 1.7 fl.oz.)

Compressor oil: ND-OIL 8 or equivalent

INSTALLATION

The installation procedures are the removal procedures in reverse order (see page [AC-71](#)).

WATER VALVE

AC27A-02

ON-VEHICLE INSPECTION

1. **WARM UP ENGINE**
2. **DISCONNECT WATER VALVE CONTROL CABLE**
3. **INSPECT WATER VALVE OPERATION**
 - (a) Check that warm air comes out from the vent when the water valve lever is moved to the "WARM" position.
 - (b) Check that cool air comes out when the water valve is moved to the "COOL" position.
If operation is not as specified, replace the water valve.
4. **CONNECT WATER VALVE CONTROL CABLE**

REMOVAL

1. DRAIN ENGINE COOLANT FROM RADIATOR

HINT:

It is not necessary to drain out all the coolant.

2. DISCONNECT WATER VALVE CONTROL CABLE FROM WATER VALVE

HINT:

At the time of installation, refer to the following:

After connection, adjust the control cable (See page [AC-105](#)).

3. DISCONNECT WATER HOSES

- (a) Using pliers, grip the claws of the hose clips and slide the hose clips along the hoses.
- (b) Disconnect the water hoses.

HINT:

At the time of installation, refer to the following:

- ◆ Heater radiator pipe:
Push the water hose onto the heater radiator pipe up to the second ridge on the pipe.
- ◆ Water valve:
Push the water hose onto the water valve pipe up to the water valve.
- ◆ Install the hose clip in the position shown in the illustration.

4. REMOVE WATER VALVE

Remove the bolt and water valve.

INSTALLATION

The installation procedures are the removal procedures in reverse order (see page [AC-75](#)).

BLOWER MOTOR INSPECTION

AC3RY-02

1. REMOVE BLOWER MOTOR

- (a) Double cab:
Remove the 2 screws and motor cover.
- (b) Disconnect the connector.
- (c) Remove the 3 screws and motor.

2. Standard cab, Access cab: INSPECT BLOWER MOTOR OPERATION

Connect the positive (+) lead from the battery to terminal 1 and the negative (-) lead to terminal 2, then check that the motor operates smoothly.

If operation is not as specified, replace the blower motor.

3. Double cab: INSPECT BLOWER MOTOR OPERATION

Connect the positive (+) lead from the battery to terminal 1 and the negative (-) lead to terminal 2, then check that the motor operates smoothly.

If operation is not as specified, replace the blower motor.

4. INSTALL BLOWER MOTOR

- (a) Install the motor with the 3 screws.
- (b) Connect the connector.

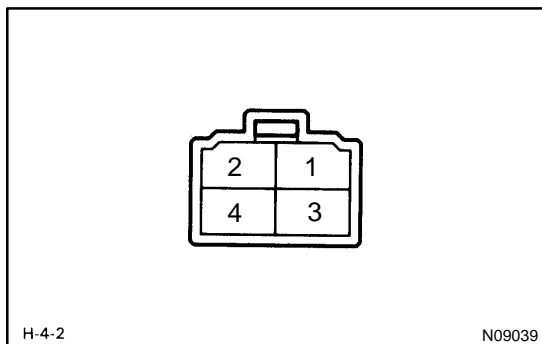

BLOWER RESISTOR INSPECTION

AC23E-05

1. REMOVE GLOVE COMPARTMENT PARTS
2. REMOVE LOWER NO. 2 FINISH PANEL
3. REMOVE LOWER CENTER COVER
4. REMOVE LOWER LH FINISH PANEL
5. REMOVE LOWER COVER (See page [BO-1 11](#))
6. REMOVE NO. 4 HEATER TO REGISTER DUCT

7. REMOVE BLOWER RESISTOR
 - (a) Disconnect the connector.
 - (b) Remove the 2 screws and blower resistor.

8. INSPECT BLOWER RESISTOR RESISTANCE

Tester connection	Condition	Specified condition
1-4	Constant	$3.3 \pm 0.2 \Omega$
1-3	Constant	$1.9 \pm 0.1 \Omega$
1-2	Constant	$2.9 \pm 0.2 \Omega$

If resistance is not as specified, replace the blower resistor.

9. INSTALL BLOWER RESISTOR
 - (a) Install the blower resistor with the 2 screws.
 - (b) Connect the connector.

10. INSTALL NO. 4 HEATER TO REGISTER DUCT
11. INSTALL LOWER COVER
12. INSTALL LOWER LH FINISH PANEL
13. INSTALL LOWER CENTER COVER
14. INSTALL LOWER NO. 2 FINISH PANEL
15. INSTALL GLOVE COMPARTMENT PARTS
(See page [BO-120](#))

PRESSURE SWITCH ON-VEHICLE INSPECTION

AC0E7-05

1. SET MANIFOLD GAUGE SET (See page AC-20)
 2. DISCONNECT CONNECTOR
 3. RUN ENGINE AT APPROX. 2,000 rpm
 4. SET BLOWER SPEED CONTROL SWITCH TO "HI" POSITION
 5. SET TEMPERATURE CONTROL LEVER TO "MAX. COOL" POSITION
 6. A/C SWITCH ON
 7. INSPECT PRESSURE SWITCH OPERATION
 - (a) Connect the positive (+) lead from the ohmmeter to terminal 1 and the negative (-) lead to terminal 2.
 - (b) Check continuity between terminals when refrigerant pressure is changed, as shown in the illustration.
- If operation is not as specified, replace the pressure switch.

REMOVAL

1. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM

HINT:

At the time of installation, refer to the following:

- ◆ Evacuate air from the refrigeration system.
- ◆ Charge the system with refrigerant and inspect for leakage of refrigerant.

Specified amount:

Access cab, Standard cab:

600 ± 50 g (21.16 ± 1.76 oz.)

Double cab: 530 ± 50 g (18.69 ± 1.76 oz.)

2. REMOVE PRESSURE SWITCH FROM LIQUID TUBE

Disconnect the connector and remove the pressure switch.

Torque: 10 N·m (100 kgf-cm, 7 ft-lbf)

HINT:

- ◆ Being careful not to deform the tube, lock the switch mounted on the tube with an open end wrench, and remove the switch.
- ◆ At the time of installation, refer to the following:
Lubricate a new O-ring with the compressor oil and install it to the switch.

INSTALLATION

The installation procedures are the removal procedures in reverse order (see page [AC-80](#)).

HEATER MAIN RELAY INSPECTION

AC3RZ-02

1. Access cab, Standard cab:
REMOVE HEATER MAIN RELAY FROM ENGINE ROOM RELAY BLOCK

2. Double cab:
REMOVE HEATER MAIN RELAY FROM ENGINE ROOM RELAY BLOCK NO. 2

3. **INSPECT HEATER MAIN RELAY (Marking: HEATER) CONTINUITY**

Condition	Tester connection	Specified condition
Constant	2 - 4	Continuity
	3 - 5	
Apply B+ between terminals 3 and 5	1 - 2	Continuity

If continuity is not as specified, replace the relay.

AIR CONDITIONING CONTROL ASSEMBLY (Center Cluster Integration)

AC350-02

ON-VEHICLE INSPECTION

1. REMOVE CENTER CLUSTER INTEGRATION PANEL (See page AC-89)
2. Access cab, Standard cab:
 - INSPECT A/C CONTROL ASSEMBLY CIRCUIT
 - (a) Disconnect the connectors from the A/C control assembly and inspect the connectors on the wire harness side, as shown in the chart below.

Test condition:

Turn the ignition switch to ON

Tester connection	Condition	Specified condition
A1 - Ground	Constant	Continuity
A4 - Ground	Turn ignition switch to ON	Battery positive voltage
	Turn ignition switch OFF	No voltage
A5 - Ground	Constant	Battery positive voltage
A13 - Ground	Turn ignition switch to ACC	Battery positive voltage
	Turn ignition switch OFF	No voltage
B11 - Ground (5VZ-FE engine)	Constant	Continuity
B20 - B10	Evaporator temperature at 25°C (77°F)	1.5 kΩ

If the result is as specified, replace the amplifier with a new one.
If the result is not as specified, inspect the circuits connected to other parts.

- (b) Connect the connectors to the A/C control assembly and inspect the connectors on the wire harness side from the back side, as shown in the chart below.

Test condition:

- ◆ Run the engine at idle speed
- ◆ Set the manifold gauge set

Tester connection	Condition	Specified condition
B1 - Ground	Constant	Continuity
B8 - Ground	Magnetic clutch is engaged	Battery positive voltage
	Magnetic clutch is not engaged	Below 1.0 V
B13 - Ground	Air inlet switch "FRESH"	Below 1.0 V
	Air inlet switch "RECIRC"	Battery positive voltage
B15 - Ground	Air inlet switch "RECIRC"	Below 1.0 V
	Air inlet switch "FRESH"	Battery positive voltage
B19 - Ground	A/C switch ON	Below 1.0 V
	A/C switch OFF	Battery positive voltage

If the result is as specified, replace the amplifier with a new one. If the result is not as specified, inspect the circuits connected to other parts.

3. Double cab:
INSPECT A/C CONTROL ASSEMBLY CIRCUIT

- (a) Disconnect the connectors from the A/C control assembly and inspect the connectors on the wire harness side, as shown in the chart below.

Test condition:

Turn the ignition switch to ON

Tester connection	Condition	Specified condition
A10 - Ground	Constant	Continuity
A14 - Ground	Turn ignition switch ON	Battery positive voltage
	Turn ignition switch OFF	No voltage
A15 - Ground	Constant	Battery positive voltage
A9 - Ground	Turn ignition switch to ACC	Battery positive voltage
	Turn ignition switch OFF	No voltage

If the result is as specified, replace the amplifier with a new one.
 If the result is not as specified, inspect the circuits connected to other parts.

- (b) Connect the connectors to the A/C control assembly and inspect the connectors on the wire harness side from the back side, as shown in the chart below.

Test condition:

- ◆ Run the engine at idle speed
- ◆ Set the manifold gauge set

P

127862

Tester connection	Condition	Specified condition
A10 - Ground	Constant	Continuity
A18 - Ground	Magnetic clutch is engaged	Battery positive voltage
	Magnetic clutch is not engaged	Below 1.0 V
B8 - Ground	Air inlet switch "FRESH"	Battery positive voltage
	Air inlet switch "RECIRC"	Below 1.0 V
B7 - Ground	Air inlet switch "RECIRC"	Battery positive voltage
	Air inlet switch "FRESH"	Below 1.0 V
B12 - Ground	A/C switch ON	9.0 V
	A/C switch OFF	Below 1.0 V

If the result is as specified, replace the amplifier with a new one. If the result is not as specified, inspect the circuits connected to other parts.

COMPONENTS

Access Cab, Standard Cab:

N

I11181
I11182

N

I11200

Double Cab:

N

I27026

REMOVAL

REMOVE CENTER CLUSTER INTEGRATION PANEL

- (a) Remove the 3 heater control knobs.
- (b) Remove the 5 screws.
- (c) Remove the integration control panel by pulling the portions indicated by arrows in the illustration.
- (d) Disconnect the connector.

DISASSEMBLY

1. Access cab, Standard cab: REMOVE AIRBAG INDICATOR CIRCUIT

Release the 2 claws and remove the indicator circuit, then disconnect the connector.

2. REMOVE BULBS

- (a) Access cab, standard cab:
Remove the 5 bulbs.
- (b) Double cab:
Remove the 6 bulbs.

3. Access cab, Standard cab: REMOVE HEATER CONTROL HOUSING

- (a) Remove the 5 screws.
- (b) Remove the heater control housing.

4. Double cab: REMOVE HEATER CONTROL HOUSING

- (a) Remove the 5 screws.
- (b) Remove the heater control housing.

- 5. Access cab, Standard cab:
REMOVE INTEGRATION CIRCUIT**
- (a) Disconnect the 2 connectors.
 - (b) Remove the circuit.

- 6. Double cab:
REMOVE INTEGRATION CIRCUIT**
- (a) Remove the 2 screws.
 - (b) Remove the circuit.

- 7. REMOVE LENS**
Release the 3 claws, then remove the lens.

INSPECTION

1. Access cab, Standard cab:

INSPECT ILLUMINATION OPERATION

Connect the positive (+) lead from the battery to terminal B7 and the negative (-) lead to terminal A8 then check that the illuminations lights up.

If operation is not as specified, check the faulty bulb.

2. Double cab:

INSPECT ILLUMINATION OPERATION

Connect the positive (+) lead from the battery to terminal B2 and the negative (-) lead to terminal B11 then check that the illuminations lights up.

If operation is not as specified, check the faulty bulb.

3. INSPECT BULB

Set the tester as shown in the illustration to check for continuity.

If continuity exists, replace the heater control.

If no continuity exists, replace the bulb.

**4. Access cab, Standard cab:
INSPECT A/C SWITCH CONTINUITY
Standard:**

Switch condition	Tester connection	Specified condition
OFF	A12 - A9	No continuity
ON	A12 - A9	Continuity

If operation is not as specified, replace the integration circuit bulb.

**5. Double cab:
INSPECT A/C SWITCH CONTINUITY
Standard:**

Switch condition	Tester connection	Specified condition
OFF	A17 - A18	No continuity
ON	A17 - A18	Continuity

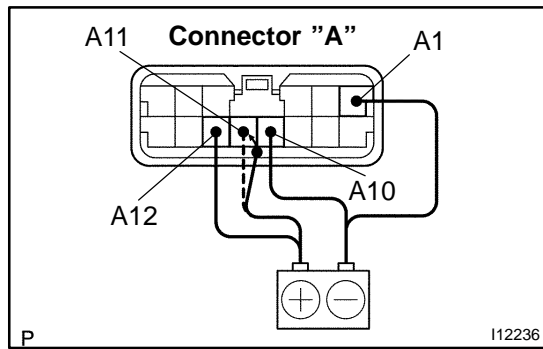

If operation is not as specified, replace the integration circuit bulb.

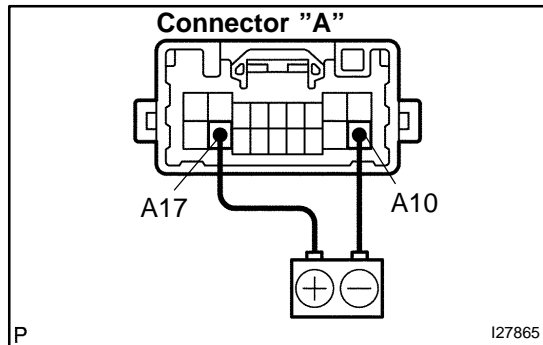

**6. Access cab, Standard cab:
INSPECT A/C INDICATOR OPERATION**

- (a) Connect the positive (+) lead from the battery to terminal A12 and the negative (-) lead to terminal A1.
- (b) Push the A/C button in and check that the A/C indicator lights up.

If operation is not as specified, replace the integration circuit.

- (c) Connect the positive (+) lead from the battery to terminal A11 and the negative (-) lead to terminal A10, then check that the indicator dims.
- If operation is not as specified, replace the integration circuit.

- 7. Double cab:**
INSPECT A/C INDICATOR OPERATION
- (a) Connect the positive (+) lead from the battery to terminal A17 and the negative (-) lead to terminal A10.
 - (b) Push the A/C button in and check that the A/C indicator lights up.
- If operation is not as specified, replace the integration circuit.

- 8. Access cab, Standard cab:**
INSPECT AIR INLET CONTROL SWITCH CONTINUITY

Switch condition	Tester connection	Specified condition
OFF	B13 - A1	No continuity
ON	B13 - A1	Continuity
Illumination circuit	A4 - B13	Continuity

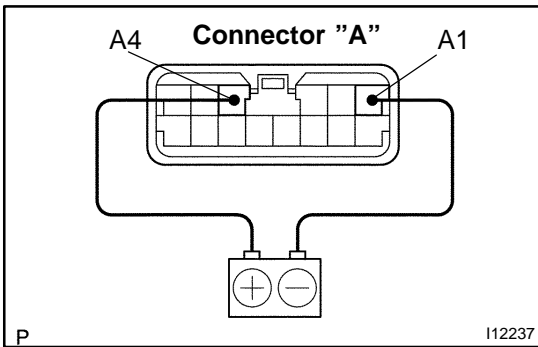

If operation is not as specified, replace the integration circuit bulb

9. Double cab:
INSPECT AIR INLET CONTROL SWITCH CONTINUITY

Switch condition	Tester connection	Specified condition
OFF	B8 - A10	No continuity
ON	B8 - A10	Continuity
Illumination circuit	A14 - B8	Continuity

If operation is not as specified, replace the integration circuit bulb

10. Access cab, Standard cab:
INSPECT AIR INLET INDICATOR OPERATION

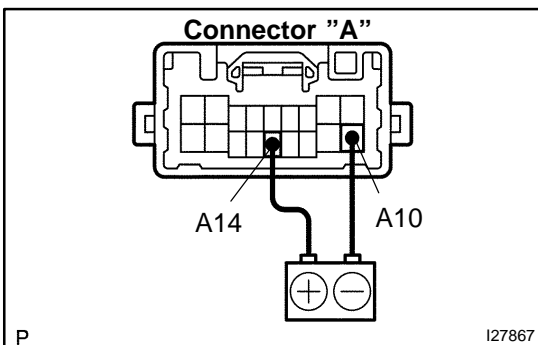

- (a) Connect the positive (+) lead from the battery to terminal A4 and the negative (-) lead to terminal A1.
- (b) Push the air inlet button in and check that the air inlet indicator lights up.

If operation is not as specified, replace the integration circuit.

- (c) Connect the positive (+) lead from the battery to terminal A11 and the negative (-) lead to terminal A10, then check that the indicator dims.

If operation is not as specified, replace the integration circuit.

11. Double cab:
INSPECT AIR INLET INDICATOR OPERATION

- (a) Connect the positive (+) lead from the battery to terminal A14 and the negative (-) lead to A10.
- (b) Push the air inlet button in and check that the air inlet indicator lights up.

If operation is not as specified, replace the integration circuit.

REASSEMBLY

1. INSTALL LENS

Install the lens.

2. Access cab, Standard cab: INSTALL INTEGRATION CIRCUIT

- (a) Connect the 2 connectors.
- (b) Install the circuit.

3. Double cab: INSTALL INTEGRATION CIRCUIT

- (a) Install the circuit.
- (b) Install the 2 screws.

4. Access cab, Standard cab: INSTALL HEATER CONTROL HOUSING

- (a) Connect the connector.
- (b) Install the heater control housing.
- (c) Install the 5 screws.

- 5. Double cab:
INSTALL HEATER CONTROL HOUSING**
- (a) Install the heater control housing.
 - (b) Install the 6 screws.

- 6. INSTALL BULBS**
- (a) Access cab, standard cab:
Install the 5 bulbs.
 - (b) Double cab:
Install the 6 bulbs.

- 7. Access cab, Standard cab:
INSTALL AIRBAG INDICATOR CIRCUIT**
- (a) Connect the connector.
 - (b) Install the circuit.

INSTALLATION

The installation procedures are the removal procedures in reverse order (see page [AC-89](#)).

HEATER CONTROL ASSEMBLY ON-VEHICLE INSPECTION

AC27J-03

INSPECT HEATER CONTROL DIAL AND LEVER OPERATION

Move the control dial and lever left and right and check for stiffness and binding through the full range of the levers.

If a click sound cannot be heard or recoil is felt, adjust the control cable or check the control cable and heater control assembly.

COMPONENTS

I11155
I11156
N

I11180

REMOVAL

1. **REMOVE CENTER CLUSTER INTEGRATION PANEL**
 - (a) Remove the 3 heater control knobs.
 - (b) Remove the 5 screws.
 - (c) Remove the integration control panel by pulling the portions indicated by arrows in the illustration.
 - (d) Disconnect the connector.
2. **REMOVE LOWER LH FINISH PANEL**
3. **REMOVE HEATER TO REGISTER DUCT NO. 2**
4. **REMOVE GLOVE COMPARTMENT DOOR**
5. **REMOVE LOWER NO. 2 FINISH PANEL**
6. **REMOVE HEATER TO REGISTER DUCT NO. 4**
(See page [BO-1 11](#))
7. **DISCONNECT HEATER CONTROL CABLES**

8. **REMOVE HEATER CONTROL ASSEMBLY**
Remove the heater control assembly, then disconnect the connectors.

DISASSEMBLY

1. REMOVE HEATER CONTROL CABLES

(a) Using a screwdriver, push the claws left and right.

HINT:

Tape the screwdriver tip before use.

(b) Pull the cable rearward until the claws are disengaged.

(c) Remove the cable.

(d) Remove the inner cable from the heater control assembly.

2. REMOVE BLOWER SPEED CONTROL SWITCH

(a) Disconnect the connector.

(b) Remove the 2 screws.

(c) Remove the switch.

3. REMOVE DEF. MODE SWITCH

Release the 2 claws, then remove the switch.

HINT:

Tape the screwdriver tip before use.

INSPECTION

1. INSPECT BLOWER SPEED CONTROL SWITCH CONTINUITY

Switch position/ Circuit	Tester connection	Specified condition
OFF	-	No continuity
LO	1 - 3	Continuity
M1	1 - 3 - 4	Continuity
M2	1 - 3 - 8	Continuity
HI	1 - 3 - 5	Continuity
Illumination circuit	6 - 7	Continuity

If continuity is not as specified, replace the switch and check the bulb.

2. INSPECT DEF. MODE SWITCH

- (a) Check the continuity exists between terminals 1 and 3 of the blower switch connector when turning the mode selector to the DEF. position and F/DEF. position.

If no continuity exists, proceed to the next step.

- (b) Check the continuity exists between the terminals of the A/C mode switch.

If no continuity exists, replace the A/C mode switch.

If continuity exists, check or replace the heater control housing base.

REASSEMBLY

1. INSTALL DEF. MODE SWITCH

Install the switch.

HINT:

After installation, check that the 2 claws are securely engaged.

2. INSTALL BLOWER SPEED CONTROL SWITCH

(a) Install the switch with the 2 screws.

(b) Connect the connector.

3. INSTALL HEATER CONTROL CABLES

Install the heater control cables to the heater control assembly.

INSTALLATION

1. INSTALL HEATER CONTROL ASSEMBLY

- (a) Connect the connectors.
- (b) Pass the heater control as shown in the illustration.

- (c) When using the removed one:
Install the heater control assembly.

- (d) When using a new one:
Install the heater control assembly.

2. ADJUST HEATER CONTROL CABLES

- (a) Set the mode control dial at the "FACE" position.
- (b) Set the temperature control dial at the "MAX. COOL" position.

- (c) Adjust the mode control cable.
Pull the air inlet control link to the "FACE" position, connect the control cable and lock the clamp.

HINT:

Lock the clamp while lightly pushing the outer cable in the direction shown by the arrow in the illustration.

- (d) Adjust the air mix control cable.
Pull the air inlet control link to the "COOL" position, connect the control cable and lock the clamp.

HINT:

Lock the clamp while lightly pulling the outer cable in the direction shown by the arrow in the illustration.

- (e) Adjust the water valve control cable.
Pull the air inlet control link to the "COOL" position, connect the control cable and lock the clamp.

HINT:

Lock the clamp while lightly pulling the outer cable in the direction, shown by the arrow in the illustration.

3. **INSTALL HEATER TO REGISTER DUCT NO. 4**
4. **INSTALL LOWER NO. 2 FINISH PANEL**
5. **INSTALL GLOVE COMPARTMENT PANEL**
6. **INSTALL HEATER TO REGISTER DUCT NO. 2**
7. **INSTALL LOWER LH FINISH PANEL**
(See page [BO-120](#))

**8. INSTALL CENTER CLUSTER INTEGRATION PANEL**

- (a) When replacing the heater control assembly:
Pull off the cover.
- (b) Install the center cluster integration panel, then connect the 2 connectors.
- (c) Install the 5 screws.
- (d) Install the 3 heater control knobs.

FOREWORD

This repair manual has been prepared to provide essential information on body panel repair methods (including cutting and welding operations, but excluding painting) for the TOYOTA TUNDRA.

Applicable models: VCK30, 40 series
UCK30, 40 series

This manual consists of body repair methods, exploded diagrams and illustrations of the body components and other information relating to body panel replacement such as handling precautions, etc. However, it should be noted that the front fenders of the TOYOTA model is bolted on and require no welding.

When repairing, don't cut and join areas that are not shown in this manual. Only work on the specified contents to maintain body strength.

Body construction will sometimes differ depending on specifications and country of destination. Therefore, please keep in mind that the information contained herein is based on vehicles for general destinations.

For the repair procedures and specifications other than collision-damaged body components of the TOYOTA TUNDRA, refer to the repair manuals.

If you require the above manuals, please contact your TOYOTA Dealer.

All information contained in this manual is the most up-to-date at the time of publication. However, specifications and procedures are subject to change without prior notice.

TOYOTA MOTOR CORPORATION

FOREWORD

This repair manual has been prepared to provide essential information on body panel repair methods (including cutting and welding operations, but excluding painting) for the TOYOTA TUNDRA.

Applicable models: UCK31, 41 series (Double Cab Models)

This manual consists of body repair methods, exploded diagrams and illustrations of the body components and other information relating to body panel replacement such as handling precautions, etc. However, it should be noted that the front fenders of the TOYOTA model is bolted on and require no welding.

When repairing, don't cut and join areas that are not shown in this manual. Only work on the specified contents to maintain body strength.

Body construction will sometimes differ depending on specifications and country of destination. Therefore, please keep in mind that the information contained herein is based on vehicles for general destinations.

For the repair procedures and specifications other than collision-damaged body components of the TOYOTA TUNDRA refer to the repair manuals.

If you require the above manuals, please contact your TOYOTA Dealer.

All information contained in this manual is the most up-to-date at the time of publication. However, specifications and procedures are subject to change without prior notice.

TOYOTA MOTOR CORPORATION

VIEWS OF THIS TEXT

Scope of the repair work explanation

- This text explains the welding panel replacement instructions from the vehicle's white body condition. We have abbreviated the explanations of the removal and reinstallation of the equipment parts up to the white body condition and of the installation, inspection, adjustment and final inspection of equipment parts after replacing the weld panel.

Section categories

- Each section has been divided as shown below.

Section Title	Contents	Examples
INTRODUCTION	Explanation of general body repair. Views of weld panel replacement instructions.	Cautionary items. Views of weld panel replacement instructions.
BODY PANEL REPLACEMENT	Instructions for replacing the weld panels from the white body condition, from which bolted parts have been removed, with individual supply parts.	Front side member replacement. Quarter panel replacement.
BODY DIMENSIONS	Body aligning measurements.	Dimension diagrams.
PAINT ◦ COATING	Scope and type of anti-rust treatment, etc. together with weld panel replacement.	Under coat. Body sealer.

Abbreviation of contents in this text.

- The following essential procedures have been abbreviated. When actually working, conduct this work properly.
 - (1) Jack and lift operations.
 - (2) Clean and wash removed parts, if necessary.
 - (3) Visual inspection.

GENERAL REPAIR INSTRUCTIONS

1. WORK PRECAUTIONS

(a) VEHICLE PROTECTION

- (1) When welding, protect the painted surfaces, windows, seats and carpet with heat resistant, fire-proof covers.

(b) SAFETY

- (1) Never stand in direct line with the chain when using a puller on the body or frame, and be sure to attach a safety cable.

- (2) Before performing repair work, check for fuel leaks. If a leak is found, be sure to close the opening totally.
- (3) If it is necessary to use a flame in the area of the fuel tank, first remove the tank and plug the fuel line.

(c) SAFETY WORK CLOTHES

- (1) In addition to the usual mechanic's wear, cap and safety shoes, the appropriate gloves, head protector, glasses, ear plugs, face protector, dust-prevention mask, etc. should be worn as the situation demands.

Code	Name
A	Dust-Prevention Mask
B	Face Protector
C	Eye Protector
D	Safety Shoes
E	Welder's Glasses
F	Ear Plugs
G	Head Protector
H	Welder's Gloves

2. HANDLING PRECAUTIONS OF PLASTIC BODY PARTS

- (1) The repair procedure for plastic body parts must conform with the type of plastic material.
- (2) Plastic body parts are identified by the codes in the following table.
- (3) When repairing metal body parts adjoining plastic body parts (by brazing, frame cutting, welding, painting etc.), consideration must be given to the property of the plastic.

Code	Material name	Heat* resistant temperature limit •C (•F)	Resistance to alcohol or gasoline	Notes
AAS	Acrylonitrile Acrylic Styrene	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
ABS	Acrylonitrile Butadiene Styrene	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
AES	Acrylonitrile Ethylene Styrene	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
ASA	Acrylonitrile Styrene Acrylate	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
CAB	Cellulose Acetate	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
EPDM	Ethylene Propylene	100 (212)	Alcohol is harmless. Gasoline is harmless if applied only for short time in small amounts.	Most solvents are harmless but avoid dipping in gasoline, solvents, etc.
FRP	Fiber Reinforced Plastics	180 (356)	Alcohol and gasoline are harmless.	Avoid alkali.
EVA	Ethylene Acetate	70 (158)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
E/VAC	Ethylene/ Vinyl Acetate Copolymer Resin	70 (158)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
PA	Polyamide (Nylon)	80 (176)	Alcohol and gasoline are harmless.	Avoid battery acid.
PBT	Polybutylene Terephthalate	160 (320)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PC	Polycarbonate	120 (248)	Alcohol is harmless.	Avoid gasoline brake fluid, wax, wax removers and organic solvents. Avoid alkali.

*Temperatures higher than those listed here may result in material deformation during repair.

Code	Material name	Heat* resistant temperature limit • C (•F)	Resistance to alcohol or gasoline	Notes
PE	Polyethylene	80 (176)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PET	Polyethylene Terephthalate	75 (167)	Alcohol and gasoline are harmless.	Avoid dipping in water.
PMMA	Polymethyl Methacrylate	80 (176)	Alcohol is harmless if applied only for short time in small amounts.	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
POM	Polyoxymethylene (Polyacetal)	100 (212)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PP	Polypropylene	80 (176)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PPF	Composite Reinforced Polypropylene	80 (176)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PPO	Modified Polyphenylene Oxide	100 (212)	Alcohol is harmless.	Gasoline is harmless if applied only for quick wiping to remove grease.
PS	Polystyrene	60 (140)	Alcohol and gasoline are harmless if applied only for short time in small amounts.	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
PUR	Polyurethane	80 (176)	Alcohol is harmless if applied only for very short time in small amounts (e.g., quick wiping to remove grease).	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
PVC	Polyvinylchloride (Vinyl)	80 (176)	Alcohol and gasoline are harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
SAN	Styrene Acrylonitrile	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid dipping or immersing in alcohol, gasoline, solvents etc.
TPO	Thermoplastic Olefine	80 (176)	Alcohol is harmless. Gasoline is harmless if applied only for short time in small amounts.	Most solvents are harmless but avoid dipping in gasoline, solvents, etc.
TPU	Thermoplastic Polyurethane	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
TSOP	TOYOTA Super Olefine Polymer	80 (176)	Alcohol and gasoline are harmless.	Most solvents are harmless.
UP	Unsaturated Polyester	110 (233)	Alcohol and gasoline are harmless.	Avoid alkali.

*Temperatures higher than those listed here may result in material deformation during repair.

3. LOCATION OF PLASTIC BODY PARTS

Parts Name	Code
Radiator Grille	ABS
Front Bumper Cover	TSOP
Front Bumper Moulding	ABS
Front Bumper Garnish	ABS
Front Bumper Extension	TSOP
Front Fender Front Splash Shield	PP
Headlight	PC
Front Turn Signal Light	PMMA/PC
Fog Light	PC/UP
Cowl Top Ventilator Louver	TSOP
Outer Rear View Mirror	ABS/AAS
Front Fender Moulding	TSOP
Front Body Mudguard	E/VAC
Front Door Outside Handle	PC/PBT ◦ PC/PET
Front Door Outside Moulding	PPF
Rear Door Outside Handle	PC/PBT ◦ PC/PET
Rear Door Outside Moulding	PPF
Center Stop Light	PC ◦ PC/PMMA
Rear Combination Light	PMMA/ASA
License Plate Light	PC
Quarter Wheel Opening Moulding	TSOP
Rear Body Mudguard	E/VAC

- Resin material differs with model.
- / Made up of 2 or more kinds of materials.

HOW TO USE THIS MANUAL

Each repair method description provided in Section RE of this manual comprises two pages, divided into 2 blocks (REMOVAL AND INSTALLATION) and includes illustrations to facilitate body repair.

A : **REPLACEMENT PARTS AND METHOD**

QUARTER PANEL (CUT)

- Replacement method
 - (ASSY) Assembly replacement
 - (CUT) Major cutting (less than 1/2 of parts used)
 - (CUT-H) Half cutting (about 1/2 of parts used)
 - (CUT-P) Partial cutting (most of parts used)
- Replacement Parts

B : **PARTS LOCATION**

C : **REMOVAL DIAGRAM**

Describes in detail removal of the damaged parts involving repair by cutting.

D : **REMOVAL GUIDE**

Provides additional information to more efficiently help you perform the removal.

- E** : **INSTALLATION DIAGRAM**
Describes in detail installation of the new parts involving repair by welding and/or cutting, but excluding painting.
- F** : **INSTALLATION GUIDE**
Provides additional information to more efficiently help you perform the installation.
- G** : **SYMBOLS**
See page IN-4.
- H** : **ILLUSTRATION OF WELD POINTS**
Weld method and panel position symbols.
See page IN-5.

SYMBOLS

The following symbols are used in the Welding Diagrams in Section RE of this manual to indicate cutting areas and the types of weld required.

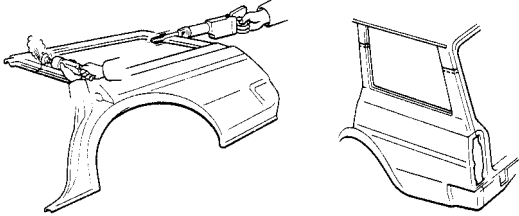

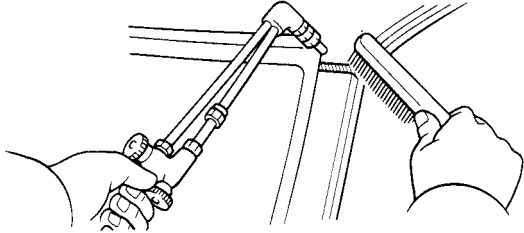

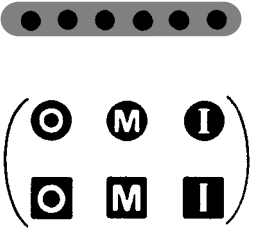

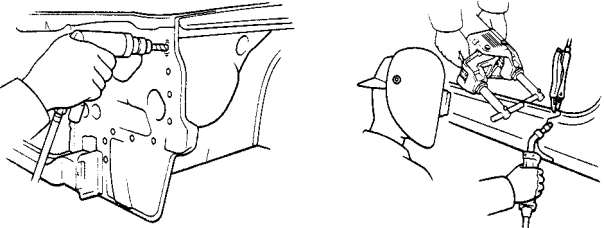

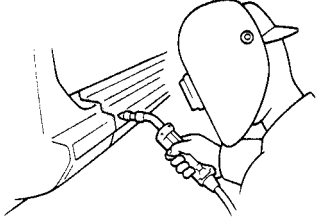

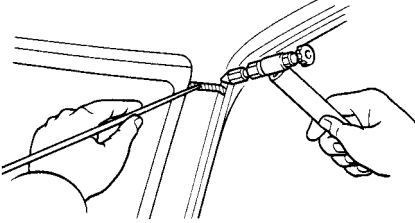

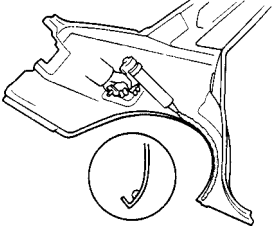

SYMBOLS	MEANING	ILLUSTRATION
	<p>SAW CUT OR ROUGH CUT</p>	
	<p>REMOVE BRAZE</p>	
	<p>WELD POINTS SPOT WELD OR MIG PLUG WELD (See page IN-5)</p>	
	<p>CONTINUOUS MIG WELD (BUTT WELD OR TACK WELD)</p>	
	<p>BRAZE</p>	
	<p>BODY SEALER</p>	

Illustration of Weld Point Symbols

EXAMPLE:

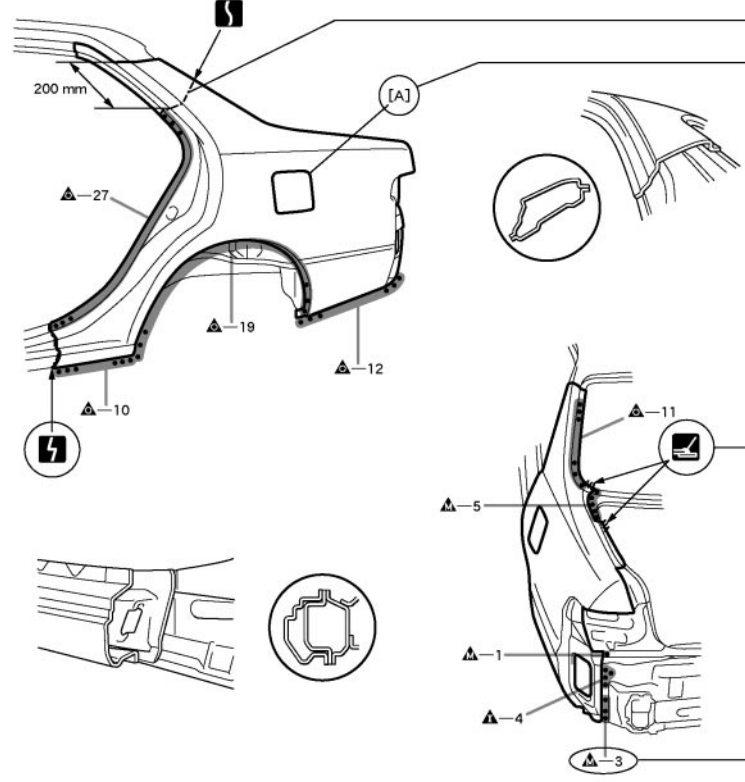

REMOVAL	INSTALLATION

SYMBOL	MEANING	ILLUSTRATION	SYMBOL	MEANING	ILLUSTRATION
 	Remove Weld Points		 	Spot Weld	
	(Outside)			Mig Plug Weld	
	(Middle)		 		
	(Inside)			Spot MIG Weld	

HINT: Panel position symbols are as seen from the working posture.

HOW TO USE THIS MANUAL

1. BODY PANEL REPLACEMENT THIS MANUAL

BP-34		BODY PANEL REPLACEMENT	
(A)	QUARTER PANEL (CUT) REPLACEMENT		(C)
(B)	REMOVAL		
(D)			(I) (K)
(E)	POINT 1. Remove the [A] at the same time. PART NAME [A] Fuel filler opening lid 200 mm (7.87 in.)		(I) (J)

- Replacement method
 (ASSY)...Assembly replacement
 (CUT)...Major cutting(less than 1/2 of part used)
 (CUT-H)...Half cutting(about 1/2 of part used)
 (CUT-P)...Partial cutting(most of part used)
- Replacement part

(B) : REMOVAL CONDITIONS

(C) : PART LOCATION

(D) : REMOVAL DIAGRAM

Describes in detail removal of the damaged part involving repair by cutting.

(E) : REMOVAL GUIDE

Provides additional information to more efficiently help you perform the removal.

BODY PANEL REPLACEMENT

BP-35

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam with corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

POINT

1. Before temporarily installing the new parts, apply body sealer to the wheel arch.

HINT

- 1) Apply body sealer about 5mm (0.20 in.) from the flange, avoiding any oozing.
- 2) Apply sealer evenly, about 3-4mm (0.12-0.16 in.) in diameter
- 3) For other sealing points, refer to section PC.

PART NAME

[A] Fuel filler opening lid

(F) : INSTALLATION CONDITIONS

(G) : INSTALLATION DIAGRAM

Describes in detail installation of the new parts involving repair by welding and/or cutting, but excluding painting.

(H) : INSTALLATION GUIDE

Provides additional information to more efficiently help you perform the installation.

	(Inside)				
<p><i>HINT: Panel position symbols are as seen from the working posture.</i></p>				Spot MIG Weld	

HANDLING PRECAUTIONS ON RELATED COMPONENTS

1. FOR VEHICLES EQUIPPED WITH SRS AIRBAG AND SEAT BELT PRETENSIONER

The TOYOTA TUNDRA is equipped with an SRS (Supplemental Restraint System), such as the driver airbag and front passenger airbag and seat belt pretensioners.

Failure to carry out service operations in the correct sequence could cause the supplemental restraint system to unexpectedly deploy during servicing, possibly leading to a serious accident.

Further, if a mistake is made in servicing the supplemental restraint system, it is possible the SRS may fail to operate when required. Before servicing (including removal or installation of parts, inspection or replacement), be sure to read the following items carefully, then follow the correct procedure described in this manual.

- Malfunction symptoms of the supplemental restraint system are difficult to confirm, so the diagnostic trouble codes become the most important source of information when troubleshooting.
When troubleshooting the supplemental restraint system, always inspect the diagnostic trouble codes before disconnecting the battery.
- Work must be started after 90 seconds from the time the ignition switch is turned to the "LOCK" position and the negative (-) terminal cable is disconnected from the battery.
(The supplemental restraint system is equipped with a back-up power source so that if work is started within 90 seconds of disconnecting the negative (-) terminal cable from the battery, the SRS may deploy.)
When the negative (-) terminal cable is disconnected from the battery, memory of the clock and audio systems will be cancelled. So before starting work, make a record of the contents memorized by the audio memory system.
Then when work is finished, reset the clock and audio systems as before.
To avoid erasing the memory of each memory system, never use a back-up power supply from outside the vehicle.
- Even in cases of a minor collision where the SRS does not deploy, the passenger's airbag assembly, the steering wheel pad and seat belt pretensioners should be inspected.
- Never use SRS parts from another vehicle. When replacing parts, replace them with new parts.
- Before repairs, remove the airbag sensor if shocks are likely to be applied to the sensor during repairs.
- Never disassemble and repair the airbag sensor assembly, steering wheel pad in order to reuse it.
- If the airbag sensor assembly, steering wheel pad have been dropped, or if there are cracks, dents or other defects in the case, bracket or connector, replace them with new ones.
- Do not expose the airbag sensor assembly, steering wheel pad directly to hot air or flames.
- Use a volt/ohmmeter with high impedance (10 k Ω /V minimum) for troubleshooting of the electrical circuit.
- Information labels are attached to the periphery of the SRS components. Follow the instructions on the notices.
- After work on the supplemental restraint system is completed, check the SRS warning light.
- Before repairing the body, remove the SRS parts if, during repair, shocks are likely to be applied to the sensors due to vibrations of the body or direct tapping with tools or other parts.
- Do not expose the SRS parts directly to hot air or flames.

NOTICE:

- 1) *The maximum ambient temperature tolerance is 120°C (248°F) for the front airbag sensor, 105°C (221°F) for the center airbag sensor assembly and 93°C (200°F) for the steering wheel pad, and front passenger airbag assembly. If it is possible that the ambient temperature may reach or exceed the temperature limit, remove the sensors and the steering wheel pad from the vehicle or protect them with a hot insulation material before starting work.*
 - 2) *Prior to welding, remove adjacent SRS parts from the vehicle or protect them with fire-proof covers.*
- If the vehicle is damaged, visually inspect for damage to the steering wheel pad using the inspection procedures described in section RS of the repair manual for the relevant model year.

STEERING WHEEL PAD (with Airbag)

- When removing the steering wheel pad or handling a new steering wheel pad, it should be placed with the pad top surface facing up.
In this case, the twin-lock type connector lock lever should be in the locked state and care should be taken to place it so the connector will not be damaged. In addition do not store a steering wheel pad on top of another one. Storing the pad with its metallic surface up may lead to a serious accident if the airbag inflates for some reason.
- Never measure the resistance of the airbag squib. (This may cause the airbag to deploy, which is very dangerous.)
- Grease should not be applied to the steering wheel pad and the pad should not be cleaned with detergents of any kind.
- Store the steering wheel pad where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.
- When using electric welding, first disconnect the airbag connector (yellow color and 2 pins) under the steering column near the combination switch connector before starting work.
- When disposing of a vehicle or the steering wheel pad alone, the airbag should be deployed using an SST before disposal.
Carry out the operation in a safe place away from electrical noise.

FRONT PASSENGER AIRBAG ASSEMBLY

- Always store a removed or new front passenger airbag assembly with the airbag deployment direction facing up. Storing the airbag assembly with the airbag deployment direction facing down could cause a serious accident if the airbag inflates.
- Never measure the resistance of the airbag squib.
(This may cause the airbag deploy, which is very dangerous.)
- Grease should not be applied to the front passenger airbag assembly and the airbag door should not be cleaned with detergents of any kind.
- Store the airbag assembly where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.
- When using electric welding, first disconnect the airbag connector (yellow color and 2 pins) installed on the glove compartment finish plate at the left side of the glove compartment before starting work.
- When disposing of a vehicle or the airbag assembly alone, the airbag should be deployed using an SST before disposal. Perform the operation in a safe place away from electrical noise.

SEAT BELT PRETENSIONER

- Before doing any operation which will apply a strong shock to the vehicle, or before removing the seat belt pretensioner, be sure to apply the sensor shock.
- Never disassemble the seat belt pretensioner.
- Do not subject the seat belt pretensioner to shocks or bring magnets close to it.
- Do not expose the seat belt pretensioner to high temperature or fire.
- Do not drop the seat belt pretensioner. Never use a seat belt pretensioner which has been dropped.
- Never install the seat belt pretensioner in another vehicle.
- Store removed seat belt pretensioners on a flat, stable surface.
- After frontal collision, always check whether the seat belt pretensioners have been activated.
- When disposing of a vehicle or the pretensioner by itself, always activate the pretensioner before disposal.
- The seat belt pretensioner is hot when activated, so let it cool down fully before you dispose of it.
Never apply water to the seat belt pretensioner.

AIRBAG SENSOR ASSEMBLY

- Never reuse the airbag sensor assembly involved in a collision when the SRS has deployed.
- The connectors to the airbag sensor assembly should be connected or disconnected with the sensor mounted on the floor. If the connectors are connected or disconnected while the airbag sensor assembly is not mounted to the floor, it could cause undesired ignition of the supplemental restraint system.
- Work must be started after 90 seconds from the time the ignition switch is turned to the "LOCK" position and the negative (-) terminal cable is disconnected from the battery, even if only loosening the set bolts of the airbag sensor assembly.

WIRE HARNESS AND CONNECTOR

- The SRS wire harness is integrated with the cowl wire harness assembly and floor wire harness assembly. The wires for the SRS wire harness are encased in a yellow corrugated tube. All the connectors for the system are also a standard yellow color. If the SRS wire harness becomes disconnected or the connector becomes broken due to an accident, etc., repair or replace it as shown on page.

2. BRAKE SYSTEM

The brake system is one of the most important safety components. Always follow the directions and notes given in section BR of the repair manual for the relevant model year when handling brake system parts.

NOTICE: When repairing the brake master cylinder or TRAC system, bleed the air out of the TRAC system.

3. DRIVE TRAIN AND CHASSIS

The drive train and chassis are components that can have great effects on the running performance and vibration resistance of the vehicle. After installing components in the sections listed in the table below, perform alignments to ensure correct mounting angles and dimensions. Particularly accurate repair of the body must also be done to ensure correct alignment.

HINT: Correct procedures and special tools are required for alignment. Always follow the directions given in the repair manual for the relevant model during alignment and section DI of this manual.

Component to be aligned	Section of repair manual for relevant model
Front Wheels	Suspension and Axle (SA) section
Rear Wheels	Suspension and Axle (SA) section
Propeller Shaft	Propeller Shaft (PR) section

4. COMPONENTS ADJACENT TO THE BODY PANELS

Various types of component parts are mounted directly on or adjacently to the body panels. Strictly observe the following precautions to prevent damaging these components and the body panels during handling.

- Before repairing the body panels, remove their components or apply protective covers over the components.
- Before prying components off using a screwdriver or a scraper, etc., attach protective tape to the tool tip or blade to prevent damaging the components and the body paint.
- Before removing components from the outer surface of the body, attach protective tape to the body to ensure no damage to painted areas.

HINT: Apply touch-up paint to any damaged paint surfaces.

- Before drilling or cutting sections, make sure that there are no wires, etc. on the reverse side.

5. ECU (ELECTRONIC CONTROL UNIT)

Many ECUs are mounted in this vehicle.

Take the following precautions during body repair to prevent damage to the ECUs.

- Before starting electric welding operations, disconnect the negative (-) terminal cable from the battery.
When the negative (-) terminal cable is disconnected from the battery, memory of the clock and audio systems will be cancelled. So before starting work, make a record of the contents memorized by each memory system. Then when work is finished, reset the clock and audio systems as before.
When the vehicle has tilt and telescopic steering, power seat and outside rear view mirror, which are all equipped with memory function, it is not possible to make a record of the memory contents.
So when the operation is finished, it will be necessary to explain this fact to the customer, and request the customer to adjust the features and reset the memory.
- Do not expose the ECUs to ambient temperatures above 80°C (176°F).
NOTICE: If it is possible the ambient temperature may reach 80°C (176°F) or more, remove the ECUs from the vehicle before starting work.
- Be careful not to drop the ECUs and not to apply physical shocks to them.

GENERAL REPAIR INSTRUCTIONS

Work Precautions

SAFETY

Never stand in direct line with the chain when using a puller on the body or frame, and be sure to attach a safety cable.

VEHICLE PROTECTION

When welding, protect the painted surfaces, windows, seats and carpet with heat-resistant, fire-proof covers.

SAFETY

1. Before performing repair work, check for fuel leaks. If a leak is found, be sure to close the opening totally.
2. If it is necessary to use a flame in the area of the fuel tank, first remove the tank and plug the fuel line.

SAFETY WORK CLOTHES

In addition to the usual mechanic's wear, cap and safety shoes, the appropriate gloves, head protector, glasses, ear plugs, face protector, dust-prevention mask, etc. should be worn as the situation demands.

HAND TOOLS

Keeping your hand tools in neat order improve your work efficiency.

Proper and Efficient Work Procedures

REMOVAL

PRE-REMOVAL MEASURING

Before removal or cutting operations, take measurements in accordance with the dimension diagram. Always use a puller to straighten a damaged body or frame.

NUMBER OF SPOT WELDS AND PANEL POSITIONS

The number of spot welds and the panel positions to be removed are shown for your reference.
HINT: See "Symbols" on page IN-4,5.

REMOVAL OF ADJACENT COMPONENTS

When removing adjacent components, apply protective tape to the surrounding body and your tools to prevent damage.
HINT: See "Handling Precautions on Related Components" on page IN-6.

PRECAUTIONS FOR DRILLING OR CUTTING

Check behind any area to be drilled or cut to insure that there are no hoses, wires, etc., that may be damaged.

HINT: See "Handling Precautions on Related Components" on page IN-6.

CUTTING AREA

Always cut in a straight line and avoid reinforced area.

WRONG

Cutting Okay

Corners

Reinforcement

PREPARATION FOR INSTALLATION

SPOT WELD POINTS

When welding panels with a combined thickness of over 3 mm (0.12in.), use a MIG (Metal Inert Gas) welder for plug welding.
HINT: Spot welding will not provide sufficient durability for panels over 3 mm (0.12in.) thick.

APPLICATION OF WELD-THROUGH PRIMER (SPOT SEALER)

Remove the paint from the portion of the new parts and body to be welded, and apply weld-through primer.
HINT: See "ANTI-RUST TREATMENT" on page AR-2.

Parts Name	Parts Number
Spot Sealer	08839-00070

※ The above SSM or equivalent

SAFETY PRECAUTIONS FOR ELECTRICAL COMPONENTS.
 When welding there is a danger that electrical components will be damaged by the electrical current flowing through the body.
 Before starting work disconnect the negative terminal of the battery and ground the welder near the welding location of the body.

ROUGH CUTTING OF JOINTS
 For joint areas, rough cut the new parts, leaving 20 - 30 mm (0.79 - 1.18in.) overlap.

MAKING HOLES FOR PLUG WELDING
 For areas where a spot welder cannot be used, use a puncher or drill to make holes for plug welding.

REFERENCE: mm (in.)

Thickness of welded portion	Size of plug hole
1.0 (0.04) under	5 (0.20) ϕ over
1.0 (0.04) - 1.5 (0.06)	6.5 (0.26) ϕ over
1.5 (0.06) over	8 (0.31) ϕ over

INSTALLATION

PRE-WELDING MEASUREMENTS

Always take measurements before installing underbody or engine components to insure correct assembly. After installation, confirm proper fit.

WELDING PRECAUTIONS

- The number of welding spots should be as follows.
Spot weld: 1.3 x No. of manufacturer's spots.
Plug weld: More than No. of manufacturer's plugs.

WRONG

POST-WELDING REFINISHING

- Always check the welded spots to insure they are secure.
- When smoothing out the weld spots with a disc grinder, be careful not to grind off too much as this would weaken the weld.

OKAY

WRONG

- Plug welding should be done with a MIG (Metal Inert Gas) welder. Do not gas weld or braze panels at areas other than specified.

SPOT WELD LOCATIONS

Try to avoid welding over previous spots.

SPOT WELDING PRECAUTIONS

- The shape of the welding tip point has an effect on the strength of the weld.
- Always insure that the seams and welding tip are free of paint.

ANTI-RUST TREATMENT

When replacing body panels, always apply body sealer, anti-rust agent or undercoat according to the requirements of your country.

HINT: For further details, see the description given in Section AR of this manual.

BODY SEALER

Apply body sealer to the required areas.

Cartridge Type

Tube Type

ANTI-RUST AGENT (WAX)

Apply anti-rust agent to following sections.

- Inside of the hems of the doors and hood.
- Around the hinges of the doors and hood.
- Inside of the welded parts with boxed cross-section.

Parts Name	Parts Number
Rustop W (Aerosol)	08860-00200
Rustop W (1 ×Milky White)	08860-00210
Rustop W (18 ×Milky White)	08860-00230
Rustop B (1 ×Black)	08860-00220
Rustop B (18 ×Black)	08860-00240

※ The above SSM or equivalent

UNDERCOAT

Apply undercoat to the underbody and wheel housings.

Undercoating (Oil base)

Undercoating (Water base)

Spray Gun

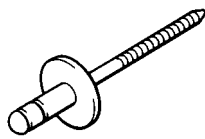

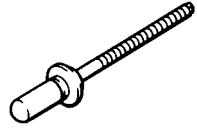

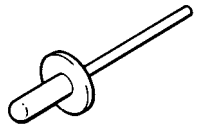

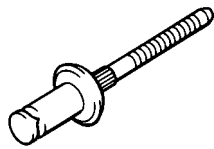

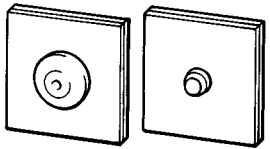

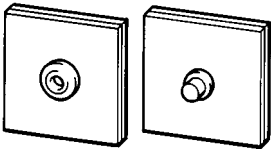

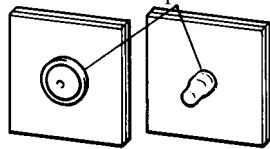

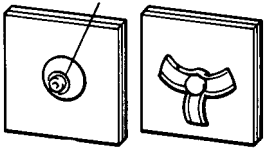

Parts Name	Parts Number
Paster UC (Oil Base)	08836-00155
Paster UW (Water Base)	08836-00115

RIVET REMOVAL AND INSTALLATION

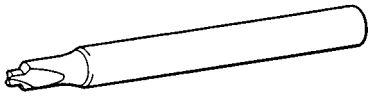

PARTS NAME AND VARIETY OF RIVET

	Aluminum-Rivet	Steel-Rivet	Waterproof-Rivet	T-Rivet
External Appearance	Before installation 	Before installation 	Before installation 	Before installation 
	After installation  Outer Inner	After installation  Outer Inner	After installation Waterproof Seal  Outer Inner	After installation Mandrel  Outer Inner
Characteristics	<ul style="list-style-type: none"> Small nonwaterproof rivet No magnetic adherence 	<ul style="list-style-type: none"> Small nonwaterproof rivet Magnetic adherence 	<ul style="list-style-type: none"> Small waterproof rivet Waterproof seal 	<ul style="list-style-type: none"> Large waterproof rivet Mandrel sticks out after installation

RIVET REMOVAL

1. SELECTION OF CUTTING TOOL

	Cutting tool	Note								
Aluminum-Rivet Steel-Rivet T-Rivet with ø6.4 mm	Drill blade <table border="1" data-bbox="511 1449 925 1638"> <thead> <tr> <th>Rivet size</th> <th>Blade size</th> </tr> </thead> <tbody> <tr> <td>ø4 mm</td> <td>ø4 mm</td> </tr> <tr> <td>ø4.8 mm</td> <td>ø5 mm</td> </tr> <tr> <td>ø6.4 mm</td> <td>ø6.5 mm</td> </tr> </tbody> </table>	Rivet size	Blade size	ø4 mm	ø4 mm	ø4.8 mm	ø5 mm	ø6.4 mm	ø6.5 mm	<ul style="list-style-type: none"> Cutting can be done with drill blade or rivet cutter for an aluminum-rivet with ø4.8 mm. When a rivet cutter is used for an aluminum-rivet (except ø4.8 mm), a steel-rivet, or a T-rivet with ø6.4 mm, it is possible that the drill will spin abnormally damaging the rivet hole and breaking the rivet cutter.
Rivet size	Blade size									
ø4 mm	ø4 mm									
ø4.8 mm	ø5 mm									
ø6.4 mm	ø6.5 mm									
Aluminum-Rivet with ø4.8 mm Waterproof-Rivet with ø4.8 mm	Rivet Cutter (P/N 09060-60350) 	<ul style="list-style-type: none"> When an ordinary cutter is used for a waterproof-rivet with ø4.8 mm the rivet can not be cut as it spins with the cutter. 								

2. RIVET REMOVAL

- (1) T-Rivet with $\phi 6.4$ mm:
Using a punch with $\phi 5$ mm, stamp out the mandrel.

- (2) Put tape around the drill blade 5 mm (0.20 in.) from the tip to prevent damage to the rivet hole.
(3) Attach the drill blade or a rivet cutter to the drill.

- (4) Gently and vertically put the drill to the rivet, and cut the rivets flange.

NOTE:

- While upward drilling, wear a protective glasses.
- If a drill is strongly pushed deeply into a rivet, the rivet can't be cut as it spins together with the drill.
- Prizing the hole with a drill can lead to damage to the rivet hole or the breaking of the rivet cutter.
- Take care as the cut rivet is hot.

- (5) Aluminum-Rivet and Waterproof-Rivet with $\phi 4.8$ mm:
Even if flange is taken off, continue drilling and push out remaining fragments with the drill.

- (6) Steel-Rivet:
If the flange is taken off, stop drilling and pull out the remaining fragments with a pliers.

- (7) T-Rivet with $\phi 6.4$ mm:
If the flange is taken off, stop drilling and push out the remaining fragments with a punch with $\phi 5$ mm or pull out the remaining fragments with pliers.

RIVET INSTALLATION

1. RIVET INSTALLATION

- (1) Apply touch-up paint at the area.
- (2) Select an installation tool.

Item	Installation tool
Aluminum-Rivet Waterproof-Rivet with $\phi 4.8$ mm	Hand Riveter or Air Riveter
Steel-Rivet T-Rivet with $\phi 6.4$ mm	Air Riveter

- (3) Select the smallest a nose piece possible for a rivets mandrel.

NOTE: Wrong selection of a nose piece may cause the riveter to be damaged or bad tightening.

<Reference> Nose piece of Air Riveter

Parts Name	Parts Number	Color	Rivet type
Nose piece No. 1	09050-02020	Silver	$\phi 4.0$ mm Aluminum $\phi 4.0$ mm Steel $\phi 4.8$ mm Waterproof
Nose piece No. 2	09050-02030	Copper	$\phi 4.8$ mm Aluminum $\phi 4.8$ mm Steel
Nose piece No. 3	09050-02040	Black	$\phi 6.4$ mm T-Rivet

- (4) Insert the nose piece to the riveter and then the mandrel of the new rivet into the nose piece.
- (5) Vertically insert the rivet into a hole and keep place it strongly.

NOTE:

- If the tip of the rivet is not deformed or the mandrel is not cut, repeat process (5) again.

- **T-Rivet with $\phi 6.4$ mm:**
Do not place your hands or the wire harness within a radius of 20 mm (0.79 in.) from the rivet, as the rivet is cut and opened in this area.

- **Prizing a riveter damages the riveter showing that it is not tightened correctly and bends the mandrel.**

- **Loose tightening may result from either tilting the riveter while handling or the riveter not connecting to the material.**

- **Loose tightening also occurs when a rivet is applied between materials without touching.**

- **T-Rivet with $\phi 6.4$ mm:**
When a mandrel of a rivet is lost, the rivet should be replaced to prevent loose tightening.

HANDLING PRECAUTIONS ON RELATED COMPONENTS

1. BRAKE SYSTEM

The brake system is one of the most important safety components. Always follow the directions and notes given in brake (32) section of the repair manual for the relevant model when handling brake system parts.

NOTICE: When repairing the brake master cylinder or TRAC system, bleed the air out of the TRAC system.

2. DRIVE TRAIN AND CHASSIS

The drive train and chassis are components that can have great effects on the running performance and vibration resistance of the vehicle. After installing components in the sections listed in the table below, perform alignments to ensure correct mounting angles and dimensions. Particularly accurate repair of the body must also be done to ensure correct alignment.

HINT: Correct procedures and special tools are required for alignment. Always follow the directions given in the repair manual for the relevant model during alignment and section DI of this section.

Component to be aligned	Section of repair manual for relevant model
Front Wheels	Front Suspension (26) section
Rear Wheels	Rear Suspension (27) section
Propeller Shaft	Propeller Shaft (30) section

3. COMPONENTS ADJACENT TO THE BODY PANELS

Various types of component parts are mounted directly on or adjacently to the body panels. Strictly observe the following precautions to prevent damaging these components and the body panels during handling.

- Before repairing the body panels, remove their components or apply protective covers over the components.
- Before prying components off using a screwdriver or a scraper, etc., attach protective tape to the tool tip or blade to prevent damaging the components and the body paint.
- Before removing components from the outer surface of the body, attach protective tape to the body to ensure no damage to painted areas.

HINT: Apply touch-up paint to any damaged paint surfaces.

- Before drilling or cutting sections, make sure that there are no wires, etc. on the reverse side.

4. ECU (ELECTRONIC CONTROL UNIT)

Many ECUs are mounted in this vehicle.

Take the following precautions during body repair to prevent damage to the ECUs.

- Before starting electric welding operations, disconnect the negative (-) terminal cable from the battery.

When the negative (-) terminal cable is disconnected from the battery, memory of the clock and audio systems will be cancelled. So before starting work, make a record of the contents memorized by each memory system. Then when work is finished, reset the clock and audio systems as before.

When the vehicle has tilt and telescopic steering, power seat and outside rear view mirror, which are all equipped with memory function, it is not possible to make a record of the memory contents.

So when the operation is finished, it will be necessary to explain this fact to the customer, and request the customer to adjust the features and reset the memory.

- Do not expose the ECUs to ambient temperatures above 80°C (176°F).

NOTICE: If it is possible the ambient temperature may reach 80°C (176°F) or more, remove the ECUs from the vehicle before starting work.

- Be careful not to drop the ECUs and not to apply physical shocks to them.

PRECAUTIONS FOR REPAIRING BODY STRUCTURE PANELS

1. HEAT REPAIR FOR BODY STRUCTURE PANELS

Toyota prohibits the use of the heat repair method on body structure panels when repairing a vehicle damaged in a collision.

Panels that have high strength and rigidity, as well as a long life span for the automobile body are being sought after.

At Toyota, in order to fulfill these requirements, we use high tensile strength steel sheets and rust preventive steel sheets on the body.

High tensile steel sheets are made with alloy additives and a special heat treatment in order to improve the strength.

To prevent the occurrence of rust for a long period of time, the surface of the steel is coated with a zinc alloy.

If a body structure part is heat repaired with an acetylene torch or other heating source, the crystalline organization of the steel sheet will change and the strength of the steel sheet will be reduced.

The ability of the body to resist rust is significantly lowered as well since the rust resistant zinc coating is destroyed by heat and the steel sheet surface is oxidized.

2. STRUCTURE PANEL KINKS

A sharp deformation angle on the panel that cannot be returned to its original shape by pulling or hammering is called a kink.

Since structure parts were designed to exhibit a 100% performance when they were in their original shape, if they are deformed in an accident, or if the deformed parts are repaired and reused, they become unable to exhibit the same performance as intended in the design.

It is necessary to replace the part where the kink has occurred.

3. IMPACT BEAM REPAIR

The impact beam and bracket are necessary and important parts in maintaining a survival space for passengers in a side collision.

For impact beam, we use special high tensile strength steel.

The high tensile strength steel maintains its special crystal-line organization by heat treatment or alloy additives.

Since these parts were designed to exhibit a 100% performance when they were in their original shape, if they are deformed in an accident, or if the deformed parts are repaired and reused, they become unable to exhibit the same performance as intended in the design.

It is necessary to replace the door assembly when impact beam or bracket is damaged.

PROPER AND EFFICIENT WORK PROCEDURES

1. REMOVAL

(a) PRE-REMOVAL MEASURING

- (1) Before removal or cutting operations, take measurements in accordance with the dimension diagram. Always use a puller to straighten a damaged body or frame.

(b) CUTTING AREA

- (1) Always cut in a straight line and avoid reinforced area.

(c) PRECAUTIONS FOR DRILLING OR CUTTING

- (1) Check behind any area to be drilled or cut to insure that there are no hoses, wires, etc., that may be damaged.

HINT: See "Handling Precautions on Related Components" on page IN-15.

(d) REMOVAL OF ADJACENT COMPONENTS

- (1) When removing adjacent components, apply protective tape to the surrounding body and your tools to prevent damage.

HINT: See "Handling Precautions on Related Components" on page IN-15.

2. PREPARATION FOR INSTALLATION

(a) SPOT WELD POINTS

- (1) When welding panels with a combined thickness of over 3mm (0.12in.), use a MIG (Metal Inert Gas) welder for plug welding.

HINT: Spot welding will not provide sufficient durability for panels over 3mm (0.12in.) thick.

(b) APPLICATION OF WELD-THROUGH PRIMER (SPOT SEALER)

- (1) Remove the paint from the portion of the new parts and body to be welded, and apply weld-through primer.

(c) MAKING HOLES FOR PLUG WELDING

- (1) For areas where a spot welder cannot be used, use a puncher or drill to make holes for plug welding.

REFERENCE:

mm (in.)

Thickness of welded portion	Size of plug hole
1.0 (0.04) under	5 (0.20) ϕ over
1.0 (0.04) - 1.5 (0.06)	6.4 (0.25) ϕ over
1.5 (0.06) over	8 (0.31) ϕ over

(d) SAFETY PRECAUTIONS FOR ELECTRICAL COMPONENTS

- (1) When welding, there is a danger that electrical components will be damaged by the electrical current flowing through the body.
- (2) Before starting work, disconnect the negative terminal of the battery and ground the welder near the welding location of the body.

(e) ROUGH CUTTING OF JOINTS

- (1) For joint areas, rough cut the new parts, leaving 20 - 30mm (0.79 - 1.18in.) overlap.

3. INSTALLATION

(a) PRE-WELDING MEASUREMENTS

- (1) Always take measurements before installing underbody or engine components to insure correct assembly. After installation, confirm proper fit.

(b) WELDING PRECAUTIONS

- (1) The number of welding spots should be as follows.
Spot weld: 1.3 X No. of manufacturer's spots.
Plug weld: More than No. of manufacturer's plugs.
- (2) Plug welding should be done with a MIG (Metal Inert Gas) welder. Do not gas weld or braze panels at areas other than specified.

(c) POST-WELDING REFINISHING

- (1) Always check the welded spots to insure they are secure.
- (2) When smoothing out the weld spots with a disc grinder, be careful not to grind off too much as this would weaken the weld.

(d) SPOT WELD LOCATIONS

- (1) Try to avoid welding over previous spots.

(e) SPOT WELDING PRECAUTIONS

- (1) The shape of the welding tip point has an effect on the strength of the weld.
- (2) Always insure that the seams and welding tip are free of paint.

4. ANTI-RUST TREATMENT

(a) BODY SEALER APPLICATION

- (1) For water-proofing and anti-corrosion measures, always apply the body sealer to the body panel seams and hems of the doors, hoods, etc.

(b) UNDERCOAT APPLICATION

- (1) To prevent corrosion and protect the body from damage by flying stones, always apply sufficient undercoat to the bottom surface of the under body and inside of the wheel housings.

5. ANTI-RUST TREATMENT AFTER PAINTING PROCESS

(a) ANTI-RUST AGENT (WAX) APPLICATION

- (1) To preserve impossible to paint areas from corrosion, always apply sufficient anti-rust agent (wax) to the inside of the hemming areas of the doors and hoods, and around the hinges, or the welded surfaces inside the boxed cross-section structure of the side member, body pillar, etc.

6. ANTI-RUST TREATMENT BY PAINTING

REFERENCE:

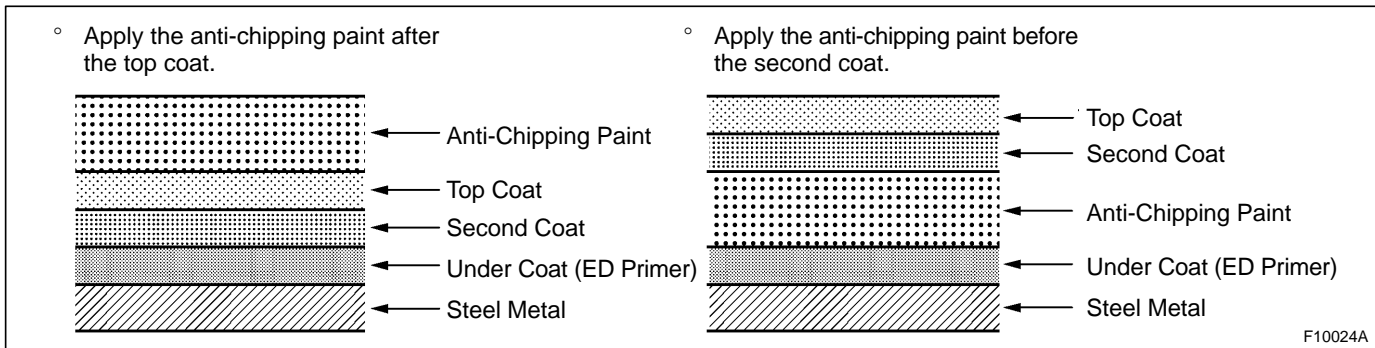

Painting prevents corrosion and protect the sheet metal from damage. In this section, anti-chipping paint only for anti-corrosion purpose is described.

(a) ANTI-CHIPPING PAINT

- (1) To prevent corrosion and protect the body from damage by flying stones, etc., apply anti-chipping paint to the rocker panel, wheel arch areas, balance panel, etc.

HINT:

Depending on the model or the application area, there are cases where the application of anti-chipping paint is necessary before the second coat or after the top coat.

HANDLING PRECAUTIONS

1. The repair procedure for plastic body parts must conform with the type of plastic material.
2. Plastic body parts are identified by the codes in the following chart.
3. When repairing metal body parts adjoining plastic body parts (by brazing, frame cutting, welding, painting etc.), consideration must given to the property of the plastic.

Code	Material name	Heat* resistant temperature limit °C (°F)	Resistance to alcohol or gasoline	Notes
AAS	Acrylonitrile Acrylic Styrene	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
ABS	Acrylonitrile Butadiene Styrene	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
AES	Acrylonitrile Ethylene Styrene	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
ASA	Acrylonitrile Styrene Acrylate	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
CAB	Cellulose Acetate	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
EPDM	Ethylene Propylene	100 (212)	Alcohol is harmless. Gasoline is harmless if applied only for short time in small amounts.	Most solvents are harmless but avoid dipping in gasoline, solvents, etc.
FRP	Fiber Reinforced Plastics	180 (356)	Alcohol and gasoline are harmless.	Avoid alkali.
EVA	Ethylene Acetate	70 (158)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid gasoline and organic or aromatic solvents.
PA	Polyamide (Nylon)	80 (176)	Alcohol and gasoline are harmless.	Avoid battery acid.
PBT	Polybutylene Terephthalate	160 (320)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PC	Polycarbonate	120 (248)	Alcohol is harmless.	Avoid gasoline, brake fluid, wax, wax removers and organic solvents. Avoid alkali.

*Temperatures higher than those listed here may result in material deformation during repair.

Code	Material name	Heat* resistant temperature limit °C (°F)	Resistance to alcohol or gasoline	Notes
PE	Polyethylene	80 (176)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PET	Polyethylene Terephthalate	75 (167)	Alcohol and gasoline are harmless.	Avoid dipping in water.
PMMA	Polymethyl Methacrylate	80 (176)	Alcohol is harmless if applied only for short time in small amounts.	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
POM	Polyoxymethylene (Polyacetal)	100 (212)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PP	Polypropylene	80 (176)	Alcohol and gasoline are harmless.	Most solvents are harmless.
PPO	Modified Polyphenylene Oxide	100 (212)	Alcohol is harmless.	Gasoline is harmless if applied only for quick wiping to remove grease.
PS	Polystyrene	60 (140)	Alcohol and gasoline are harmless if applied only for short time in small amounts.	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
PUR	Polyurethane	80 (176)	Alcohol is harmless if applied only for very short time in small amounts (e.g., quick wiping to remove grease).	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
PVC	Polyvinylchloride (Vinyl)	80 (176)	Alcohol and gasoline are harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
SAN	Styrene Acrylonitrile	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid dipping or immersing in alcohol, gasoline, solvents etc.
TPO	Thermoplastic Olefine	80 (176)	Alcohol is harmless. Gasoline is harmless if applied only for short time in small amounts.	Most solvents are harmless but avoid dipping in gasoline, solvents, etc.
TPU	Thermoplastic Polyurethane	80 (176)	Alcohol is harmless if applied only for short time in small amounts (e.g., quick wiping to remove grease).	Avoid dipping or immersing in alcohol, gasoline, solvents, etc.
TSOP	TOYOTA Super Olefine Polymer	80 (176)	Alcohol and gasoline are harmless.	Most solvents are harmless.
UP	Unsaturated Polyester	110 (233)	Alcohol and gasoline are harmless.	Avoid alkali.

*Temperatures higher than those listed here may result in material deformation during repair.

HINT:

- Resin material differs with model.
- / Made up of 2 or more kinds of materials.

RUST-RESISTANT SHEET STEEL PARTS

Rust-Resistant Sheet Steel have zinc, tin or aluminum etc, plating over the base metal surface in order to improve the corrosion resistance of the sheet metal. This sheeting is used on areas that require anti-corrosive abilities but there is no need to distinguish the differences between rust resistant sheet steel and ordinary sheet steel in body repair.

Body panels on TOYOTA models are made of two different melted galvanized sheet steel. The ordinary melted galvanized sheet has a zinc plating over the base metal surface and when heated a zinc-iron alloy plating. The zinc-iron double layered galvanized sheet has an iron rich and another zinc-rich layer above the sheet steel. These 2 layers improve paint adhesion. These two melted galvanized sheet steels are used selectively according to need.

The handling of Rust-Resistant Sheet Steel is the same as for ordinary sheet steel, but the following should be observed.

1. Panel Welding: The paint as well as the zinc portion must be removed completely from the welding area to guarantee good welding integrity.
2. Anti-Rust Treatment: Since the zinc plating is lost after welding, anti-rust treatment of the welded area must be thoroughly performed (refer to section AR).

 : Rust-Resistant Sheet Steel

HIGH-STRENGTH STEEL (HSS) PARTS

Generally, High-Strength Steel (HSS) is that which has an intensity value of at 35 kgf/mm^2 (343 MPa), and distinguished from mild steel.

The handling of HSS is the same as for mild steel, but the following should be observed.

1. Panel Hammering: Because HSS is thinner than mild steel, care should be taken to avoid warping during hammering operations.
2. Removing Spot Welds: Because HSS is tougher than mild steel, damage will occur more easily to a regular drill. Therefore, an HSS Spot Cutter is recommended. Also, use a high-torque drill at low speed, and supply grinding oil to the drill use.
3. Panel Welding: Panel welding procedures for HSS are exactly the same as for mild steel. Plug welding should be done with MIG (Metal Inert Gas) welder. Do not gas weld or braze panels at areas other than specified.

 : High Strength Sheet Steel

RADIATOR UPPER SUPPORT (ASSY)

REMOVAL

INSTALLATION

1. Temporarily install the new parts and measure each part in accordance with the body dimension diagram.

HINT: First install the hood lock support.

RADIATOR SIDE SUPPORT (ASSY)

REMOVAL (With the radiator upper support removed.)

INSTALLATION

1. Temporarily install the new parts and measure each part in accordance with the body dimension diagram.

HINT: First install the radiator upper support.

FRONT CROSSMEMBER (ASSY)

REMOVAL

INSTALLATION

1. Temporarily install the new parts and measure each part in accordance with the body dimension diagram.

RADIATOR SUPPORT (ASSY)

REMOVAL

INSTALLATION

1. Temporarily install the new parts and measure each part in accordance with the body dimension diagram.

COWL TOP SIDE PANEL (ASSY)

REMOVAL

INSTALLATION

FRONT FENDER APRON (ASSY)

REMOVAL (With the radiator support, cowl top side panel removed.)

- RH: ⓪ — 6
- LH (M/T): ⓪ — 7
- LH (A/T): ⓪ — 8

INSTALLATION

RH: □ — 6
 LH (M/T): □ — 7
 LH (A/T): □ — 8

1. Temporarily install the new parts and measure each part in accordance with the body dimension diagram.
2. Temporarily install the front fender and hood, and check the fit.

FRONT BODY PILLAR (CUT)

REMOVAL (With the cowl top side panel removed.)

1. Cut and join the parts at the locations as shown above.

HINT:

- 1) Shift the each cut and join locations of the outer pillar, inner pillar and roof drip channel.
- 2) Cut and join the rocker outer panel and rocker panel reinforcement at position shifted about 50 mm (1.97 in.)

mm	in
30	1.18
50	1.97
610	24.02

INSTALLATION

1. Cut the new parts for the outer pillar at the locations as shown above.

HINT: After welding the pillar reinforcement attach it to the lower area of the outer pillar.

2. After welding the cowl side panel reinforcement, cowl side inner panel, front body inner pillar, front body pillar reinforcement and rocker panel reinforcement, weld the front body outer pillar with standard points.

INSTALLATION

[RH only]

3. Before welding the new parts, check the fit of the front door, front fender and windshield glass.
4. Temporarily install the new parts and measure each part in accordance with the body dimension diagram.
5. Apply foamed material to the pillar section.

FRONT DOOR OUTER PANEL (CUT)**REMOVAL**

1. Cut and join the parts at the locations as shown above.
2. After grinding off the hemming location, remove the outer panel.

INSTALLATION

mm	in.
10	0.39

1. Before temporarily installing the new parts, apply body sealer to the reinforcement, side impact protection beam and back side of the new parts.

HINT:

- 1) Apply just enough sealer for the reinforcement and side impact beam to touch the new panel. Apply sealer evenly around the flange area, about 10 mm (0.39 in.) from the edge, as shown.
- 2) For other sealing points, refer to section AR.

2. Bend the flange hem about 30° with a hammer and dolly, then fasten tightly with a hemming tool.

HINT:

- 1) Perform hemming in three steps, being careful not to warp the panel.
- 2) If a hemming tool cannot be used hem with a hammer and dolly.

ACCESS PANEL OUTER PANEL (CUT)

REMOVAL

1. Cut and join the parts at the locations as shown above.
2. After grinding off the hemming location, remove the outer panel.

INSTALLATION

mm	in.
10	0.39

1. Before temporarily installing the new parts, apply body sealer to the reinforcement, side impact protection beam and back side of the new parts.

HINT:

- 1) Apply just enough sealer for the reinforcement and side impact beam to touch the new panel. Apply sealer evenly around the flange area, about 10 mm (0.39 in.) from the edge, as shown.
- 2) For other sealing points, refer to section AR.

2. Bend the flange hem about 30° with a hammer and dolly, then fasten tightly with a hemming tool.

HINT:

- 1) Perform hemming in three steps, being careful not to warp the panel.
- 2) If a hemming tool cannot be used hem with a hammer and dolly.

ROCKER OUTER PANEL (CUT): Regular Cab

REMOVAL

[Cut and Join Location]

[Cut and Join Location]

1. Cut and join the parts at the locations as shown above.

INSTALLATION

-
1. Temporarily install the new parts and check the fit of the front door.

ROCKER OUTER PANEL (CUT): Access Cab

REMOVAL

[Cut and Join Location]

[Cut and Join Location]

1. Cut and join the parts at the locations as shown above.

INSTALLATION

1. Temporarily install the new parts and check the fit of the front door and access panel.

QUARTER PANEL (CUT): Regular Cab

REMOVAL

1. Cut and join the parts at the locations as shown above.

mm	in.
50	1.97

INSTALLATION

1. Temporarily install the new parts and check the fit of the front door and back window glass.
2. After installing the new parts apply foamed material.

HINT:

- 1) Apply just enough sealer for the new parts to make contact.
- 2) For other sealing points, refer to Section AR.

GENERAL INFORMATION

Anti-rust treatment is necessary before welding and before and after the painting process.

ANTI-RUST TREATMENT BEFORE WELDING

1. WELD-THROUGH PRIMER (SPOT SEALER) APPLICATION

For anti-corrosion measures, always apply the weld-through primer (spot sealer) to welding surfaces where the paint film has been removed.

HINT: Apply the weld-through primer (spot sealer) so that it does not ooze out from the joining surfaces.

WELD-THROUGH PRIMER (SPOT SEALER) APPLICATION

ANTI-RUST TREATMENT BEFORE PAINTING PROCESS

1. BODY SEALER APPLICATION

For water-proofing and anti-corrosion measures, always apply the body sealer to the body panel seams and hems of the doors, hoods, etc.

BODY SEALER APPLICATION

2. UNDERCOAT APPLICATION

To prevent corrosion and protect the body from damage by flying stones, always apply sufficient undercoat to the bottom surface of the under body and inside of the wheel housings.

UNDERCOAT APPLICATION

ANTI-RUST TREATMENT AFTER PAINTING PROCESS

1. ANTI-RUST AGENT (WAX) APPLICATION

To preserve impossible to paint areas from corrosion, always apply sufficient anti-rust agent (wax) to the inside of the hemming areas of the doors and hoods, and around the hinges, or the welded surfaces inside the boxed cross-section structure of the side member, body pillar, etc.

ANTI-RUST AGENT (WAX) APPLICATION

REFERENCE: ANTI-RUST TREATMENT BY PAINTING

Painting prevents corrosion and protects the sheet metal from damage. In this section, anti-chipping paint only for anti-corrosion purpose is described.

1. ANTI-CHIPPING PAINT

To prevent corrosion and protect the body from damage by flying stones, etc., apply anti-chipping paint to the rocker panel, wheel arch areas, valance panel, etc.

HINT:

Depending on the model or the application area, there are cases where the application of anti-chipping paint is necessary before the second coat or after the top coat.

- Apply the anti-chipping paint after the top coat.

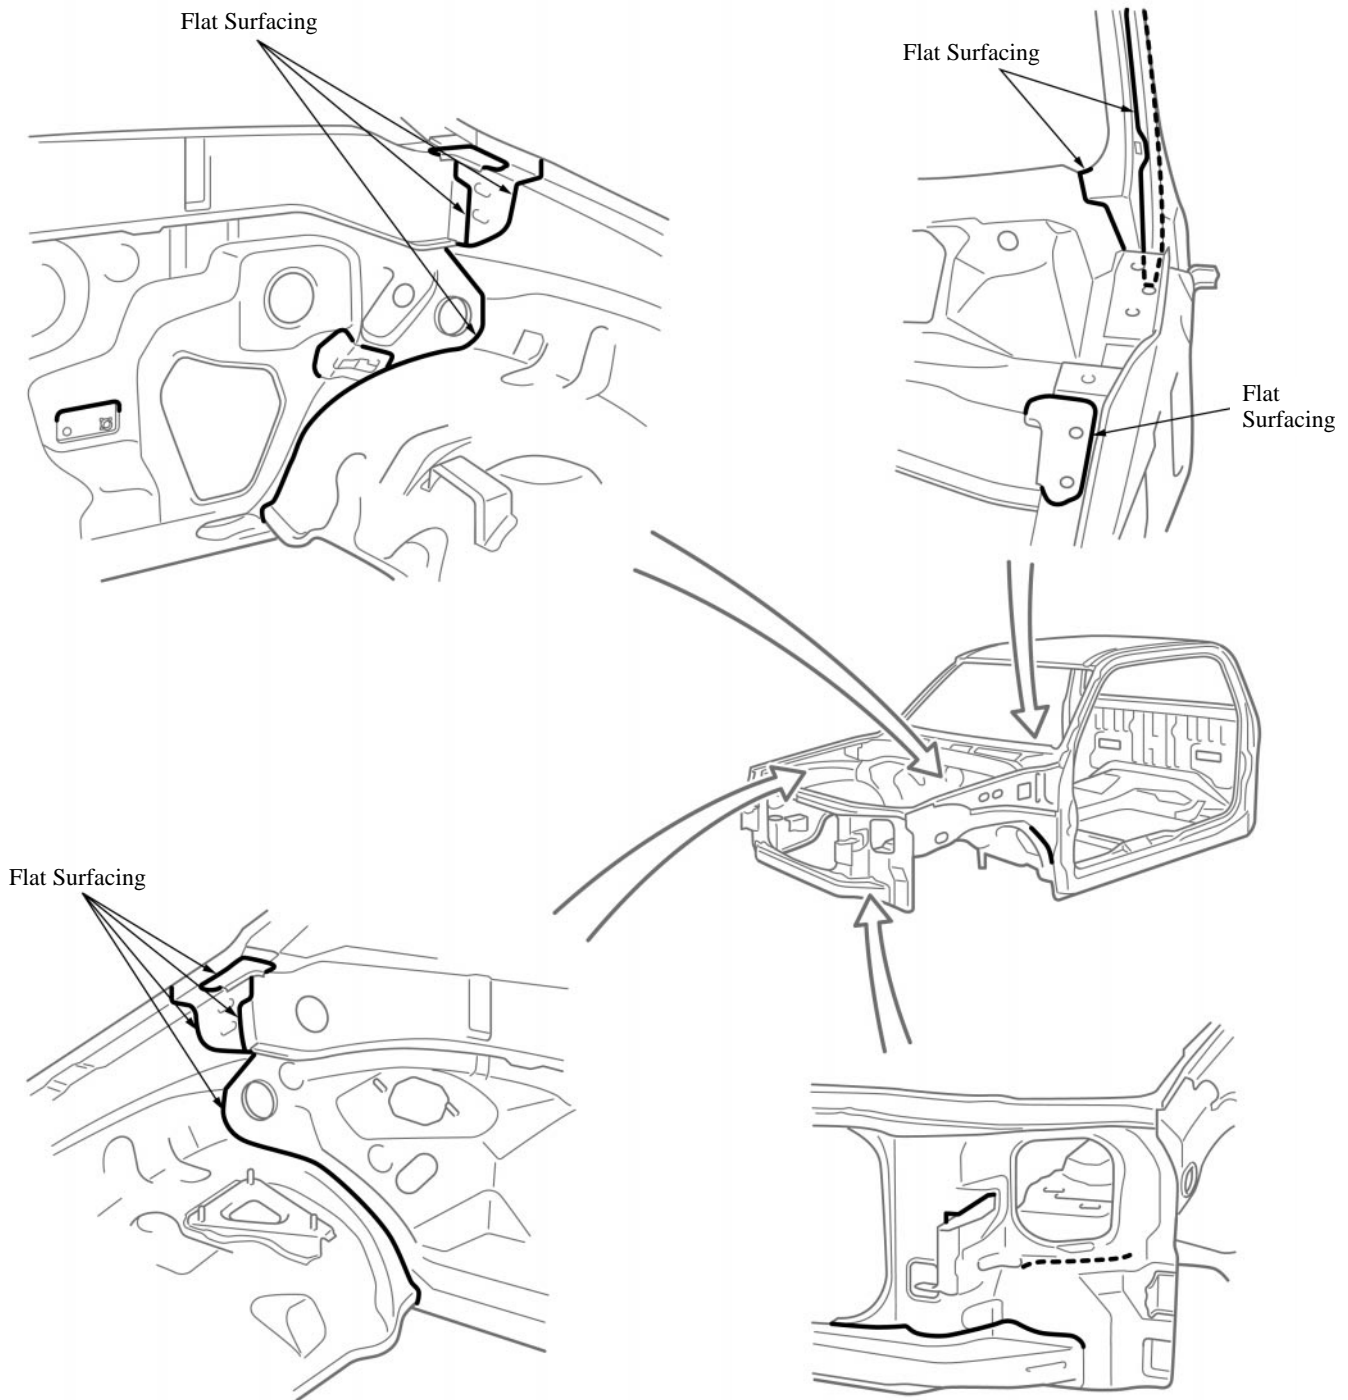

- Apply the anti-chipping paint before the second coat.

BODY PANEL SEALING AREAS**HINT:**

1. Prior to applying body sealer, clean the area with a rag soaked in a grease, wax and silicone remover.
2. If weld-through primer was used, first wipe off any excess and coat with anti-corrosion primer before applying body sealer.
3. Wipe off excess body sealer with a rag soaked in a grease, wax and silicone remover.
4. If body sealer is damaged by peeling, cracks, etc., be sure to repair as necessary.

BODY PANEL UNDERCOATING AREAS

HINT:

1. First wipe off any dirt, grease or oil with a rag soaked in a grease, wax and silicone remover.
2. Cover the surrounding areas with masking paper to avoid coating unnecessary areas. If other areas are accidentally coated, wipe off the coating immediately.
3. Apply the first coating of undercoat to all welded areas and panel joints, then apply a second coat over the entire area.
4. Do not coat parts which become hot, such as the tailpipe, or moving parts, such as the propeller shaft.
5. Besides the locations described below, apply undercoating to all weld points under the body to insure corrosion prevention.
6. Be sure to seal the edge of the flange of the member and bracket with undercoating.
7. If undercoat is damaged by peeling, cracks, etc., be sure to repair as necessary.
8. Before the undercoat apply sealer allowing rust prevention to be attained.

REGULAR CAB

ACCES CAB

REFERENCE: Referring to the notes above, undercoating should be applied according to the specifications for your country.

BODY PANEL ANTI-RUST AGENT (WAX) APPLICATION AREAS

HINT:

1. Whenever adjusting the doors and hoods, apply anti-rust agent (wax) around the hinges.
2. Even if partially repairing a part, apply anti-rust agent (wax) over the entire application area of the part.
3. Wipe off the anti-rust agent immediately with a rag soaked in a grease, wax and silicone remover, if accidentally applied to other areas.

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16949

POINT

- 1 Before temporarily installing the new parts, apply body sealer to the reinforcement, side impact protection beam and back side of the new parts.
HINT:
 - 1) Apply sealer evenly about 10 mm (0.39 in.) from the flange and 3 mm (0.12 in.) in diameter to the outer panel and apply just enough sealer for the reinforcement and side impact protection beam to make contact.
- 2 Bend the flange hem about 30° with a hammer and dolly, then fasten tightly with a hemming tool.
HINT:
 - 1) Perform hemming in three steps, being careful not to warp the panel.
 - 2) If a hemming tool cannot be used, hem with a hammer and dolly.

REAR DOOR OUTER PANEL (CUT)**REPLACEMENT**

F16950A

REMOVAL

F16950

POINT

- 1 After grinding off the hemming location, remove the outer panel.

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16951

POINT

- 1 Before temporarily installing the new parts, apply body sealer to the reinforcement, side impact protection beam and back side of the new parts.
HINT:
 - 1) Apply sealer evenly about 10 mm (0.39 in.) from the flange and 3 mm (0.12 in.) in diameter to the outer panel and apply just enough sealer for the reinforcement and side impact protection beam to make contact.
- 2 Bend the flange hem about 30° with a hammer and dolly, then fasten tightly with a hemming tool.
HINT:
 - 1) Perform hemming in three steps, being careful not to warp the panel.
 - 2) If a hemming tool cannot be used, hem with a hammer and dolly.

ROCKER PANEL (CUT-H)

REPLACEMENT

F16940A

REMOVAL

F16940

20 mm (0.79 in.)

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16941

POINT

- 1 Inspect the fitting of the front door, etc., before welding, since this affects the appearance of the finish.

ROCKER PANEL (CUT)

REPLACEMENT

F16942A

REMOVAL

F16942

50 mm (1.97 in.)

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16943

POINT

- 1 Inspect the fitting of the front door and rear door, etc., before welding, since this affects the appearance of the finish.

QUARTER PANEL (CUT)

REPLACEMENT

F16952A

REMOVAL

F16952

200 mm (7.87 in.)

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16953

POINT

- 1 Inspect the fitting of the rear door and back window glass, etc., before welding, since this affects the appearance or the finish.

QUARTER PANEL REINFORCEMENT (CUT)

REPLACEMENT

With the quarter panel removed.

F16954A

REMOVAL

F16954

POINT

- 1 Leave the [A] to the vehicle side.
- 2 Take care not to damage the internal reinforcement.

PART NAME

[A] Quarter Lock Pillar Upper Reinforcement
75 mm (2.95 in.)

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16955

POINT

- 1 Take care not to damage the internal reinforcement.

30 mm (1.18 in.)

BACK PANEL (ASSY)

REPLACEMENT

F16956A

REMOVAL

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16957

POINT

- 1 Inspect the fitting of the back window glass etc., before welding, since this affects the appearance of the finish.

ROOF PANEL (ASSY): w/o sun roof

REPLACEMENT

F16958A

REMOVAL

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16959

POINT

- 1 Before temporarily installing the new parts, apply body sealer to the windshield header panel, roof panel reinforcement and back window upper frame.

HINT:

- 1) Apply just enough sealer for the new parts to make contact.

ROOF PANEL (ASSY): w/ sun roof

REPLACEMENT

F16960A

REMOVAL

F16960

POINT

- 1 If reusing the roof panel reinforcement, trim the hemming location using a disc sander, etc.

INSTALLATION

- Temporarily install the new parts and measure each part of the new parts in accordance with the body dimension diagram. (See the body dimension diagram)
- Inspect the fitting of the related parts around the new parts before welding. This affects the appearance of the finish.
- After welding, apply the polyurethane foam to the corresponding parts.
- After welding, apply body sealer and under-coating to the corresponding parts.
- After applying the top coat layer, apply anti-rust agent to the inside of the necked section structural weld spots.

F16961

POINT

- 1 Before temporarily installing the new parts, apply body sealer to the windshield header panel, roof panel reinforcement and back window upper frame.
HINT:
 1) Apply just enough sealer for the new parts to make contact.
- 2 Bend the flange hem with a wooden hammer and dolly.
HINT:
 1) Perform hemming three steps, being careful not to warp the panel.

OUTER PANEL INSTALLATION TORQUE

23.0 N·m (234.6 kgf·cm, 17 ft·lbf)

—

—

F16918

47.0 N·m (479.4 kgf·cm, 35 ft·lbf)

61.0 N·m (622.2 kgf·cm, 45 ft·lbf)

86.0 N·m (877.2 kgf·cm, 63 ft·lbf)

BODY PANEL SEALING AREAS

HINT:

- 1) Prior to applying body sealer, clean the area with a rag soaked in grease, wax and silicone remover.
- 2) If weld-through primer was used, first wipe off any excess and coat with anti-corrosion primer before applying body sealer.
- 3) Wipe off excess body sealer with a rag soaked in a grease, wax and silicone remover.
- 4) If body sealer is damaged by peeling, cracks, etc., be sure to repair as necessary.

Flat Finishing

No Flat Finishing

1. ENGINE COMPARTMENT

2. INSIDE

3. OUTSIDE

4. DOOR PARTS

BODY PANEL UNDERCOATING AREAS

HINT:

- 1) First wipe off any dirt, grease or oil with a rag soaked in a grease, wax and silicone remover.
- 2) Cover the surrounding areas with masking paper to avoid coating unnecessary areas. If other areas are accidentally coated, wipe off the coating immediately.
- 3) Apply the first coating of undercoat to all welded areas and panel joints, then apply a second coat over the entire area.
- 4) Do not coat parts which become hot, such as the tailpipe, or moving parts, such as the propeller shaft.
- 5) Besides the locations described below, apply undercoating to all weld points under the body to insure corrosion prevention.
- 6) Be sure to seal the edge of the flange of the member and bracket with undercoating.
- 7) If undercoat is damaged by peeling, cracks, etc., be sure to repair as necessary.
- 8) Before the undercoat apply sealer allowing rust prevention to be attained.

F16910

REFERENCE

Referring to the notes above, undercoating should be applied according to the specifications for your country.

FOAMED MATERIAL APPLICATION AREAS

The sections shown in the figure below are filled with foamed material to provide noise insulation. After repairing these sections or their peripheries, refill with foamed materials

HINT:

- 1) Use the service holes located on the reverse side of the body panel to refill with foamed materials.
- 2) When handling foamed material, follow the directions of the material's manufacturer.

I-I

BODY PANEL ANTI-RUST AGENT (WAX) APPLICATION AREAS

HINT:

- 1) Whenever adjusting the doors and hoods, apply anti-rust agent (wax) around the hinges.
- 2) Even if partially repairing a part, apply anti-rust agent (wax) over the entire application area of the part.
- 3) Wipe off the anti-rust agent immediately with a rag soaked in a grease, wax and silicone remover, if accidentally applied to other areas.

SILENCER SHEET INSTALLATION AREAS

F16915

Thickness of Silencer Sheet

1.5 mm (0.059 in.)

3.0 mm (0.118 in.)

3.7 mm (0.146 in.)

BODY PANEL ANTI-CHIPPING PAINT APPLICATION AREAS

HINT:

- 1) Anti-chipping paint should be applied to some areas before the second coat and to others after the top coat.
- 2) If other areas are accidentally coated, wipe off the paint immediately with a rag soaked in grease, wax and silicone remover.

GENERAL INFORMATION

1. BASIC DIMENSIONS

- (a) There are two types of dimensions in the diagram.
 - (1) (Three-dimensional distance)
 - Straight-line distance between the centers of two measuring points.
 - (2) (Two-dimensional distance)
 - Horizontal distance in forward/rearward between the centers of two measuring points.
 - The height from an imaginary standard line.
- (b) In cases in which only one dimension is given, left and right are symmetrical.
- (c) The dimensions in the following drawing indicate actual distance. Therefore, please use the dimensions as a reference.

2. MEASURING

- (a) Basically, all measurements are to be done with a tracking gauge. For portions where it is not possible to use a tracking gauge, a tape measure should be used.
- (b) Use only a tracking gauge that has no looseness in the body, measuring plate, or pointers.

HINT:

- 1) *The height of the left and right pointers must be equal.*
 - 2) *Always calibrate the tracking gauge before measuring or after adjusting the pointer height.*
 - 3) *Take care not to drop the tracking gauge or otherwise shock it.*
 - 4) *Confirm that the pointers are securely in the holes.*
- (c) When using a tape measure, avoid twists and bends in the tape.

FOREWORD

This wiring diagram manual has been prepared to provide information on the electrical system of the 2005 TOYOTA TUNDRA.

Applicable models: GSK30 Series
UCK30, 31, 40, 41 Series

For service specifications and repair procedures of the above models other than those listed in this manual, refer to the following manuals;

Manual Name	Pub. No.
▲ 2005 TOYOTA TUNDRA Repair Manual	RM1150U
▲ 2005 TOYOTA New Car Features	NCF275U

All information in this manual is based on the latest product information at the time of publication. However, specifications and procedures are subject to change without notice.

TOYOTA MOTOR CORPORATION

NOTICE

When handling supplemental restraint system components (removal, installation or inspection, etc.), always follow the direction given in the repair manuals listed above to prevent accidents and supplemental restraint system malfunction.

A INTRODUCTION

This manual consists of the following 13 sections:

No.	Section	Description
A	INDEX	Index of the contents of this manual.
	INTRODUCTION	Brief explanation of each section.
B	HOW TO USE THIS MANUAL	Instructions on how to use this manual.
C	TROUBLE-SHOOTING	Describes the basic inspection procedures for electrical circuits.
D	ABBREVIATIONS	Defines the abbreviations used in this manual.
E	GLOSSARY OF TERMS AND SYMBOLS	Defines the symbols and functions of major parts.
F	RELAY LOCATIONS	Shows position of the Electronic Control Unit, Relays, Relay Block, etc. This section is closely related to the system circuit.
G	ELECTRICAL WIRING ROUTING	Describes position of Parts Connectors, Splice points, Ground points, etc. This section is closely related to the system circuit.
H	INDEX	Index of the system circuits.
	SYSTEM CIRCUITS	Electrical circuits of each system are shown from the power supply through ground points. Wiring connections and their positions are shown and classified by code according to the connection method. (Refer to the section, "How to use this manual"). The "System Outline" and "Service Hints" useful for troubleshooting are also contained in this section.
I	GROUND POINT	Shows ground positions of all parts described in this manual.
J	POWER SOURCE (Current Flow Chart)	Describes power distribution from the power supply to various electrical loads.
K	CONNECTOR LIST	Describes the form of the connectors for the parts appeared in this book. This section is closely related to the system circuit.
L	PART NUMBER OF CONNECTORS	Indicates the part number of the connectors used in this manual.
M	OVERALL ELECTRICAL WIRING DIAGRAM	Provides circuit diagrams showing the circuit connections.

This manual provides information on the electrical circuits installed on vehicles by dividing them into a circuit for each system.

The actual wiring of each system circuit is shown from the point where the power source is received from the battery as far as each ground point. (All circuit diagrams are shown with the switches in the OFF position.)

When troubleshooting any problem, first understand the operation of the circuit where the problem was detected (see System Circuit section), the power source supplying power to that circuit (see Power Source section), and the ground points (see Ground Point section). See the System Outline to understand the circuit operation.

When the circuit operation is understood, begin troubleshooting of the problem circuit to isolate the cause. Use Relay Location and Electrical Wiring Routing sections to find each part, junction block and wiring harness connectors, wiring harness and wiring harness connectors, splice points, and ground points of each system circuit. Internal wiring for each junction block is also provided for better understanding of connection within a junction block.

Wiring related to each system is indicated in each system circuit by arrows (from__, to__). When overall connections are required, see the Overall Electrical Wiring Diagram at the end of this manual.

B HOW TO USE THIS MANUAL

* The system shown here is an EXAMPLE ONLY. It is different to the actual circuit shown in the SYSTEM CIRCUITS SECTION.

[A] Stop Light

[A] : System Title

[B] : Indicates a Relay Block. No shading is used and only the Relay Block No. is shown to distinguish it from the J/B

Example: ① Indicates Relay Block No.1

[C] : () is used to indicate different wiring and connector, etc. when the vehicle model, engine type, or specification is different.

[D] : Indicates related system.

[E] : Indicates the wiring harness and wiring harness connector. The wiring harness with male terminal is shown with arrows (↗). Outside numerals are pin numbers.

The first letter of the code for each wiring harness and wiring harness connector(s) indicates the component's location, e.g, "E" for the Engine Compartment, "I" for the Instrument Panel and Surrounding area, and "B" for the Body and Surrounding area.

When more than one code has the first and second letters in common, followed by numbers (e.g, IH1, IH2), this indicates the same type of wiring harness and wiring harness connector.

[F] : Represents a part (all parts are shown in sky blue). The code is the same as the code used in parts position.

[G] : Junction Block (The number in the circle is the J/B No. and the connector code is shown beside it). Junction Blocks are shaded to clearly separate them from other parts.

Example:

[H] : Indicates the wiring color.

Wire colors are indicated by an alphabetical code.

- B = Black W = White BR = Brown
- L = Blue V = Violet SB = Sky Blue
- R = Red G = Green LG = Light Green
- P = Pink Y = Yellow GR = Gray
- O = Orange

The first letter indicates the basic wire color and the second letter indicates the color of the stripe.

Example: L - Y

[I] : Indicates a wiring Splice Point (Codes are "E" for the Engine Room, "I" for the Instrument Panel, and "B" for the Body).

Example:

The Location of splice Point I 5 is indicated by the shaded section.

[J] : Indicates a shielded cable.

[K] : Indicates the pin number of the connector. The numbering system is different for female and male connectors.

Example: Numbered in order from upper left to lower right

Numbered in order from upper right to lower left

Female

Male

[L] : Indicates a ground point.

The first letter of the code for each ground point(s) indicates the component's location, e.g, "E" for the Engine Compartment, "I" for the Instrument Panel and Surrounding area, and "B" for the Body and Surrounding area.

[M] : Page No.

B HOW TO USE THIS MANUAL

[N] System Outline

Current is applied at all times through the STOP fuse to TERMINAL 2 of the stop light SW.
When the ignition SW is turned on, current flows from the GAUGE fuse to TERMINAL 8 of the light failure sensor, and also flows through the rear lights warning light to TERMINAL 4 of the light failure sensor.

Stop Light Disconnection Warning

When the ignition SW is turned on and the brake pedal is pressed (Stop light SW on), if the stop light circuit is open, the current flowing from TERMINAL 7 of the light failure sensor to TERMINALS 1, 2 changes, so the light failure sensor detects the disconnection and the warning circuit of the light failure sensor is activated.

As a result, the current flows from TERMINAL 4 of the light failure sensor to TERMINAL 11 to GROUND and turns the rear lights warning light on. By pressing the brake pedal, the current flowing to TERMINAL 8 of the light failure sensor keeps the warning circuit on and holds the warning light on until the ignition SW is turned off.

[O] Service Hints

S6 Stop Light SW

2-1 : Closed with the brake pedal depressed

L4 Light Failure Sensor

1, 2, 7-Ground : Approx. 12 volts with the stop light SW on

4, 8-Ground : Approx. 12 volts with the ignition SW at ON position

11-Ground : Always continuity

[P] ○ : Parts Location

Code	See Page	Code	See Page	Code	See Page
C7	34	L4	36	R7	37
H17	36	R6	37	S6	35

[Q] ○ : Relay Blocks

Code	See Page	Relay Blocks (Relay Block Location)
1	18	R/B No.1 (Instrument Panel Brace LH)

[R] ○ : Junction Block and Wire Harness Connector

Code	See Page	Junction Block and Wire Harness (Connector Location)
IB	20	Instrument Panel Wire and Instrument Panel J/B (Lower Finish Panel)
3C	22	Instrument Panel Wire and J/B No.3 (Instrument Panel Brace LH)

[S] □ : Connector Joining Wire Harness and Wire Harness

Code	See Page	Joining Wire Harness and Wire Harness (Connector Location)
IE1	42	Floor Wire and Instrument Panel Wire (Left Kick Panel)
BV1	50	Luggage Room Wire and Floor Wire (Luggage Room Left)

[T] ▽ : Ground Points

Code	See Page	Ground Points Location
BL	50	Under the Left Center Pillar
BO	50	Back Panel Center

[U] ○ : Splice Points

Code	See Page	Wire Harness with Splice Points	Code	See Page	Wire Harness with Splice Points
I5	44	Cowl Wire	B18	50	Luggage Room Wire

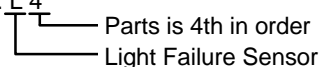

[N] : Explains the system outline.

[O] : Indicates values or explains the function for reference during troubleshooting.

[P] : Indicates the reference page showing the position on the vehicle of the parts in the system circuit.

Example : Part "L4" (Light Failure Sensor) is on page 36 of the manual.

* The letter in the code is from the first letter of the part, and the number indicates its order in parts starting with that letter.

Example : L 4

[Q] : Indicates the reference page showing the position on the vehicle of Relay Block Connectors in the system circuit.

Example : Connector "1" is described on page 18 of this manual and is installed on the left side of the instrument panel.

[R] : Indicates the reference page showing the position on the vehicle of J/B and Wire Harness in the system circuit.

Example : Connector "3C" connects the Instrument Panel Wire and J/B No.3. It is described on page 22 of this manual, and is installed on the instrument panel left side.

[S] : Indicates the reference page describing the wiring harness and wiring harness connector (the female wiring harness is shown first, followed by the male wiring harness).

Example : Connector "IE1" connects the floor wire (female) and Instrument panel wire (male). It is described on page 42 of this manual, and is installed on the left side kick panel.

[T] : Indicates the reference page showing the position of the ground points on the vehicle.

Example : Ground point "BO" is described on page 50 of this manual and is installed on the back panel center.

[U] : Indicates the reference page showing the position of the splice points on the vehicle.

Example : Splice point "I5" is on the Cowl Wire Harness and is described on page 44 of this manual.

B HOW TO USE THIS MANUAL

The ground points circuit diagram shows the connections from all major parts to the respective ground points. When troubleshooting a faulty ground point, checking the system circuits which use a common ground may help you identify the problem ground quickly. The relationship between ground points (∇_{EA} , ∇_{IB} and ∇_{IC} shown below) can also be checked this way.

I GROUND POINT

* The system shown here is an EXAMPLE ONLY. It is different to the actual circuit shown in the SYSTEM CIRCUITS SECTION.

B HOW TO USE THIS MANUAL

K CONNECTOR LIST

[A] : Indicates connector to be connected to a part. (The numeral indicates the pin No.)

[B] : Junction Connector
Indicates a connector which is connected to a short terminal.

Junction connector in this manual include a short terminal which is connected to a number of wire harnesses. Always perform inspection with the short terminal installed. (When installing the wire harnesses, the harnesses can be connected to any position within the short terminal grouping. Accordingly, in other vehicles, the same position in the short terminal may be connected to a wire harness from a different part.)
Wire harness sharing the same short terminal grouping have the same color.

[C] : Parts Code
The first letter of the code is taken from the first letter of part, and the numbers indicates its order in parts which start with the same letter.

[D] : Connector Color
Connectors not indicated are milky white in color.

L PART NUMBER OF CONNECTORS

Code	Part Name	Part Number	Code	Part Name	Part Number

		90980-1 1194			

[A] : Part Code

[B] : Part Name

[C] : Part Number

Toyota Part Number are indicated.

Not all of the above part numbers of the connector are established for the supply.

C TROUBLESHOOTING

VOLTAGE CHECK

- (a) Establish conditions in which voltage is present at the check point.

Example:

- [A] - Ignition SW on
- [B] - Ignition SW and SW 1 on
- [C] - Ignition SW, SW 1 and Relay on (SW 2 off)

- (b) Using a voltmeter, connect the negative lead to a good ground point or negative battery terminal, and the positive lead to the connector or component terminal.

This check can be done with a test light instead of a voltmeter.

CONTINUITY AND RESISTANCE CHECK

- (a) Disconnect the battery terminal or wire so there is no voltage between the check points.
- (b) Contact the two leads of an ohmmeter to each of the check points.

If the circuit has diodes, reverse the two leads and check again.

When contacting the negative lead to the diode positive side and the positive lead to the negative side, there should be continuity.

When contacting the two leads in reverse, there should be no continuity.

- (c) Use a volt/ohmmeter with high impedance (10 k Ω /V minimum) for troubleshooting of the electrical circuit.

FINDING A SHORT CIRCUIT

- Remove the blown fuse and disconnect all loads of the fuse.
- Connect a test light in place of the fuse.
- Establish conditions in which the test light comes on.

Example:

- [A] - Ignition SW on
 - [B] - Ignition SW and SW 1 on
 - [C] - Ignition SW, SW 1 and Relay on (Connect the Relay) and SW 2 off (or Disconnect SW 2)
- Disconnect and reconnect the connectors while watching the test light. The short lies between the connector where the test light stays lit and the connector where the light goes out.
 - Find the exact location of the short by lightly shaking the problem wire along the body.

CAUTION:

- Do not open the cover or the case of the ECU unless absolutely necessary. (If the IC terminals are touched, the IC may be destroyed by static electricity.)
- When replacing the internal mechanism (ECU part) of the digital meter, be careful that no part of your body or clothing comes in contact with the terminals of leads from the IC, etc. of the replacement part (spare part).

DISCONNECTION OF MALE AND FEMALE CONNECTORS

To pull apart the connectors, pull on the connector itself, not the wire harness.

HINT: Check to see what kind of connector you are disconnecting before pulling apart.

C TROUBLESHOOTING

HOW TO REPLACE TERMINAL (with terminal retainer or secondary locking device)

1. PREPARE THE SPECIAL TOOL

HINT : To remove the terminal from the connector, please construct and use the special tool or like object shown on the left.

2. DISCONNECT CONNECTOR

3. DISENGAGE THE SECONDARY LOCKING DEVICE OR TERMINAL RETAINER.

(a) Locking device must be disengaged before the terminal locking clip can be released and the terminal removed from the connector.

(b) Use a special tool or the terminal pick to unlock the secondary locking device or terminal retainer.

NOTICE:

Do not remove the terminal retainer from connector body.

[A] For Non-Waterproof Type Connector

HINT : The needle insertion position varies according to the connector's shape (number of terminals etc.), so check the position before inserting it.

"Case 1"

Raise the terminal retainer up to the temporary lock position.

"Case 2"

Open the secondary locking device.

[B] For Waterproof Type Connector

HINT : Terminal retainer color is different according to connector body.

Example:

Terminal Retainer : Connector Body

Black or White : Gray

Black or White : Dark Gray

Gray or White : Black

"Case 1"

Type where terminal retainer is pulled up to the temporary lock position (Pull Type).

Insert the special tool into the terminal retainer access hole (▲Mark) and pull the terminal retainer up to the temporary lock position.

HINT : The needle insertion position varies according to the connector's shape (Number of terminals etc.), so check the position before inserting it.

"Case 2"

Type which cannot be pulled as far as Power Lock insert the tool straight into the access hole of terminal retainer as shown.

C TROUBLESHOOTING

Push the terminal retainer down to the temporary lock position.

(c) Release the locking lug from terminal and pull the terminal out from rear.

4. INSTALL TERMINAL TO CONNECTOR

(a) Insert the terminal.

HINT:

1. Make sure the terminal is positioned correctly.
2. Insert the terminal until the locking lug locks firmly.
3. Insert the terminal with terminal retainer in the temporary lock position.

(b) Push the secondary locking device or terminal retainer in to the full lock position.

5. CONNECT CONNECTOR

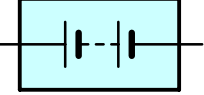

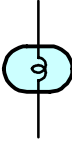

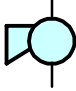

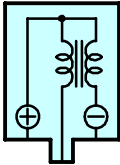

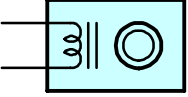

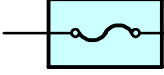

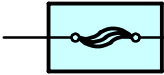

ABBREVIATIONS

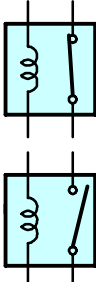

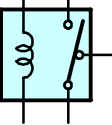

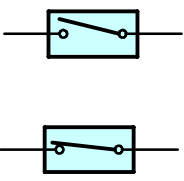

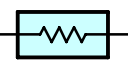

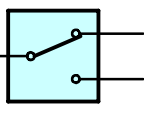

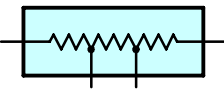

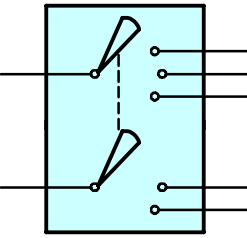

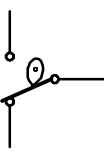

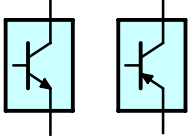

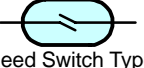

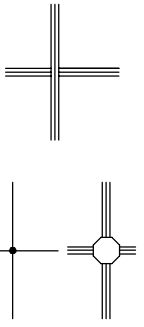

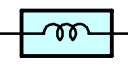

The following abbreviations are used in this manual.

2WD	=	Two Wheel Drive Vehicles
4WD	=	Four Wheel Drive Vehicles

E GLOSSARY OF TERMS AND SYMBOLS

 <p>BATTERY Stores chemical energy and converts it into electrical energy. Provides DC current for the auto's various electrical circuits.</p>	 <p>GROUND The point at which wiring attaches to the Body, thereby providing a return path for an electrical circuit; without a ground, current cannot flow.</p>
 <p>CAPACITOR (Condenser) A small holding unit for temporary storage of electrical voltage.</p>	<p>HEADLIGHTS Current flow causes a headlight filament to heat up and emit light. A headlight may have either a single (1) filament or a double (2) filament</p> <p>1. SINGLE FILAMENT</p>  <p>2. DOUBLE FILAMENT</p> 
 <p>CIGARETTE LIGHTER An electric resistance heating element.</p>	
 <p>CIRCUIT BREAKER Basically a reusable fuse, a circuit breaker will heat and open if too much current flows through it. Some units automatically reset when cool, others must be manually reset.</p>	 <p>HORN An electric device which sounds a loud audible signal.</p>
 <p>DIODE A semiconductor which allows current flow in only one direction.</p>	 <p>IGNITION COIL Converts low-voltage DC current into high-voltage ignition current for firing the spark plugs.</p>
 <p>DIODE, ZENER A diode which allows current flow in one direction but blocks reverse flow only up to a specific voltage. Above that potential, it passes the excess voltage. This acts as a simple voltage regulator.</p>	 <p>LIGHT Current flow through a filament causes the filament to heat up and emit light.</p>
 <p>PHOTODIODE The photodiode is a semiconductor which controls the current flow according to the amount of light.</p>	 <p>LED (LIGHT EMITTING DIODE) Upon current flow, these diodes emit light without producing the heat of a comparable light.</p>
 <p>DISTRIBUTOR, IIA Channels high-voltage current from the ignition coil to the individual spark plugs.</p>	 <p>METER, ANALOG Current flow activates a magnetic coil which causes a needle to move, thereby providing a relative display against a background calibration.</p>
 <p>FUSE A thin metal strip which burns through when too much current flows through it, thereby stopping current flow and protecting a circuit from damage.</p>  <p>FUSIBLE LINK A heavy-gauge wire placed in high amperage circuits which burns through on overloads, thereby protecting the circuit. The numbers indicate the crosssection surface area of the wires.</p> <p>(for Medium Current Fuse)</p>  <p>(for High Current Fuse or Fusible Link)</p>	 <p>METER, DIGITAL Current flow activates one or many LED's, LCD's, or fluorescent displays, which provide a relative or digital display.</p>
	 <p>MOTOR A power unit which converts electrical energy into mechanical energy, especially rotary motion.</p>

 <p>RELAY Basically, an electrically operated switch which may be normally closed (1) or open (2). Current flow through a small coil creates a magnetic field which either opens or closes an attached switch.</p> <p>1. NORMALLY CLOSED</p> <p>2. NORMALLY OPEN</p>	 <p>SPEAKER An electromechanical device which creates sound waves from current flow.</p>
 <p>RELAY, DOUBLE THROW A relay which passes current through one set of contacts or the other.</p>	<p>SWITCH, MANUAL Opens and closes circuits, thereby stopping (1) or allowing (2) current flow.</p>  <p>1. NORMALLY OPEN</p> <p>2. NORMALLY CLOSED</p>
 <p>RESISTOR An electrical component with a fixed resistance, placed in a circuit to reduce voltage to a specific value.</p>	<p>SWITCH, DOUBLE THROW A switch which continuously passes current through one set of contacts or the other.</p> 
 <p>RESISTOR, TAPPED A resistor which supplies two or more different non adjustable resistance values.</p>	<p>SWITCH, IGNITION A key operated switch with several positions which allows various circuits, particularly the primary ignition circuit, to become operational.</p> 
 <p>RESISTOR, VARIABLE or RHEOSTAT A controllable resistor with a variable rate of resistance. Also called a potentiometer or rheostat.</p>	<p>SWITCH, WIPER PARK Automatically returns wipers to the stop position when the wiper switch is turned off.</p> 
 <p>SENSOR (Thermistor) A resistor which varies its resistance with temperature.</p>	<p>TRANSISTOR A solidstate device typically used as an electronic relay; stops or passes current depending on the voltage applied at "base".</p> 
 <p>SENSOR, SPEED Uses magnetic impulses to open and close a switch to create a signal for activation of other components. (Reed Switch Type)</p>	<p>WIRES Wires are always drawn as straight lines on wiring diagrams. Crossed wires (1) without a black dot at the junction are not joined; crossed wires (2) with a black dot or octagonal mark at the junction are spliced (joined) connections.</p>  <p>(1) NOT CONNECTED</p> <p>(2) SPLICED</p>
 <p>SHORT PIN Used to provide an unbroken connection within a junction block.</p>	
 <p>SOLENOID An electromagnetic coil which forms a magnetic field when current flows, to move a plunger, etc.</p>

System Outline

The engine control system utilizes a microcomputer and maintains overall control of the engine, transmission etc. An outline of the engine control is given here.

1. Input Signals

(1) Engine coolant temp. signal circuit

The engine coolant temp. sensor detects the engine coolant temp. and has a built-in thermistor with a resistance which varies according to the engine coolant temp. The engine coolant temp. is input into TERMINAL THW of the engine control module as a control signal.

(2) Intake air temp. signal circuit

The intake air temp. sensor is installed in the mass air flow meter and detects the intake air temp., which is input as a control signal to TERMINAL THA of the engine control module.

(3) Oxygen sensor signal circuit

The oxygen density in the exhaust emission is detected and is input as a control signal from the heated oxygen sensors to TERMINALS OX1B, OX2B of the engine control module.

(4) RPM signal circuit

The camshaft position is detected by the camshaft position sensor and is input into TERMINAL G2+ of the engine control module as a control signal. Also, the engine RPM is detected by the crankshaft position sensor and the signal is input into TERMINAL NE+ of the engine control module.

(5) Throttle position sensor signal circuit

The throttle position sensor detects the throttle valve opening angle as a control signal, which is input into TERMINALS VTA1, VTA2 of the engine control module.

(6) Vehicle speed circuit

The vehicle speed sensor, detects the vehicle speed and input to the speed sensor of the skid control ECU with actuator, from skid control ECU to TERMINAL SPD of the engine control module, via combination meter.

(7) Battery signal circuit

Voltage is constantly applied to TERMINAL BATT of the engine control module. When the ignition SW is turned on, the voltage for engine control module start up power supply is applied through the EFI relay, to TERMINALS +B, +B2 of the engine control module. The current from the IGN fuse flows to TERMINAL IGSW of the engine control module, and voltage is constantly applied to TERMINAL +BM.

(8) Intake air volume signal circuit

The intake air volume is detected by the mass air flow meter, and is input as a control signal to TERMINAL VG of the engine control module.

(9) Stop light SW signal circuit

The stop light SW is used to detect whether the vehicle is braking or not, and the signal is input into TERMINAL STP of the engine control module as a control signal.

(10) Starter signal circuit

To confirm whether the engine is cranking, the voltage applied to the starter motor when the engine is cranking is detected, and is input into TERMINAL STA of the engine control module as a control signal.

(11) Engine knock signal circuit

Engine knocking is detected by the knock sensors, and is input into TERMINALS KNK1, KNK2 of the engine control module as a control signal.

2. Control System

*** SFI system**

The SFI system monitors the engine condition through the signals input from each sensors to the engine control module. The control signal is sent to the engine control module TERMINALS #10, #20, #30, #40, #50, #60, #70, #80 to operate the injector (Fuel injection). The SFI system controls the fuel injection by the engine control module in response to the driving conditions.

*** ESA system**

The ESA system monitors the engine condition through the signals input from each sensors to the engine control module. The best ignition timing is decided according to this data and the data memorized in the engine control module. The control signal is output to TERMINALS IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8, and these signals control the igniter to provide the best ignition timing.

*** Heated oxygen sensor heater control system**

The heated oxygen sensor heater control system turns the heater on when the intake air volume is low (Temp. of exhaust emission is low), and warms up the heated oxygen sensors to improve their detection performance. The engine control module evaluates the signals from each sensors, and outputs current to TERMINALS HT1B and HT2B to control the heater.

*** Air fuel ratio sensor heater control system**

The air fuel ratio sensor heater control system turns the heater on when the intake air volume is low (Temp. of exhaust emission is low) and warms up the air fuel ratio sensor to improve detection performance of the sensor.

The engine control module evaluates the signals from each sensor, current is output to TERMINALS HA1A and HA2A controlling the heater.

*** Fuel pump control system**

The engine control module supplies current to TERMINAL FPR, and controls the operation speed of the fuel pump with the F/PMP relay.

*** ETCS-i**

The ETCS-i controls the engine output at its optimal level in accordance with the opening of the accelerator pedal, under all driving conditions.

3. Diagnosis System

When there is a malfunction in the engine control module signal system, the malfunctioning system is recorded in the memory. The malfunctioning system can be found by reading the code displayed on the malfunction indicator lamp.

4. Fail-Safe System

When a malfunction has occurred in any system, there is a possibility of causing engine trouble due to continued control based on that system. In that case, the fail-safe system either controls the system using the data (Standard values) recorded in the engine control module memory, or else stops the engine.

Engine Control for 2UZ-FE (Access/Standard Cab)

Service Hints

EFI Relay

5-3 : Closed with ignition SW at ON or ST position

C/OPN Relay

5-3 : Closed with starter cranking or engine cranking

E2 Engine Coolant Temp. Sensor

1-2 : Approx. 16.2 k Ω (-20°C, -4°F)

: Approx. 2.45 k Ω (20°C, 68°F)

: Approx. 0.32 k Ω (80°C, 176°F)

E3 (A), E4 (B), E5 (C), E6 (D), E7 (E) Engine Control Module

BATT-E1 : Always 9.0-14.0 volts

+BM-E1 : Always 9.0-14.0 volts

IGSW-E1 : 9.0-14.0 volts with ignition SW at ON or ST position

+B, +B2-E1 : 9.0-14.0 volts with ignition SW at ON or ST position

VC-E1 : 4.5-5.5 volts with ignition SW at ON or ST position

VTA2-E1 : 2.0-2.9 volts with ignition SW on and throttle valve fully closed

: 4.7-5.1 volts with ignition SW on and throttle valve fully open

VTA1-E1 : 0.4-1.0 volts with ignition SW on and throttle valve fully closed

: 3.2-4.8 volts with ignition SW on and throttle valve fully open

VPA-E1 : 0.3-0.9 volts with ignition SW on and throttle valve fully closed

: 3.2-4.8 volts with ignition SW on and throttle valve fully open

VPA2-E1 : 1.8-2.7 volts with ignition SW on and throttle valve fully closed

: 4.7-5.1 volts with ignition SW on and throttle valve fully open

THA-E1 : 0.5-3.4 volts with idling, intake air temp. 0°C (32°F) -80°C (176°F)

THW-E1 : 0.2-1.0 volts with idling, engine coolant temp. 60°C (140°F) -120°C (248°F)

STA-E1 : 6.0 volts or more with engine cranking

W-E1 : 9.0-14.0 volts with idling and malfunction indicator lamp off

SPD-E1 : Pulse generation with vehicle moving

STP-E1 : 7.5-14.0 volts with brake pedal depressed

Engine Control for 1GR-FE (Access/Standard Cab)

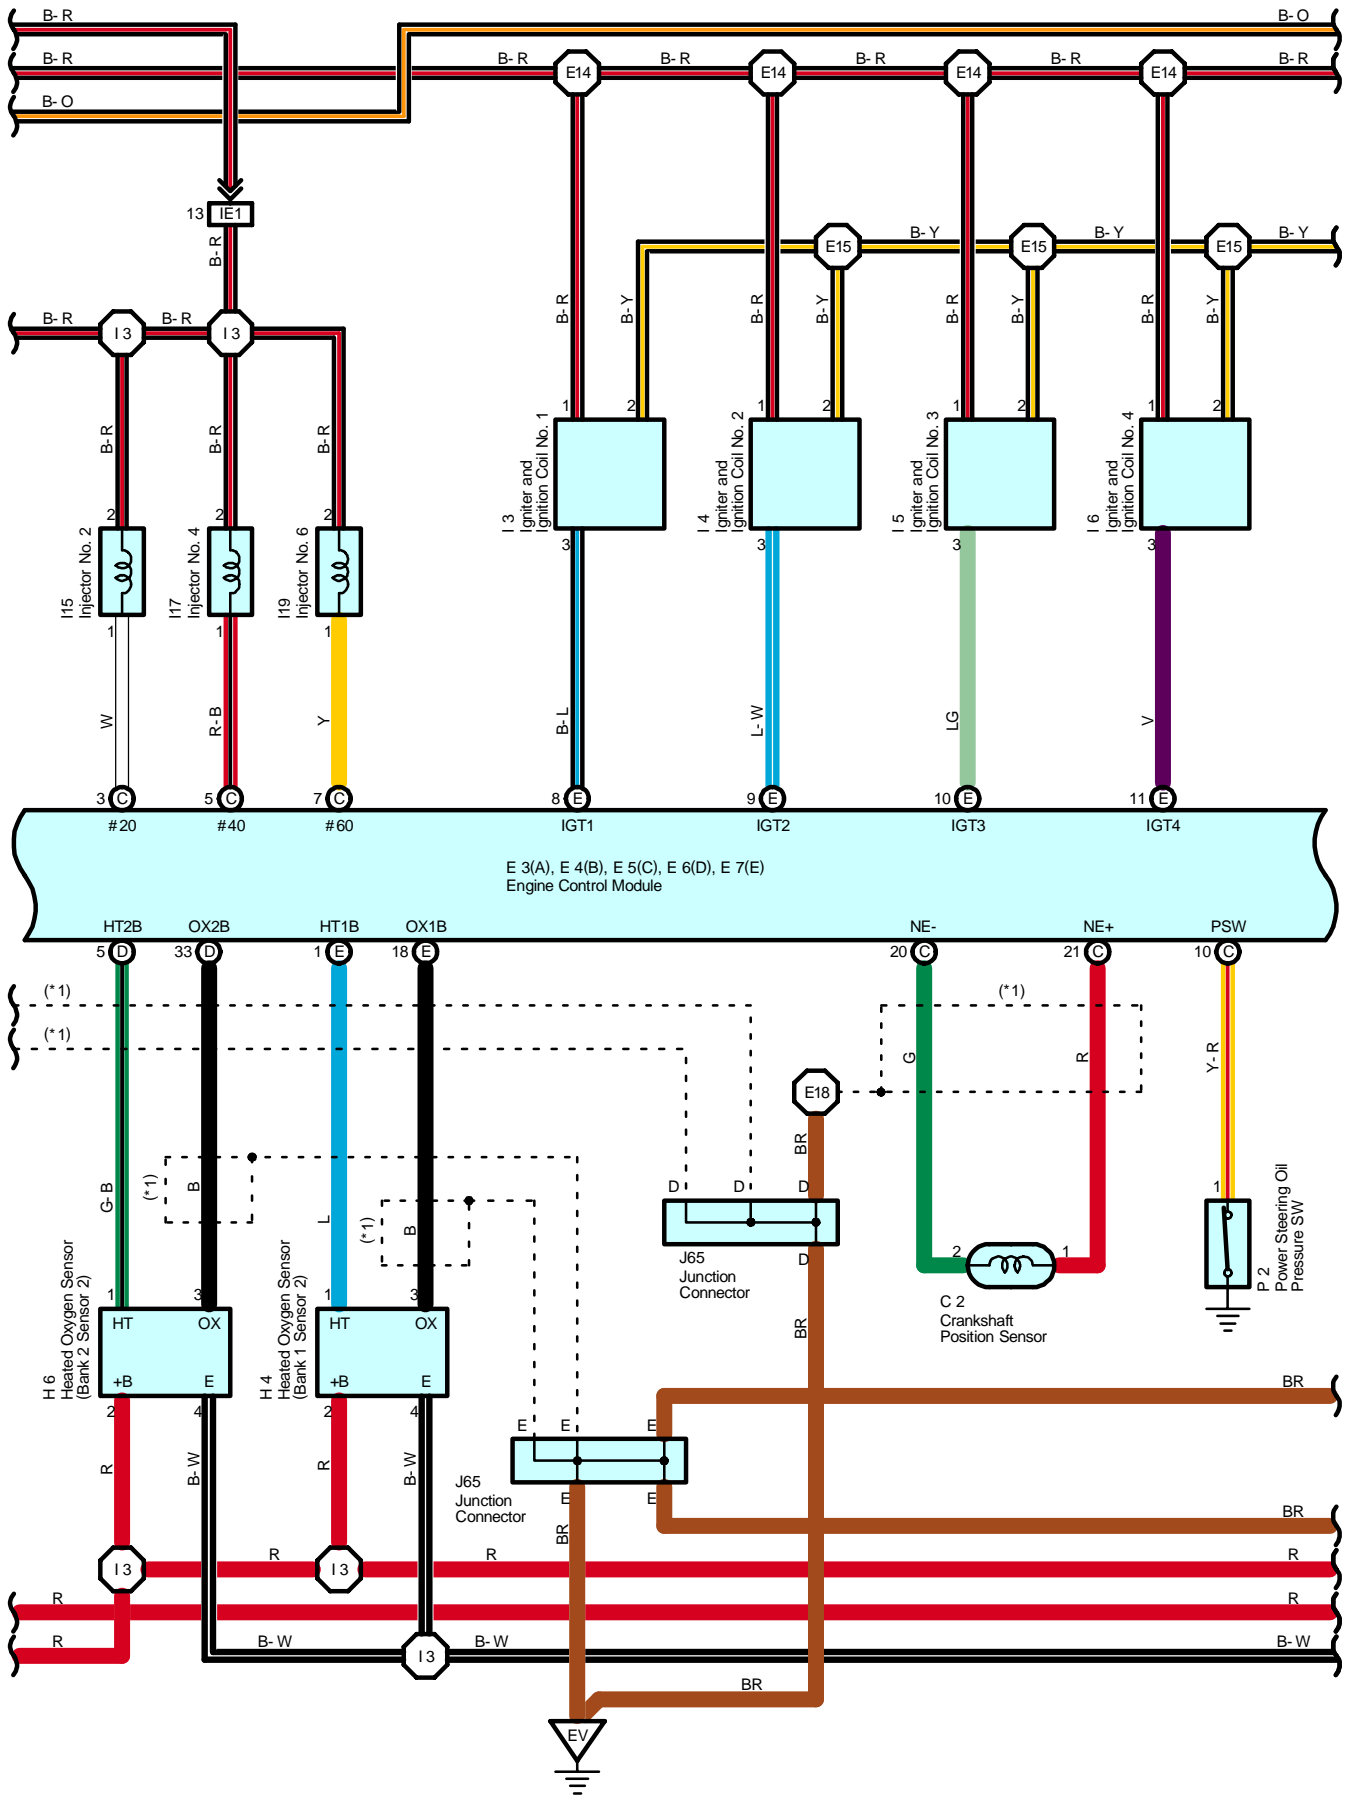

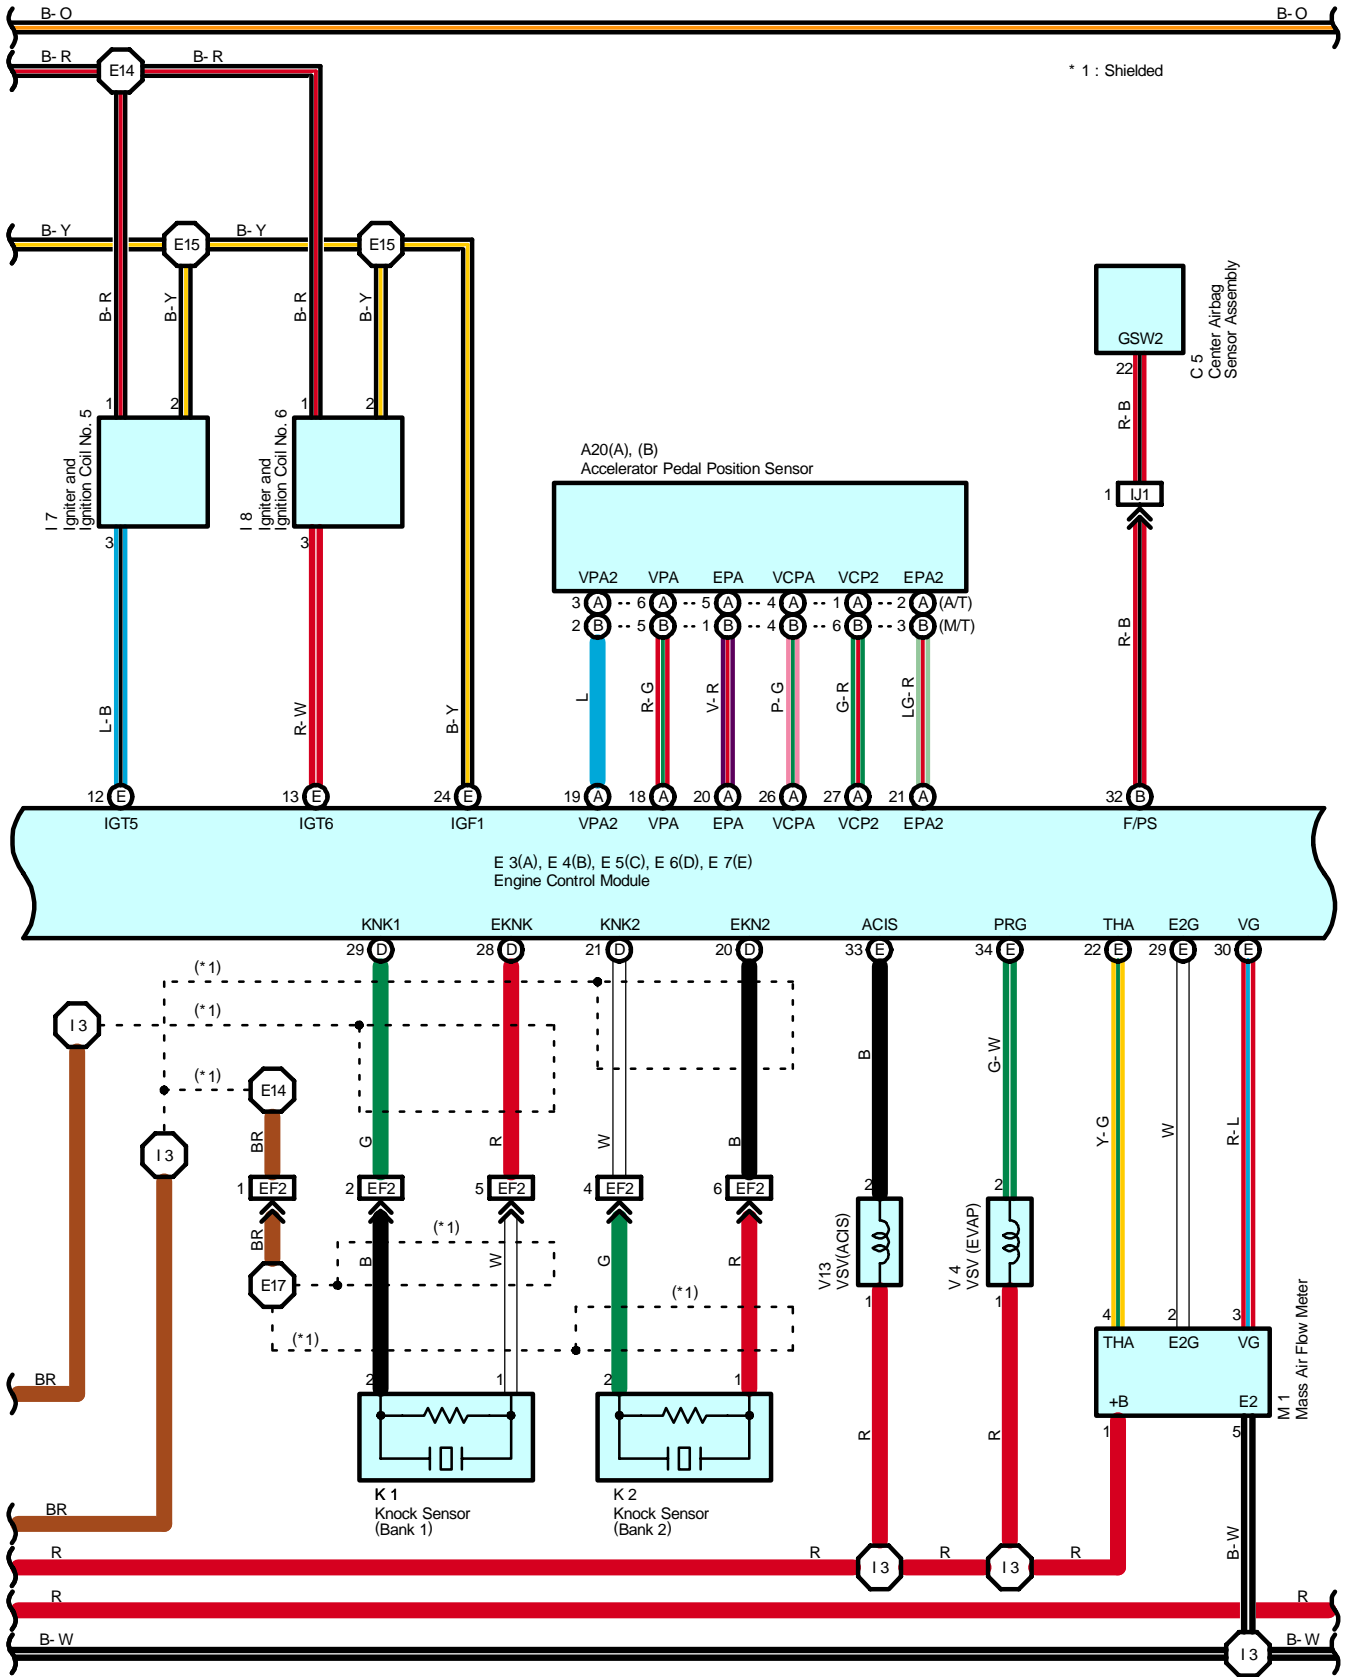

Engine Control for 1GR-FE (Access/Standard Cab)

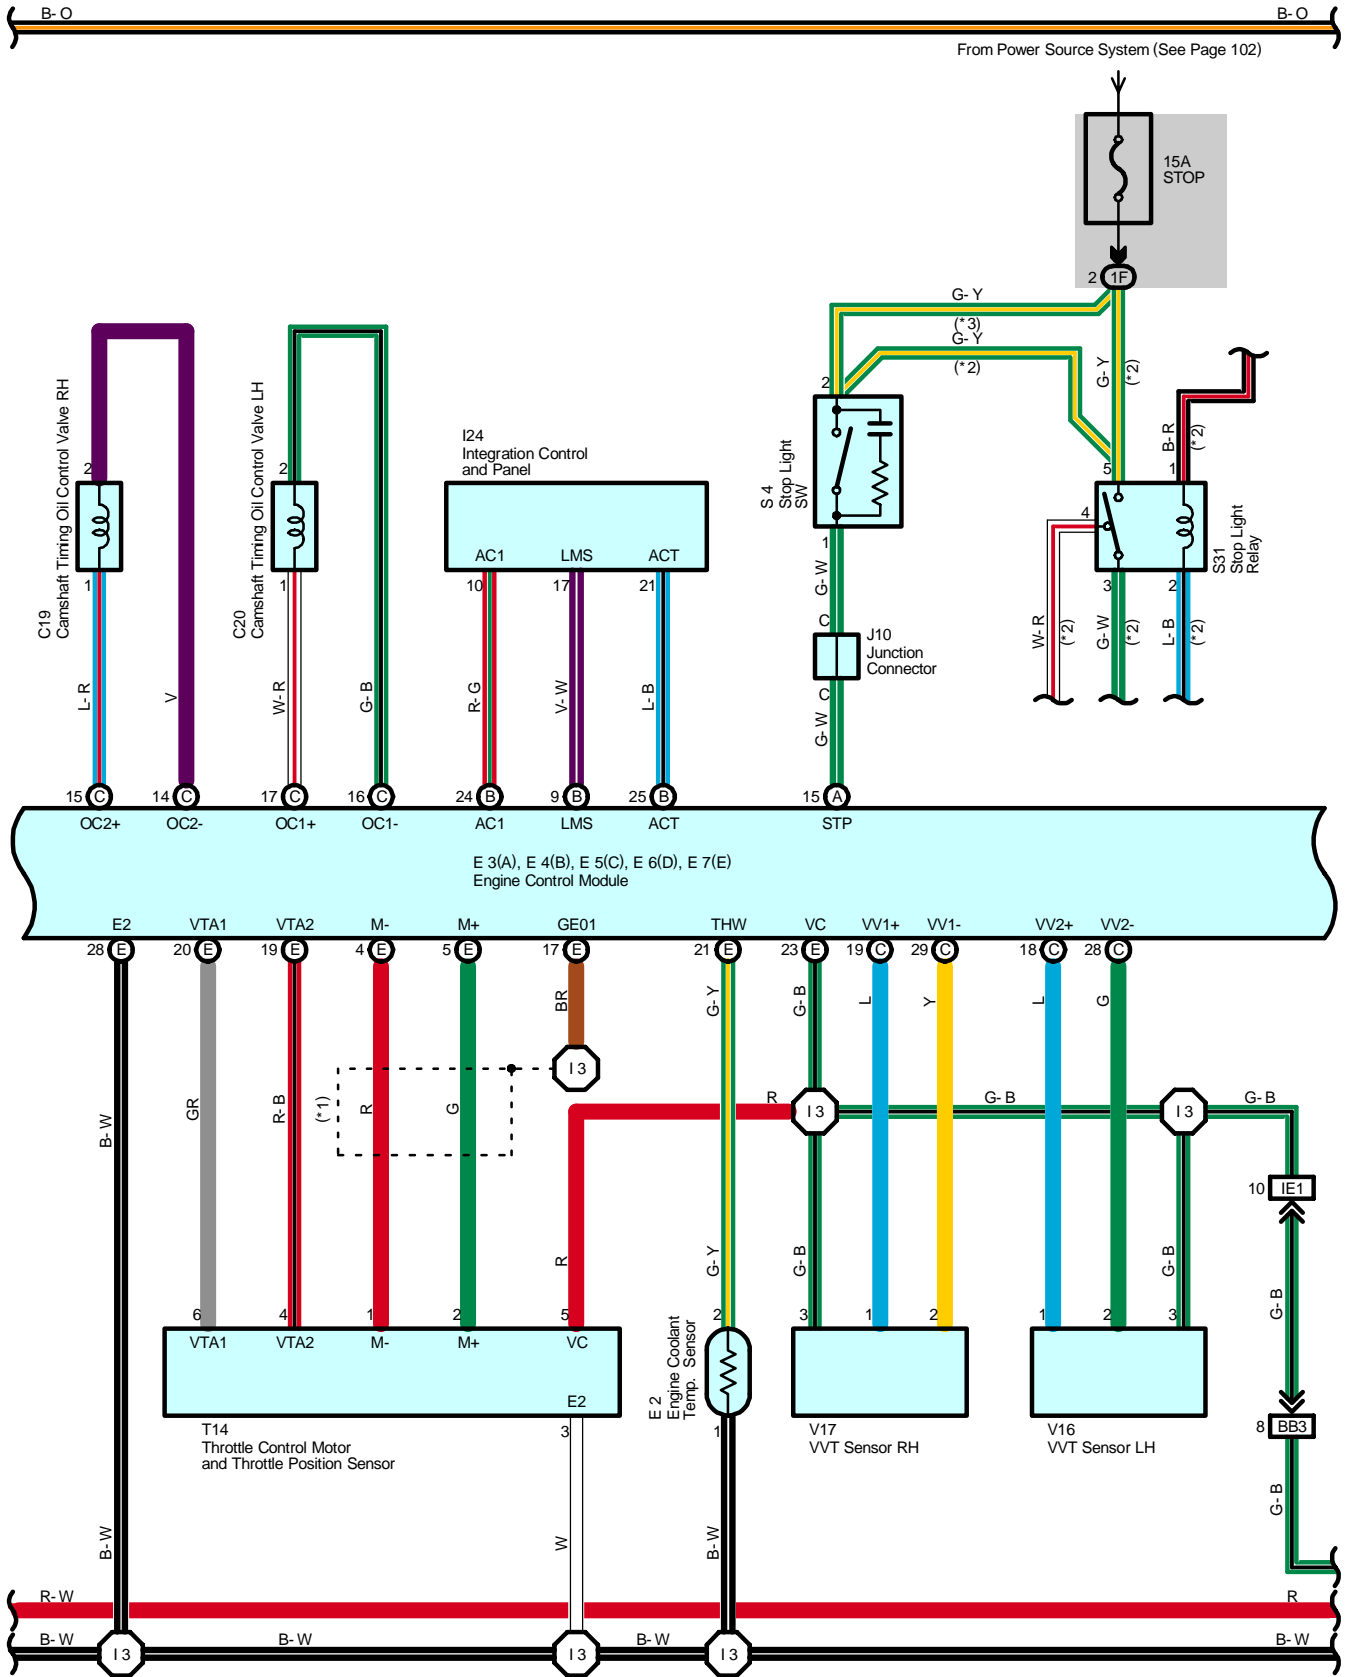

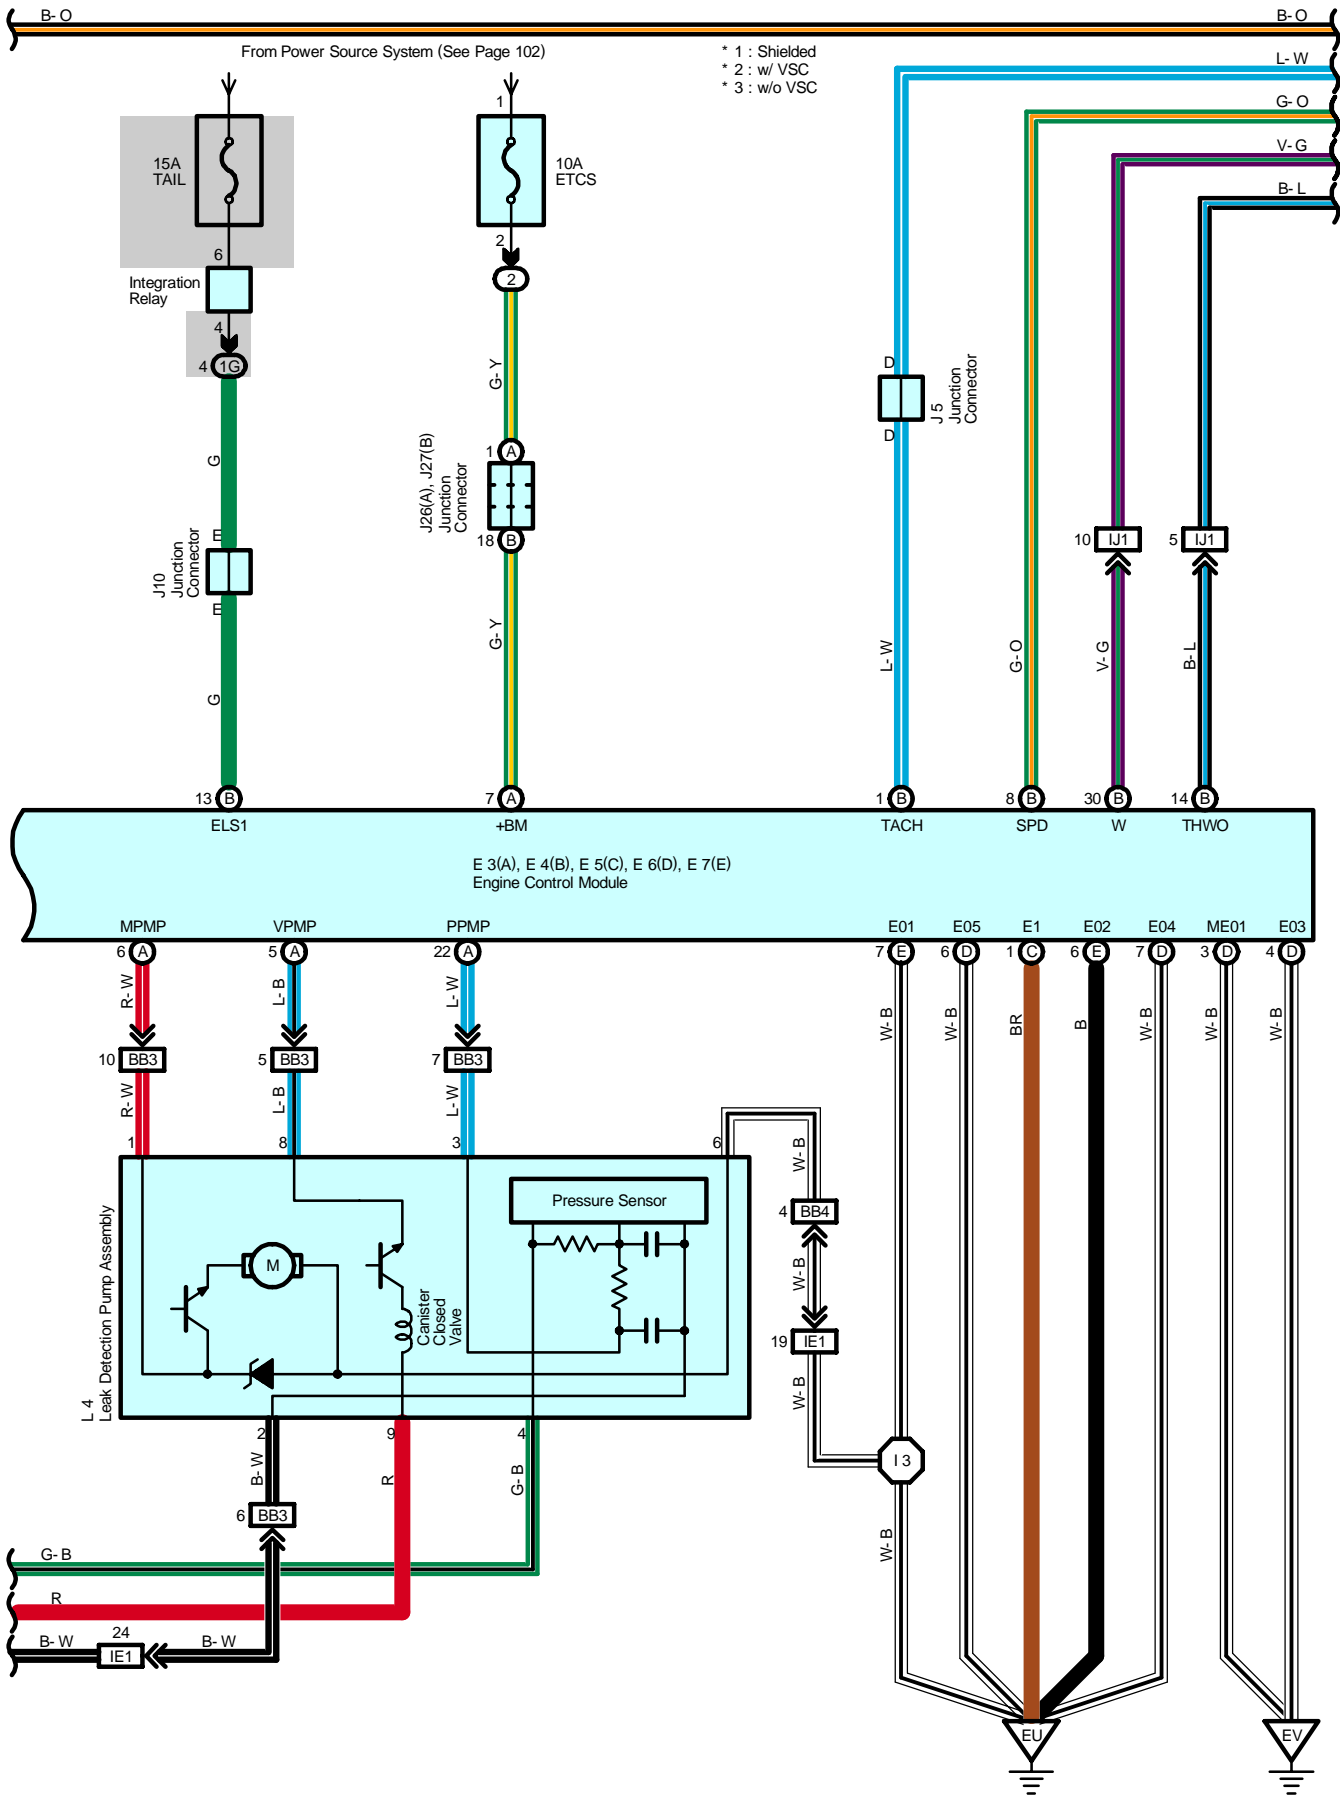

Engine Control for 1GR-FE (Access/Standard Cab)

Engine Control for 1GR-FE (Access/Standard Cab)

Engine Control for 1GR-FE (Access/Standard Cab)

System Outline

The engine control system utilizes a microcomputer and maintains overall control of the engine, transmission etc. An outline of the engine control is given here.

1. Input Signals

- (1) Engine coolant temp. signal circuit
The engine coolant temp. sensor detects the engine coolant temp. and has a built-in thermistor with a resistance which varies according to the engine coolant temp. The engine coolant temp. is input into TERMINAL THW of the engine control module as a control signal.
- (2) Intake air temp. signal circuit
The intake air temp. sensor is installed in the mass air flow meter and detects the intake air temp., which is input as a control signal to TERMINAL THA of the engine control module.
- (3) Oxygen sensor signal circuit
The oxygen density in the exhaust emission is detected and is input as a control signal from the heated oxygen sensors to TERMINALS OX1B, OX2B of the engine control module.
- (4) RPM signal circuit
The camshaft position is detected by the camshaft position sensor and is input into TERMINAL G2+ of the engine control module as a control signal. Also, the engine RPM is detected by the crankshaft position sensor and the signal is input into TERMINAL NE+ of the engine control module.
- (5) Throttle position sensor signal circuit
The throttle position sensor detects the throttle valve opening angle as a control signal, which is input into TERMINALS VTA1, VTA2 of the engine control module.
- (6) Vehicle speed circuit
The vehicle speed sensor, detects the vehicle speed and input to the speed sensor of the skid control ECU with actuator, from skid control ECU to TERMINAL SPD of the engine control module, via combination meter.
- (7) Battery signal circuit
Voltage is constantly applied to TERMINAL BATT of the engine control module. When the ignition SW is turned on, the voltage for engine control module start up power supply is applied through the EFI relay, to TERMINALS +B, +B2 of the engine control module. The current from the IGN fuse flows to TERMINAL IGSW of the engine control module, and voltage is constantly applied to TERMINAL +BM.
- (8) Intake air volume signal circuit
The intake air volume is detected by the mass air flow meter, and is input as a control signal to TERMINAL VG of the engine control module.
- (9) Stop light SW signal circuit
The stop light SW is used to detect whether the vehicle is braking or not, and the signal is input into TERMINAL STP of the engine control module as a control signal.
- (10) Starter signal circuit
To confirm whether the engine is cranking, the voltage applied to the starter motor when the engine is cranking is detected, and is input into TERMINAL STA of the engine control module as a control signal.
- (11) Engine knock signal circuit
Engine knocking is detected by the knock sensors, and is input into TERMINALS KNK1, KNK2 of the engine control module as a control signal.

Engine Control for 1GR-FE (Access/Standard Cab)

2. Control System

* SFI system

The SFI system monitors the engine condition through the signals input from each sensors to the engine control module. The control signal is sent to the engine control module TERMINALS #10, #20, #30, #40, #50, #60 to operate the injector (Fuel injection). The SFI system controls the fuel injection by the engine control module in response to the driving conditions.

* ESA system

The ESA system monitors the engine condition through the signals input from each sensors to the engine control module. The best ignition timing is decided according to this data and the data memorized in the engine control module. The control signal is output to TERMINALS IGT1, IGT2, IGT3, IGT4, IGT5, IGT6 and these signals control the igniter to provide the best ignition timing.

* Heated oxygen sensor heater control system

The heated oxygen sensor heater control system turns the heater on when the intake air volume is low (Temp. of exhaust emission is low), and warms up the heated oxygen sensors to improve their detection performance. The engine control module evaluates the signals from each sensors, and outputs current to TERMINALS HT1B and HT2B to control the heater.

* Air fuel ratio sensor heater control system

The air fuel ratio sensor heater control system turns the heater on when the intake air volume is low (Temp. of exhaust emission is low) and warms up the air fuel ratio sensor to improve detection performance of the sensor. The engine control module evaluates the signals from each sensor, current is output to TERMINALS HA1A and HA2A controlling the heater.

* Fuel pump control system

The engine control module supplies current to TERMINAL FPR, and controls the operation speed of the fuel pump with the F/PMP relay.

* ETCS-i

The ETCS-i controls the engine output at its optimal level in accordance with the opening of the accelerator pedal, under all driving conditions.

3. Diagnosis System

When there is a malfunction in the engine control module signal system, the malfunctioning system is recorded in the memory. The malfunctioning system can be found by reading the code displayed on the malfunction indicator lamp.

4. Fail-Safe System

When a malfunction has occurred in any system, there is a possibility of causing engine trouble due to continued control based on that system. In that case, the fail-safe system either controls the system using the data (Standard values) recorded in the engine control module memory, or else stops the engine.

Headlight with DRL (Access/Standard Cab)

Headlight with DRL (Access/Standard Cab)

System Outline

When the following conditions are met while the ignition SW is ON, and if the light control SW is at OFF or TAIL position, the daytime running light is controlled.

- * Parking brake lever is released (Parking brake SW is OFF)
- * Input signal from the generator

If any of the following conditions are met, the daytime running light control is canceled.

- * Ignition SW is turned OFF.
- * Light control SW is at HEAD position.

Service Hints

H-LP Relay

- 5-3 : Closed with light control SW at HEAD position or dimmer SW at FLASH position
- Closed with engine running and parking brake lever released

Light Auto Turn Off System with DRL (Access/Standard Cab)

System Outline

With the ignition SW turned on, the current flows to TERMINAL 9 of the integration relay through ECU IG fuse. Voltage is applied at all times to TERMINAL 6 of the integration relay through the TAIL fuse, and through the H-LP relay coil side.

1. Normal Lighting Operation

<Turn taillight on>

With the light control SW turned to TAIL position, a signal is input into the integration relay. Due to this signal, the current flowing to TERMINAL 6 of the relay flows to TERMINAL 14 of the light control SW to TERMINAL 16 to GROUND, and taillights to turn on.

<Turn headlight on>

With the light control SW turned to HEAD position, a signal is input into the integration relay. Due to this signal, the current flowing to the relay flows to TERMINAL 13 of the light control SW to TERMINAL 16 to GROUND in the headlight circuit, and causes taillight and H-LP relay to turn the lights on. The taillight circuit is same as above.

2. Light Auto Turn Off Operation

With light on and ignition SW turned off (Input signal goes to TERMINAL 9 of the relay), when the driver's door is opened (Input signal goes to TERMINAL 14 of the relay), the relay operates and the current is cut off which flows from TERMINAL 6 and through the H-LP relay coil side of the relay to taillight circuit and headlight circuit.

As a result, all lights are turned off automatically.

Service Hints

H-LP Relay

- 5-3 : Closed with the light control SW at HEAD position or the dimmer SW at FLASH position
- Closed with the engine running and the parking brake lever released

C15 Combination SW

- 13-16 : Closed with light control SW at HEAD position
- 14-16 : Closed with light control SW at TAIL or HEAD position

D16 Door Courtesy SW Front LH

- 1-Ground : Continuity with the front LH door open

INTEGRATION Relay

- 9-Ground : Approx. 12 volts with the ignition SW at ON position
- 14-Ground : Continuity with the front LH door open
- 6-Ground : Always approx. 12 volts
- 8-Ground : Always continuity

- * 2 : w/o VSC

ECT and A/T Indicator for 2UZ-FE (Access/Standard Cab)

System Outline

The electronically controlled transmission electrically controls the, throttle pressure, lock-up pressure, and accumulator pressure etc. through the solenoid valve.

The electronically controlled transmission is a system which precisely controls the gear shift timing and lock-up timing in response to the vehicle's driving conditions and the engine condition detected by various sensors. It makes smooth driving possible by shift selection of the gear which is the most appropriate to the driving conditions at that time, and by preventing downing, squat and gear shift shock when starting off.

1. Gear Shift Operation

When driving, the engine warm up condition is input as a control signal from the engine coolant temp. sensor to TERMINAL THW of the engine control module, and the vehicle speed is input to TERMINAL SP2+ of the engine control module from the vehicle speed sensor. At the same time, the throttle valve opening signal from the throttle position sensor is input to TERMINALS VTA1, VTA2 of the engine control module as a throttle angle signal. Based on these signals, the engine control module selects the best shift position for the driving conditions and sends current to the electronically controlled transmission solenoid.

2. Lock-Up Operation

When the engine control module decides based on each signal that the lock-up condition has been met, the current flows through TERMINAL SLU+ of the engine control module to TERMINAL 5 of the electronically controlled transmission solenoid to TERMINAL 13 to TERMINAL SLU- of the engine control module to GROUND.

3. Stop Light SW Circuit

If the brake pedal is depressed (Stop light SW on) when driving in lock-up position, a signal is input to TERMINAL STP of the engine control module. As a result, the engine control module cuts the current to the solenoid to release the lock-up.

4. Overdrive Circuit

* O/D main SW on

When the O/D main SW is switched to ON position, a signal is input to TERMINAL ODMS of the engine control module, and enables shift change to the overdrive range, through the control of the engine control module.

* O/D main SW off

When the O/D main SW is switched to OFF position, a signal is input to TERMINAL ODMS of the engine control module, and prohibits shift change to the overdrive range through the control of the engine control module. When in the overdrive range already, shift down is made.

Multiplex Communication System - CAN (Access/Standard Cab)

System Outline

CAN has two lines as a pair which make communication with operating voltage. CAN has excellent data speed and error detecting capacity. It consists of vehicle control systems such as engine control module, data link connector 3 and skid control ECU with actuator.

This system is working for the following systems:

- * Cruise Control
- * Electronically Controlled Transmission and A/T Indicator
- * Engine Control
- * VSC

VSC (Access/Standard Cab)

VSC (Access/Standard Cab)

System Outline

1. ABS Operation

If the brake pedal is depressed suddenly, the ABS controls the hydraulic pressure of the wheel cylinders for all the four wheels to automatically avoid wheel locking and ensure the directional and steering stability of the vehicle. If the brake pedal is depressed suddenly, the skid control ECU controls the solenoids in the actuators using the signals from the sensors to move the brake fluid to the reservoir in order to release the braking pressure applied to the wheel cylinder. If the skid control ECU detects that the fluid pressure in the wheel cylinder is insufficient, the ECU controls the solenoids in the actuators to increase the braking pressure.

2. Traction Control Operation

The traction control system controls the engine torque, the hydraulic pressure of the driving wheel cylinders, slipping of the wheels which may occur at start or acceleration of the vehicle, to ensure an optimal driving power and vehicle stability corresponding to the road conditions.

3. VSC Operation

Unexpected road conditions, vehicle speed, emergency situation, and any other external factors may cause large under- or over-steering of the vehicle. If this occurs, the VSC system automatically controls the engine power and wheel brakes to reduce the under- or over-steering.

To reduce large over-steering :

If the VSC system determines that the over-steering is large, it activates the brakes for the outer turning wheels depending on the degree of the over-steering to produce the moment toward the outside of the vehicle and reduce the over-steering.

To reduce large under-steering :

If the VSC system determines that the under-steering is large, it controls the engine power and activates the rear wheel brakes to reduce the under-steering.

Traction control SW

The traction control SW is used to stop the TRAC function. After the engine is started, the TRAC system is stopped (turned off) and the VSC OFF indicator light lights up. When the traction control SW is pressed again, the TRAC system enters the stand-by mode. If the engine is stopped and restarted, the TRAC system enters the stand-by mode regardless of the traction control SW.

4. Mutual System Control

To efficiently operate the VSC system at its optimal level, the VSC system and other control systems are mutually controlled while the VSC system is being operated.

Engine throttle control

The engine power does not interfere with the VSC brake control by controlling the opening of the throttle and reducing the engine output.

Engine control and electronically controlled transmission control

The strong braking force does not interfere with the braking force control of the VSC system by turning off the accel. and reducing changes in the driving torque at shift-down.

VSC system operation indication

The Slip indicator light flashes and the buzzer sounds intermittently to warn the driver that the current road is slippery, while the VSC system is being operated.

5. Fail Safe Function

If an error occurs in the skid control ECU with actuator, sensor signals, and/or actuators, the skid control ECU with actuator inhibits the brake actuator control and inputs the error signal to the engine control module. According to the error signal, the brake actuator turns off the solenoid and the engine control module rejects any electronically controlled throttle open request from the VSC system. As a result, the vehicle functions regardless of the ABS, TRAC, and VSC systems.

ABS (Access/Standard Cab)

ABS (Access/Standard Cab)

System Outline

This system controls the respective brake fluid pressures acting on the disc brake cylinders of the right front wheel, left front wheel, and rear wheels when the brakes are applied in a panic stop so that the wheels do not lock. This results in improved directional stability and steerability during panic braking.

1. Input Signal

(1) Speed sensor signal

The speed of the wheels is detected and input to TERMINALS FL+, FR+, RL+ and RR+ of the ABS actuator with ECU.

(2) Stop light SW signal

A signal is input to TERMINAL STP of the ABS actuator with ECU when the brake pedal is depressed.

2. System Operation

During sudden braking, the ABS actuator with ECU which has signals input from each sensor lets the hydraulic pressure acting on each wheel cylinder escape to the reservoir.

The pump inside the ABS actuator with ECU is also operating at this time and it returns the brake fluid from the reservoir to the master cylinder, thus preventing locking of vehicle wheels.

If the ABS actuator with ECU judges that the hydraulic pressure acting on the wheel cylinder is insufficient, the current acting on the solenoid is controlled and the hydraulic pressure is increased.

Holding of the hydraulic pressure is also controlled by the ECU, by the same method as above, by repeated pressure reduction. Holding and increase are repeated to maintain vehicle stability and to improve steerability during sudden braking.

Service Hints

Tire Pressure Warning System (Access/Standard Cab)

System Outline

The air pressure sensor installed in the tire wheel detects the tire air pressure and transmits signals to the vehicle side receiver. When the detected tire air pressure is below a specified level, the warning light in the combination meter comes on to inform the driver.

Press the tire pressure warning standardization SW for 3 seconds with the ignition SW at ON position after the tire pressure is adjusted to the specified value. It will lead the tire pressure monitor ECU to control and warn the pressure according to the specified value.

Warnings when the tire pressure is low

* When the tire air pressure is below a specified level, the warning light in the combination meter comes on.

Service Hints

Cruise Control for 2UZ-FE (Access/Standard Cab)

* 1 : w/ VSC
 * 2 : w/o VSC

From Power Source System (See Page 102)

Cruise Control for 2UZ-FE (Access/Standard Cab)

System Outline

The cruise control system is a constant vehicle speed controller which controls the opening angle of the engine throttle valve by the SW, and allows driving at a constant speed without depressing the accelerator pedal.

1. Set Control

When the - SET SW is operated while traveling with the ON-OFF SW on, the speed when the - SET SW is operated to off is memorized, and the vehicle speed is controlled at that speed.

2. Coast Control

When the - SET SW is operated to on, the cruise control opening angle requirement is turned to 0 to decrease the vehicle speed, and the speed when the - SET SW is operated to off is memorized, and the vehicle speed is controlled at that speed. Furthermore, every time the - SET SW is operated momentarily (Approx. 0.5 sec.) to on, the memorized vehicle speed is decreased by approx. 1.6 km/h (1.0 mph).

3. Accel Control

When the + RES SW is operated to on, the throttle motor rotates the throttle valve to open direction to increase the vehicle speed, and the speed when the + RES SW is operated to off is memorized, and the vehicle speed is controlled at that speed.

Furthermore, every time the + RES SW is operated momentarily (Approx. 0.5 sec.) to on, the memorized vehicle speed is increased by approx. 1.6 km/h (1.0 mph).

4. Manual Cancel Mechanism

If any of the following signals are input during cruise control traveling, the current to the motor flows in the direction to close the throttle valve, and cancel the cruise control.

- (1) Stop lamp SW is on (Brake pedal is depressed)
- (2) The CANCEL SW of the control SW is on
- (3) ON-OFF SW is off
- (4) Gear is shifted from D position to other positions than D.

5. Resume Control

After canceling the cruise control (Except when the ON-OFF SW is off) if the vehicle speed is above the minimum speed limit (Approx. 40km/h, 25mph), operating the + RES SW to on from off will cause the system to accelerate and resume to the vehicle speed before manual cancellation.

6. Overdrive Function

The overdrive may be cut on an uphill grade, while traveling with the cruise control.

After the overdrive is cut, when the throttle opening information indicates the hill climbing is finished after the overdrive is canceled, the vehicle returns to overdrive mode again as the overdrive return timer is completed, and if the system determines that the uphill grade has finished, the overdrive will resume after the overdrive timer operation.

7. Auto Cancel Operation

If any of the following conditions are detected, the control is canceled.

- (1) Disconnection and/or short in the stop light SW
- (2) Malfunction in the vehicle speed signal
- (3) Malfunction in the electronic throttle parts
- (4) Malfunction in the stop light SW input circuit
- (5) Malfunction in the cancel circuit
- (6) When the vehicle speed gets slower than the low speed limit.
- (7) The actual vehicle speed becomes -16 km/h (10 mph) slower than the set speed

Service Hints

Cruise Control for 1GR-FE (Access/Standard Cab)

* 1 : w/ VSC
 * 2 : w/o VSC

From Power Source System (See Page 102)

Cruise Control for 1GR-FE (Access/Standard Cab)

System Outline

The cruise control system is a constant vehicle speed controller which controls the opening angle of the engine throttle valve by the SW, and allows driving at a constant speed without depressing the accelerator pedal.

1. Set Control

When the - SET SW is operated while traveling with the ON-OFF SW on, the speed when the - SET SW is operated to off is memorized, and the vehicle speed is controlled at that speed.

2. Coast Control

When the - SET SW is operated to on, the cruise control opening angle requirement is turned to 0 to decrease the vehicle speed, and the speed when the - SET SW is operated to off is memorized, and the vehicle speed is controlled at that speed. Furthermore, every time the - SET SW is operated momentarily (Approx. 0.5 sec.) to on, the memorized vehicle speed is decreased by approx. 1.6 km/h (1.0 mph).

3. Accel Control

When the + RES SW is operated to on, the throttle motor rotates the throttle valve to open direction to increase the vehicle speed, and the speed when the + RES SW is operated to off is memorized, and the vehicle speed is controlled at that speed.

Furthermore, every time the + RES SW is operated momentarily (Approx. 0.5 sec.) to on, the memorized vehicle speed is increased by approx. 1.6 km/h (1.0 mph).

4. Manual Cancel Mechanism

If any of the following signals are input during cruise control traveling, the current to the motor flows in the direction to close the throttle valve, and cancel the cruise control.

- (1) Stop lamp SW is on (Brake pedal is depressed)
- (2) The CANCEL SW of the control SW is on
- (3) ON-OFF SW is off
- (4) Gear is shifted from D position to other positions than D.

5. Resume Control

After canceling the cruise control (Except when the ON-OFF SW is off) if the vehicle speed is above the minimum speed limit (Approx. 40km/h, 25mph), operating the + RES SW to on from off will cause the system to accelerate and resume to the vehicle speed before manual cancellation.

6. Overdrive Function

The overdrive may be cut on an uphill grade, while traveling with the cruise control.

After the overdrive is cut, when the throttle opening information indicates the hill climbing is finished after the overdrive is canceled, the vehicle returns to overdrive mode again as the overdrive return timer is completed, and if the system determines that the uphill grade has finished, the overdrive will resume after the overdrive timer operation.

7. Auto Cancel Operation

If any of the following conditions are detected, the control is canceled.

- (1) Disconnection and/or short in the stop light SW
- (2) Malfunction in the vehicle speed signal
- (3) Malfunction in the electronic throttle parts
- (4) Malfunction in the stop light SW input circuit
- (5) Malfunction in the cancel circuit
- (6) When the vehicle speed gets slower than the low speed limit.
- (7) The actual vehicle speed becomes -16 km/h (10 mph) slower than the set speed

NOTICE: When inspecting or repairing the SRS, perform service in accordance with the following precautionary instructions and the procedure, and precautions in the Repair Manual applicable for the model year.

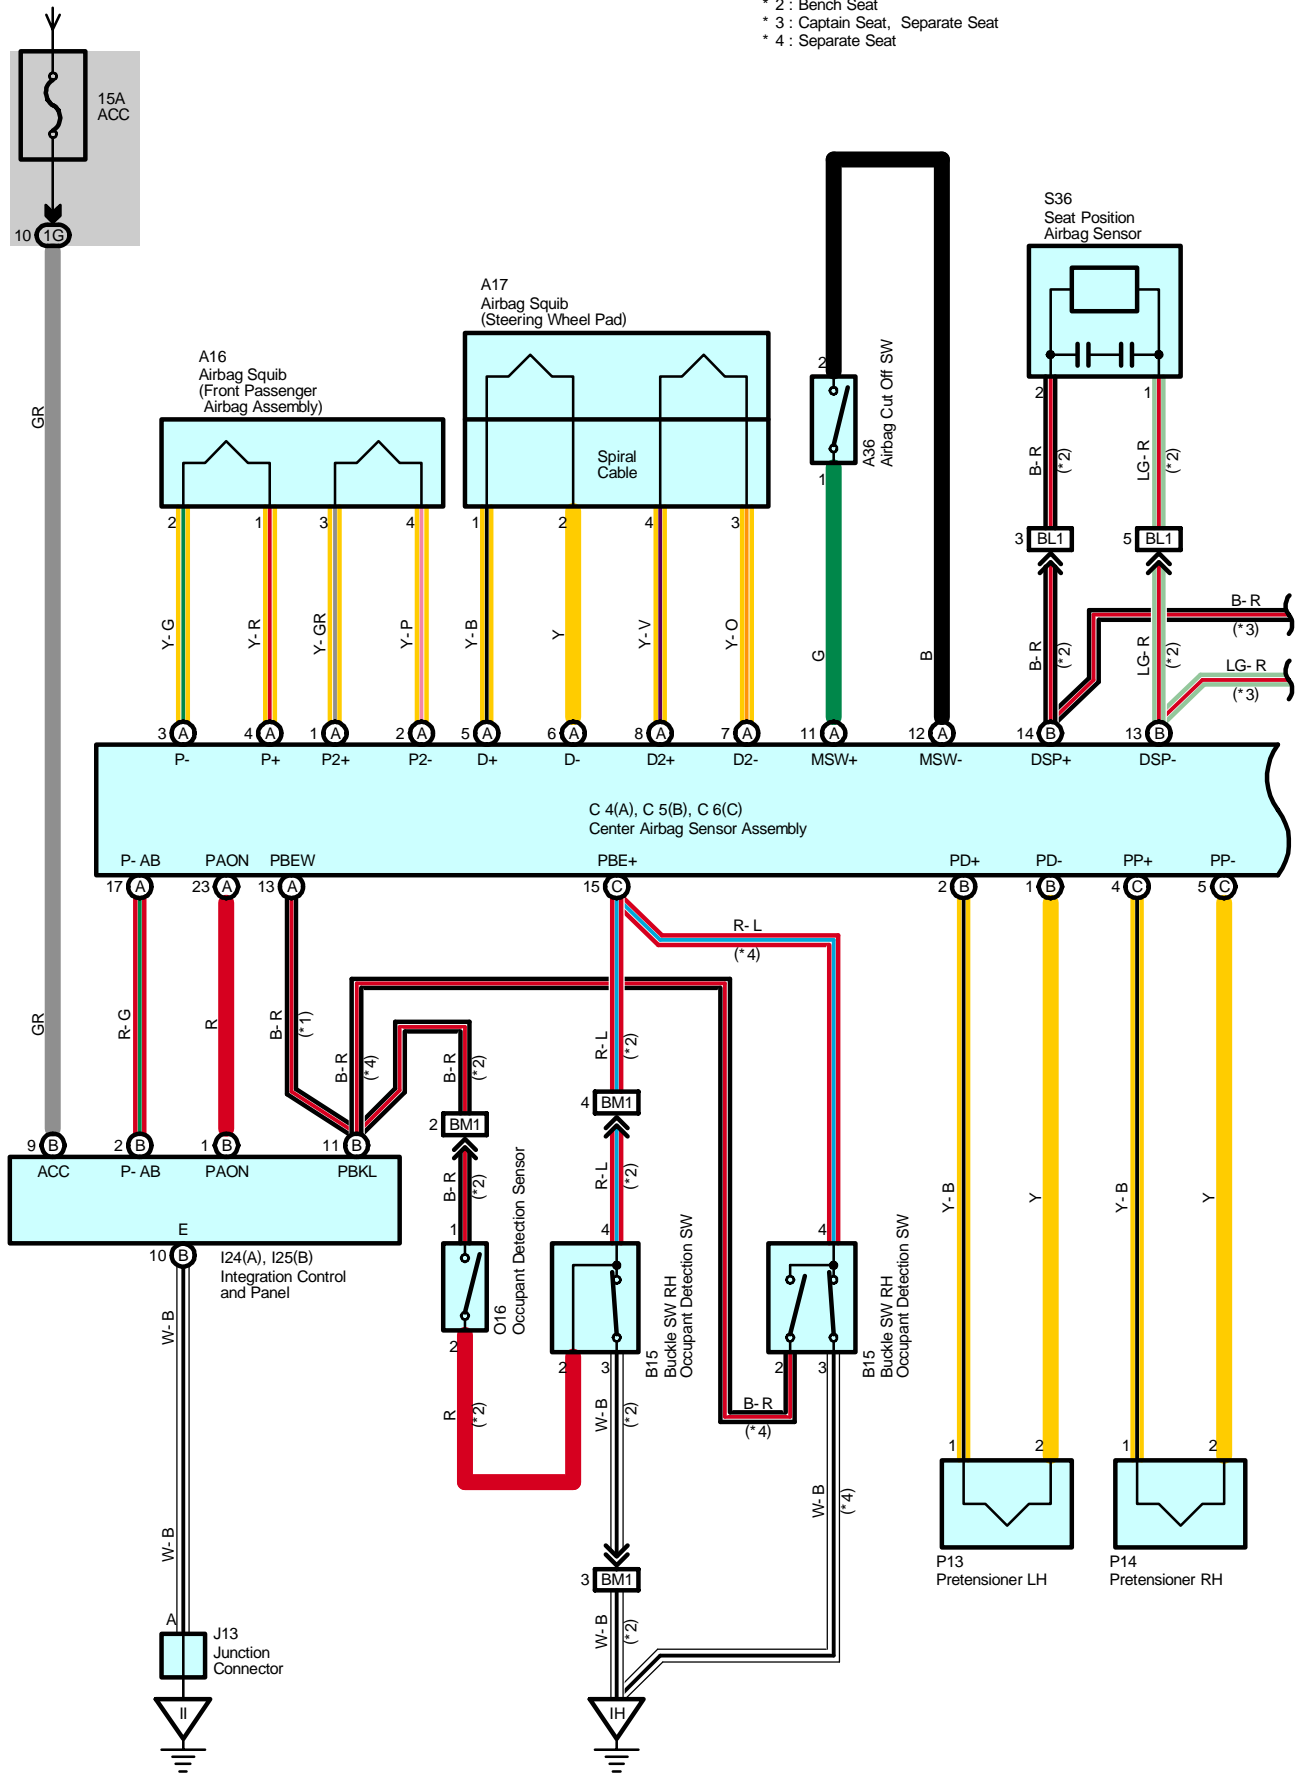

- Malfunction symptoms of the SRS are difficult to confirm, so the DTCs become the most important source of information when troubleshooting. When troubleshooting the SRS, always inspect the DTCs before disconnecting the battery.
- **Work must be started more than 90 seconds after the ignition SW is turned to the "LOCK" position and the negative (-) terminal cable is disconnected from the battery.**
(The SRS is equipped with a back-up power source so that if work is started within 90 seconds from disconnecting the negative (-) terminal cable of the battery, the SRS may deploy.)
- When the negative (-) terminal cable is disconnected from the battery, the memory of the clock and audio system will be cleared. So before starting work, make a record of the contents in the audio memory system. When work is finished, reset the audio systems as they were before and adjust the clock. Some vehicles have power tilt steering, power telescopic steering, power seat and power outside rear view mirror which are all equipped with memory function. However, it is not possible to make a record of these memory contents. So when the work is finished, it will be necessary to explain it to your customer, and ask the customer to adjust the features and reset the memory. To avoid erasing the memory in each system, never use a back-up power supply from outside the vehicle.
- Before repair, remove the airbag sensor if shocks are likely to be applied to the sensor during repair.
- Do not expose the following parts directly to hot air or flame;
- Even in cases of a minor collision where the SRS does not deploy, the following parts should be inspected;
- Never use SRS parts from another vehicle. When replacing parts, replace with new parts.
- For the purpose of reuse, never disassemble and repair the following parts.
- If the following parts have been dropped, or have cracks, dents and other defects in their case, bracket, and connector, replace with new one.
- Use a volt/ohmmeter with high impedance (10 k Ω /V minimum) for troubleshooting electrical circuits of the system.
- Information labels are attached to the periphery of the SRS components. Follow the instructions of the notice.
- After work on the SRS is completed, check the SRS warning light.
- If the vehicle is equipped with a mobile communication system, refer to the precaution in the IN section of the Repair Manual.

SRS (Access/Standard Cab)

From Power Source System (See Page 102)

- * 1 : Captain Seat
- * 2 : Bench Seat
- * 3 : Captain Seat, Separate Seat
- * 4 : Separate Seat

System Outline

The SRS is a driver protection device which has a supplemental role to the seat belts.

When the ignition SW on, the current from the IGN fuse flows to TERMINAL (A) 21 of the center airbag sensor assembly.

If an accident occurs while driving, deceleration caused by a frontal impact is detected (by sensor) and when the frontal impact exceeds a set level, the current from the IGN fuse flows to TERMINAL (A) 21 of the center airbag sensor assembly.

This current flows to TERMINALS (A) 4, (A) 5, (B) 2, (C) 4 to TERMINAL 1 of the airbag squib (Steering wheel pad) and pretensioners to TERMINAL 2 to TERMINALS (A) 3, (A) 6, (B) 1, (C) 5 of the center airbag sensor assembly to TERMINAL (B) 27 or (B) 28 to GROUND, causing the center airbag squibs to expand.

When the safing sensor built into the center airbag sensor assembly is on, airbag sensor is off and the current from the IGN fuse flows same as above-mentioned flowing, causing the airbag squibs to expand. When the safing sensor built into the center airbag sensor assembly is on, the airbag sensor on one of the above-mentioned circuits is activated so that current flows to the airbag squibs and causes them to operate.

The airbag stored inside the steering wheel pad is instantaneously expanded to soften the shock to the driver.

The airbag stored inside the passenger's instrument panel is instantaneously expanded to soften the shock to the passenger.

Front Passenger Airbag On/Off Operation

When the passenger airbag manual On-Off SW is on, the current flowing from the IGN fuse to the airbag squib (Front passenger airbag assembly) is same as above, causing the airbag squib (Front passenger airbag assembly) to expand in an accident.

 * 2 : w/o VSC

4WD (Access/Standard Cab)

* 1 : w/ VSC
 * 2 : w/o VSC

System Outline

In the conventional system, the 2-4 select SW and the transfer shift lever was used to shift the mode between H-L. In this system, the transfer shift lever is not used, and the H-L mode shift can be done by the transfer shift actuator.

The mode can be changed by the touch select 2-4 SW and touch select high-low in the integration control and panel.

The shift range is controlled according to the vehicle speed sensor and Park/Neutral position SW, and the indicator light is turned ON to inform the driver if any of the following conditions are detected:

- * The shift is not completed even though 3 seconds have elapsed after transfer operation.
- * The vehicle speed is above approximately 100 km/h (63 mph) when shifting from H2 to H4.
- * The vehicle speed is below approximately 5 km/h (3 mph) or the A/T shift lever is in a position other than N position, when shifting from H4 to L4 or visa versa, and from L4 to H2.

Transfer Operation

H2 to H4

When the touch select 2-4 SW in the integration control and panel is turned ON, a signal is input into TERMINAL (A) 8 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 2 to transfer shift actuator TERMINAL 2 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (B) 1 to GROUND, and the transfer shifts to 4WD (H4 position.)

When the system shifts to 4WD, the detection SW (Transfer 4WD position) is turned ON, and the current flows from 4WD control ECU TERMINAL (A) 2 to ADD actuator TERMINAL 5 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (A) 1 to GROUND, and the ADD actuator is activated, and the ADD is connected. When the ADD is connected, the detection SW (ADD position SW) is turned ON, and the 4HI Indicator light comes ON.

H4 to H2

When the touch select 2-4 SW in the integration control and panel is turned OFF, a signal is input into TERMINAL (A) 8 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 1 to transfer shift actuator TERMINAL 1 to motor to TERMINAL 2 to 4WD control ECU TERMINAL (B) 2 to GROUND, and the transfer shifts to 2WD (H2 position.)

When the system shifts to 2WD, the detection SW (Transfer 4WD position) is turned OFF, and the current flows from 4WD control ECU TERMINAL (A) 1 to ADD actuator TERMINAL 1 to motor to TERMINAL 5 to 4WD control ECU TERMINAL (A) 2 to GROUND, and the ADD actuator is activated, and the ADD is disconnected. When the ADD is disconnected, the detection SW (ADD position SW) is turned OFF, and the 4HI indicator Light turns OFF.

H4 to L4

When the touch select high-low SW in the integration control and panel is turned ON, a signal is input into TERMINAL (A) 15 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 2 to transfer shift actuator TERMINAL 2 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (B) 1 to GROUND, and the transfer shifts to 4WD LO position (L4 position.)

The 4HI Indicator is turned OFF and the 4LO indicator is turned ON.

L4 to H4

When the touch select high-low SW in the integration control and panel is turned OFF, a signal is input into TERMINAL (A) 15 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 1 to transfer shift actuator TERMINAL 1 to motor to TERMINAL 2 to 4WD control ECU TERMINAL (B) 2 to GROUND, and the transfer shifts to 4WD HI position (H4 Position.)

The 4HI indicator is turned ON and the 4LO indicator is turned OFF.

The shift is not completed even though 3 seconds have elapsed after transfer operation.

- * The vehicle speed is above approximately 100 km/h (63 mph) when shifting from H2 to H4.
- * The vehicle speed is below approximately 5 km/h (3 mph) or the A/T Shift Lever is in a position other than N position, when shifting from H4 to L4 or visa versa, and from L4 to H2.

L4 to H2

When the touch select 2-4 SW in the integration control and panel is turned OFF, a signal is input into TERMINAL (A) 8 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 1 to transfer shift actuator TERMINAL 1 to motor to TERMINAL 2 to 4WD control ECU TERMINAL (B) 2 to GROUND, and the detection SW (Transfer L4 position) is turned OFF.

Furthermore, the motor rotates to shift the transfer to 2WD (H2 position.)

When the system shifts to 2WD, the detection SW (Transfer 4WD position) is turned OFF, and the current flows from 4WD control ECU TERMINAL (A) 1 to ADD actuator TERMINAL 1 to motor to TERMINAL 5 to 4WD control ECU TERMINAL (A) 2 to GROUND, and the ADD actuator is activated, and the ADD is disconnected. When the ADD is disconnected, the detection SW (ADD position SW) is turned OFF, and the 4LO indicator light turns OFF.

4WD (Access/Standard Cab)

H2 to L4

When the touch select 2-4 SW in the integration control and panel is turned ON, and the touch select high-low SW is turned ON, a signal is input into TERMINAL (A) 8 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 2 to transfer shift actuator TERMINAL 2 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (B) 1 to GROUND, and the transfer shifts to 4WD (H4 position.)

When the system shifts to 4WD, the detection SW (Transfer 4WD position) is turned ON, and the current flows from 4WD control ECU TERMINAL (A) 2 to ADD actuator TERMINAL 5 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (A) 1 to GROUND, and the ADD actuator is activated, and the ADD is connected. Then a signal is input into TERMINAL (A) 15 of the 4WD control ECU and the 4WD control ECU is activated by this, so the current flows from the 4WD control ECU TERMINAL (B) 2 to transfer shift actuator TERMINAL 2 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (B) 1 to GROUND. The transfer shifts to 4WD LO position (L4 position), and the 4LO indicator light comes ON.

Service Hints

F20 (A) 4WD Control ECU

(A) 5-Ground : Approx. 12 volts with ignition SW at ON or ST position

(A) 6-Ground : Always continuity

(A) 9-Ground : 4 pulses with 1 rotation

(A) 8-Ground : 2 volts or less with touch select 2-4 SW on

(A)17-Ground : 2 volts or less with detection SW (Transfer L4 position) on and transfer shift lever at L4 position

I24 (A), I25 (B) Integration Control and Panel

(A) 5-(B) 1 : Closed with touch select 2-4 SW on

P1 Park/Neutral Position SW

2-9 : Closed with A/T shift lever at N position

Door Lock Control with DRL (Access/Standard Cab)

System Outline

Current always flows to TERMINAL 3 of the integration relay through the POWER fuse.

1. Manual Lock Operation

(Driver's door)

To push the door lock control SW or door key lock and unlock SW to LOCK position, a lock signal is input to the integration relay and causes the relay to function. Current flows from TERMINAL 3 of the relay to TERMINAL 13 to TERMINAL 2 of the door lock motor to TERMINAL 3 to TERMINAL 2 of the TVIP ECU to TERMINAL 4 to TERMINAL 12 of the integration relay to TERMINAL 8 to GROUND and the door lock motor causes the door to lock.

(Passenger's door)

To push the door lock control SW or door key lock and unlock SW to LOCK position, a lock signal is input to the integration relay and causes the relay to function. Current flows from TERMINAL 3 of the relay to TERMINAL 13 to TERMINAL 2 of the door lock motor to TERMINAL 3 to TERMINAL 12 of the relay to TERMINAL 8 to GROUND and the door lock motor causes the door to lock.

2. Manual Unlock Operation

(Driver's door)

To push the door lock control SW or door key lock and unlock SW to UNLOCK position, an unlock signal is input to the integration relay and causes the relay to function. Current flows from TERMINAL 3 of the relay to TERMINAL 12 to TERMINAL 4 of the TVIP ECU to TERMINAL 2 to TERMINAL 3 of the door lock motor to TERMINAL 2 to TERMINAL 13 of the integration relay to TERMINAL 8 to GROUND and the door lock motor causes the door to unlock.

(Passenger's door)

To push the door lock control SW or door key lock and unlock SW to UNLOCK position, an unlock signal is input to the integration relay and causes the relay to function. Current flows from TERMINAL 3 of the relay to TERMINAL 12 to TERMINAL 3 of the door lock motor to TERMINAL 2 to TERMINAL 13 of the relay to TERMINAL 8 to GROUND and the door lock motor causes the door to unlock.

3. Double Operation Unlock Operation

When the door key lock and unlock SW LH is turned to unlock position, only the front LH door is mechanically unlocked. Turning the door key lock and unlock SW LH to the unlock side causes a signal to be input to the relay, and if the signal is input again within 3 seconds by turning the door key lock and unlock SW LH to the unlock side again, current flows from TERMINAL 12 of the integration relay to TERMINAL 4 of the TVIP ECU to TERMINAL 2 to TERMINAL 3 of the door lock motor, TERMINAL 2 to TERMINAL 13 of the integration relay to TERMINAL 8 to GROUND, causing the door lock motors to operate and unlock the doors.

4. Key Confine Prevention Function

- * Operating door lock knob (In door lock motor operation)

With ignition key in cylinder (Unlock warning SW on), when any door is opened and locked using door lock knob (Door lock motor), the door is locked once but each door is unlocked soon by the function of the integration relay. As a result, current flows from TERMINAL 3 of the relay to TERMINAL 12 to TERMINAL 3 of the door lock motors to TERMINAL 2 to TERMINAL 13 of the relay to TERMINAL 8 to GROUND and causes all the doors to unlock.

- * Operating door lock control SW or door key lock and unlock SW

With ignition key in cylinder (Unlock warning SW on), when any door is opened and locked using the door lock control SW or door key lock and unlock SW, all doors are locked once but each door is unlocked by the function of the SW contained in motor, which inputs the signal to the integration relay. According to this input signal, current flows from TERMINAL 3 of the relay to TERMINAL 12 to TERMINAL 3 of the door lock motors to TERMINAL 2 to TERMINAL 13 of the relay to TERMINAL 8 to GROUND and causes all the doors to unlock.

Door Lock Control without DRL (Access/Standard Cab)

Door Lock Control without DRL (Access/Standard Cab)

System Outline

Current always flows to TERMINAL 3 of the integration relay through the POWER fuse.

1. Manual Lock Operation

(Driver's door)

To push the door lock control SW or door key lock and unlock SW to LOCK position, a lock signal is input to the integration relay and causes the relay to function. Current flows from TERMINAL 3 of the relay to TERMINAL 13 to TERMINAL 2 of the door lock motor to TERMINAL 3 to TERMINAL 2 of the TVIP ECU to TERMINAL 4 to TERMINAL 12 of the integration relay to TERMINAL 8 to GROUND and the door lock motor causes the door to lock.

(Passenger's door)

To push the door lock control SW or door key lock and unlock SW to LOCK position, a lock signal is input to the integration relay and causes the relay to function. Current flows from TERMINAL 3 of the relay to TERMINAL 13 to TERMINAL 2 of the door lock motor to TERMINAL 3 to TERMINAL 12 of the relay to TERMINAL 8 to GROUND and the door lock motor causes the door to lock.

2. Manual Unlock Operation

(Driver's door)

To push the door lock control SW or door key lock and unlock SW to UNLOCK position, an unlock signal is input to the integration relay and causes the relay to function. Current flows from TERMINAL 3 of the relay to TERMINAL 12 to TERMINAL 4 of the TVIP ECU to TERMINAL 2 to TERMINAL 3 of the door lock motor to TERMINAL 2 to TERMINAL 13 of the integration relay to TERMINAL 8 to GROUND and the door lock motor causes the door to unlock.

(Passenger's door)

To push the door lock control SW or door key lock and unlock SW to UNLOCK position, an unlock signal is input to the integration relay and causes the relay to function. Current flows from TERMINAL 3 of the relay to TERMINAL 12 to TERMINAL 3 of the door lock motor to TERMINAL 2 to TERMINAL 13 of the relay to TERMINAL 8 to GROUND and the door lock motor causes the door to unlock.

3. Double Operation Unlock Operation

When the door key lock and unlock SW LH is turned to unlock position, only the front LH door is mechanically unlocked. Turning the door key lock and unlock SW LH to the unlock side causes a signal to be input to the relay, and if the signal is input again within 3 seconds by turning the door key lock and unlock SW LH to the unlock side again, current flows from TERMINAL 12 of the integration relay to TERMINAL 4 of the TVIP ECU to TERMINAL 2 to TERMINAL 3 of the door lock motor, TERMINAL 2 to TERMINAL 13 of the integration relay to TERMINAL 8 to GROUND, causing the door lock motors to operate and unlock the doors.

4. Key Confine Prevention Function

- * Operating door lock knob (In door lock motor operation)

With ignition key in cylinder (Unlock warning SW on), when any door is opened and locked using door lock knob (Door lock motor), the door is locked once but each door is unlocked soon by the function of the integration relay. As a result, current flows from TERMINAL 3 of the relay to TERMINAL 12 to TERMINAL 3 of the door lock motors to TERMINAL 2 to TERMINAL 13 of the relay to TERMINAL 8 to GROUND and causes all the doors to unlock.

- * Operating door lock control SW or door key lock and unlock SW

With ignition key in cylinder (Unlock warning SW on), when any door is opened and locked using the door lock control SW or door key lock and unlock SW, all doors are locked once but each door is unlocked by the function of the SW contained in motor, which inputs the signal to the integration relay. According to this input signal, current flows from TERMINAL 3 of the relay to TERMINAL 12 to TERMINAL 3 of the door lock motors to TERMINAL 2 to TERMINAL 13 of the relay to TERMINAL 8 to GROUND and causes all the doors to unlock.

Power Window (Access/Standard Cab)

System Outline

With the ignition SW turned on, current flows through the ECU IG fuse to TERMINAL 9 of the integration relay to TERMINAL 2 to TERMINAL 1 of the power relay to TERMINAL 2 to GROUND, activating the power relay, and the current flowing from TERMINAL 5 of the power relay flows to TERMINAL 3 to TERMINAL 9 of the power window master SW, TERMINAL 4 of the power window control SW RH and TERMINAL 1 of power window SW (Back window).

1. Manual Operation (Driver's Window)

With the ignition SW turned on and with the power window master SW (Manual SW) in UP position, the current flowing to TERMINAL 9 of the power window master SW flows to TERMINAL 3 to TERMINAL 2 of the power window motor LH to TERMINAL 1 to TERMINAL 4 of the master SW to TERMINAL 1 to GROUND and causes the power window motor to rotate in the up direction. The window ascends only while the SW is being pushed.

In down operation, the current flowing from TERMINAL 9 of the power window master SW to TERMINAL 4 flows to TERMINAL 1 of the motor LH to TERMINAL 2 to TERMINAL 3 of the master SW to TERMINAL 1 to GROUND, flowing in the opposite direction to manual up operation, causing the motor to rotate in reverse and lowering the window.

2. Auto Down Operation (Driver's Window)

With the ignition SW on and with the auto SW of the power window master SW in DOWN position, the current flowing to TERMINAL 9 of the master SW flows to TERMINAL 4 of the master SW to TERMINAL 1 of the power window motor LH to TERMINAL 2 to TERMINAL 3 of the master SW to TERMINAL 1 to GROUND, causing the motor to rotate towards the down side.

Then the solenoid in the master SW is activated and it locks the auto SW being pushed, causing the motor to continue to rotate in auto down operation.

When the window has completely descended, the current flowing between TERMINAL 3 of the master SW and TERMINAL 1 increases. As a result, the solenoid stops operating, the auto SW turns off and the flowing from TERMINAL 9 of the master SW to TERMINAL 4 is cut off, stopping the motor so that auto stop occurs.

3. Stopping of Auto Down AT Driver's Window

When the manual SW (Driver's) is pushed to the up side during auto down operation, a ground circuit opens in the master SW and current does not flow from TERMINAL 3 of the master SW to TERMINAL 1, so the motor stops, causing auto down operation to stop. If the manual SW is pushed continuously, the motor rotates in the up direction in manual up operation.

4. Manual Operation By Power Window Control SW (Passenger's Window)

With the power window control SW RH is pushed to the up side, the current flowing from TERMINAL 4 of the power window control SW RH flows to TERMINAL 3 of the power window control SW RH to TERMINAL 1 of the power window motor RH to TERMINAL 2 to TERMINAL 1 of the power window control SW RH to TERMINAL 2 to TERMINAL 10 of the master SW to TERMINAL 1 to GROUND. This causes the power window motor RH to rotate in the up direction. Up operation is continuous only while the power window control SW RH is pushed to the up side. When the window descends, the current flowing to the motor flows in the opposite direction, from TERMINAL 1 to TERMINAL 2, and the motor rotates in reverse.

When the window lock SW is pushed to the lock side, the ground circuit to the passenger's window becomes open. As a result, even if Open/Close operation of the passenger's window is tried, the current from TERMINAL 9 of the power window master SW is not grounded and the motor does not rotate, so the passenger's window can not be operated and window lock occurs.

5. Key Off Power Window Operation

With the ignition SW turned from on to off, the integration relay operates for about 43 seconds and current flows from TERMINAL 1 of the power relay to TERMINAL 2 to GROUND. For this period, current also flows TERMINAL 5 to TERMINAL 3. This current flows to TERMINAL 9 of the power window master SW and to TERMINAL 4 of the power window control SW RH. As a result, for about 43 seconds after the ignition SW is turned off, it is possible to raise and lower the power window by the functioning of the integration relay. Also, by opening the door (Door courtesy SW on) within about 43 seconds after turning the ignition SW to off, a signal is input to TERMINAL 3, 14 or 15 of the integration relay. As a result, the integration relay turns off, and up and down movement of the window stops.

Service Hints

D16, D17 Door Courtesy SW LH, RH

1-Ground : Continuity with door open

INTEGRATION Relay

9-Ground : Approx. 12 volts with ignition SW at ON position

3-Ground : Always approx. 12 volts

14-Ground : Continuity with front LH door open

15-Ground : Continuity with front RH door open (Standard cab)

15-Ground : Continuity with front RH, rear LH, RH door open (Access cab)

P9 Power Window Control SW Front RH

4-Ground : Approx. 12 volts with ignition SW on and stays at 12 volts for 41.5 -44.5 seconds after the ignition SW is turned off, but if a door is open in the approx. 43 seconds period, voltage will drop to 0 volts

P10 Power Window Master SW

1-Ground : Always continuity

9-Ground : Approx. 12 volts with ignition SW on and stays at 12 volts for 41.5 -44.5 seconds after the ignition SW is turned off, but if a door is opened in this approx. 43 seconds period, voltage will drop to 0 volts

3-Ground : Approx. 12 volts with ignition SW at ON position and master SW at UP position

4-Ground : Approx. 12 volts with ignition SW at ON position and master SW at DOWN or AUTO DOWN position

Window Lock SW

Open with window lock SW at LOCK position

Key Reminder and Seat Belt Warning (Access/Standard Cab)

System Outline

Current always flows to TERMINAL (B) 23 of the combination meter through the DOME fuse.

1. Seat Belt Warning System

When the ignition SW is turned on, current flows from the IGN fuse to TERMINAL (B) 24 of the combination meter. This current activates the combination meter and the current flowing through the seat belt warning light flows from TERMINAL (B) 12 to GROUND, causing the warning light to light up. A buckle SW off signal is input to TERMINAL (A) 5 of the combination meter to TERMINAL (B) 12 to GROUND, causing the warning light to light up. A buckle SW on signal is input to TERMINAL (A) 5 of the combination meter, the current flowing to TERMINAL (B) 23 of the combination meter flows from TERMINAL (B) 12 to GROUND and the seat belt warning buzzer sounds. However, if the seat belt is put on during this period (While the buzzer is sounding), signal input to TERMINAL (A) 5 of the combination meter stops and the current flow from TERMINAL (B) 23 of the combination meter to TERMINAL (B) 12 to GROUND is cut, causing the buzzer to stop.

2. Key Reminder System

With the ignition key inserted in the key cylinder (Unlock warning SW on), the ignition SW still off and driver's door open (Door courtesy SW on), when a signal is input to TERMINAL (A) 30 of the combination meter, the combination meter operates, current flows from TERMINAL (B) 23 of the combination meter to TERMINAL (B) 12 to GROUND and key reminder buzzer sounds.

Service Hints

B7 Buckle SW LH (Captain Seat)

System Outline

With the ignition SW turned on, current flows to TERMINAL 17 of the wiper and washer SW, TERMINAL 3 of the washer motor and TERMINAL 2 of the wiper motor through the WIP fuse.

1. Low Speed Position

With wiper SW turned to LOW position, current flows from TERMINAL 17 of the wiper and washer SW to TERMINAL 7 to TERMINAL 5 of the wiper motor to TERMINAL 4 to GROUND and causes the wiper motor to run at low speed.

2. High Speed Position

With wiper SW turned to HIGH position, current flows from TERMINAL 17 of the wiper and washer SW to TERMINAL 8 to TERMINAL 3 of the wiper motor to TERMINAL 4 to GROUND and causes the motor to run at high speed.

3. INT Position

With wiper SW turned to INT position, the relay operates and the current which is connected by relay function flows from TERMINAL 17 of the wiper and washer SW to TERMINAL 2 to GROUND. This flowing the intermittent circuit and current flows from TERMINAL 17 of the wiper and washer SW to TERMINAL 7 to TERMINAL 5 of the wiper motor to TERMINAL 4 to GROUND and the wiper functions.

The intermittent operation is controlled by charging and discharging of the condenser installed in the relay and the intermittent time is controlled by a time control SW to change the charging time of the condenser.

4. Washer Interlocking Operation

With the washer SW turned to on, current flows from TERMINAL 3 of the washer motor to TERMINAL 4 to TERMINAL 11 of the wiper and washer SW to TERMINAL 2 to GROUND and causes to the washer motor to run, and the window washer is jetted.

This causes current to flow to washer continuous operation circuit in TERMINAL 17 of the wiper and washer SW to TERMINAL 7 to TERMINAL 5 of the wiper motor to TERMINAL 4 to GROUND and the wiper functions.

Service Hints

Air Conditioning (Access/Standard Cab)

Air Conditioning (Access/Standard Cab)

System Outline

1. Heater Blower Motor Operation

Current is applied at all times through the HTR fuse to TERMINAL 5 of the HTR relay.

When the ignition SW is turned on, current flows through the GAUGE fuse to TERMINAL 2 of the HTR relay to the coil side to TERMINAL 1 to TERMINAL 3 of the blower SW.

* Low speed operation

When the blower SW is moved to LO position, current flows to TERMINAL 3 of the blower SW to TERMINAL 1 to GROUND, causing the HTR relay to switch on. This causes the current to flow from the HTR fuse to TERMINAL 5 of the HTR relay to TERMINAL 3 to TERMINAL 1 of the blower motor to TERMINAL 2 to TERMINAL 4 of the blower resistor to TERMINAL 1 to GROUND, causing the blower motor to rotate at low speed.

* Medium speed operation (Operation at M1, M2)

When the blower SW is moved to M1 position, current flows to TERMINAL 3 of the blower SW to TERMINAL 1 to GROUND, turning the HTR relay to switch on. This causes the current to flow from the HTR fuse to TERMINAL 5 of the HTR relay to TERMINAL 3 to TERMINAL 1 of the blower motor to TERMINAL 2 to TERMINAL 4 of the blower resistor to TERMINAL 3 to TERMINAL 4 of the blower SW to TERMINAL 1 to GROUND. At this time, the blower resistance of the blower resistor is less than at low speed, so the blower motor rotates at medium low speed.

When the blower SW is moved to M2 position, current flows through the motor flows from TERMINAL 4 of the blower resistor to TERMINAL 2 to TERMINAL 8 of the blower SW to TERMINAL 1 to GROUND. At this time, resistance of the blower resistor is less than at M1 position, so the blower motor rotates at medium high speed.

* High speed operation

When the blower SW is moved to HIGH position, current flows to TERMINAL 3 of the blower SW to TERMINAL 1 to GROUND, turning the HTR relay to switch on.

This causes the current to flow from the HTR fuse to TERMINAL 5 of the HTR relay to TERMINAL 3 to TERMINAL 1 of the blower motor to TERMINAL 2 to TERMINAL 5 of the blower SW to TERMINAL 1 to GROUND, causing the blower motor to rotate at high speed.

2. Operation of Air Inlet Control Servo Motor

* Switching from FRESH to RECIRC

With the ignition SW turned on, current flows from the GAUGE fuse to TERMINAL 5 of the air inlet control servo motor. When the RECIRC/FRESH SW is switched to the RECIRC side, current flows from TERMINAL 5 of the air inlet control servo motor to TERMINAL 1 to TERMINAL (A) 8 of the integration control and panel to TERMINAL (B) 1 to GROUND. The motor rotates and the damper moves to the RECIRC side. When it is in the RECIRC position, current is cut inside the servo motor and the damper stops at that position.

* Switching from RECIRC to FRESH

With the ignition SW turned on, when the RECIRC/FRESH SW is switched to the FRESH side, current flows from TERMINAL 5 of the air inlet control servo motor to TERMINAL 2 to TERMINAL (A) 7 of the integration control and panel to TERMINAL (B) 1 to GROUND, the motor rotates and the damper moves to the FRESH side. when it is in the FRESH position, current is cut inside the servo motor and the damper stops at that position. When the ignition SW turned on, and mode SW (Integration control and panel) is at DEF or F/DEF position, it causes the damper to move to the FRESH side. Whether the RECIRC/FRESH SW (Integration control and panel) is on or not.

3. Air Conditioning Operation

When the blower SW is on, current flows from the GAUGE fuse to the HTR relay (Coil side) to TERMINAL 3 of the blower SW to TERMINAL 1 to GROUND, activating the HTR relay. This causes current to flow from the HTR fuse to the HTR relay (Point side) to A/C fuse to TERMINAL (B) 12 of the A/C SW (Integration control and panel). When the A/C SW (Integration Control and panel) is turned on. Current flows from the A/C fuse to TERMINAL (B) 14 of the integration control and panel to TERMINAL (B) 18 to A/C magnetic clutch. Causing The compressor to operate.

When blower SW is on and mode SW (Integration control and panel) is at DEF or F/DEF position, it causes A/C to run whether A/C SW (Integration control and panel) is on or not.

Service Hints

HEATER Relay

5-3 : Closed with ignition SW on and heater blower SW on

A1 A/C Dual Pressure SW

1-2 : Open with refrigerant pressure at less than approx. 2.0 kgf/cm² (196.1 kpa, 28.4 psi) or more than approx. 32.0 kgf/cm² (3138.1 kpa, 455 psi)

Engine Control (Double Cab)

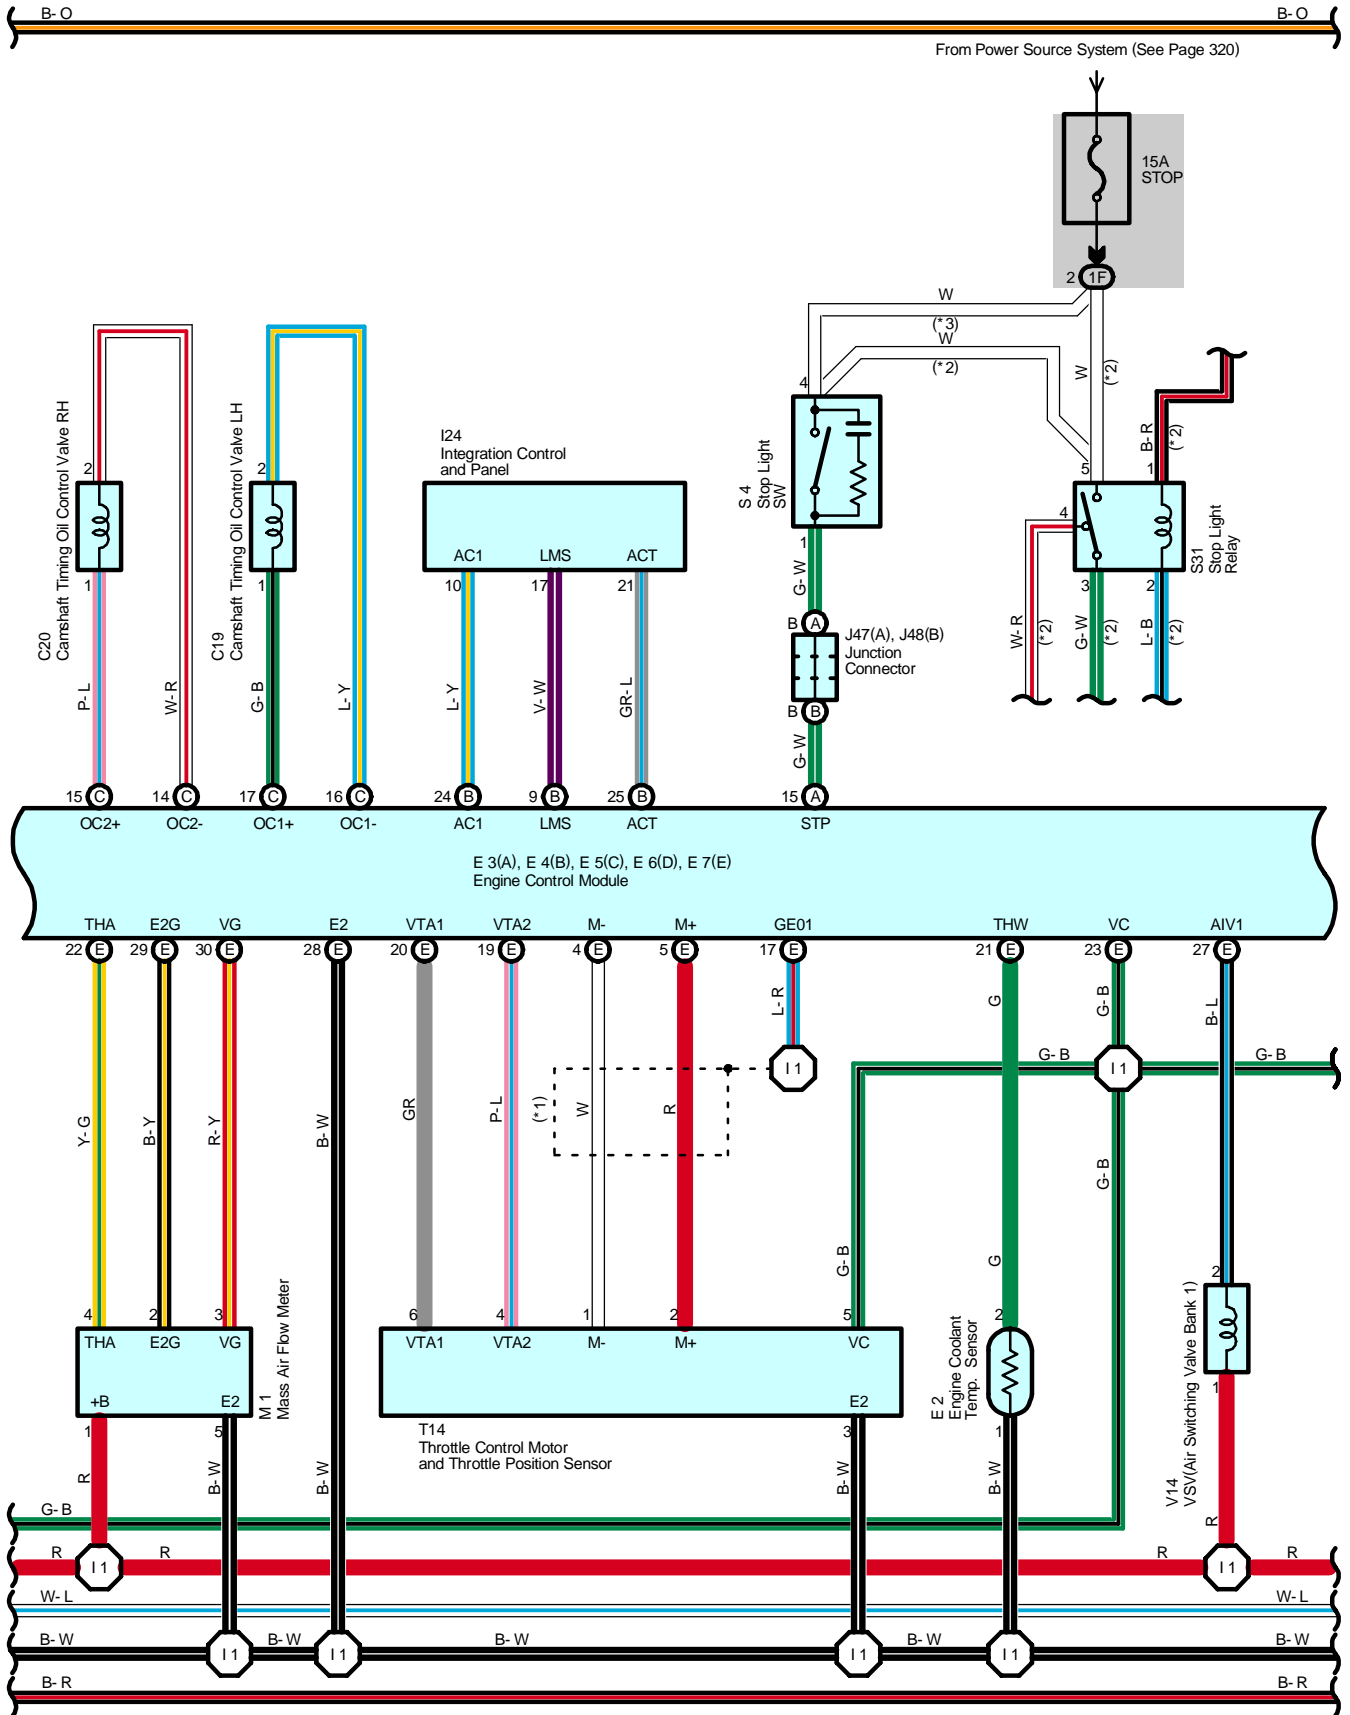

Engine Control (Double Cab)

Engine Control (Double Cab)

Engine Control (Double Cab)

Engine Control (Double Cab)

Engine Control (Double Cab)

System Outline

The engine control system utilizes a microcomputer and maintains overall control of the engine, transmission etc. An outline of the engine control is given here.

1. Input Signals

(1) Engine coolant temp. signal circuit

The engine coolant temp. sensor detects the engine coolant temp. and has a built-in thermistor with a resistance which varies according to the engine coolant temp. The engine coolant temp. is input into TERMINAL THW of the engine control module as a control signal.

(2) Intake air temp. signal circuit

The intake air temp. sensor is installed in the mass air flow meter and detects the intake air temp., which is input as a control signal to TERMINAL THA of the engine control module.

(3) Oxygen sensor signal circuit

The oxygen density in the exhaust emission is detected and is input as a control signal from the heated oxygen sensors to TERMINALS OX1B, OX2B of the engine control module.

(4) RPM signal circuit

The camshaft position is detected by the camshaft position sensor and is input into TERMINAL G2+ of the engine control module as a control signal. Also, the engine RPM is detected by the crankshaft position sensor and the signal is input into TERMINAL NE+ of the engine control module.

(5) Throttle position sensor signal circuit

The throttle position sensor detects the throttle valve opening angle as a control signal, which is input into TERMINALS VTA1, VTA2 of the engine control module.

(6) Vehicle speed circuit

The vehicle speed sensor, detects the vehicle speed and input to the speed sensor of the skid control ECU with actuator, from skid control ECU to TERMINAL SPD of the engine control module, via combination meter.

(7) Battery signal circuit

Voltage is constantly applied to TERMINAL BATT of the engine control module. When the ignition SW is turned on, the voltage for engine control module start up power supply is applied through the EFI relay, to TERMINALS +B, +B2 of the engine control module. The current from the IGN fuse flows to TERMINAL IGSW of the engine control module, and voltage is constantly applied to TERMINAL +BM.

(8) Intake air volume signal circuit

The intake air volume is detected by the mass air flow meter, and is input as a control signal to TERMINAL VG of the engine control module.

(9) Stop light SW signal circuit

The stop light SW is used to detect whether the vehicle is braking or not, and the signal is input into TERMINAL STP of the engine control module as a control signal.

(10) Starter signal circuit

To confirm whether the engine is cranking, the voltage applied to the starter motor when the engine is cranking is detected, and is input into TERMINAL STA of the engine control module as a control signal.

(11) Engine knock signal circuit

Engine knocking is detected by the knock sensors, and is input into TERMINALS KNK1, KNK2 of the engine control module as a control signal.

2. Control System

*** SFI system**

The SFI system monitors the engine condition through the signals input from each sensors to the engine control module. The control signal is sent to the engine control module TERMINALS #10, #20, #30, #40, #50, #60, #70, #80 to operate the injector (Fuel injection). The SFI system controls the fuel injection by the engine control module in response to the driving conditions.

*** ESA system**

The ESA system monitors the engine condition through the signals input from each sensors to the engine control module. The best ignition timing is decided according to this data and the data memorized in the engine control module. The control signal is output to TERMINALS IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8, and these signals control the igniter to provide the best ignition timing.

*** Heated oxygen sensor heater control system**

The heated oxygen sensor heater control system turns the heater on when the intake air volume is low (Temp. of exhaust emission is low), and warms up the heated oxygen sensors to improve their detection performance. The engine control module evaluates the signals from each sensors, and outputs current to TERMINALS HT1B and HT2B to control the heater.

*** Air fuel ratio sensor heater control system**

The air fuel ratio sensor heater control system turns the heater on when the intake air volume is low (Temp. of exhaust emission is low) and warms up the air fuel ratio sensor to improve detection performance of the sensor.

The engine control module evaluates the signals from each sensor, current is output to TERMINALS A1A+ and A2A+ controlling the heater.

*** Fuel pump control system**

The engine control module supplies current to TERMINAL FPR, and controls the operation speed of the fuel pump with the F/PMP relay.

*** ETCS-i**

The ETCS-i controls the engine output at its optimal level in accordance with the opening of the accelerator pedal, under all driving conditions.

3. Diagnosis System

When there is a malfunction in the engine control module signal system, the malfunctioning system is recorded in the memory. The malfunctioning system can be found by reading the code displayed on the malfunction indicator lamp.

4. Fail-Safe System

When a malfunction has occurred in any system, there is a possibility of causing engine trouble due to continued control based on that system. In that case, the fail-safe system either controls the system using the data (Standard values) recorded in the engine control module memory, or else stops the engine.

Engine Control (Double Cab)

Service Hints

EFI Relay

5-3 : Closed with ignition SW at ON or ST position

C/OPN Relay

5-3 : Closed with starter cranking or engine cranking

E2 Engine Coolant Temp. Sensor

1-2 : Approx. 16.2 kΩ (-20°C, -4°F)

: Approx. 2.45 kΩ (20°C, 68°F)

: Approx. 0.32 kΩ (80°C, 176°F)

E3 (A), E4 (B), E5 (C), E6 (D), E7 (E) Engine Control Module

BATT-E1 : Always 9.0-14.0 volts

+BM-E1 : Always 9.0-14.0 volts

IGSW-E1 : 9.0-14.0 volts with ignition SW at ON or ST position

+B, +B2-E1 : 9.0-14.0 volts with ignition SW at ON or ST position

VC-E1 : 4.5-5.5 volts with ignition SW at ON or ST position

VTA2-E1 : 2.0-2.9 volts with ignition SW on and throttle valve fully closed

: 4.7-5.1 volts with ignition SW on and throttle valve fully open

VTA1-E1 : 0.4-1.0 volts with ignition SW on and throttle valve fully closed

: 3.2-4.8 volts with ignition SW on and throttle valve fully open

VPA-E1 : 0.3-0.9 volts with ignition SW on and throttle valve fully closed

: 3.2-4.8 volts with ignition SW on and throttle valve fully open

VPA2-E1 : 1.8-2.7 volts with ignition SW on and throttle valve fully closed

: 4.7-5.1 volts with ignition SW on and throttle valve fully open

THA-E1 : 0.5-3.4 volts with idling, intake air temp. 0°C (32°F) -80°C (176°F)

THW-E1 : 0.2-1.0 volts with idling, engine coolant temp. 60°C (140°F) -120°C (248°F)

STA-E1 : 6.0 volts or more with engine cranking

W-E1 : 9.0-14.0 volts with idling and malfunction indicator lamp off

SPD-E1 : Pulse generation with vehicle moving

STP-E1 : 7.5-14.0 volts with brake pedal depressed

Headlight with DRL (Double Cab)

From Power Source System (See Page 320)

Headlight with DRL (Double Cab)

System Outline

Daytime Running Light Operation

When the engine is started, the generator signal is input of the body ECU. At this time, if the parking brake pedal is depressed (Parking brake SW ON), the body ECU is not activated, and the daytime running light system does not operate. When the parking brake pedal is released (Parking brake SW OFF), a signal is input into TERMINAL (C) 3 of the body ECU. This activates the body ECU and the headlight turns on.

Service Hints

HEAD Relay

5-3 : Closed with the light control SW at HEAD position or dimmer SW at FLASH position
 Closed with the engine running and parking brake pedal released

Center Cluster Integration Control System (Double Cab)

System Outline

The integration control panel is composed by design components such as the cluster, resistor, heater control panel, and SW. The integration control panel controls systems such as the air conditioning, cargo light, 4WD and hazard warning light and clock.

Service Hints

I25 (B) Integration Control and Panel

- (B)17-Ground : Approx. 12 volts with ignition SW on and blower SW on
- (B)14-Ground : Approx. 12 volts with ignition SW at ON or ST position

Multiplex Communication System - CAN (Double Cab)

System Outline

CAN has two lines as a pair which make communication with operating voltage. CAN has excellent data speed and error detecting capacity. It consists of vehicle control systems such as engine control module, data link connector 3 and skid control ECU with actuator.

This system is working for the following systems:

- * Cruise Control
- * Electronically Controlled Transmission and A/T Indicator
- * Engine Control
- * VSC

Light Auto Turn Off System (Double Cab)

Light Auto Turn Off System (Double Cab)

System Outline

With the light control SW at TAIL position, and the ignition SW turned to ACC or OFF position from ON or ST position, the tail lights will be turned off when the driver's door is opened.

When the ignition SW is turned to ACC or OFF position from ON or ST position with the headlights on, the headlights will be turned off 30 seconds after all the doors are closed.

The light goes off immediately when all the doors are locked using the wireless door lock.

Service Hints

HEAD Relay

5-3 : Closed with the light control SW at HEAD position or the dimmer SW at FLASH position

Closed with the engine running and the parking brake pedal released (w/ daytime running light)

C15 Combination SW

13-16 : Closed with the light control SW at HEAD position

14-16 : Closed with the light control SW at TAIL or HEAD position

D16 Door Courtesy SW Front LH

1-Ground : Continuity with the front LH door open

Key Reminder and Seat Belt Warning (Double Cab)

From Power Source System (See Page 320)

Key Reminder and Seat Belt Warning (Double Cab)

System Outline

1. Seat Belt Warning

In case the driver has not fastened the seat belt when the ignition SW is turned ON, a warning light flashes, and the warning buzzer goes on.

2. Key Reminder

In case the driver's door is opened with the key in the key cylinder and the ignition SW at ACC or OFF position, a warning buzzer goes on.

Service Hints

B7 Buckle SW LH

Power Window (Double Cab)

Power Window (Double Cab)

Power Window (Double Cab)

System Outline

The power window motor will operate when the power window SW, remote control SW, or the key-linked SW is operated.

1. Power Window SW Manual/Automatic Operation

When the ignition SW is turned ON, or during key-off operation stand-by mode, the power window can be operated by the power window SW.

2. Remote Control SW Manual/Automatic Operation

When the ignition SW is turned ON, or during key-off operation stand-by mode, the power window can be operated by the remote control SW. The front passenger, rear left, right windows can be operated according to the remote control signals from the DRIVER DOOR ECU.

3. Key-Off Operation

With all the doors closed, within 43 seconds after the ignition switch has been turned to OFF from ON, the power window can be operated. However, if the front door is opened, the power window cannot be operated.

Service Hints

B10 (B), B11 (C) Body ECU

Door Lock Control and Theft Deterrent (Double Cab)

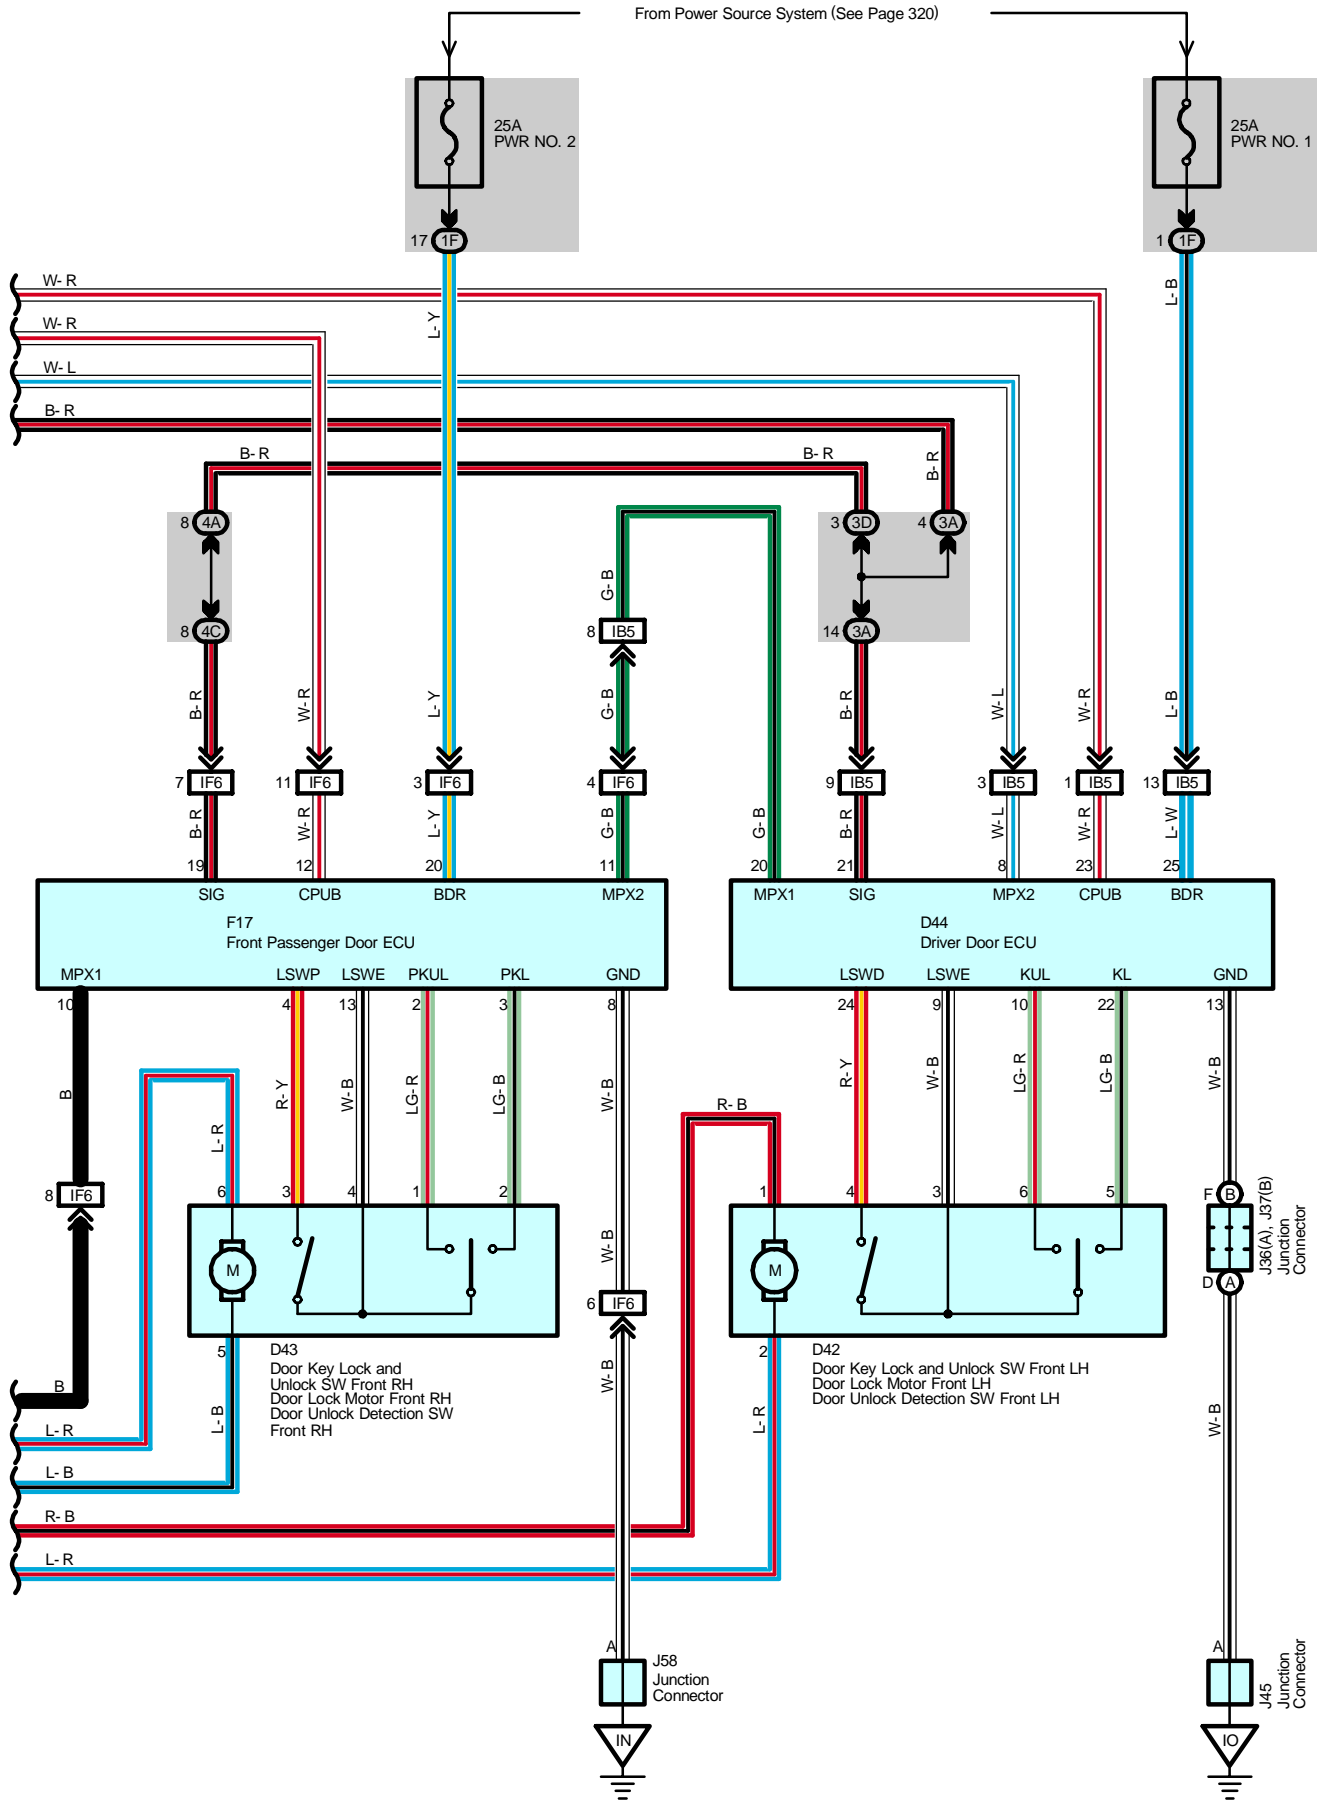

Door Lock Control and Theft Deterrent (Double Cab)

Door Lock Control and Theft Deterrent (Double Cab)

System Outline

1. Manual Unlock Operation

When the door lock control SW of the driver's or passenger's side door is pushed to UNLOCK, the door lock will unlock.

2. Manual Lock Operation

When the door lock control SW of the driver's or passenger's side door is pushed to LOCK, the door lock will lock.

3. Door Key Unlock Operation

* Unlock operation from driver's side door

When the driver's side door is unlocked once using the ignition key, only the driver's side door is unlocked. If this operation is repeated within 3 seconds, all the other doors are unlocked.

* Unlock operation from front passenger's side door

When the front passenger's side door is unlocked using the ignition key, all the other doors are unlocked, too.

Service Hints

D42 Door Lock Motor, Door Key Lock and Unlock SW and Door Unlock Detection SW Front LH

2-Ground : Approx. 12 volts with the door lock motor at lock operate

Wireless Door Lock Control (Double Cab)

Wireless Door Lock Control (Double Cab)

System Outline

The current flows continuously from DOOR NO.2 fuse to body ECU TERMINAL BDR, from PWR NO.2 fuse to front passenger door ECU TERMINAL BDR, from PWR NO.1 fuse to driver door ECU TERMINAL BDR, and from ECU-B fuse to body ECU, front passenger ECU, driver door ECU, door control receiver.

1. Wireless Door Lock/Unlock Normal Operation:

Lock operation

All the doors are locked when the lock SW of the transmitter is operated.

Unlock operation

When the unlock SW of the transmitter is operated, the driver's door is unlocked, and if the SW is operated again within 3 seconds, all the doors are unlocked.

2. Automatic Lock Operation

When the doors are unlocked by operating the unlock SW of the transmitter, if no door is opened or the ignition key is not inserted in the key cylinder within 30 seconds, all the doors will be locked again.

3. Lock/Unlock Operation Audiovisual Effect Check

When the vehicle is locked by the transmitter, the parking light & taillight flashes once, and a buzzer sounds once. When the vehicle is unlocked by the transmitter, the parking light & taillight flashes twice, and a buzzer sounds twice.

When the unlock SW of the transmitter is operated while all the doors are locked, the doors will be unlocked and the room light will come on.

4. Output Repeat Function

If there is not change in the lock condition of the vehicle after the lock signal is output from the transmitter, the lock signal is output again.

Wiper and Washer (Double Cab)

System Outline

With the ignition SW turned on, current flows to TERMINAL 17 of the wiper and washer SW and TERMINAL 2 of the wiper motor through the WIP fuse. The current flows to TERMINAL 3 of the washer motor through the WSH fuse.

1. Low Speed Position

With wiper SW turned to LOW position, current flows from TERMINAL 17 of the wiper and washer SW to TERMINAL 7 to TERMINAL 5 of the wiper motor to TERMINAL 4 to GROUND and causes the wiper motor to run at low speed.

2. High Speed Position

With wiper SW turned to HIGH position, current flows from TERMINAL 17 of the wiper and washer SW to TERMINAL 8 to TERMINAL 3 of the wiper motor to TERMINAL 4 to GROUND and causes the motor to run at high speed.

3. INT Position

With wiper SW turned to INT position, the relay operates and the current which is connected by relay function flows from TERMINAL 17 of the wiper and washer SW to TERMINAL 2 to GROUND. This flowing the intermittent circuit and current flows from TERMINAL 17 of the wiper and washer SW to TERMINAL 7 to TERMINAL 5 of the wiper motor to TERMINAL 4 to GROUND and the wiper functions.

The intermittent operation is controlled by charging and discharging of the condenser installed in the relay and the intermittent time is controlled by a time control SW to change the charging time of the condenser.

4. Washer Interlocking Operation

With the washer SW pulled up, current flows from TERMINAL 3 of the washer motor to TERMINAL 4 to TERMINAL 11 of the wiper and washer SW to TERMINAL 2 to GROUND and causes to the washer motor to run, and the window washer is jetted. This causes current to flow to washer continuous operation circuit in TERMINAL 17 of the wiper and washer SW to TERMINAL 7 to TERMINAL 5 of the wiper motor to TERMINAL 4 to GROUND and the wiper functions.

Service Hints

ECT and A/T Indicator (Double Cab)

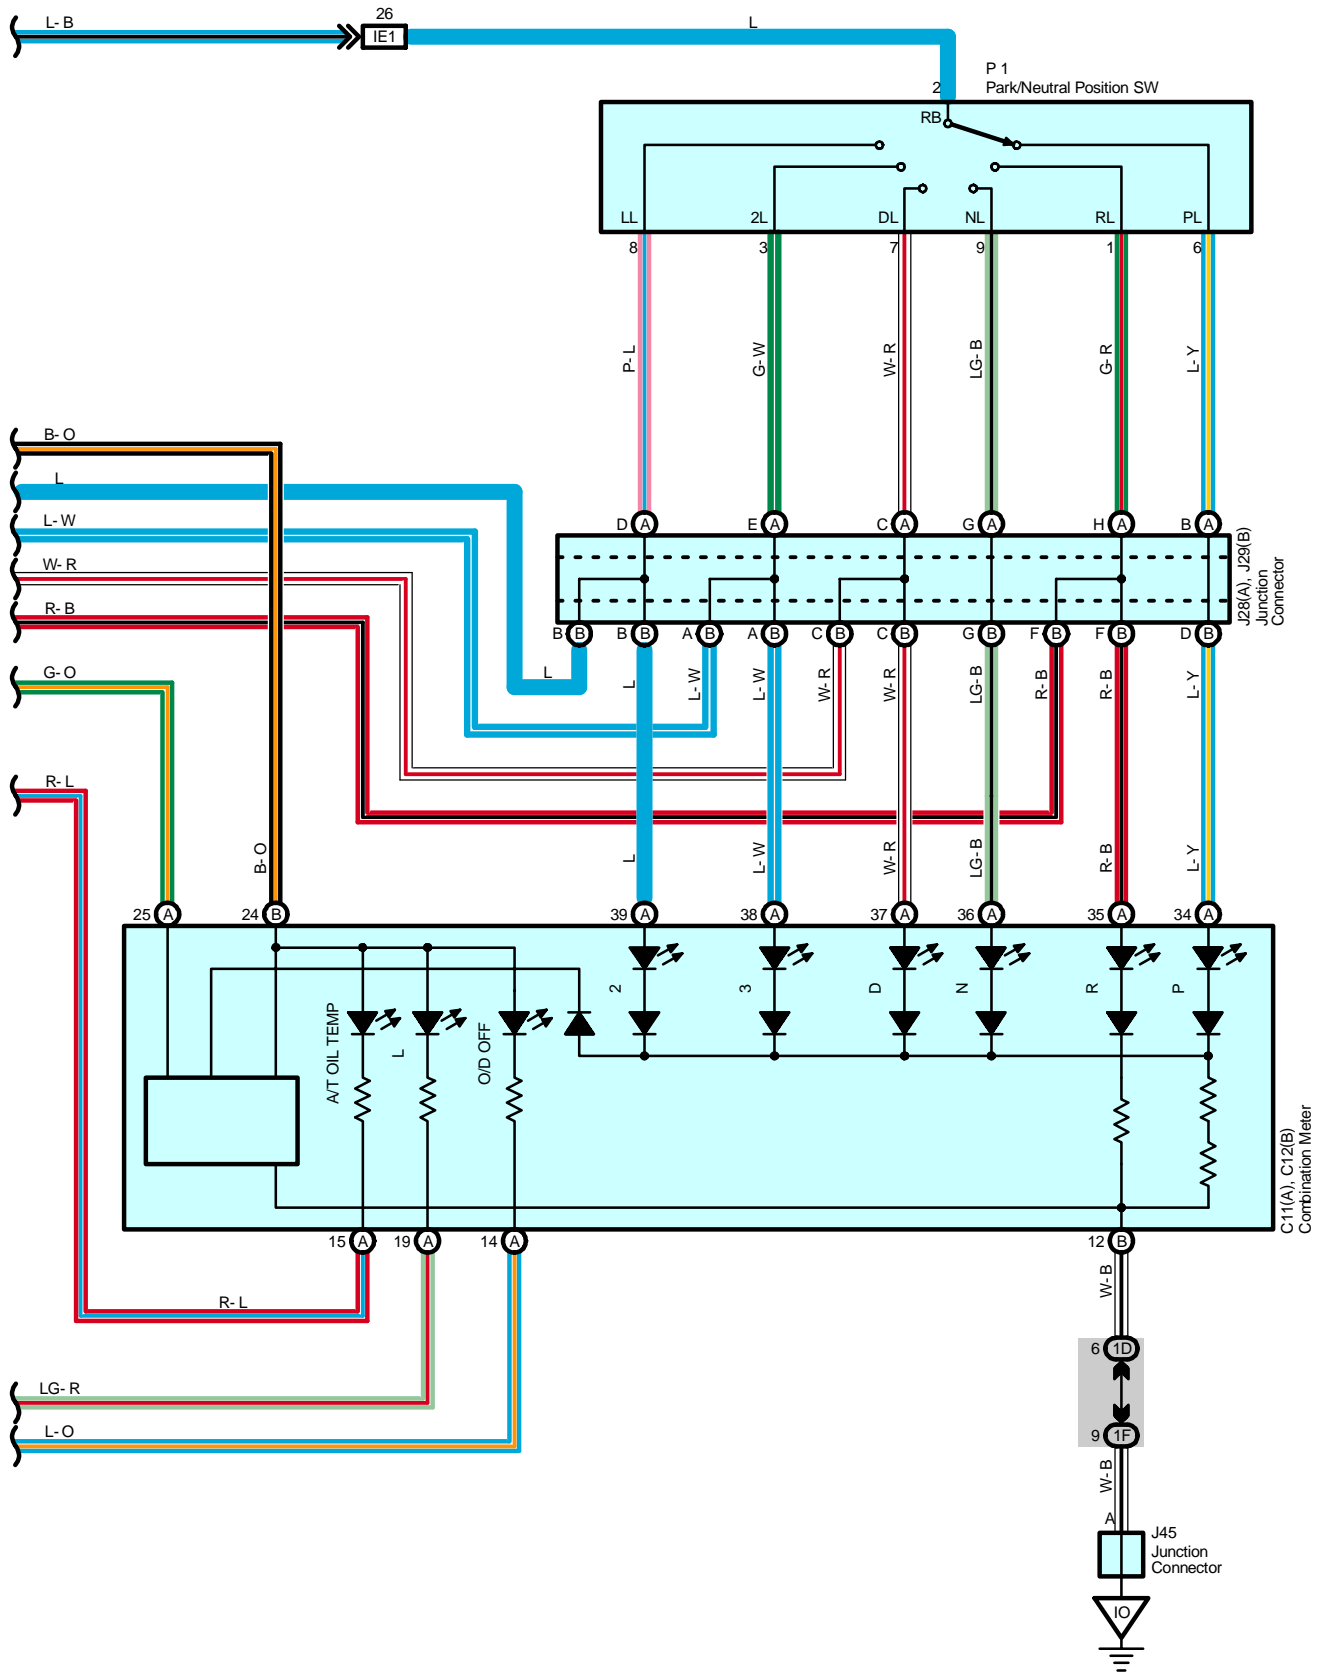

* 1 : w/ VSC
 * 2 : w/o VSC

From Power Source System (See Page 320)

ECT and A/T Indicator (Double Cab)

System Outline

The electronically controlled transmission electrically controls the, throttle pressure, lock-up pressure, and accumulator pressure etc. through the solenoid valve.

The electronically controlled transmission is a system which precisely controls the gear shift timing and lock-up timing in response to the vehicle's driving conditions and the engine condition detected by various sensors. It makes smooth driving possible by shift selection of the gear which is the most appropriate to the driving conditions at that time, and by preventing downing, squat and gear shift shock when starting off.

1. Gear Shift Operation

When driving, the engine warm up condition is input as a control signal from the engine coolant temp. sensor to TERMINAL THW of the engine control module, and the vehicle speed is input to TERMINAL SP2+ of the engine control module from the vehicle speed sensor. At the same time, the throttle valve opening signal from the throttle position sensor is input to TERMINALS VTA1, VTA2 of the engine control module as a throttle angle signal. Based on these signals, the engine control module selects the best shift position for the driving conditions and sends current to the electronically controlled transmission solenoid.

2. Lock-Up Operation

When the engine control module decides based on each signal that the lock-up condition has been met, the current flows through TERMINAL SLU+ of the engine control module to TERMINAL 5 of the electronically controlled transmission solenoid to TERMINAL 13 to TERMINAL SLU- of the engine control module to GROUND.

3. Stop Light SW Circuit

If the brake pedal is depressed (Stop light SW on) when driving in lock-up position, a signal is input to TERMINAL STP of the engine control module. As a result, the engine control module cuts the current to the solenoid to release the lock-up.

4. Overdrive Circuit

* O/D main SW on

When the O/D main SW is switched to ON position, a signal is input to TERMINAL ODMS of the engine control module, and enables shift change to the overdrive range, through the control of the engine control module.

* O/D main SW off

When the O/D main SW is switched to OFF position, a signal is input to TERMINAL ODMS of the engine control module, and prohibits shift change to the overdrive range through the control of the engine control module. When in the overdrive range already, shift down is made.

Cruise Control (Double Cab)

Cruise Control (Double Cab)

System Outline

The cruise control system is a constant vehicle speed controller which controls the opening angle of the engine throttle valve by the SW, and allows driving at a constant speed without depressing the accelerator pedal.

1. Set Control

When the - SET SW is operated while traveling with the ON-OFF SW on, the speed when the - SET SW is operated to off is memorized, and the vehicle speed is controlled at that speed.

2. Coast Control

When the - SET SW is operated to on, the cruise control opening angle requirement is turned to 0 to decrease the vehicle speed, and the speed when the - SET SW is operated to off is memorized, and the vehicle speed is controlled at that speed. Furthermore, every time the - SET SW is operated momentarily (Approx. 0.5 sec.) to on, the memorized vehicle speed is decreased by approx. 1.6 km/h (1.0 mph).

3. Accel Control

When the + RES SW is operated to on, the throttle motor rotates the throttle valve to open direction to increase the vehicle speed, and the speed when the + RES SW is operated to off is memorized, and the vehicle speed is controlled at that speed.

Furthermore, every time the + RES SW is operated momentarily (Approx. 0.5 sec.) to on, the memorized vehicle speed is increased by approx. 1.6 km/h (1.0 mph).

4. Manual Cancel Mechanism

If any of the following signals are input during cruise control traveling, the current to the motor flows in the direction to close the throttle valve, and cancel the cruise control.

- (1) Stop lamp SW is on (Brake pedal is depressed)
- (2) The CANCEL SW of the control SW is on
- (3) ON-OFF SW is off
- (4) Gear is shifted from D position to other positions than D.

5. Resume Control

After canceling the cruise control (Except when the ON-OFF SW is off) if the vehicle speed is above the minimum speed limit (Approx. 40km/h, 25mph), operating the + RES SW to on from off will cause the system to accelerate and resume to the vehicle speed before manual cancellation.

6. Overdrive Function

The overdrive may be cut on an uphill grade, while traveling with the cruise control.

After the overdrive is cut, when the throttle opening information indicates the hill climbing is finished after the overdrive is canceled, the vehicle returns to overdrive mode again as the overdrive return timer is completed, and if the system determines that the uphill grade has finished, the overdrive will resume after the overdrive timer operation.

7. Auto Cancel Operation

If any of the following conditions are detected, the control is canceled.

- (1) Disconnection and/or short in the stop light SW
- (2) Malfunction in the vehicle speed signal
- (3) Malfunction in the electronic throttle parts
- (4) Malfunction in the stop light SW input circuit
- (5) Malfunction in the cancel circuit
- (6) When the vehicle speed gets slower than the low speed limit.
- (7) The actual vehicle speed becomes -16 km/h (10 mph) slower than the set speed

Service Hints

E3 (A), E4 (B), E5 (C), E7 (E) Engine Control Module

IGSW-E1 : 9.0-14.0 volts with ignition SW at ON or ST position

VSC (Double Cab)

VSC (Double Cab)

System Outline

1. ABS Operation

If the brake pedal is depressed suddenly, the ABS controls the hydraulic pressure of the wheel cylinders for all the four wheels to automatically avoid wheel locking and ensure the directional and steering stability of the vehicle. If the brake pedal is depressed suddenly, the skid control ECU controls the solenoids in the actuators using the signals from the sensors to move the brake fluid to the reservoir in order to release the braking pressure applied to the wheel cylinder. If the skid control ECU detects that the fluid pressure in the wheel cylinder is insufficient, the ECU controls the solenoids in the actuators to increase the braking pressure.

2. Traction Control Operation

The traction control system controls the engine torque, the hydraulic pressure of the driving wheel cylinders, slipping of the wheels which may occur at start or acceleration of the vehicle, to ensure an optimal driving power and vehicle stability corresponding to the road conditions.

3. VSC Operation

Unexpected road conditions, vehicle speed, emergency situation, and any other external factors may cause large under- or over-steering of the vehicle. If this occurs, the VSC system automatically controls the engine power and wheel brakes to reduce the under- or over-steering.

To reduce large over-steering :

If the VSC system determines that the over-steering is large, it activates the brakes for the outer turning wheels depending on the degree of the over-steering to produce the moment toward the outside of the vehicle and reduce the over-steering.

To reduce large under-steering :

If the VSC system determines that the under-steering is large, it controls the engine power and activates the rear wheel brakes to reduce the under-steering.

Traction control SW

The traction control SW is used to stop the TRAC function. After the engine is started, the TRAC system is stopped (turned off) and the VSC OFF indicator light lights up. When the traction control SW is pressed again, the TRAC system enters the stand-by mode. If the engine is stopped and restarted, the TRAC system enters the stand-by mode regardless of the traction control SW.

4. Mutual System Control

To efficiently operate the VSC system at its optimal level, the VSC system and other control systems are mutually controlled while the VSC system is being operated.

Engine throttle control

The engine power does not interfere with the VSC brake control by controlling the opening of the throttle and reducing the engine output.

Engine control and electronically controlled transmission control

The strong braking force does not interfere with the braking force control of the VSC system by turning off the accel. and reducing changes in the driving torque at shift-down.

VSC system operation indication

The Slip indicator light flashes and the buzzer sounds intermittently to warn the driver that the current road is slippery, while the VSC system is being operated.

5. Fail Safe Function

If an error occurs in the skid control ECU with actuator, sensor signals, and/or actuators, the skid control ECU with actuator inhibits the brake actuator control and inputs the error signal to the engine control module. According to the error signal, the brake actuator turns off the solenoid and the engine control module rejects any electronically controlled throttle open request from the VSC system. As a result, the vehicle functions regardless of the ABS, TRAC, and VSC systems.

Service Hints

ABS (Double Cab)

From Power Source System (See Page 320)

From Power Source System (See Page 320)

ABS (Double Cab)

System Outline

This system controls the respective brake fluid pressures acting on the disc brake cylinders of the right front wheel, left front wheel, and rear wheels when the brakes are applied in a panic stop so that the wheels do not lock. This results in improved directional stability and steerability during panic braking.

1. Input Signal

(1) Speed sensor signal

The speed of the wheels is detected and input to TERMINALS FL+, FR+, RL+ and RR+ of the ABS actuator with ECU.

(2) Stop light SW signal

A signal is input to TERMINAL STP of the ABS actuator with ECU when the brake pedal is depressed.

2. System Operation

During sudden braking, the ABS actuator with ECU which has signals input from each sensor lets the hydraulic pressure acting on each wheel cylinder escape to the reservoir.

The pump inside the ABS actuator with ECU is also operating at this time and it returns the brake fluid from the reservoir to the master cylinder, thus preventing locking of vehicle wheels.

If the ABS actuator with ECU judges that the hydraulic pressure acting on the wheel cylinder is insufficient, the current acting on the solenoid is controlled and the hydraulic pressure is increased.

Holding of the hydraulic pressure is also controlled by the ECU, by the same method as above, by repeated pressure reduction. Holding and increase are repeated to maintain vehicle stability and to improve steerability during sudden braking.

Service Hints

Tire Pressure Warning System (Double Cab)

System Outline

The air pressure sensor installed in the tire wheel detects the tire air pressure and transmits signals to the vehicle side receiver. When the detected tire air pressure is below a specified level, the warning light in the combination meter comes on to inform the driver.

Press the tire pressure warning standardization SW for 3 seconds with the ignition SW at ON position after the tire pressure is adjusted to the specified value. It will lead the tire pressure monitor ECU to control and warn the pressure according to the specified value.

Warnings when the tire pressure is low

* When the tire air pressure is below a specified level, the warning light in the combination meter comes on.

Service Hints

T16 Tire Pressure Monitor ECU

2-Ground : Approx. 12 volts with ignition SW at ON position

11-Ground : Always continuity

 4WD Control ECU

System Outline

In the conventional system, the 2-4 select SW and the transfer shift lever was used to shift the mode between H-L. In this system, the transfer shift lever is not used, and the H-L mode shift can be done by the transfer shift actuator.

The mode can be changed by the touch select 2-4 SW and touch select high-low in the integration control and panel.

The shift range is controlled according to the vehicle speed sensor and Park/Neutral position SW, and the indicator light is turned ON to inform the driver if any of the following conditions are detected:

- * The shift is not completed even though 3 seconds have elapsed after transfer operation.
- * The vehicle speed is above approximately 100 km/h (63 mph) when shifting from H2 to H4.
- * The vehicle speed is below approximately 5 km/h (3 mph) or the A/T shift lever is in a position other than N position, when shifting from H4 to L4 or visa versa, and from L4 to H2.

Transfer Operation

H2 to H4

When the touch select 2-4 SW in the integration control and panel is turned ON, a signal is input into TERMINAL (A) 8 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 2 to transfer shift actuator TERMINAL 2 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (B) 1 to GROUND, and the transfer shifts to 4WD (H4 position.)

When the system shifts to 4WD, the detection SW (Transfer 4WD position) is turned ON, and the current flows from 4WD control ECU TERMINAL (A) 2 to ADD actuator TERMINAL 5 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (A) 1 to GROUND, and the ADD actuator is activated, and the ADD is connected. When the ADD is connected, the detection SW (ADD position SW) is turned ON, and the 4HI Indicator light comes ON.

H4 to H2

When the touch select 2-4 SW in the integration control and panel is turned OFF, a signal is input into TERMINAL (A) 8 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 1 to transfer shift actuator TERMINAL 1 to motor to TERMINAL 2 to 4WD control ECU TERMINAL (B) 2 to GROUND, and the transfer shifts to 2WD (H2 position.)

When the system shifts to 2WD, the detection SW (Transfer 4WD position) is turned OFF, and the current flows from 4WD control ECU TERMINAL (A) 1 to ADD actuator TERMINAL 1 to motor to TERMINAL 5 to 4WD control ECU TERMINAL (A) 2 to GROUND, and the ADD actuator is activated, and the ADD is disconnected. When the ADD is disconnected, the detection SW (ADD position SW) is turned OFF, and the 4HI indicator Light turns OFF.

H4 to L4

When the touch select high-low SW in the integration control and panel is turned ON, a signal is input into TERMINAL (A) 15 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 2 to transfer shift actuator TERMINAL 2 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (B) 1 to GROUND, and the transfer shifts to 4WD LO position (L4 position.)

The 4HI Indicator is turned OFF and the 4LO indicator is turned ON.

L4 to H4

When the touch select high-low SW in the integration control and panel is turned OFF, a signal is input into TERMINAL (A) 15 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 1 to transfer shift actuator TERMINAL 1 to motor to TERMINAL 2 to 4WD control ECU TERMINAL (B) 2 to GROUND, and the transfer shifts to 4WD HI position (H4 Position.)

The 4HI indicator is turned ON and the 4LO indicator is turned OFF.

The shift is not completed even though 3 seconds have elapsed after transfer operation.

- * The vehicle speed is above approximately 100 km/h (63 mph) when shifting from H2 to H4.
- * The vehicle speed is below approximately 5 km/h (3 mph) or the A/T Shift Lever is in a position other than N position, when shifting from H4 to L4 or visa versa, and from L4 to H2.

L4 to H2

When the touch select 2-4 SW in the integration control and panel is turned OFF, a signal is input into TERMINAL (A) 8 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 1 to transfer shift actuator TERMINAL 1 to motor to TERMINAL 2 to 4WD control ECU TERMINAL (B) 2 to GROUND, and the detection SW (Transfer L4 position) is turned OFF.

Furthermore, the motor rotates to shift the transfer to 2WD (H2 position.)

When the system shifts to 2WD, the detection SW (Transfer 4WD position) is turned OFF, and the current flows from 4WD control ECU TERMINAL (A) 1 to ADD actuator TERMINAL 1 to motor to TERMINAL 5 to 4WD control ECU TERMINAL (A) 2 to GROUND, and the ADD actuator is activated, and the ADD is disconnected. When the ADD is disconnected, the detection SW (ADD position SW) is turned OFF, and the 4LO indicator light turns OFF.

4WD (Double Cab)

H2 to L4

When the touch select 2-4 SW in the integration control and panel is turned ON, and the touch select high-low SW is turned ON, a signal is input into TERMINAL (A) 8 of the 4WD control ECU.

The 4WD control ECU is activated by this, and the current flows from the 4WD control ECU TERMINAL (B) 2 to transfer shift actuator TERMINAL 2 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (B) 1 to GROUND, and the transfer shifts to 4WD (H4 position.)

When the system shifts to 4WD, the detection SW (Transfer 4WD position) is turned ON, and the current flows from 4WD control ECU TERMINAL (A) 2 to ADD actuator TERMINAL 5 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (A) 1 to GROUND, and the ADD actuator is activated, and the ADD is connected. Then a signal is input into TERMINAL (A) 15 of the 4WD control ECU and the 4WD control ECU is activated by this, so the current flows from the 4WD control ECU TERMINAL (B) 2 to transfer shift actuator TERMINAL 2 to motor to TERMINAL 1 to 4WD control ECU TERMINAL (B) 1 to GROUND. The transfer shifts to 4WD LO position (L4 position), and the 4LO indicator light comes ON.

NOTICE: When inspecting or repairing the SRS, perform service in accordance with the following precautionary instructions and the procedure, and precautions in the Repair Manual applicable for the model year.

- Malfunction symptoms of the SRS are difficult to confirm, so the DTCs become the most important source of information when troubleshooting. When troubleshooting the SRS, always inspect the DTCs before disconnecting the battery.
- **Work must be started more than 90 seconds after the ignition SW is turned to the "LOCK" position and the negative (-) terminal cable is disconnected from the battery.**
(The SRS is equipped with a back-up power source so that if work is started within 90 seconds from disconnecting the negative (-) terminal cable of the battery, the SRS may deploy.)
- When the negative (-) terminal cable is disconnected from the battery, the memory of the clock and audio system will be cleared. So before starting work, make a record of the contents in the audio memory system. When work is finished, reset the audio systems as they were before and adjust the clock. Some vehicles have power tilt steering, power telescopic steering, power seat and power outside rear view mirror which are all equipped with memory function. However, it is not possible to make a record of these memory contents. So when the work is finished, it will be necessary to explain it to your customer, and ask the customer to adjust the features and reset the memory. To avoid erasing the memory in each system, never use a back-up power supply from outside the vehicle.
- Before repair, remove the airbag sensor if shocks are likely to be applied to the sensor during repair.
- Do not expose the following parts directly to hot air or flame;
- Even in cases of a minor collision where the SRS does not deploy, the following parts should be inspected;
- Never use SRS parts from another vehicle. When replacing parts, replace with new parts.
- For the purpose of reuse, never disassemble and repair the following parts.
- If the following parts have been dropped, or have cracks, dents and other defects in their case, bracket, and connector, replace with new one.
- Use a volt/ohmmeter with high impedance (10 k Ω /V minimum) for troubleshooting electrical circuits of the system.
- Information labels are attached to the periphery of the SRS components. Follow the instructions of the notice.
- After work on the SRS is completed, check the SRS warning light.
- If the vehicle is equipped with a mobile communication system, refer to the precaution in the IN section of the Repair Manual.

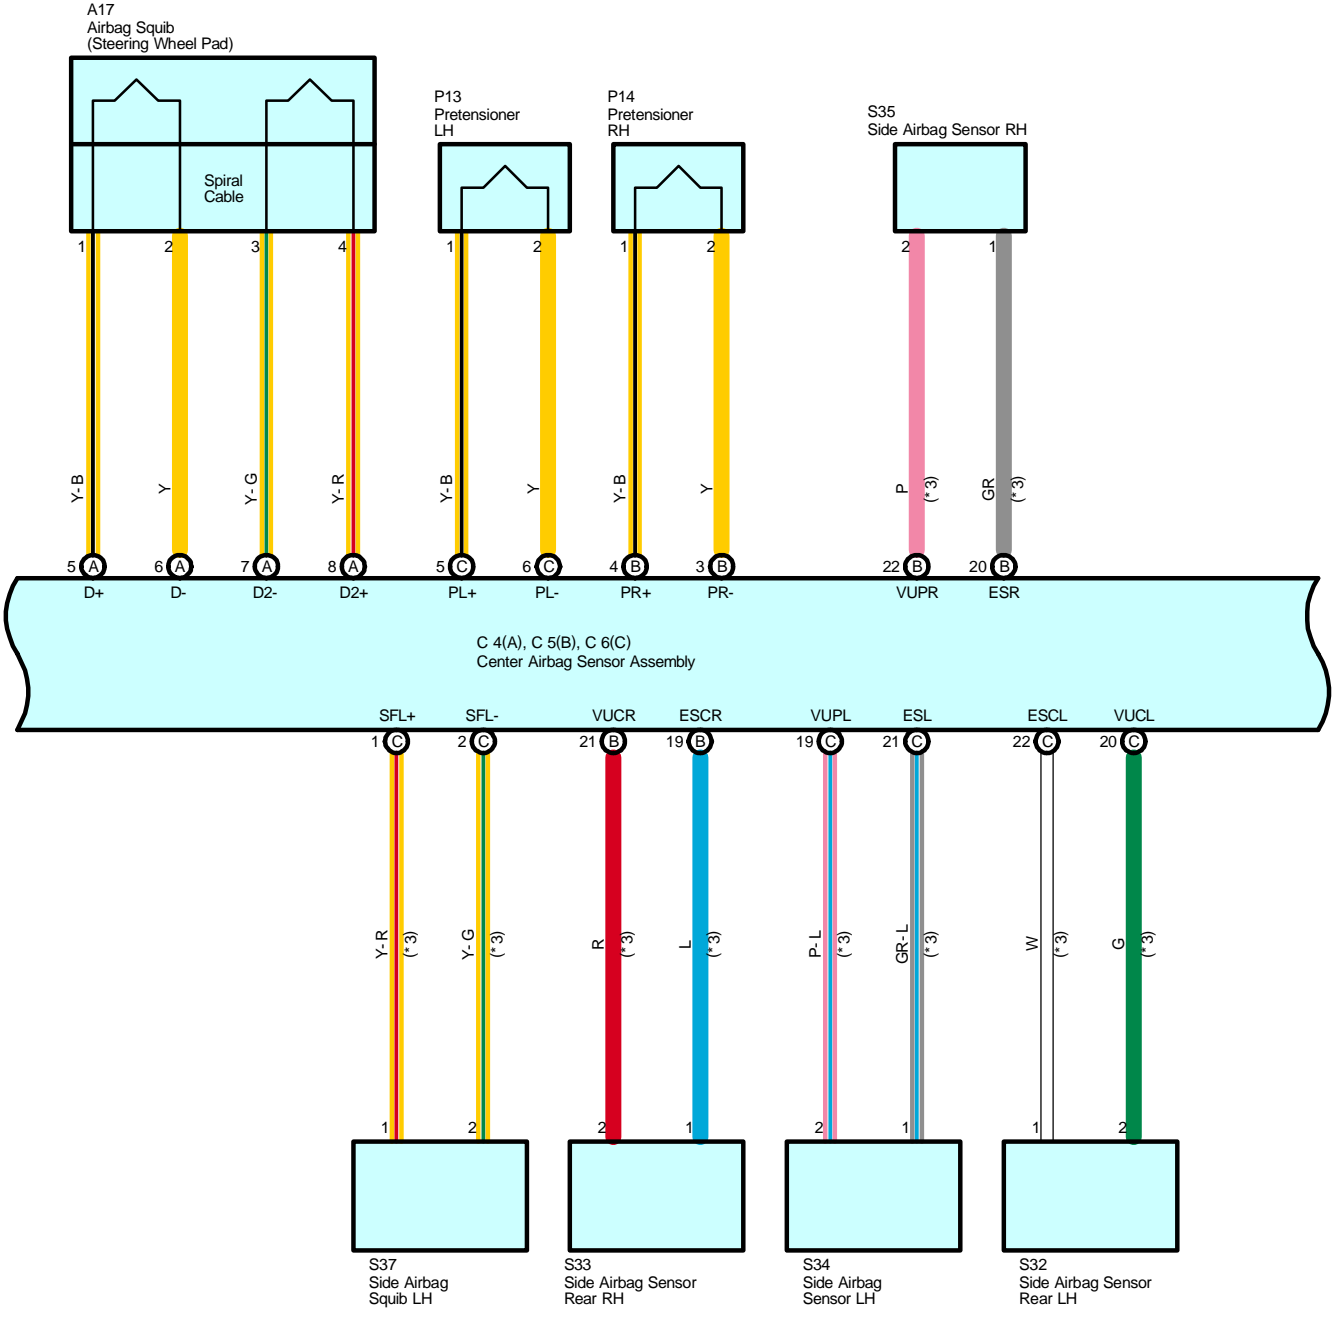

- * Steering wheel pad
- * Front passenger airbag assembly
- * Side airbag assembly
- * Curtain shield airbag assembly
- * Seat belt pretensioner

- * Rear airbag sensor assembly

SRS (Double Cab)

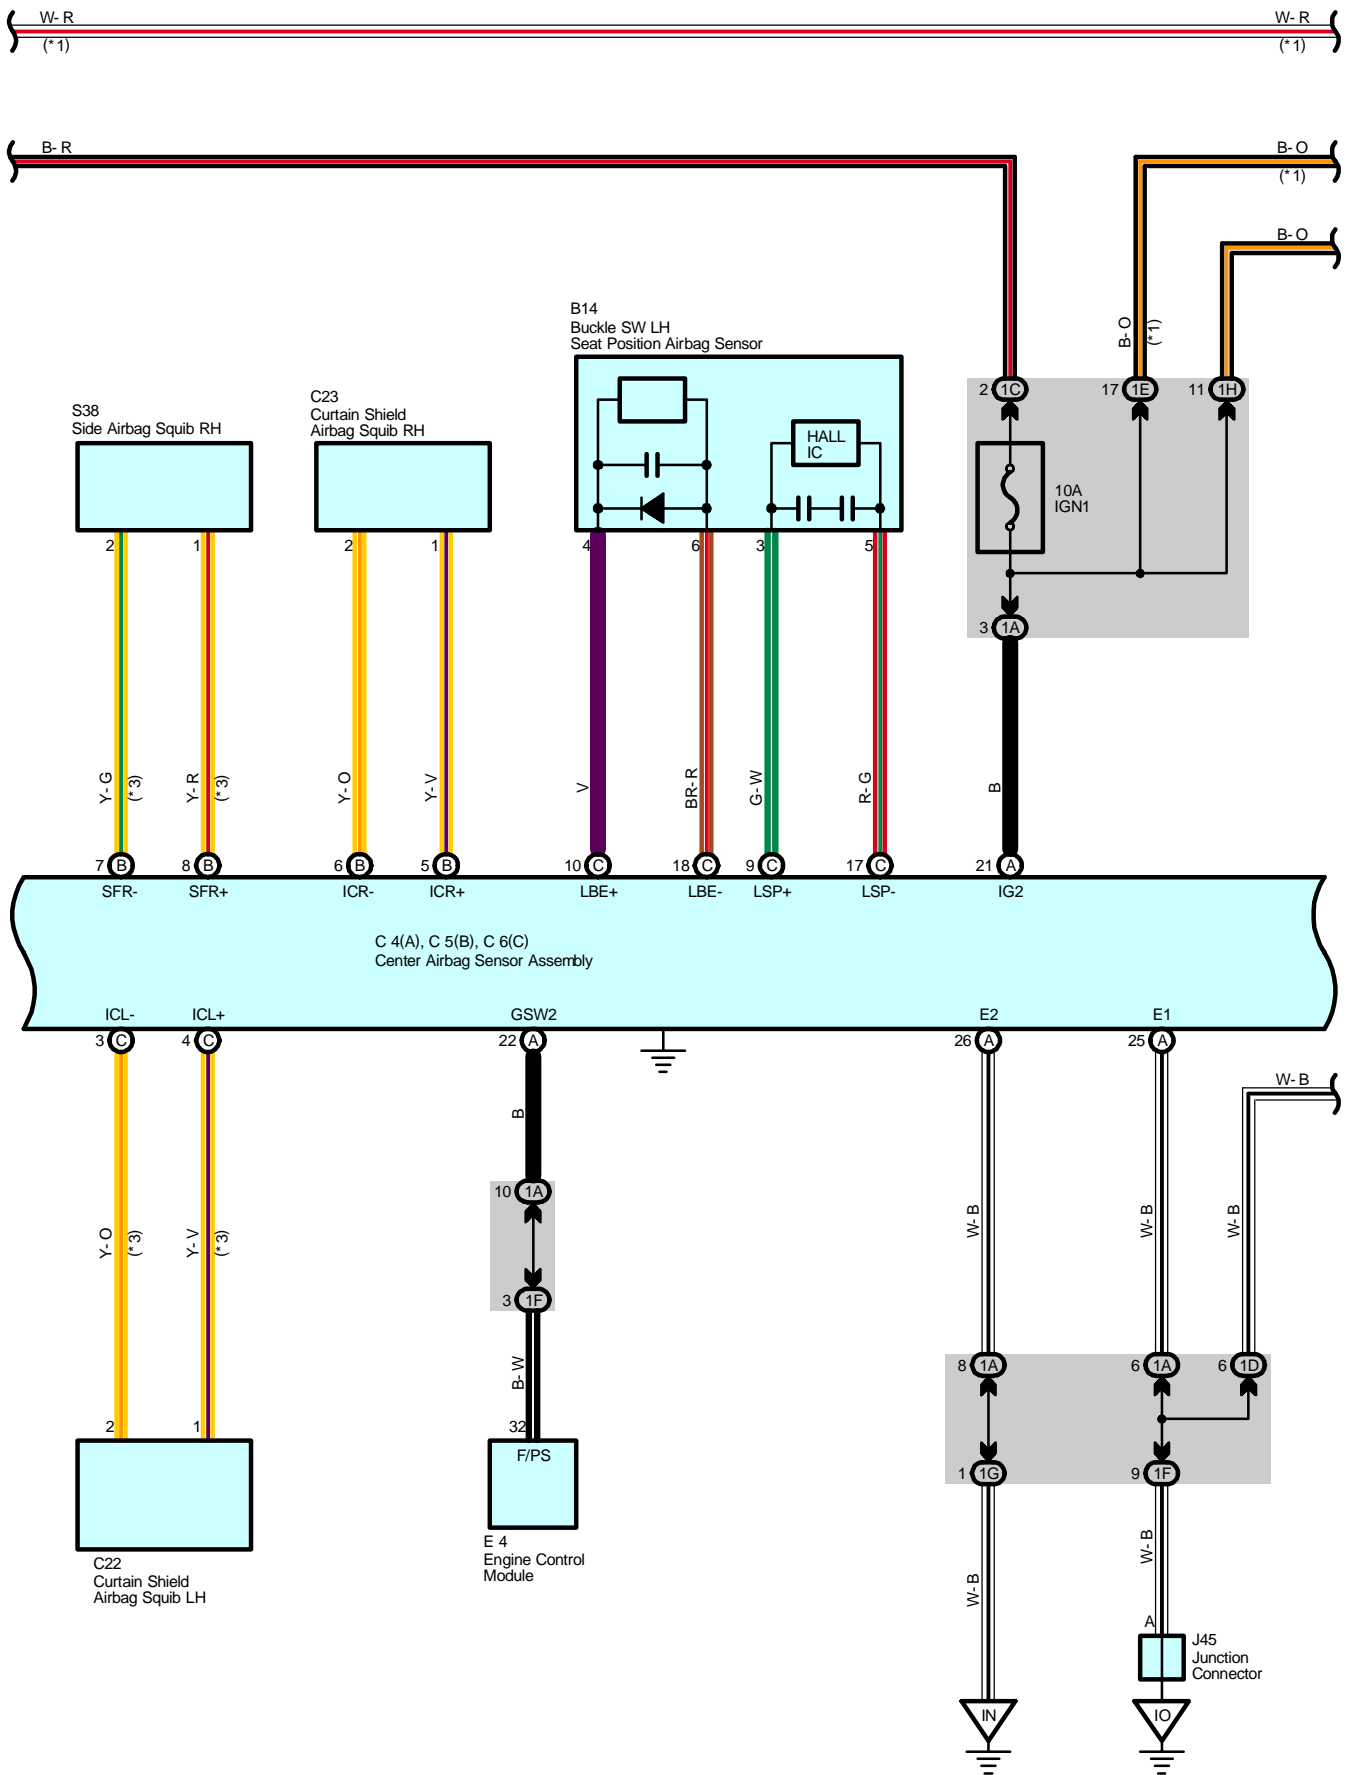

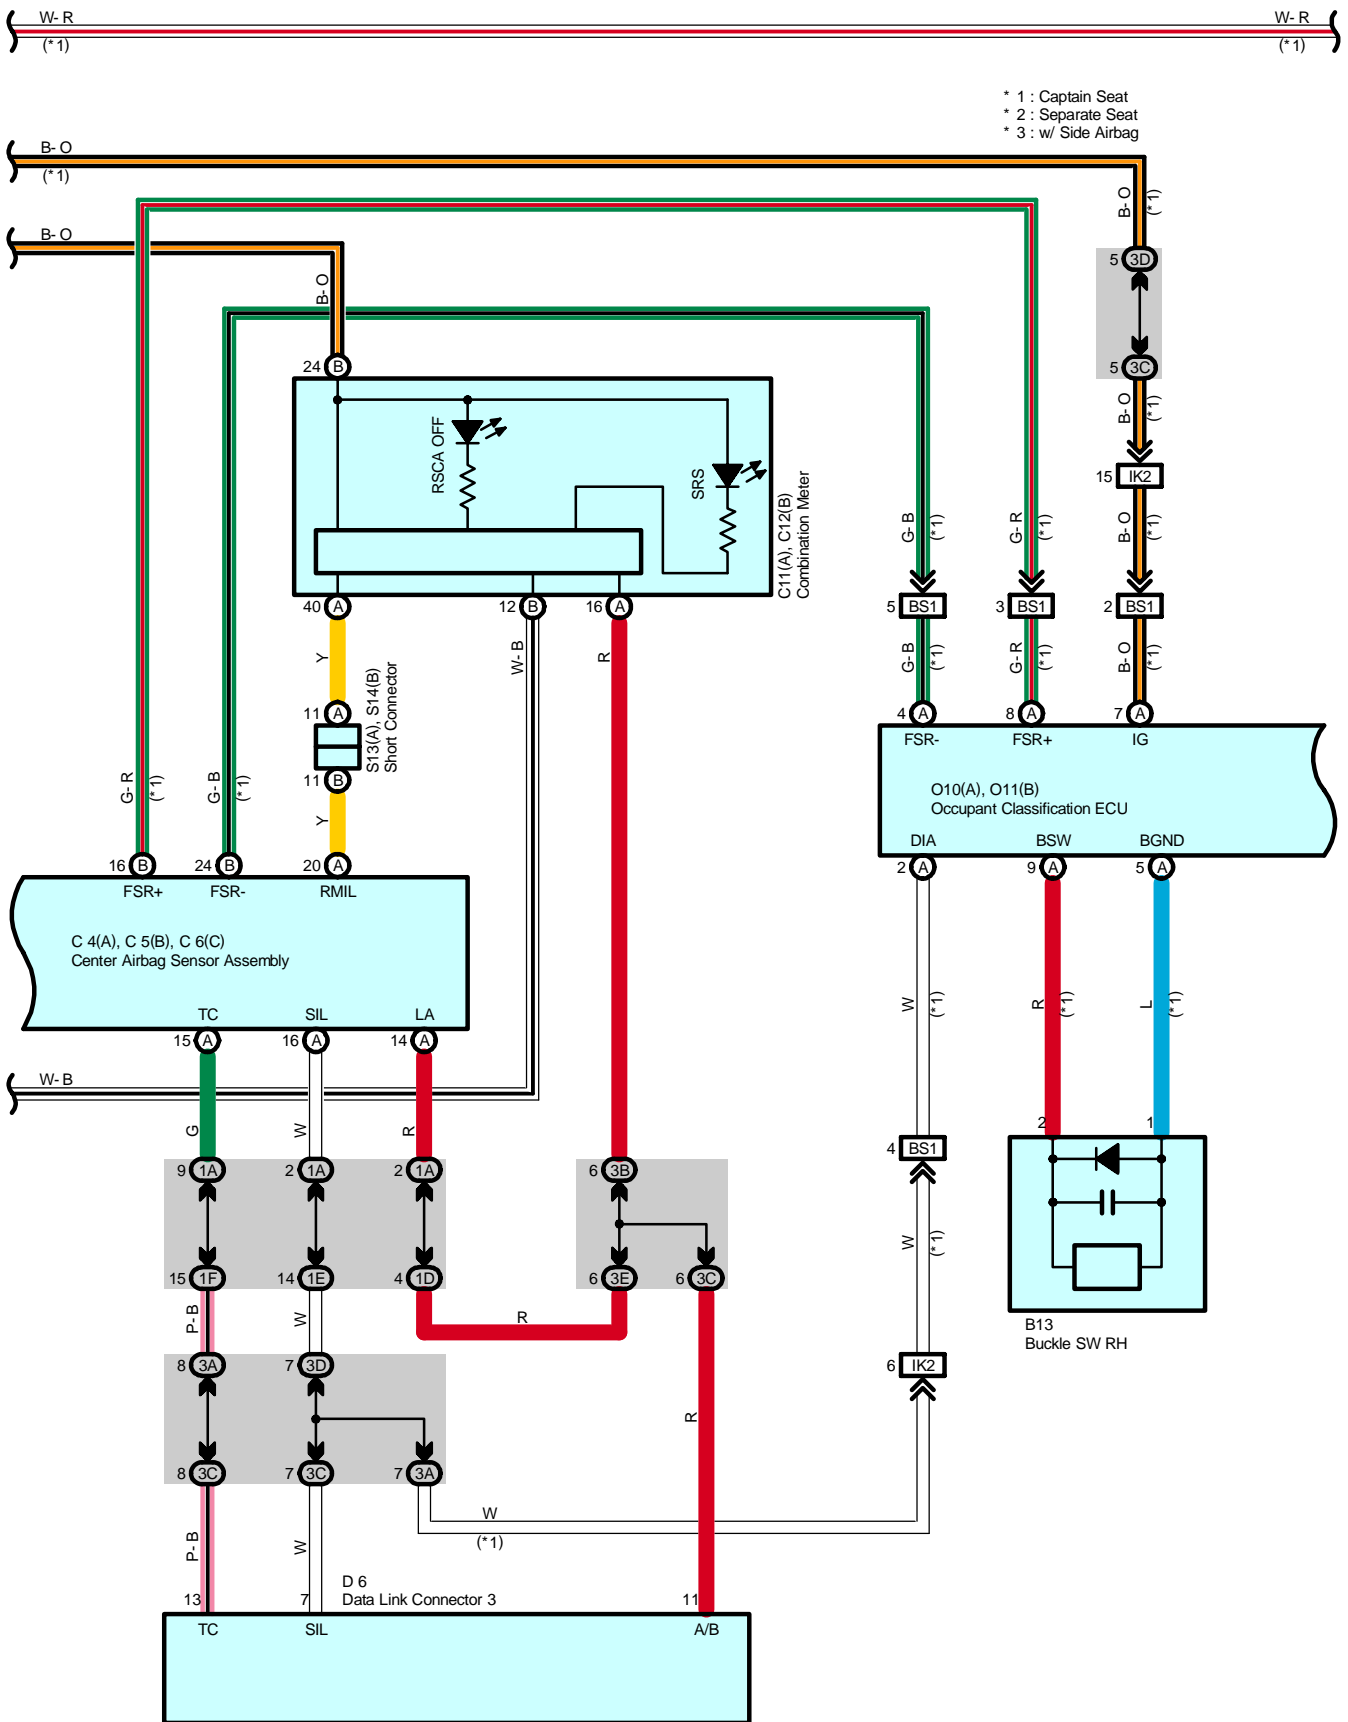

- * 1 : Captain Seat
- * 2 : Separate Seat
- * 3 : w/ Side Airbag

SRS (Double Cab)

SRS (Double Cab)

System Outline

The SRS is a driver protection device which has a supplemental role to the seat belts.

When the ignition SW on, the current from the IGN1 fuse flows to TERMINAL (A) 21 of the center airbag sensor assembly.

If an accident occurs while driving, deceleration caused by a frontal impact is detected (by sensor) and when the frontal impact exceeds a set level, the current from the IGN1 fuse flows to TERMINAL (A) 21 of the center airbag sensor assembly.

This current flows to TERMINALS (A) 4, (A) 5, (B) 4, (B) 5, (C) 4, (C) 5 to TERMINAL 1 of the airbag squib and Pretensioners to TERMINAL 2 to TERMINALS (A) 3, (A) 6, (B) 3, (B) 6, (C) 3, (C) 6 of the center airbag sensor assembly. Furthermore, the current flows to TERMINAL (A) 25 or (A) 26 to GROUND, causing the center airbag squibs to expand.

When the safing sensor built into the center airbag sensor assembly is on, airbag sensor is off and the current from the IGN1 fuse flows same as above-mentioned flowing, causing the airbag squibs to expand. When the safing sensor built into the center airbag sensor assembly is on, the airbag sensor on one of the above-mentioned circuits is activated so that current flows to the airbag squibs and causes them to operate.

The airbag stored inside the steering wheel pad is instantaneously expanded to soften the shock to the driver.

The airbag stored inside the passenger's instrument panel is instantaneously expanded to soften the shock to the passenger.

Moon Roof (Double Cab)

System Outline

The moon roof can be operated by the moon roof control SW, when the ignition SW is at ON position or during the key-off operation.

1. Jam Protection Function

During close or tilt down operation, if the system detects a load, the motor rotates in the opposite direction.

2. Key-Off Operation

With all the doors closed, within 43 seconds after the ignition switch has been turned to OFF from ON, the moon roof can be operated. However, if the front door is opened, the moon roof cannot be operated.

Service Hints

Air Conditioning (Double Cab)

Air Conditioning (Double Cab)

System Outline

1. Heater Blower Motor Operation

Current is applied at all times through the HEATER fuse to TERMINAL 5 of the HTR relay.

When the ignition SW is turned on, current flows through the HTR fuse to TERMINAL 2 of the HTR relay to the coil side to TERMINAL 1 to TERMINAL 3 of the blower SW.

* Low speed operation

When the blower SW is moved to LO position, current flows to TERMINAL 3 of the blower SW to TERMINAL 1 to GROUND, causing the HTR relay to switch on. This causes the current to flow from the HEATER fuse to TERMINAL 5 of the HTR relay to TERMINAL 3 to TERMINAL 2 of the blower motor to TERMINAL 1 to TERMINAL 4 of the blower resistor to TERMINAL 1 to GROUND, causing the blower motor to rotate at low speed.

* Medium speed operation (Operation at M1, M2)

When the blower SW is moved to M1 position, current flows to TERMINAL 3 of the blower SW to TERMINAL 1 to GROUND, turning the HTR relay to switch on. This causes the current to flow from the HEATER fuse to TERMINAL 5 of the HTR relay to TERMINAL 3 to TERMINAL 2 of the blower motor to TERMINAL 1 to TERMINAL 4 of the blower resistor to TERMINAL 3 to TERMINAL 4 of the blower SW to TERMINAL 1 to GROUND. At this time, the blower resistance of the blower resistor is less than at low speed, so the blower motor rotates at medium low speed.

When the blower SW is moved to M2 position, current flows through the motor flows from TERMINAL 4 of the blower resistor to TERMINAL 2 to TERMINAL 8 of the blower SW to TERMINAL 1 to GROUND. At this time, resistance of the blower resistor is less than at M1 position, so the blower motor rotates at medium high speed.

* High speed operation

When the blower SW is moved to HIGH position, current flows to TERMINAL 3 of the blower SW to TERMINAL 1 to GROUND, turning the HTR relay to switch on.

This causes the current to flow from the HEATER fuse to TERMINAL 5 of the HTR relay to TERMINAL 3 to TERMINAL 2 of the blower motor to TERMINAL 1 to TERMINAL 5 of the blower SW to TERMINAL 1 to GROUND, causing the blower motor to rotate at high speed.

2. Operation of Air Inlet Control Servo Motor

* Switching from FRESH to RECIRC

With the ignition SW turned on, current flows from the HTR fuse to TERMINAL 5 of the air inlet control servo motor. When the RECIRC/FRESH SW is switched to the RECIRC side, current flows from TERMINAL 5 of the air inlet control servo motor to TERMINAL 1 to TERMINAL (A) 8 of the integration control and panel to TERMINAL (B) 10 to GROUND. The motor rotates and the damper moves to the RECIRC side. When it is in the RECIRC position, current is cut inside the servo motor and the damper stops at that position.

* Switching from RECIRC to FRESH

With the ignition SW turned on, when the RECIRC/FRESH SW is switched to the FRESH side, current flows from TERMINAL 5 of the air inlet control servo motor to TERMINAL 2 to TERMINAL (A) 7 of the integration control and panel to TERMINAL (B) 10 to GROUND, the motor rotates and the damper moves to the FRESH side. when it is in the FRESH position, current is cut inside the servo motor and the damper stops at that position. When the ignition SW turned on, and mode SW (Integration control and panel) is at DEF or F/DEF position, it causes the damper to move to the FRESH side. Whether the RECIRC/FRESH SW (Integration control and panel) is on or not.

3. Air Conditioning Operation

When the blower SW is on, current flows from the HTR fuse to the HTR relay (Coil side) to TERMINAL 3 of the blower SW to TERMINAL 1 to GROUND, activating the HTR relay. This causes current to flow from the HEATER fuse to the HTR relay (Point side) to A/C fuse to TERMINAL (B) 14 of the A/C SW (Integration control and panel). When the A/C SW (Integration Control and panel) is turned on. Current flows from the A/C fuse to TERMINAL (B) 14 of the integration control and panel to TERMINAL (B) 18 to A/C magnetic clutch. Causing The compressor to operate.

When blower SW is on and mode SW (Integration control and panel) is at DEF or F/DEF position, it causes A/C to run whether A/C SW (Integration control and panel) is on or not.

Service Hints

HEATER Relay

5-3 : Closed with ignition SW on and heater blower SW on

A1 A/C Dual Pressure SW

1-2 : Open with refrigerant pressure at less than approx. 2.0 kgf/cm² (196.1 kpa, 28.4 psi) or more than approx. 32.0 kgf/cm² (3138.1 kpa, 455 psi)

I25 (B) Integration Control and Panel

(B)17-Ground : Approx. 12 volts with ignition SW at ON or ST position

(B)14-Ground : Approx. 12 volts with ignition SW on and blower SW on

(B)10-Ground : Always continuity

M OVERALL ELECTRICAL WIRING DIAGRAM

* The system shown here is an EXAMPLE ONLY. It is different to the actual circuit shown in the wiring diagram section.

HOW TO READ THIS SECTION

[A] : System Title

[B] : Indicates the wiring color.

Wire colors are indicated by an alphabetical code.

- | | | |
|------------|------------|------------------|
| B = Black | W = White | BR = Brown |
| L = Blue | V = Violet | SB = Sky Blue |
| R = Red | G = Green | LG = Light Green |
| P = Pink | Y = Yellow | GR = Gray |
| O = Orange | | |

The first letter indicates the basic wire color and the second letter indicates the color of the stripe.

Example: L - Y

[C] : The position of the parts is the same as shown in the wiring diagram and wire routing.

[D] : Indicates the pin number of the connector. The numbering system is different for female and male connectors.

Example : Numbered in order from upper left to lower right

Numbered in order from upper right to lower left

Female

Male

The numbering system for the overall wiring diagram is the same as above

[E] : Indicates a Relay Block. No shading is used and only the Relay Block No. is shown to distinguish it from the J/B.

Example :  Indicates Relay Block No.1

[F] : Junction Block (The number in the circle is the J/B No. and the connector code is shown beside it). Junction Blocks are shaded to clearly separate them from other parts.

Example:

[G] : Indicates related system.

[H] : Indicates the wiring harness and wiring harness connector. The wiring harness with male terminal is shown with arrows (↘). Outside numerals are pin numbers.

[I] : () is used to indicate different wiring and connector, etc. when the vehicle model, engine type, or specification is different.

[J] : Indicates a shielded cable.

[K] : Indicates and located on ground point.

[L] : The same code occurring on the next page indicates that the wire harness is continuous.

Foreword

Welcome to the growing group of value-conscious people who drive Toyotas. We are proud of the advanced engineering and quality construction of each vehicle we build.

This Owner's Manual explains the operation of your new Toyota. Please read it thoroughly and have all the occupants follow the instructions carefully. Doing so will help you enjoy many years of safe and trouble-free motoring. For important information about this manual and your Toyota, read the following pages carefully.

When it comes to service, remember that your Toyota dealer knows your vehicle very well and is interested in your complete satisfaction. Your Toyota dealer will provide quality maintenance and any other assistance you may require.

If there is not a Toyota dealer near you, or you need emergency assistance for any reason, please call the following number:

▶ U.S. OWNERS:	Toyota Customer Assistance Center	Toll-free: 1-800-331-4331
▶ CANADIAN OWNERS:	Toyota Canada Customer Interaction Centre	Toll-free: 1-888-TOYOTA-8 (1-888-869-6828)

Please leave this Owner's Manual in this vehicle at the time of resale. The next owner will need this information also.

All information and specifications in this manual are current at the time of printing. However, because of Toyota's policy of continual product improvement, we reserve the right to make changes at any time without notice.

Please note that this manual applies to all models and explains all equipment, including options. Therefore, you may find some explanations for equipment not installed on your vehicle.

SECTION 1-2

OPERATION OF INSTRUMENTS AND CONTROLS

Keys and Doors

Keys	16
Front doors	16
Side doors	18
Access doors	20
Wireless remote control	21
Power windows	31
Rear side windows	34
Back window	35
Power back window	35
Tailgate	37
Hood	38
Toyota vehicle intrusion protection system (TVIP)	39
Theft deterrent system	41
Fuel tank cap	42
Electric moon roof	45

Keys

These keys work in every lock.

Your vehicle is supplied with two kinds of keys.

1. Master keys—These keys work in every lock.
2. Sub key—This key will not work in the glove box.

To protect items locked in the glove box when using valet parking, leave the sub key with the attendant.

Since the side doors can be locked without a key, you should always carry a spare key in case you accidentally lock your keys inside the vehicle.

KEY NUMBER PLATE

Your key number is shown on the plate. Keep the plate in a safe place such as your wallet, not in the vehicle.

If you should lose your keys or if you need additional keys, duplicates can be made by a Toyota dealer using the key number.

We recommend writing down the key number and storing it in a safe place.

Front doors (standard and access cab models)

LOCKING AND UNLOCKING WITH KEY

Insert the key into the keyhole and turn it.

To lock: Turn the key forward.

To unlock: Turn the key backward.

Vehicles with power door lock system— Both doors lock and unlock simultaneously with either door. In the driver's door lock, turning the key once will unlock the driver's door and twice in succession will unlock the driver's door and passenger's door simultaneously.

LOCKING AND UNLOCKING WITH INSIDE LOCK KNOB

Move the lock knob.

To lock: Push the knob forward.
To unlock: Pull the knob backward.

Closing the door with the lock knob in the lock position will also lock the door. Be careful not to lock your keys in the vehicle.

Vehicles with power door lock system—
The door will not lock if the key is left in the ignition switch when closing the front doors.

Driver's side

Passenger's side

LOCKING AND UNLOCKING WITH POWER DOOR LOCK SWITCH

Push the switch.

To lock: Push the switch down on the front side.

To unlock: Push the switch down on the rear side.

Both doors lock or unlock simultaneously.

CAUTION

Before driving, be sure that the doors are closed and locked, especially when small children are in the vehicle. Along with the proper use of seat belts, locking the doors helps prevent the driver and passengers from being thrown out from the vehicle during an accident. It also helps prevent the doors from being opened unintentionally.

**Side doors
(double cab models)**

LOCKING AND UNLOCKING WITH KEY
Insert the key into the keyhole and turn it.

To lock: Turn the key forward.
To unlock: Turn the key backward.

All the doors lock and unlock simultaneously with either front door. In the driver's door lock, turning the key once will unlock the driver's door and twice in succession will unlock all the doors simultaneously.

This double key turning operation to unlock all the doors can be changed to a single key turning operation. For details, contact your Toyota dealer.

When all the doors are unlocked simultaneously using a key, the interior light, ignition switch light, step light come on for about 15 seconds and cargo lamp for about 20 seconds before fading out. (For details, see "Center interior and personal lights", "Ignition switch and step lights" and "Cargo lamp" in Section 1-5.)

**LOCKING AND UNLOCKING WITH
INSIDE LOCK KNOB**

Move the lock knob.

To lock: Push the knob forward.
To unlock: Pull the knob backward.

The front doors can be opened by pulling the inside handles even if the lock knobs are in the locked position.

CAUTION

Do not pull the inside handle of the front doors while driving. The doors will open and an accident may occur. Toyota strongly recommends that all children be placed in the rear seat of the vehicle.

Closing the door with the lock knob in the lock position will also lock the door. Be careful not to lock your keys in the vehicle.

Doors cannot be locked when either front door is open and the key is in the ignition.

Driver's side

Passenger's side

LOCKING AND UNLOCKING WITH POWER DOOR LOCK SWITCH

Push the switch.

To lock: Push the switch down on the front side.

To unlock: Push the switch down on the rear side.

All the doors lock or unlock simultaneously.

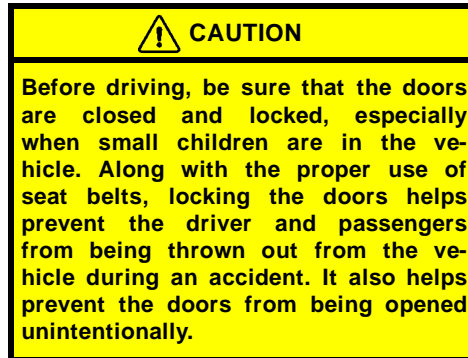

When the front doors are locked with the inside lock knob, the key or the wireless remote control transmitter, the power door lock switch will not work until either front door is unlocked with the key, lock knob, or wireless remote control transmitter.

REAR DOOR CHILD-PROTECTORS

Move the lock lever to the "LOCK" position as shown on the label.

When the child-protector is locked, you cannot open the rear door by the inside door handle. We recommend using this feature whenever small children are in the vehicle.

**Access doors
(access cab models)**

**Wireless remote control
(standard and access cab
models for U.S.A. only)—**

For easy access to the rear seat, open the access door (rear door).

To open: First, open the front door widely. Then pull the outside handle or inside lever of the access door.

If you try to open the front and rear doors simultaneously, they will not open.

To close: First, close the access door completely. Then close the front door.

You can open and close the access door only when the front door is widely opened.

NOTICE

The front door and access door could be damaged if they hit each other when being opened or closed. Be sure to follow the above instructions.

1. Indicator light
2. "LOCK" switch
3. "UNLOCK" switch
4. "PANIC" switch

The wireless remote control system is designed to lock or unlock all the doors or activate the "PANIC" mode from a distance within approximately 1 m (3 ft.) of the vehicle.

When you operate any switch, push it slowly and securely.

The wireless remote control transmitter is an electronic component. Observe the following instructions in order not to cause damage to the transmitter.

- ▶ Do not leave the transmitter in places where the temperature becomes high such as on the dashboard.
- ▶ Do not disassemble it.
- ▶ Avoid knocking it hard against other objects or dropping it.
- ▶ Avoid putting it in water.

You can use up to 4 wireless remote control transmitters for the same vehicle. Contact your Toyota dealer for detailed information.

'05 TUNDRA_U (L/O 0409)

If the wireless remote control transmitter does not actuate the doors or alarm, or operate from a normal distance, or the indicator light on the transmitter is dimmed or does not come on:

- ▶ Check for closeness to a radio transmitter such as a radio station or an airport which can interfere with normal operation of the transmitter.
- ▶ The battery may have been consumed. Check the battery in the transmitter. To replace the battery, see “—Replacing battery”.

If you lose your transmitter, contact your Toyota dealer as soon as possible to avoid the possibility of theft, or an accident. (See “If you lose your wireless remote control transmitter” in Section 4.)

MODEL/FCC ID: BAB237131-056
CAN: 2024 102 1519
ASSEMBLED IN U.S.A.

This complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

—Locking and unlocking doors

Locking operation

Unlocking operation

To lock and unlock all the doors, push the switches slowly and securely. At this time, the indicator light on the transmitter flash once.

To lock: Push the "LOCK" switch. All the doors are locked simultaneously. At this time one beep will be heard, and the tail lights and front side marker lights will flash once.

Check to see that the doors are securely locked.

If any door is not securely closed, locking cannot be performed by the "LOCK" switch and a beep will sound continuously for 5 seconds. However, if the key is in the ignition, a beep will not sound.

To stop the beep, close all the doors securely or push the "UNLOCK" switch.

To unlock: Push the "UNLOCK" switch once to unlock the driver's door alone. Pushing the switch twice within 3 seconds unlocks all the doors simultaneously. Each time the "UNLOCK" switch is pushed, two beeps will be heard, and the tail lights and front side marker lights will flash twice.

When the "UNLOCK" switch is pressed, the interior light, personal light come on. The lights remain on for about 30 seconds unless any door is opened and closed. (For details, see "Interior light" and "Personal lights" in Section 1-5.)

You have 30 seconds to open a door after using the wireless remote unlock feature. If a door is not opened by then, all the doors will be automatically locked again.

If the "LOCK" or "UNLOCK" switch is kept pressed in, the locking or unlocking operation is not repeated. Release the switch and then push again.

—Activating panic mode

Pushing the "PANIC" switch blows the horn intermittently, flashes the tail lights, and turns on the interior light.

The "PANIC" switch is used to deter vehicle theft when you witness anyone attempting to break into or damage your vehicle.

The alarm will last for one minute. To stop alarm midway, push the "PANIC" switch once again, lock or unlock any door with the key or transmitter, or turn the ignition key from the "LOCK" to "ON" position.

The "PANIC" mode does not work when the ignition key is in the ignition switch.

—Replacing battery

For replacement, use a CR2025 lithium battery or equivalent.

CAUTION
Special care should be taken to prevent small children from swallowing the removed transmitter battery or components.

NOTICE

- ◆ *When replacing the battery, be careful not to lose the components.*
- ◆ *Replace only with the same or equivalent type recommended by a Toyota dealer.*
- ◆ *Dispose of used batteries according to the local laws.*

Replace the transmitter battery by following these procedures:

1. Using a coin or equivalent, open the transmitter case.

2. Remove the rubber gasket and set it aside.

'05 TUNDRA_U (L/O 0409)

3. Remove the discharged transmitter battery.

NOTICE

Do not bend the terminals.

4. Put in a new transmitter battery with positive (+) side up.

Place the rubber gasket back on the transmitter. Then close the transmitter case securely.

NOTICE

- ◆ ***Make sure the positive side and negative side of the transmitter battery are faced correctly.***
- ◆ ***Do not replace the battery with wet hands. Water may cause unexpected rust.***

- ◆ ***Do not touch or move any components inside the transmitter, or it may interfere with proper operation.***
- ◆ ***Be careful not to bend the electrode when inserting the transmitter battery and that dust or oils do not adhere to the transmitter case.***
- ◆ ***Close the transmitter case securely.***

After replacing the battery, check that the transmitter operates properly. If the transmitter still does not operate properly, contact your Toyota dealer.

**Wireless remote control
(double cab models)—**

1. "LOCK" switch
2. "UNLOCK" switch
3. "PANIC" switch

The wireless remote control system is designed to lock or unlock all the doors or activate the "PANIC" mode from a distance within approximately 1 m (3 ft.) of the vehicle.

When you operate any switch, push it slowly and securely.

The wireless remote control transmitter is an electronic component. Observe the following instructions in order not to cause damage to the transmitter.

- ▶ Do not leave the transmitter in places where the temperature becomes high such as on the dashboard.
- ▶ Do not disassemble it.
- ▶ Avoid knocking it hard against other objects or dropping it.
- ▶ Avoid putting it in water.

You can use up to 4 wireless remote control transmitters for the same vehicle. Contact your Toyota dealer for detailed information.

If the wireless remote control transmitter does not actuate the doors or alarm, or operate from a normal distance:

- ▶ Check for closeness to a radio transmitter such as a radio station or an airport which can interfere with normal operation of the transmitter.
- ▶ The battery may have been consumed. Check the battery in the transmitter. To replace the battery, see "—Replacing battery".

If you lose your transmitter, contact your Toyota dealer as soon as possible to avoid the possibility of theft, or an accident. (See "If you lose your wireless remote control transmitter" in Section 4.)

For vehicles sold in U.S.A.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

NOTICE:

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- ▶ Reorient or relocate the receiving antenna.
- ▶ Increase the separation between the equipment and receiver.

- ▶ Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- ▶ Consult the dealer or an experienced radio / TV technician for help.

FCC WARNING:

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

For vehicles sold in Canada

Operation is subject to the following two conditions:

- (1) this device may not cause interference, and
- (2) this device must accept any interference, including interference that may cause undesired operation of the device.

—Locking and unlocking doors

Locking operation

Unlocking operation

'05 TUNDRA_U (L/O 0409)

To lock and unlock all the doors, push the switches slowly and securely.

To lock: Push the "LOCK" switch. All the doors are locked simultaneously. At this time one beep will be heard, and the parking lights, tail lights and license plate lights flash once.

Check to see that all the doors are securely locked.

If any of the doors is not securely closed, locking cannot be performed by the "LOCK" switch and a beep will sound continuously for 10 seconds. However, if the key is in the ignition, a beep will not sound.

To stop the beep, close all the doors securely or push the "UNLOCK" switch.

The beep can be disabled. For details, contact your Toyota dealer.

To unlock: Push the "UNLOCK" switch once to unlock the driver's door alone. Pushing the switch twice within 3 seconds unlocks all the doors simultaneously. Each time the "UNLOCK" switch is pushed, two beeps will be heard, and the parking lights, tail lights and license plate lights flash twice.

This double switch operation to unlock all the doors can be changed to a single switch operation. For details, contact your Toyota dealer.

When all the doors are unlocked simultaneously with a wireless remote control transmitter, the interior light, ignition switch light, step light come on for about 15 seconds and cargo lamp for about 20 seconds before fading out, even if the door is not opened. (For details, see "Center interior and personal lights", "Ignition switch and step lights" and "Cargo lamp" in Section 1-5.)

You have 30 seconds to open a door after using the wireless remote unlock feature. If a door is not opened by then, all the doors will be automatically locked again.

The timing for the automatic door lock function can be changed. For details, contact your Toyota dealer.

If the "LOCK" or "UNLOCK" switch is kept pressed in, the locking or unlocking operation is not repeated. Release the switch and then push again.

The wireless door locking or unlocking function can be erased. For details, contact your Toyota dealer.

SWITCHING BEEP SOUND ON AND OFF

You can switch the beep on and off. (The beep is on initially and after battery replacement.)

To switch the beep on and off:

With the driver's door opened—

1. Insert the ignition key and remove it.
2. Within 5 seconds, insert the ignition key again and turn it to the "ON" position.
3. After 10 seconds, push the same "LOCK", "UNLOCK" or "PANIC" switch twice within 10 seconds.

Two beep sounds inform you that the program has been switched on or off.

If this procedure is not followed exactly, the beep will not operate as expected.

Check the beep ON/OFF operation by pushing the transmitter switch after you finish this procedure. If the beep does not operate as expected, repeat this procedure from step 1.

—Activating panic mode

Pushing the “PANIC” switch blows the horn intermittently and flashes the headlights and tail lights.

The “PANIC” switch is used to deter vehicle theft when you witness anyone attempting to break into or damage your vehicle.

The alarm will last for one minute. To stop alarm midway, do the following:

- ▶ Push any of the switches on the wireless remote control transmitter.
- ▶ Unlock any of the doors with the key.
- ▶ Turn the ignition key from the “LOCK” to the “ON” position.

The “PANIC” mode does not work when the ignition key is in the “ON” position.

This alarm function can be disabled. For details, contact your Toyota dealer.

—Replacing battery

For replacement, use a CR2016 lithium battery or equivalent.

CAUTION

Special care should be taken to prevent small children from swallowing the removed battery or components.

NOTICE

- ◆ *When replacing the transmitter battery, be careful not to lose the components.*
- ◆ *Replace only with the same or equivalent type recommended by a Toyota dealer.*
- ◆ *Dispose of used batteries according to the local laws.*

Replace the battery by following these procedures:

'05 TUNDRA_U (L/O 0409)

1. Using a coin or equivalent, open the transmitter case.

2. Remove the discharged transmitter battery.

NOTICE

Do not bend the terminals.

3. Put in a new transmitter battery with positive (+) side up.

Close the transmitter case securely.

NOTICE

- ◆ *Make sure the positive side and negative side of the transmitter battery are faced correctly.*
- ◆ *Do not replace the battery with wet hands. Water may cause unexpected rust.*
- ◆ *Do not touch or move any components inside the transmitter, or it may interfere with proper operation.*

- ◆ *Be careful not to bend the electrode when inserting the transmitter battery and that dust or oils do not adhere to the transmitter case.*
- ◆ *Close the transmitter case securely.*

After replacing the battery, check that the transmitter operates properly. If the transmitter still does not operate properly, contact your Toyota dealer.

Power windows

Standard and access cab models

Double cab models

The windows can be operated with the switch on either front door (standard and access cab models)/each door (double cab models).

The power windows work when the ignition switch is in the "ON" position.

Key off operation: If both front doors are closed, they work for 43 seconds even after the ignition switch is turned off. They stop working when either front door is opened.

OPERATING THE DRIVER'S WINDOW

Use the switch on the driver's door.

Normal operation: The window moves as long as you hold the switch.

To open: Lightly push down the switch.

To close: Pull up the switch.

'05 TUNDRA_U (L/O 0409)

Standard and access cab models

Automatic operation (to open only): Push the switch completely down and then release it. The window will fully open. To stop the window partway, lightly pull the switch up and then release it.

Driver's door switch (standard and access cab models)

Double cab models

Driver's door switches (double cab models)

Passenger's door switch (Standard and access cab models)

Passenger's door switches (Double cab models)

OPERATING THE PASSENGERS' WINDOWS

Use the switches on the passenger's door (standard and access cab models)/passengers' doors (double cab models) or the switch on the driver's door that controls each passenger's window.

The window moves as long as you hold the switch.

To open: Push down the switch.

To close: Pull up the switch.

If you push in the window lock switch on the driver's door, the passenger's (standard and access cab models)/passengers' (double cab models) windows and power back window cannot be operated.

 CAUTION

To avoid serious personal injury, you must do the following.

- ▶ Before you close the power windows, always make sure there is nobody around the power windows. You must also make sure the heads, hands and other parts of the bodies of all occupants are kept completely inside the vehicle. If someone's neck, head or hands get caught in a closing window, it could result in a serious injury. When anyone closes the power windows, make sure he or she operates the windows safely.
- ▶ When small children are in the vehicle, never let them use the power window switches without supervision. Use the window lock switch to prevent them from making unexpected use of the switches.

- ▶ Be sure to remove the ignition key when you leave your vehicle.
- ▶ Never leave anyone (particularly a small child) alone in your vehicle, especially with the ignition key still inserted. Otherwise, he/she could use the power window switches and get trapped in a window. Unattended person (particularly a small child) can be involved in a serious accident.

**Rear side windows
(access cab models)**

To open the rear side window, pull the latch handle toward you and swing it fully out.

After closing the window, make sure it is completely closed.

Back window

To open the back window, push the lever and slide the window.

After closing the window, make sure it is completely closed.

Power back window

Access cab models

Double cab models

The back window can be operated with the switch on the instrument panel.

The ignition key must be in the "ON" position.

Key off operation: If both front doors are closed, they work 43 seconds even after the ignition switch is turned off. The power back window stops working when either front door is opened.

The back window moves as long as you hold the switch.

Access cab models—

To open: Push the switch on the "➡" side.

To close: Push the switch on the "⬅️" side.

Double cab models—

To open: Push the switch on the "▼" side.

To close: Push the switch on the "▲" side. At this time, the window will stop partway. Push the switch again to fully close the window.

Access cab models only—If you push in the window lock switch on the driver's door, the back window cannot be operated.

⚠ CAUTION

To avoid serious personal injury, you must do the following.

- ▶ Before you close the power back window, always make sure there is nobody around the power back window. You must also make sure the heads, hands and other parts of the bodies of all occupants are kept completely inside the vehicle. If someone's neck, head or hands get caught in a closing window, it could result in a serious injury. When anyone closes the power back window, make sure he or she operates the window safely.
- ▶ When small children are in the vehicle, never let them use the power back window switch without supervision.
- ▶ Be sure to remove the ignition key when you leave your vehicle.

- ▶ Never leave anyone (particularly a small child) alone in your vehicle, especially with the ignition key still inserted. Otherwise, he/she could use the power back window switch and get trapped in a window. Unattended person (particularly a small child) can be involved in a serious accident.
- ▶ Keep the back window closed while driving. This not only keeps the luggage from being thrown out but also prevents exhaust gases from entering the vehicle.

Tailgate

OPENING

To open the tailgate, pull the handle up.

The support cables will hold the tailgate horizontal.

See “—Stowage precautions” in Section 2 for precautions when loading luggage.

After closing the tailgate, try pulling and pushing it to make sure it is securely closed.

NOTICE

Avoid driving with the tailgate open.

REMOVAL

1. Open the tailgate to the angle where you can release the brackets on the support cables from the lugs on both sides.

To release the support cable bracket, lift it up and slide it off.

2. Tilt the tailgate to about 30° from vertical and pull up the right side of the tailgate to unhook the right side.

3. Slide the tailgate a little to the right to unhook the left side.

To attach the tailgate, follow the removal procedure in reverse order.

After closing the tailgate, try pulling it toward you to make sure it is securely closed.

We recommend you keep the tailgate closed when not in use.

NOTICE

Make sure the support brackets are securely latched on both side panels when installing the tailgate.

LOCKING AND UNLOCKING WITH KEY
Insert the key into the keyhole and turn it to lock or unlock the tailgate.

To lock: Turn the key clockwise.

To unlock: Turn the key counterclockwise.

Hood

To open the hood:

1. Pull the hood lock release lever. The hood will spring up slightly.

CAUTION

Before driving, be sure that the hood is closed and securely locked. Otherwise, the hood may open unexpectedly while driving and an accident may occur.

'05 TUNDRA_U (L/O 0409)

Toyota vehicle intrusion protection system (TVIP) (standard and access cab models for U.S.A. only)

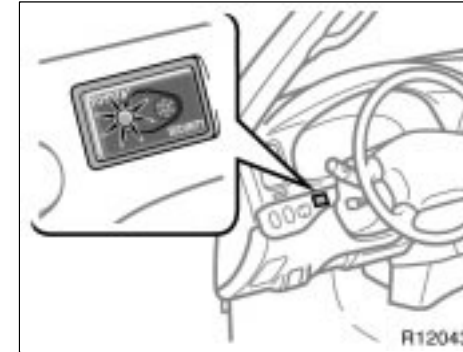

2. In front of the vehicle, pull up the auxiliary catch lever and lift the hood.

Before closing the hood, check to see that you have not forgotten any tools, rags, etc. Then lower the hood and make sure it locks into place. If necessary, press down gently on the front edge to lock it.

TVIP is a theft deterrent system. If someone attempts to damage or break into your vehicle, the system sounds the alarm while flashing the lights.

SETTING THE SYSTEM

You can set the system as follows.

1. Remove the key from the ignition switch.
2. Have all passengers get out of the vehicle.
3. Close all the doors securely.
4. Lock all the doors with the key or remote keyless entry transmitter. At this time, the TVIP indicator light comes on.

The system will be set in 30 seconds. When the system is set, the indicator light will start to flash.

'05 TUNDRA_U (L/O 0409)

5. Make sure that the indicator light flashes. Then you may leave the vehicle.

Never leave anyone in the vehicle when you set the system because unlocking from the inside activates the alarm.

Activating the alarm

If the system detects a threat to the vehicle, blows the horn intermittently for one minute while flashing tail lights and front side marker lights, and turns on the interior light.

The system detects a threat under any of the following conditions:

- ▶ Either of the front doors is unlocked by means other than the key or remote keyless entry transmitter.

If the key is not in the ignition switch, all the doors will be automatically locked again.

- ▶ Any door is forcibly opened.
- ▶ The side windows are tapped or broken.
- ▶ The battery terminal is disconnected and then reconnected.
- ▶ The ignition is hotwired.

After one minute, the alarm automatically stops and the indicator light starts flashing again.

Reactivating the alarm

Once set, until you cancel the system, the system automatically resets the alarm after the alarm has stopped.

The alarm will activate again under the same circumstances described in "Activating the alarm".

Stopping the alarm

You can stop the alarm in either of the following ways:

- ▶ Unlock any of the doors with the key or remote keyless entry transmitter.
- ▶ Place the ignition switch in the "ON" position.

CANCELLING THE SYSTEM

You can cancel the system as described in "Stopping the alarm".

If you cancel the system by unlocking any of the doors but no door is opened within 30 seconds, all the doors lock automatically and the system will be set again.

NOTE: If your vehicle's tail lights and front side marker lights turn on and the buzzer sounds for 2 seconds when the system is canceled, the trigger memory was activated; an alarm was triggered while you were away from the vehicle.

TESTING THE SYSTEM

You can check the system operation as follows.

1. Open all the windows.
2. Set the system as described in "SETTING THE SYSTEM".
3. Unlock the driver's door with the inside lock knob. The system should activate and the alarm should sound.
4. Stop the alarm as described in "Stopping the alarm".
5. Repeat steps 2 to 4 for the passenger's door.

If the system does not work properly, have it checked by your Toyota dealer.

Theft deterrent system (double cab models)

To deter vehicle theft, the system is designed to sound an alarm if any of the doors or hood is forcibly unlocked or opened or the battery terminal is disconnected and then reconnected when the vehicle is locked.

The alarm blows the horn intermittently and flashes the headlights and tail lights.

SETTING THE SYSTEM

1. Turn the ignition key to the "LOCK" position and remove it.

The indicator light will start flashing when the key is removed from the ignition switch.

2. Have all passengers get out of the vehicle.
 3. Close and lock all the doors and hood.
- The indicator light will remain on when all the doors and hood are closed and locked.

The system will automatically be set after 30 seconds. When the system is set, the indicator light will start flashing again.

4. After making sure the indicator light starts flashing, you may leave the vehicle.

Never leave anyone in the vehicle when you set the system, because unlocking from the inside will activate the system.

WHEN THE SYSTEM IS SET

Activating the system

The system will sound the alarm under the following conditions:

- ▶ If any of the doors is unlocked or opened without the key or wireless remote control transmitter, or if the hood is forcibly opened
- ▶ If the battery terminal is disconnected and then reconnected

The indicator light will come on when the system is activated.

If the alarm has been activated and the key is not in the ignition switch, all the doors will re-lock automatically.

After one minute, the alarm will automatically stop and the indicator light will start flashing again.

'05 TUNDRA_U (L/O 0409)

Reactivating the alarm

Once set, the system automatically resets the alarm after the alarm stops.

The alarm will activate again under the same circumstances described in "Activating the system".

Stopping the alarm

The alarm will be stopped by the following two ways:

- ▶ Turn the ignition key from the "LOCK" to "ON" position.
- ▶ Unlock any of the doors with the key or wireless remote control transmitter.

These ways cancel the system at the same time.

TESTING THE SYSTEM

1. Open all the windows.
2. Set the system as described above. The doors should be locked with the key or wireless remote control transmitter. Be sure to wait until the indicator light goes off or starts flashing.
3. Unlock any door from the inside. The system should activate the alarm.
4. Stopping the alarm as described above.
5. Repeat this operation for the other doors and hood. When testing the hood, also check that the system is activated when the battery terminal is disconnected and then reconnected.

If the system does not work properly, have it checked by your Toyota dealer.

Fuel tank cap

Without tachometer

With tachometer

'05 TUNDRA_U (L/O 0409)

This indicates that the fuel filler door is on the left side of your vehicle.

Type A

Type B

1. To open the fuel filler door, pull the door toward out as shown.

When refueling, turn off the engine.

 CAUTION

- ▶ Do not smoke, cause sparks or allow open flames when refueling. The fumes are flammable.
- ▶ When opening the cap, do not remove the cap quickly. In hot weather, fuel under pressure could cause injury by spraying out of the filler neck if the cap is suddenly removed.
- ▶ Do not fill a fuel container on a plastic truck bed liner, a rubber truck bed mat, or any other insulating material. A static electricity charge could cause a spark and fire hazard. The proper procedure is to place an approved fuel container on the ground away from the truck for filling.

'05 TUNDRA_U (L/O 0409)

Type A

Type B

2. To remove the fuel tank cap, turn the cap counterclockwise by 90 degrees (to the pressure point 1), and then turn it an additional 30 degrees (to point 2). Pause slightly before removing it.

It is not unusual to hear a slight swoosh when the cap is opened.

When installing the cap, turn the cap clockwise until you hear a click. When you hear the click, the cap is fully closed.

If the cap is not tightened securely, the malfunction indicator lamp comes on. Make sure the cap is tightened securely.

The indicator lamp goes off after driving several times. If the indicator lamp does not go off, contact your Toyota dealer as soon as possible.

CAUTION

- ▶ Make sure the cap is tightened securely to prevent fuel spillage in the event of an accident.
- ▶ Use only a genuine Toyota fuel tank cap for replacement. It is designed to regulate fuel tank pressure.

NOTICE

To prevent damage to the cap, apply force only in the turning direction to the cap. Do not pull or pry it.

Electric moon roof

Sliding operation

Tilting operation

To operate the moon roof, use the switches between the personal lights.

The moon roof works when the ignition switch is in the "ON" position.

The sun shade can be opened or closed by hand.

Sliding operation—

To open: Push the "SLIDE" switch on the "x" (rear) side.

The roof will open and stop partway 135 mm (5.3 in.) from the fully opened position. When you push "x" (rear) side again, the moon roof will open fully. To stop the roof partway, push the same side or "v" (front) side while the roof is moving.

As driving with the moon roof opened fully will cause wind throbs, we recommend you to drive with the moon roof partway 135 mm (5.3 in.) from the fully opened position.

The sun shade will be opened together with the roof.

To close: Push the "SLIDE" switch on the "v" (front) side.

The roof will fully close. To stop the roof partway, push the same side or "x" (rear) side briefly.

Tilting operation—

To tilt up: Push the "TILT" switch on the "UP" side.

To lower: Push the "TILT" switch on the opposite side of "UP".

You may stop the moon roof at any desired position. The roof will move while the switch is being pushed and stop when released.

Key off operation: If all the doors are closed, it works for 43 seconds even after the ignition switch is turned off. It stops working when any of the doors is opened.

Jam protection function: If something gets caught between the moon roof and frame during closing operation, the moon roof stops and opens half way.

If the moon roof receives a strong impact, this function may work even if nothing is caught.

CAUTION

To avoid serious personal injury, you must do the following.

- ▶ While the vehicle is moving, always keep the heads, hands and other parts of the bodies of all occupants away from the roof opening. Otherwise, they could be seriously injured if the vehicle stops suddenly or if the vehicle is involved in an accident.
- ▶ Before you close the moon roof, always make sure there is nobody around the moon roof. You must also make sure nobody places his or her head, hands and other parts of the body in the roof opening. If someone's neck, head or hands get caught in the closing roof, it could result in a serious injury. When anyone closes the moon roof, first make sure it is safe to do so.
- ▶ Be sure to remove the ignition key when you leave your vehicle.

- ▶ Never leave anyone (particularly a small child) alone in your vehicle, especially with the ignition key still inserted. Otherwise, he/she could use the moon roof switches and get trapped in the roof opening. Unattended person (particularly a small child) can be involved in a serious accident.
- ▶ Never sit on top of the vehicle around the roof opening.
- ▶ Never try jamming any part of your body to activate the jam protection function intentionally.
- ▶ The jam protection function may not work if something gets caught just before the window is fully closed.

SECTION 1-3

OPERATION OF INSTRUMENTS AND CONTROLS

Occupant restraint systems

Seats	48
Front seats	48
Swing- up rear seats	53
Tumbling rear seats	54
Head restraints	56
Armrest	57
Seat heaters	58
Seat belts	59
SRS driver airbag and front passenger airbag	70
Passenger airbag manual on- off switch	87
SRS side airbags and curtain shield airbags	88
Front passenger occupant classification system	98
Roll sensing of curtain shield airbags off switch	103
Child restraint	104

Seats

While the vehicle is being driven, all vehicle occupants should have the seatback upright, sit well back in the seat and properly wear the seat belts provided.

CAUTION

- ▶ Do not drive the vehicle unless the occupants are properly seated. Do not allow any passengers to sit on top of a folded-down seatback, or in the luggage compartment or cargo area. Persons not properly seated and/or not properly restrained by seat belts can be severely injured in the event of emergency braking or a collision.
- ▶ During driving, do not allow any passengers to stand up or move around between seats. Otherwise, severe injuries can occur in the event of emergency braking or a collision.

Front seats— —Front seat precautions

Driver seat

CAUTION

The SRS driver airbag deploys with considerable force, and can cause death or serious injury especially if the driver is very close to the airbag. The National Highway Traffic Safety Administration (“NHTSA”) advises:

Since the risk zone for driver airbag is the first 50—75 mm (2—3 in.) of inflation, placing yourself 250 mm (10 in.) from your driver airbag provides you with a clear margin of safety. This distance is measured from the center of the steering wheel to your breastbone. If you sit less than 250 mm (10 in.) away now, you can change your driving position in several ways:

- ▶ Move your seat to the rear as far as you can while still reaching the pedals comfortably.

- ▶ Slightly recline the back of the seat. Although vehicle designs vary, many drivers can achieve the 250 mm (10 in.) distance, even with the driver seat all the way forward, simply by reclining the back of the seat somewhat. If reclining the back of your seat makes it hard to see the road, raise yourself by using a firm, non-slippery cushion, or raise the seat if your vehicle has that feature.

- ▶ If your steering wheel is adjustable, tilt it downward. This points the airbag toward your chest instead of your head and neck.

The seat should be adjusted as recommended by NHTSA above, while still maintaining control of the foot pedals, steering wheel, and your view of the instrument panel controls.

Front passenger seats

CAUTION

The SRS front passenger airbag also deploys with considerable force, and can cause death or serious injury especially if the front passenger is very close to the airbag. The front passenger seat should be as far from the airbag as possible with the seatback adjusted, so the front passenger sits upright.

—Seat adjustment precautions

CAUTION

- ▶ Do not adjust the seat while the vehicle is moving as the seat may unexpectedly move and cause the driver to lose control of the vehicle.
- ▶ Be careful that the seat does not hit a passenger or luggage.
- ▶ After adjusting the seat position, release the lever and try sliding the seat forward and backward to make sure it is locked in position.
- ▶ After adjusting the seatback, push your body back against the seat to make sure the seat is locked in position.
- ▶ Do not put objects under the seats. Otherwise, the objects may interfere with the seat-lock mechanism or unexpectedly push up the seat position adjusting lever and the seat may suddenly move, causing the driver to lose control of the vehicle.
- ▶ While adjusting the seat, do not put your hands under the seat or near the moving parts. Otherwise, your hands or fingers may be caught and injured.

—Adjusting front seats (manual seat)

Non-split bench seat

Separate seat and split bench seat

1. SEAT POSITION ADJUSTING LEVER

Non-split bench seat: Pull the lever up. Then slide the seat to the desired position with slight body pressure and release the lever.

Separate seat and split bench seat: Hold the center of the lever and pull it up. Then slide the seat to the desired position with slight body pressure and release the lever.

2. SEAT CUSHION HEIGHT ADJUSTING LEVER

Pull up or push down the lever.

3. SEATBACK ANGLE ADJUSTING LEVER

Lean forward and pull the lever up. Then lean back to the desired angle and release the lever.

⚠ CAUTION

Avoid reclining the seatback any more than needed. The seat belts provide maximum protection in a frontal or rear collision when the driver and the front passenger are sitting up straight and well back in the seats. If you are reclined, the lap belt may slide past your hips and apply restraint forces directly to the abdomen or your neck may contact the shoulder belt. In the event of a frontal collision, the more the seat is reclined, the greater the risk of death or personal injury.

—Adjusting front seats (power seats)

1. SEAT POSITION AND SEAT CUSHION ANGLE ADJUSTING SWITCH

Move the control switch in the desired direction.

Releasing the switch will stop the seat at that position.

Do not place anything under the front seats, as this might interfere with the seat movement.

2. SEATBACK ANGLE ADJUSTING SWITCH

Move the control switch in the desired direction.

Releasing the switch will stop the seatback at that position.

CAUTION

Avoid reclining the seatback any more than needed. The seat belts provide maximum protection in a frontal or rear collision when the driver and the front passenger are sitting up straight and well back in the seats. If you are reclined, the lap belt may slide past your hips and apply restraint forces directly to the abdomen or your neck may contact the shoulder belt. In the event of a frontal collision, the more the seat is reclined, the greater the risk of death or personal injury.

3. SEAT LUMBAR SUPPORT ADJUSTING SWITCH

Push the control switch on either way.

The amount of lumbar support will change while the switch is pushed.

**—Tilting passenger's seatback
for rear seat entry
(access cab models)**

For easy access to the rear seat, do this.

Lift the seatback angle adjusting lever or press the pedal behind the seatback.

The seatback will tilt forward.

After passengers are in, lift up the seatback until it locks.

CAUTION

- ▶ After putting back the seatback, try pushing the seatback forward and rearward to make sure it is secured in place.
- ▶ Never allow anyone to rest their foot on the press pedal while the vehicle is moving.

**—Folding seatback
(non-split bench seat)**

Pull the seatback lock release lever and fold down the seatback.

Hold the lever until you have swung the seatback forward slightly.

Make sure the shoulder belt pass through the guide when returning the seatback.

CAUTION

When returning the seatback to the upright position, observe the following precautions in order to prevent personal injury in a collision or sudden stop:

- ▶ Make sure the seatback is securely locked by pushing forward and rearward on the top of the seatback. Failure to do so will prevent the seat belt from operating properly.
- ▶ Make sure the seat belts are not twisted or caught in the seatback and are arranged in their proper position and are ready to use.

Swing-up rear seats (access cab models)

1. Stow the rear seat belt buckles as shown in the illustration.

This prevents the belt buckles from falling out when you swing up the rear seat.

NOTICE

The seat belt buckles must be stowed before you swing up the rear seat.

2. Raise the bottom cushion while pushing the lock release lever.

CAUTION

When returning the bottom cushion to its original position, observe the following precautions in order to prevent personal injury in a collision or sudden stop:

- ▶ Make sure the bottom cushion is securely locked by trying to pull up the edge of the bottom cushion. Failure to do so will prevent the seat belt from operating properly.
- ▶ Make sure the seat belts are not twisted or caught under the bottom cushion and are arranged in their proper position and are ready to use.

Tumbling rear seats (double cab models)

BEFORE TUMBLING REAR SEATS

Stow the rear seat belt buckles as shown in the illustration.

This prevents the buckles from falling out when you tumble the seatback.

NOTICE

The seat belt buckles must be stowed before you tumble the rear seat.

TUMBLING REAR SEATS

1. Lower the head restraints to the lowest position. Fold down the seatback while pulling the seatback angle adjusting lever and swing the whole seat up and forward while pulling the seat lock release lever on the side.

To return the tumbled seat to the original position, reverse the above operation.

CAUTION

- ▶ Make sure people or luggage are clear of the seat. Then, hold the seat and slowly move it. Otherwise, people may be injured or luggage may be damaged, if the seat hits them.
- ▶ To avoid serious injury, do not sit on the folded seatback.
- ▶ Use the seat lock release lever on the side only when tumbling the seat.

2. Take the holding strap out of its hole, and hook the strap onto the assist grip. Then, pull the strap on the free end to secure the seat.

When returning the rear seat to its original position, put the holding strap into the hole.

CAUTION

When tumbling the rear seats, fix the seats securely by adjusting the length of the holding strap. Failure to do so may cause an unexpected accident or severe injury in the event of emergency braking or a collision.

WHEN RETURNING THE REAR SEATS

If you cannot raise the seatback because of the locked seat belt, do not try it forcibly. Release the lock of the seat belt in the following way. Push in the lower front edge of the seatback cushion to slacken the seat belt (1) and let the seat belt retract a little (2).

CAUTION

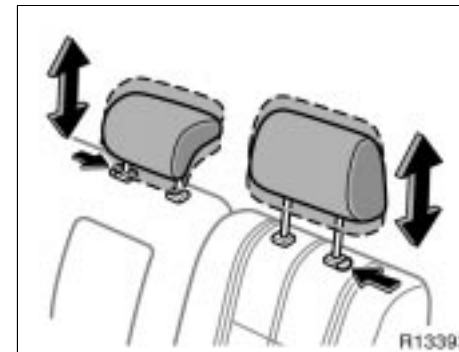

When returning seats to their original position, observe the following precautions in order to prevent personal injury in a collision or sudden stop:

- ▶ Be careful not to get your hands or feet pinched in the seat.
- ▶ Make sure the seat is securely locked by pushing forward and rearward on the top of the seatback or by trying to pull up the edge of the bottom cushion. Failure to do so will prevent the seat belt from operating properly.
- ▶ Make sure the seat belts are not twisted or caught in the seatback and are arranged in their proper position and are ready to use.

Head restraints

Front (separate seat and non-split bench seat)

Front (split bench seat)

Rear

For your safety and comfort, adjust the head restraint before driving.

To raise: Pull it up.

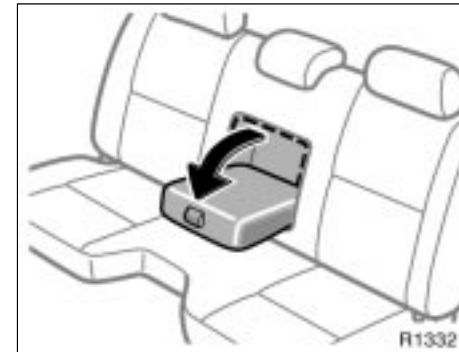

To lower: Push it down while pressing the lock release button.

Center head restraint—When an occupant sits on the center position of the seats, always pull up the center head restraint to the lock position.

The head restraint is most effective when it is close to your head. Therefore, using a cushion on the seatback is not recommended.

Armrest

Non-split bench seat

Split bench seat

Seat heaters

Separate seat

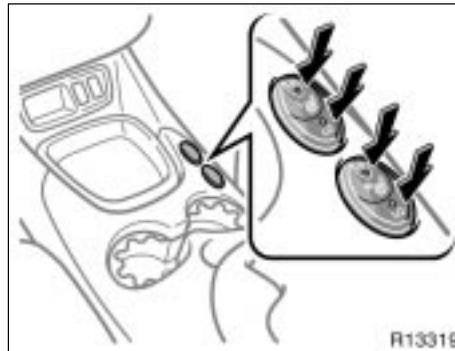

To use the armrest, do this.

Non-split and split bench seat—Pull the armrest out as shown in the illustration.

Separate seat—Pull the armrest down as shown in the illustration.

NOTICE

To prevent damage to the armrest, avoid putting heavy loads on it.

To turn on the seat heater, push the switch ("L" switch for the left front seat and "R" switch for the right seat).

At this time, the indicator light will illuminate to indicate the seat heater is operating.

The seat heater switches have the following positions.

"HI"—High heating temperature

"LO"—Low heating temperature

The key must be in the "ON" position to operate seat heaters.

Pushing lightly on the opposite side will turn it off.

CAUTION

Occupants must use caution when operating the seat heater because it may make them feel too hot or cause burns at low temperatures (erythema, varicella). Use extra caution for;

- ▶ Babies, small children, elderly persons, sick persons or persons with physical disabilities
- ▶ Persons who have delicate skin
- ▶ Persons who are exhausted
- ▶ Person who have taken alcohol or drugs which induce sleep (sleeping drug, cold remedy, etc.)

To prevent the seat overheating, do not use the seat heater with a blanket, cushion, or other insulating objects which cover the seat.

**Seat belts—
—Seat belt precautions**

Toyota strongly urges that the driver and passengers in the vehicle be properly restrained at all times with the seat belts provided. Failure to do so could increase the chance of injury and/or the severity of injury in accidents.

The seat belts provided for your vehicle are designed for people of adult size, large enough to properly wear them.

Child. Use a child restraint system appropriate for the child until the child becomes large enough to properly wear the vehicle's seat belts. See "Child restraint" in this Section for details.

STANDARD CAB MODELS—

If a child is too large for a child restraint system, the child should sit in the seat and must be restrained using the vehicle's seat belt.

ACCESS CAB AND DOUBLE CAB MODELS—

If a child is too large for a child restraint system, the child should sit in the rear seat and must be restrained using the vehicle's seat belt. According to accident statistics, the child is safer when properly restrained in the rear seat than in the front seat.

If a child must sit in the front seat, the seat belts should be worn properly. If an accident occurs and the seat belts are not worn properly, the force of the rapid inflation of the airbag may cause death or serious injury to the child.

Do not allow any children to stand up or kneel on either rear or front seats. An unrestrained child could suffer serious injury or death during emergency braking or a collision. Also, do not let the child sit on your lap. Holding a child in your arms does not provide sufficient restraint.

Pregnant woman. Toyota recommends the use of a seat belt. Ask your doctor for specific recommendations. The lap belt should be worn securely and as low as possible over the hips and not on the waist.

Injured person. Toyota recommends the use of a seat belt. Depending on the injury, first check with your doctor for specific recommendations.

 **CAUTION**

Persons should ride in their seats properly wearing their seat belts whenever the vehicle is moving. Otherwise, they are much more likely to suffer serious bodily injury or death in the event of sudden braking or a collision.

When using the seat belts, observe the following:

- ▶ **Use the belt for only one person at a time. Do not use a single belt for two or more people—even children.**
- ▶ **Avoid reclining the seatback any more than needed. The seat belts provide maximum protection in a frontal or rear collision when the driver and the front passenger are sitting up straight and well back in the seats. If you are reclined, the lap belt may slide past your hips and apply restraint forces directly to the abdomen or your neck may contact the shoulder belt. In the event of a frontal collision, the more the seat is reclined, the greater the risk of death or personal injury.**

—Fastening front and rear seat belts

- ▶ Be careful not to damage the belt webbing or hardware. Take care that they do not get caught or pinched in the seat or side doors.
- ▶ Inspect the belt system periodically. Check for cuts, fraying, and loose parts. Damaged parts should be replaced. Do not disassemble or modify the system.
- ▶ Keep the belts clean and dry. If they need cleaning, use a mild soap solution or lukewarm water. Never use bleach, dye, or abrasive cleaners, or allow them to come into contact with the belt—they may severely weaken the belts. (See “Cleaning the interior” in Section 5.)
- ▶ Replace the belt assembly (including bolts) if it has been used in a severe impact. The entire assembly should be replaced even if damage is not obvious.

Adjust the seat as needed and sit up straight and well back in the seat. To fasten your belt, pull it out of the retractor and insert the tab into the buckle.

You will hear a click when the tab locks into the buckle.

The seat belt length automatically adjusts to your size and the seat position.

The retractor will lock the belt during a sudden stop or on impact. It also may lock if you lean forward too quickly. A slow, easy motion will allow the belt to extend, and you can move around freely.

When a passenger's shoulder belt is completely extended and is then retracted even slightly, the belt is locked in that position and cannot be extended. This feature is used to hold the child restraint system securely. (For details, see “Child restraint” in this Section.) To free the belt again, fully retract the belt and then pull the belt out once more.

If the seat belt cannot be pulled out of the retractor, firmly pull the belt and release it. You will then be able to smoothly pull the belt out of the retractor.

 CAUTION

- ▶ After inserting the tab, make sure the tab and buckle are locked and that the belt is not twisted.
- ▶ Do not insert coins, clips, etc. in the buckle as this may prevent you from properly latching the tab and buckle.
- ▶ If the seat belt does not function normally, immediately contact your Toyota dealer. Do not use the seat until the seat belt is fixed, because it cannot protect an adult occupant or your child from injury.

Adjust the position of the lap and shoulder belts.

Position the lap belt as low as possible on your hips—not on your waist, then adjust it to a snug fit by pulling the shoulder portion upward through the latch plate.

CAUTION

- ▶ Both high-positioned lap belts and loose-fitting belts could cause serious injuries due to sliding under the lap belt during a collision or other unintended event. Keep the lap belt positioned as low on hips as possible.
- ▶ Do not place the shoulder belt under your arm.

Standard and double cab models

Access cab models

Seat belts with an adjustable shoulder anchor—

Adjust the shoulder anchor position to your size.

Standard and double cab models—

To raise: Slide the anchor up.

To lower: Push in the lock release button and slide the anchor down.

Access cab models—

To raise: Slide the anchor up.

To lower: Pull the lock release knob and slide the anchor down.

After adjustment, make sure the anchor is locked in position.

To release the belt, press the buckle release button and allow the belt to retract.

If the belt does not retract smoothly, pull it out and check for kinks or twists. Then make sure it remains untwisted as it retracts.

FRONT CENTER SEAT BELT (standard cab models with non-split bench seat) AND REAR CENTER SEAT BELT (access cab models)

The center seat belt is a 3-point type restraint with 2 buckles. Both seat belt buckles must be correctly located and securely latched for proper operation.

Make sure buckle 1 (with light gray buckle-release button) is securely latched for ready use of the center seat belt.

⚠ CAUTION

Always make sure the shoulder belt is positioned across the center of your shoulder. The belt should be kept away from your neck, but not falling off your shoulder. Failure to do so could reduce the amount of protection in an accident and cause severe injuries in a collision.

'05 TUNDRA_U (L/O 0409)

**Front center seat belt only—
Make sure the shoulder belt pass
through the guide when using the seat
belt for front center seat.**

**Two buckles and tabs for center seat
belt**

The 2 buckles for the center seat belt are distinguished with colors of the buckle release button. Also the 2 tabs have different shape for its end so that the belt is not buckled in the wrong place.

Buckle 1 (with light gray buckle-release button)—Properly matches with concave end tab

Buckle 2 (with red buckle-release button)—Properly matches with round end tab

CAUTION

Make sure the both buckles are correctly located and securely latched. Failure to properly match the buckle and tab may cause severe injury in case of an accident or a collision.

To release the concave end tab, insert the key into the hole on buckle 1 (with light gray buckle-release button) and allow the belt to retract.

! CAUTION

Do not use the center seat belt with either buckle released. Fastening only the shoulder belt or lap belt may cause severe personal injury in case of sudden braking or a collision.

—Stowing the rear seat belt buckles (access cab models)

The rear seat belt buckles can be stowed when not in use.

Seat belt buckles must be stowed before you swing up the bottom cushion. (See “Swing-up rear seats” in this Section.)

—Stowing the rear seat belt buckles (double cab models)

The rear seat belt buckles can be stowed when not in use.

Seat belt buckles must be stowed before you fold the seatback. (See “Tumbling rear seats” in this Section.)

—Seat belt extender

If your seat belts cannot be fastened securely because they are not long enough, a personalized seat belt extender is available from your Toyota dealer free of charge.

Please contact your local Toyota dealer to order the proper required length for the extender. Bring the heaviest coat you expect to wear for proper measurement and selection of length. Additional ordering information is available at your Toyota dealer.

! CAUTION

When using the seat belt extender, observe the following precautions. Failure to follow these instructions could reduce the effectiveness of the seat belt restraint system in case of an accident, increasing the chance of personal injury.

▶ Remember that the extender provided for you may not be safe when used on a different vehicle, for another person, or at a different seating position than the one originally intended.

▶ If the seat belt extender has been connected to the driver's seat belt buckle without wearing the seat belt when using the extender in the driver's seat, the SRS driver's airbag system will judge that the driver wears the seat belt even if not wearing it. In this case, the driver's airbag may not activate correctly, causing death or serious injury in the event of collision. Be sure to wear the seat belt with the seat belt extender.

'05 TUNDRA_U (L/O 0409)

▶ Vehicles with separate seat—Make sure the front passenger occupant classification indicator light indicates “ON” when using the seat belt extender for the front passenger seat. If the indicator light indicates “OFF”, disconnect the extender tongue from the seat belt buckle, then reconnect the seat belt. Reconnect the seat belt extender after making sure the indicator light indicates “ON”. If you use the seat belt extender while the indicator light indicates “OFF”, the front passenger airbag and side airbag on the front passenger side may not activate correctly, which could cause death or serious injury in the event of collision.

▶ Be sure to wear the seat belt without the seat belt extender if you can fasten the seat belt without the extender.

▶ Do not use the seat belt extender when installing a child restraint system on the front or rear passenger seat. If installing a child restraint system with the seat belt extender connected to the seat belt, the seat belt will not securely hold the child restraint system, which could cause death or serious injury to the child or other passengers in the event of collision.

To connect the extender to the seat belt, insert the tab into the seat belt buckle so that the “PRESS” signs on the buckle release buttons of the extender and the seat belt are both facing outward as shown.

You will hear a click when the tab locks into the buckle.

When releasing the seat belt, press on the buckle release button on the extender, not on the seat belt. This helps prevent damage to the vehicle interior and extender itself.

Vehicles with separate seat—As far as the seat belt extender on the front passenger side is concerned, do not fail to disconnect the extender from the seat belt after the above operation in order to activate the front passenger airbag correctly when getting into the vehicle next time.

When not in use, remove the extender and store in the vehicle for future use.

! CAUTION

- ▶ **After inserting the tab, make sure the tab and buckle are locked and that the lap and shoulder portions of the belt and the seat belt extender are not twisted.**
- ▶ **Do not insert coins, clips, etc. in the buckle as this may prevent you from properly latching the tab and buckle.**
- ▶ **If the seat belt does not function normally, immediately contact your Toyota dealer. Do not use the seat until the seat belt is fixed, because it cannot protect an adult occupant or your child from injury.**

—Seat belt pretensioners

The driver and front passenger seat belt pretensioners are designed to be activated in response to a severe frontal impact. On vehicles equipped with curtain shield airbags, the pretensioners are also activated during vehicle rollover.

When the sensor detects a severe frontal impact or a vehicle rollover, the front seat belts are quickly drawn back by the retractors so that the belts snugly restrain the occupants.

Vehicles with bench seat—The seat belt pretensioners are activated even with no passenger in the front seat.

Vehicles with separate seat—The front passenger's seat belt pretensioner will not activate if no passenger is detected in the front passenger seat by the front passenger occupant classification system. However, the front passenger's seat belt pretensioner may activate if luggage is put on the seat, or the seat belt is buckled up regardless of the presence of an occupant in the seat. (As for the front passenger occupant classification system, see "Front passenger occupant classification system" in this Section.)

The seat belt pretensioners and SRS airbags may not operate together in all collisions.

'05 TUNDRA_U (L/O 0409)

The seat belt pretensioners will not operate in a vehicle rollover if the "RSCA OFF" indicator light is on. For details, see "Roll sensing of curtain shield airbags off switch" in this Section.

The seat belt pretensioner system consists mainly of the following components and their locations are shown in the illustration.

1. Front airbag sensors
2. Separate seat only—Front passenger occupant classification indicator light
3. Separate seat only—Front passenger occupant classification system (ECU and sensors)
4. Seat belt pretensioner assemblies
5. Front passenger's seat belt buckle switch
6. Airbag sensor assembly
7. SRS warning light

The seat belt pretensioners are controlled by the airbag sensor assembly. The airbag sensor assembly consists of a safing sensor and airbag sensor.

When the seat belt pretensioners are activated, an operating noise may be heard and a small amount of non-toxic gas may be released. This does not indicate that a fire is occurring. This gas is normally harmless.

Once the seat belt pretensioners have been activated, the seat belt retractors remain locked.

CAUTION

Do not modify, remove, strike or open the seat belt pretensioner assemblies, airbag sensor or surrounding area or wiring. Failure to follow these instructions may prevent the seat belt pretensioners from activating correctly, cause sudden operation of the system or disable the system, which could result in death or serious injury. Consult your Toyota dealer about any repair and modification.

NOTICE

Do not perform any of the following changes without consulting your Toyota dealer. Such changes can interfere with proper operation of the seat belt pretensioners in some cases.

- ◆ *Installation of electronic devices such as a mobile two-way radio, cassette tape player or compact disc player*
- ◆ *Repairs on or near the front seat belt pretensioner assemblies*
- ◆ *Modification of the suspension system*
- ◆ *Modification of the front end structure*
- ◆ *Attachment of a grille guard (bull bar, kangaroo bar, etc.), snowplow, winches or any other equipment to the front end*
- ◆ *Repairs made on or near the front fenders, front end structure or console*

Without tachometer

With tachometer

This indicator comes on when the ignition key is turned to the "ON" position. It goes off after about 6 seconds. This means the seat belt pretensioners are operating properly.

This warning light system monitors the airbag sensor assembly, front airbag sensors, side and curtain shield airbag sensors, curtain shield airbag sensors, driver's seat position sensor, driver's seat belt buckle switch, front passenger occupant classification system and indicator light, passenger airbag manual on-off switch, front passenger's seat belt buckle switch, seat belt pretensioner assemblies, inflators, warning light, interconnecting wiring and power sources. (For details, see "Service reminder indicators and warning buzzers" in Section 1-6.)

If any of the following conditions occurs, this indicates a malfunction of the airbags or seat belt pretensioners. Contact your Toyota dealer as soon as possible.

- ▶ The light does not come on when the ignition key is turned to the "ON" position or remains on for more than 6 seconds.
- ▶ The light comes on while driving.

'05 TUNDRA_U (L/O 0409)

- ▶ If any seat belt does not retract or can not be pulled out due to a malfunction or activation of the relevant seat belt pretensioner.
- ▶ The seat belt pretensioner assembly or surrounding area has been damaged.

In the following cases, contact your Toyota dealer as soon as possible:

- ▶ The front of the vehicle (shaded in the illustration) was involved in an accident that was not severe enough to cause the seat belt pretensioners to operate.
- ▶ Either seat belt pretensioner assembly or surrounding area is scratched, cracked, or otherwise damaged.

SRS driver airbag and front passenger airbag (standard and access cab models)

The SRS (Supplemental Restraint System) airbags are designed to provide further protection for the driver and right front passenger in addition to the primary safety protection provided by the seat belts.

Vehicles with bench seat—The SRS airbags are designed to protect the driver and right front passenger and they are not designed to protect an occupant in the front center seating position.

In response to a severe frontal impact, the SRS airbags work together with the seat belts to help reduce injury by inflating. The SRS airbags help reduce injuries mainly to the driver's or front passenger's head or chest caused by hitting the vehicle interior.

Vehicles with bench seat—The SRS front passenger airbag is activated even with no passenger in the front seat.

Vehicles with separate seat—The SRS front passenger airbag will not activate if there is no passenger sitting in the front passenger seat. However, the front passenger airbag may deploy if luggage is put in the seat, or the seat belt is buckled up, regardless of the presence of an occupant in the seat. (As for the front passenger occupant classification system, see "Front passenger occupant classification system" in this Section.)

Always wear your seat belt properly.

 **CAUTION**

▶ **The SRS airbag system is designed only as a supplement to the primary protection of the driver and front passenger seat belt systems. The driver and front passenger can be killed or seriously injured by the inflating airbags if they do not wear the available seat belts properly. During sudden braking just before a collision, an unrestrained driver or front passenger can move forward into direct contact with or close proximity to the airbag which may then deploy during the collision. To ensure maximum protection in an accident, the driver and all passengers in the vehicle must wear their seat belts properly. Wearing a seat belt properly during an accident reduces the chances of death or serious injury or being thrown out of the vehicle. For instructions and precautions concerning the seat belt system, see "Seat belts" in this Section.**

▶ **Improperly seated and/or restrained infants and children can be killed or seriously injured by the deploying airbags. An infant or child who is too small to use a seat belt should be properly secured using a child restraint system. Toyota strongly recommends that all infants and children be placed in the rear seat of the vehicle and properly restrained. The rear seat is the safest for infants and children. For instructions concerning the installation of a child restraint system, see "Child restraint" in this Section.**

'05 TUNDRA_U (L/O 0409)

Except for separate seat with automatic transmission

For separate seat with automatic transmission

The passenger airbag system is equipped with a manual on-off switch and indicator light. Turning the passenger airbag manual on-off switch clockwise to the “ON” or “AUTO” position makes the passenger airbag system operational. To disable the passenger airbag system, turn the manual on-off switch counterclockwise to the “OFF” position and remove the key. The indicator light on the passenger airbag manual on-off switch will come on when the passenger airbag system has been disabled.

See “Passenger airbag manual on-off switch” in this Section for detail.

▶When the passenger airbag manual on-off switch is turned off, the passenger airbag will not inflate in a collision and turning off the passenger airbag can reduce the occupant protection which your vehicle safety systems can provide to you in certain accidents and increase the likelihood of death or serious personal injuries.

CAUTION

▶Do not turn off the passenger airbag manual on-off switch except when a member of a passenger risk group identified in TABLE 1 is occupying the right front passenger seating position.

'05 TUNDRA_U (L/O 0409)

TABLE 1: A PASSENGER RISK GROUP
<p>Infant. An infant (less than 1 year old) who must ride in the front seat because:</p> <ul style="list-style-type: none"> ▶ Vehicle has no rear seat; ▶ Vehicle has a rear seat too small to accommodate a rear-facing infant seat; or ▶ The infant has a medical condition which, according to the infant's physician, makes it necessary for the infant to ride in the front seat so that the driver can constantly monitor the child's condition.
<p>Child age 1 to 12. A child age 1 to 12 must ride in the front seat because:</p> <ul style="list-style-type: none"> ▶ Vehicle has no rear seat; ▶ Although children ages 1 to 12 ride in the rear seat(s) whenever possible, children ages 1 to 12 sometimes must ride in the front because no space is available in the rear seat(s) of vehicle; or ▶ The child has a medical condition which, according to the child's physician, makes it necessary for the child to ride in the front seat so that the driver can constantly monitor the child's condition.
<p>Medical condition. A passenger has a medical condition which according to his or her physician:</p> <ul style="list-style-type: none"> ▶ Causes the passenger airbag to pose a special risk for the passenger: and ▶ Makes the potential harm from the passenger airbag in a crash greater than the potential harm from turning off the airbag and allowing the passenger, even if belted, to hit the dashboard, or windshield in a crash.

For more detailed information concerning about the passenger risk group, please contact NHTSA at 1-800-424-9393 or Transport Canada at 1-800-333-0371.

The SRS airbags are designed to deploy in severe (usually frontal) collisions where the magnitude and duration of the forward deceleration of the vehicle exceeds the designed threshold level.

The SRS airbags will deploy if the severity of the impact is above the designed threshold level, comparable to an approximate 25 km/h (15 mph) collision when the vehicle has the impact straight into a fixed barrier that does not move or deform.

However, this threshold velocity will be considerably higher if the vehicle strikes an object, such as a parked vehicle or sign pole, which can move or deform on impact, or if the vehicle is involved in an underride collision (e.g. a collision in which the front of the vehicle "underrides", or goes under, the bed of a truck, etc.).

It is possible that in some collisions where the forward deceleration of the vehicle is very close to the designed threshold level, the SRS airbags and front seat belt pretensioners may not activate together.

Always wear your seat belts properly.

'05 TUNDRA_U (L/O 0409)

The SRS airbags are generally not designed to inflate if the vehicle is involved in a side or rear collision, if it rolls over, or if it is involved in a low-speed frontal collision. But, whenever a collision of any type causes sufficient forward deceleration of the vehicle, deployment of the SRS airbags may occur.

The SRS airbags may also deploy if a serious impact occurs to the underside of your vehicle. Some examples are shown in the illustration.

The SRS airbag system consists mainly of the following components, and their locations are shown in the illustration.

1. Front airbag sensors
2. Front passenger occupant classification indicator light or passenger airbag on-off indicator light
3. Airbag module for right front passenger (airbag and inflator)
4. Separate seat only—Front passenger occupant classification system (ECU and sensors)
5. Front passenger's seat belt buckle switch
6. Driver's seat belt buckle switch

'05 TUNDRA_U (L/O 0409)

7. Driver's seat position sensor
8. For separate seat with automatic transmission—Passenger airbag manual on-off switch
9. Except for separate seat with automatic transmission—Passenger airbag manual on-off switch
10. Airbag sensor assembly
11. Airbag module for driver (airbag and inflator)
12. SRS warning light

The airbag sensor assembly consists of a safing sensor and airbag sensor.

The front airbag sensors constantly monitor the forward deceleration of the vehicle. If an impact results in a forward deceleration beyond the designed threshold level, the system triggers the airbag inflators. At this time a chemical reaction in the inflators very quickly fills the airbags with non-toxic gas to help restrain the forward motion of the occupants. The airbags then quickly deflate, so that there is no obstruction of the driver's vision should it be necessary to continue driving.

When the airbags inflate, they produce a loud noise and release some smoke and residue along with non-toxic gas. This does not indicate a fire. This smoke may remain inside the vehicle for some time, and may cause some minor irritation to the eyes, skin or breathing. Be sure to wash off any residue as soon as possible to prevent any potential skin irritation with soap and water. If you can safely exit from the vehicle, you should do so immediately.

Deployment of the airbags happens in a fraction of a second, so the airbags must inflate with considerable force. While the system is designed to reduce serious injuries, primarily to the head and chest, it may also cause other, less severe injuries to the face, chest, arms and hands. These are usually in the nature of minor burns or abrasions and swelling, but the force of a deploying airbag can cause more serious injuries, especially if an occupant's hands, arms, chest or head is in close proximity to the airbag module at the time of deployment. This is why it is important for the occupant to: avoid placing any object or part of the body between the occupant and the airbag module; sit straight and well back into the seat; wear the available seat belt properly; and sit as far as possible from the airbag module, while still maintaining control of the vehicle.

Parts of the airbag module (steering wheel hub, airbag cover and inflator) may be hot for several minutes after deployment, so do not touch! The airbags inflate only once. The windshield may be damaged by absorbing some of the force of the inflating airbag.

 CAUTION

The driver or front passenger who is too close to the steering wheel or dashboard during airbag deployment can be killed or seriously injured. Toyota strongly recommends that:

- ▶ The driver sit as far back as possible from the steering wheel while still maintaining control of the vehicle.
- ▶ The front passenger sit as far back as possible from the dashboard.
- ▶ All vehicle occupants be properly restrained using the available seat belts.

For instructions and precautions concerning the seating position, see “—Front seat precautions” in this Section.

 CAUTION

A member of a passenger risk group should never sit or be occupied in the front outside passenger seat with airbag manual on-off switch in the “ON” or “AUTO” position. (For details, see “SRS driver airbag and front passenger airbag” in this Section.)

- ▶ Do not sit on the edge of the seat or lean against the dashboard when the vehicle is in use, since the front passenger airbag could inflate with considerable speed and force. Anyone who is up against, or very close to, an airbag when it inflates, can be killed or seriously injured. Sit up straight and well back in the seat, and always use your seat belt properly.

'05 TUNDRA_U (L/O 0409)

▶ Do not hold a child on your lap or in your arms. Use a child restraint system in the rear seat. For instructions concerning the installation of a child restraint system, see "Child restraint" in this Section.

▶ Toyota strongly recommends that all infants and children be placed in the rear seat of the vehicle and be properly restrained.

▶ Vehicles with bench seat—Do not allow a child to stand up or kneel on the front passenger seat, since the front passenger airbag could inflate with considerable speed and force. Otherwise, the child may be killed or seriously injured.

▶ Do not put anything or any part of your body on or in front of the dashboard or steering wheel pad that houses the airbag system. They might restrict inflation or cause death or serious injury as they are projected rearward by the force of the deploying airbags. Likewise, the driver and front passenger should not hold objects in their arms or on their knees.

▶ Do not modify or remove any wiring. Do not modify, remove, strike or open any components such as the steering wheel pad, steering wheel, column cover, dashboard near the front passenger airbag, front passenger airbag cover, front passenger airbag or airbag sensor assembly. Doing so may prevent the front airbag system from activating correctly, cause sudden activation of the system or disable the system, which could result in death or serious injury.

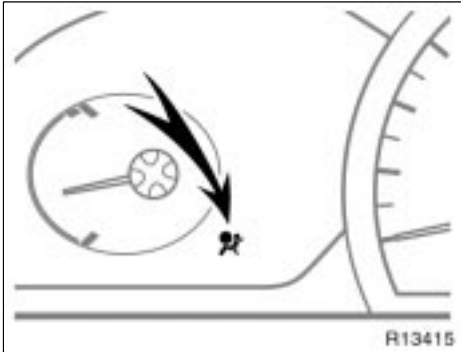

Failure to follow these instructions can result in death or serious injury. Consult your Toyota dealer about any repair and modification.

If you wish to modify your vehicle for a person with physical disability, consult your Toyota dealer. It may dangerously interfere with the SRS front airbags operation.

NOTICE

Do not perform any of the following changes without consulting your Toyota dealer. Such changes can interfere with proper operation of the SRS airbag system in some cases.

- ◆ *Installation of electronic devices such as a mobile two-way radio, cassette tape player or compact disc player*
- ◆ *Modification of the suspension system*
- ◆ *Modification of the front end structure*
- ◆ *Attachment of a grille guard (bull bar, kangaroo bar, etc.), snowplow, winches or any other equipment to the front end*
- ◆ *Repairs made on or near the front fenders, front end structure, console, steering column, steering wheel or dashboard near the front passenger airbag*

Without tachometer

With tachometer

'05 TUNDRA_U (L/O 0409)

This indicator comes on when the ignition key is turned to the "ON" position. It goes off after about 6 seconds. This means the SRS airbags are operating properly.

This warning light system monitors the airbag sensor assembly, front airbag sensors, side and curtain shield airbag sensors, curtain shield airbag sensors, driver's seat position sensor, driver's seat belt buckle switch, front passenger occupant classification system and indicator light, passenger airbag manual on-off switch, front passenger's seat belt buckle switch, seat belt pretensioner assemblies, inflators, warning light, interconnecting wiring and power sources. (For details, see "Service reminder indicators and warning buzzers" in Section 1-6.)

If either of the following conditions occurs, this indicates a malfunction of the airbags or seat belt pretensioners. Contact your Toyota dealer as soon as possible.

- ▶ The light does not come on when the ignition key is turned to the "ON" position or remains on for more than 6 seconds.
- ▶ The light comes on while driving.

Vehicles with separate seat—The SRS warning light will come on and front passenger occupant classification indicator light will indicate "OFF" if there is a malfunction in the front passenger occupant classification system.

In the following cases, contact your Toyota dealer as soon as possible:

- ▶ The SRS airbags have been inflated.
- ▶ The front of the vehicle (shaded in the illustration) was involved in an accident that was not severe enough to cause the SRS airbags to inflate.
- ▶ The pad section of the steering wheel or front passenger airbag cover (shaded in the illustration) is scratched, cracked, or otherwise damaged.

NOTICE

Do not disconnect the battery cables before contacting your Toyota dealer.

SRS driver airbag and front passenger airbag (double cab models)

The SRS (Supplemental Restraint System) airbags are designed to provide further protection for the driver and front passenger in addition to the primary safety protection provided by the seat belts.

In response to a severe frontal impact, the SRS front airbags work together with the seat belts to help reduce injury by inflating. The SRS front airbags help reduce injuries mainly to the driver's or front passenger's head or chest caused by hitting the vehicle interior.

Vehicles with split bench seat—The SRS front passenger airbag is activated even with no passenger in the front seat.

Vehicles with separate seat—The SRS front passenger airbag will not activate if there is no passenger sitting in the front passenger seat. However, the front passenger airbag may deploy if luggage is put in the seat, or the seat belt is buckled up, regardless of the presence of an occupant in the seat. (As for the front passenger occupant classification system, see "Front passenger occupant classification system" in this Section.)

Always wear your seat belt properly.

CAUTION

▶ The SRS front airbag system is designed only as a supplement to the primary protection of the driver and front passenger seat belt systems. The driver and front passenger can be killed or seriously injured by the inflating airbags if they do not wear the available seat belts properly. During sudden braking just before a collision, an unrestrained driver or front passenger can move forward into direct contact with or close proximity to the airbag which may then deploy during the collision. To ensure maximum protection in an accident, the driver and all passengers in the vehicle must wear their seat belts properly. Wearing a seat belt properly during an accident reduces the chances of death or serious injury or being thrown out of the vehicle. For instructions and precautions concerning the seat belt system, see "Seat belts" in this Section.

'05 TUNDRA_U (L/O 0409)

► Improperly seated and/or restrained infants and children can be killed or seriously injured by the deploying airbags. An infant or child who is too small to use a seat belt should be properly secured using a child restraint system. Toyota strongly recommends that all infants and children be placed in the rear seat of the vehicle and properly restrained. The rear seat is the safest for infants and children. For instructions concerning the installation of a child restraint system, see "Child restraint" in this Section.

The SRS front airbags are designed to deploy in severe (usually frontal) collisions where the magnitude and duration of the forward deceleration of the vehicle exceeds the designed threshold level.

The SRS front airbags will deploy if the severity of the impact is above the designed threshold level, comparable to an approximate 25 km/h (15 mph) collision when the vehicle has the impact straight into a fixed barrier that does not move or deform.

However, this threshold velocity will be considerably higher if the vehicle strikes an object, such as a parked vehicle or sign pole, which can move or deform on impact, or if the vehicle is involved in an underride collision (e.g. a collision in which the front of the vehicle "underrides", or goes under, the bed of a truck, etc.).

It is possible that in some collisions where the forward deceleration of the vehicle is very close to the designed threshold level, the SRS front airbags and the seat belt pretensioners may not activate together.

Always wear your seat belts properly.

The SRS front airbags are generally not designed to inflate if the vehicle is involved in a side or rear collision, if it rolls over, or if it is involved in a low-speed frontal collision. But, whenever a collision of any type causes sufficient forward deceleration of the vehicle, deployment of the SRS front airbags may occur.

'05 TUNDRA_U (L/O 0409)

The SRS front airbags may also deploy if a serious impact occurs to the underside of your vehicle. Some examples are shown in the illustration.

The SRS front airbag system consists mainly of the following components, and their locations are shown in the illustration.

1. Front airbag sensors
2. Separate seat only—Front passenger occupant classification indicator light
3. Airbag module for front passenger (airbag and inflator)
4. Separate seat only—Front passenger occupant classification system (ECU and sensors)
5. Front passenger's seat belt buckle switch
6. Driver's seat belt buckle switch

7. Driver's seat position sensor
8. Airbag sensor assembly
9. Airbag module for driver (airbag and inflator)
10. SRS warning light

The airbag sensor assembly consists of a safing sensor and airbag sensor.

The front airbag sensors constantly monitor the forward deceleration of the vehicle. If an impact results in a forward deceleration beyond the designed threshold level, the system triggers the airbag inflators. At this time a chemical reaction in the inflators very quickly fills the airbags with non-toxic gas to help restrain the forward motion of the occupants. The airbags then quickly deflate, so that there is no obstruction of the driver's vision should it be necessary to continue driving.

'05 TUNDRA_U (L/O 0409)

When the airbags inflate, they produce a loud noise and release some smoke and residue along with non-toxic gas. This does not indicate a fire. This smoke may remain inside the vehicle for some time, and may cause some minor irritation to the eyes, skin or breathing. Be sure to wash off any residue as soon as possible to prevent any potential skin irritation with soap and water. If you can safely exit from the vehicle, you should do so immediately.

Deployment of the airbags happens in a fraction of a second, so the airbags must inflate with considerable force. While the system is designed to reduce serious injuries, primarily to the head and chest, it may also cause other, less severe injuries to the face, chest, arms and hands. These are usually in the nature of minor burns or abrasions and swelling, but the force of a deploying airbag can cause more serious injuries, especially if an occupant's hands, arms, chest or head is in close proximity to the airbag module at the time of deployment. This is why it is important for the occupant to: avoid placing any object or part of the body between the occupant and the airbag module; sit straight and well back into the seat; wear the available seat belt properly; and sit as far as possible from the airbag module, while still maintaining control of the vehicle.

Parts of the airbag module (steering wheel hub, airbag cover and inflator) may be hot for several minutes after deployment, so do not touch! The airbags inflate only once. The windshield may be damaged by absorbing some of the force of the inflating airbag.

 **CAUTION**

The driver or front passenger who is too close to the steering wheel or dashboard during airbag deployment can be killed or seriously injured. Toyota strongly recommends that:

- ▶ **The driver sit as far back as possible from the steering wheel while still maintaining control of the vehicle.**
- ▶ **The front passenger sit as far back as possible from the dashboard.**
- ▶ **All vehicle occupants be properly restrained using the available seat belts.**

For instructions and precautions concerning the seating position, see “—Front seat precautions” in this Section.

▶ Do not sit on the edge of the seat or lean against the dashboard when the vehicle is in use, since the front passenger airbag could inflate with considerable speed and force. Anyone who is up against, or very close to, an airbag when it inflates, can be killed or seriously injured. Sit up straight and well back in the seat, and always use your seat belt properly.

▶ Toyota strongly recommends that all infants and children be placed in the rear seat of the vehicle and be properly restrained.

▶ Vehicles with split bench seat—Do not allow a child to stand up or kneel on the front passenger seat, since the front passenger airbag could inflate with considerable speed and force. Otherwise, the child may be killed or seriously injured.

▶ Do not hold a child on your lap or in your arms. Use a child restraint system in the rear seat. For instructions concerning the installation of a child restraint system, see “Child restraint” in this Section.

▶ Do not put anything or any part of your body on or in front of the dashboard or steering wheel pad that houses the airbag system. They might restrict inflation or cause death or serious injury as they are projected rearward by the force of the deploying airbags. Likewise, the driver and front passenger should not hold objects in their arms or on their knees.

▶ Do not modify or remove any wiring. Do not modify, remove, strike or open any components such as the steering wheel pad, steering wheel, column cover, dashboard near the front passenger airbag, front passenger airbag cover, front passenger airbag or airbag sensor assembly. Doing so may prevent the front airbag system from activating correctly, cause sudden activation of the system or disable the system, which could result in death or serious injury.

Failure to follow these instructions can result in death or serious injury. Consult your Toyota dealer about any repair and modification.

If you wish to modify your vehicle for a person with physical disability, consult your Toyota dealer. It may dangerously interfere with the SRS front airbags operation.

NOTICE

Do not perform any of the following changes without consulting your Toyota dealer. Such changes can interfere with proper operation of the SRS front airbag system in some cases.

- ◆ *Installation of electronic devices such as a mobile two-way radio, cassette tape player or compact disc player*
- ◆ *Modification of the suspension system*
- ◆ *Modification of the front end structure*
- ◆ *Attachment of a grille guard (bull bar, kangaroo bar, etc.), snowplow, winches or any other equipment to the front end*
- ◆ *Repairs made on or near the front fenders, front end structure, console, steering column, steering wheel or dashboard near the front passenger airbag*

'05 TUNDRA_U (L/O 0409)

This indicator comes on when the ignition key is turned to the "ON" position. It goes off after about 6 seconds. This means the SRS front airbags are operating properly.

This warning light system monitors the airbag sensor assembly, front airbag sensors, side and curtain shield airbag sensors, curtain shield airbag sensors, driver's seat position sensor, driver's seat belt buckle switch, front passenger occupant classification system and indicator light, front passenger's seat belt buckle switch, seat belt pretensioner assemblies, inflators, warning light, interconnecting wiring and power sources. (For details, see "Service reminder indicators and warning buzzers" in Section 1-6.)

If either of the following conditions occurs, this indicates a malfunction of the airbags or seat belt pretensioners. Contact your Toyota dealer as soon as possible.

- ▶ The light does not come on when the ignition key is turned to the "ON" position or remains on for more than 6 seconds.
- ▶ The light comes on while driving.

Vehicles with separate seat—The SRS warning light will come on and front passenger occupant classification indicator light will indicate "OFF" if there is a malfunction in the front passenger occupant classification system.

In the following cases, contact your Toyota dealer as soon as possible:

- ▶ The SRS front airbags have been inflated.
- ▶ The front of the vehicle (shaded in the illustration) was involved in an accident that was not severe enough to cause the SRS front airbags to inflate.
- ▶ The pad section of the steering wheel or front passenger airbag cover (shaded in the illustration) is scratched, cracked, or otherwise damaged.

**Passenger airbag manual
on-off switch (standard cab
and access cab models only)**

NOTICE

*Do not disconnect the battery cables
before contacting your Toyota dealer.*

Except for separate seat with automatic transmission

For separate seat with automatic transmission

This on-off switch is designed to disable the passenger airbag in order to allow usage, if necessary, of a member of a passenger risk group identified in TABLE 1 is occupying the right front passenger seating position. (For details, see “SRS driver airbag and front passenger airbag” in this Section.)

Operate on-off switch as follows:

Insert key into the keyhole.

To turn passenger airbag on—

Except for separate seat with automatic transmission: Turn the key clockwise to the “ON” position. At this time, the “ON” indicator light comes on.

For separate seat with automatic transmission: Turn the key clockwise to the “AUTO” position. At this time, the indicator light condition varies depending on the occupant in the right front seat. (For details, see “Front passenger occupant classification system” in the Section.)

To turn passenger airbag off—Turn the key counterclockwise to the “OFF” position and remove it. At this time, the “OFF” indicator light comes on. If the key is removed at any other position than “OFF”, the switch will automatically return to the “ON” or “AUTO” position.

Without tachometer

With tachometer

The SRS warning light and the front passenger occupant classification indicator light or passenger airbag manual on-off indicator light will indicate "OFF" if there is a malfunction in the passenger airbag manual on-off switch.

CAUTION

▶ Do not turn off the passenger airbag manual on-off switch except when a member of a passenger risk group identified in TABLE 1 is occupying the right front passenger seating position.

▶ When the passenger airbag manual on-off switch is turned off, the passenger airbag will not inflate in a collision and turning off the passenger airbag can reduce the occupant protection which your vehicle safety systems can provide to you in certain accidents and increase the likelihood of serious personal injuries.

For details, see "SRS driver airbag and front passenger airbag" in this Section.

SRS side airbags and curtain shield airbags

The SRS (Supplemental Restraint System) side airbags and curtain shield airbags are designed to provide further protection for the driver, front passenger and rear outside passengers in addition to the primary safety protection provided by the seat belts.

'05 TUNDRA_U (L/O 0409)

In response to a severe side impact, the SRS side airbags and curtain shield airbags work with the seat belts to help reduce injury by inflating. The SRS side airbags help reduce injuries mainly to the driver's or front passenger's chest and the SRS curtain shield airbags help reduce injuries mainly to the driver's, front passenger's or rear outside passenger's head.

Vehicles with separate seat—The SRS side airbag on the passenger seat will not activate if there is no passenger sitting in the front passenger seat. However, the side airbag on the passenger seat may deploy if luggage is put in the seat, or the seat belt is buckled up, regardless of the presence of an occupant in the seat. (As for the front passenger occupant classification system, see "Front passenger occupant classification system" in this Section.)

Roll sensing function:

In response to a vehicle rollover, the curtain shield airbags on both sides work with the seat belts to help reduce injury by inflating. The curtain shield airbags help reduce injuries mainly to the driver's or front passenger's head and help prevent them from being thrown out of the vehicle. (This function can be turned off if inflation is not desired. See "Roll sensing of curtain shield airbags off switch" in this Section.)

The SRS curtain shield airbag on the passenger side are activated even with no passenger in the front seat or rear outside seat.

The SRS curtain shield airbags may activate even when the side airbags are not activated.

Always wear your seat belt properly.

CAUTION

► **The SRS side airbag and curtain shield airbag system is designed only as a supplement to the primary protection of the driver, front passenger and rear outside passenger seat belt systems. To ensure maximum protection in an accident, the driver and all passengers in the vehicle must wear their seat belts properly. Wearing a seat belt properly during an accident reduces the chances of death or serious injury or being thrown out of the vehicle. For instructions and precautions concerning the seat belt system, see "Seat belts" in this Section.**

▶ Do not allow anyone to lean his/her head or any part of his/her body against the door or the area of the seat, front pillar, rear pillar or roof side rail from which the SRS side airbag and curtain shield airbag deploy even if he/she is a child seated in the child restraint system. It is dangerous if the SRS side airbag and curtain shield airbag inflate, and the impact of the deploying airbag could cause death or serious injury to the occupant.

▶ Improperly seated and/or restrained infants and children can be killed or seriously injured by the deploying airbags. An infant or child who is too small to use a seat belt should be properly secured using a child restraint system. Toyota strongly recommends that all infants and children be placed in the rear seats of the vehicle and properly restrained. The rear seats are the safest for infants and children. For instructions concerning the installation of a child restraint system, see "Child restraint" in this Section.

The SRS side airbag and curtain shield airbag system may not activate if the vehicle is subjected to a collision from the side at certain angles, or a collision to the side of the vehicle body other than the passenger compartment as shown in the illustration.

The SRS side airbags are designed to inflate when the passenger compartment area suffers a severe impact from the side.

The curtain shield airbags are designed to inflate when the passenger compartment area suffers a severe impact from the side or vehicle rollover.

Always wear your seat belts properly.

'05 TUNDRA_U (L/O 0409)

The SRS side airbags are not generally designed to inflate if the vehicle is involved in a front or rear collision, if it rolls over, or if it is involved in a low-speed side collision.

The curtain shield airbags may inflate if the angle of vehicle tip-up is marginal or if the skidding vehicle's tires hit a curb stone laterally as shown in the illustration.

The curtain shield airbags are not generally designed to inflate if the vehicle is involved in a front or rear collision, if it pitches end over end, or if it is involved in a low-speed side collision.

'05 TUNDRA_U (L/O 0409)

The SRS side and curtain shield airbags may deploy if a serious impact occurs to the underside of your vehicle. Some examples are shown in the illustration.

The SRS side airbag and curtain shield airbag system consists mainly of the following components, and their locations are shown in the illustration.

1. SRS warning light
2. Separate seat only—Front passenger occupant classification indicator light
3. Curtain shield airbag modules (airbag and inflator)
4. Separate seat only—Front passenger occupant classification system (ECU and sensors)
5. Side airbag modules (airbag and inflator)
6. Curtain shield airbag sensors

7. Side and curtain shield airbag sensors
8. Front passenger's seat belt buckle switch
9. Airbag sensor assembly

The SRS side airbag and curtain shield airbag system is controlled by the airbag sensor assembly. The airbag sensor assembly consists of a safing sensor and airbag sensor.

In a severe side impact, the side and curtain shield airbag sensor and/or the curtain shield airbag sensor trigger(s) the side airbag inflators and/or the curtain shield airbag inflators. At this time a chemical reaction in the inflators quickly fills the airbags with non-toxic gas to help restrain the lateral motion of the occupants.

In a vehicle rollover, the airbag sensor assembly triggers the curtain shield airbag inflator. At this time, a chemical reaction in the inflators quickly fills the airbags with non-toxic gas to help restrain the lateral motion of the occupants.

When the airbags inflate, they produce a fairly loud noise and release some smoke and residue along with non-toxic gas. This does not indicate a fire. This smoke may remain inside the vehicle for some time, and may cause some minor irritation to the eyes, skin or breathing. Be sure to wash off any residue as soon as possible to prevent any potential skin irritation with soap and water. If you can safely exit from the vehicle, you should do so immediately.

Deployment of the airbags happens in a fraction of a second, so the airbags must inflate with considerable force. While the system is designed to reduce serious injuries, it may also cause minor burns or abrasions and swelling.

Front seats as well as parts of the front and rear pillars, and roof side rail may be hot for several minutes, but the airbags themselves will not be hot. The airbags are designed to inflate only once.

⚠ CAUTION

SRS side airbags and curtain shield airbags inflate with considerable force. To reduce the possibility of death or serious injury when they inflate, the driver, front passenger and rear outside passengers must:

- ▶ **Wear their seat belts properly.**
- ▶ **Remain properly seated with their backs upright and against the seats at all times.**

- ▶ **Do not allow anyone to lean against the door when the vehicle is in use, since the side airbag and curtain shield airbag could inflate with considerable speed and force. Otherwise, he/she may be killed or seriously injured. Special care should be taken especially when you have a small child in the vehicle.**
- ▶ **Sit up straight and well back in the seat, distributing your weight evenly in the seat. Do not apply excessive weight to the outer side of the seats with a side airbag, and to the front pillar, rear pillar and roof side rail with a curtain shield airbag.**

'05 TUNDRA_U (L/O 0409)

► Make sure the "RSCA OFF" indicator light is off. The curtain shield airbags will not inflate in a vehicle rollover if this indicator light is on and you may be killed or seriously injured. For details, see "Roll sensing of curtain shield airbags off switch" in this Section.

► Do not allow anyone to get his/her head closer to the area where the side airbag and curtain shield airbag inflate, since these airbags could inflate with considerable speed and force. Otherwise, he/she may be killed or seriously injured. Special care should be taken especially when you have a small child in the vehicle.

► Do not allow anyone to kneel on the passenger seat, facing the passenger's side door, since the side airbag and curtain shield airbag could inflate with considerable speed and force. Otherwise, he/she may be killed or seriously injured. Special care should be taken especially when you have a small child in the vehicle.

'05 TUNDRA_U (L/O 0409)

▶ Do not allow anyone to get his/her head or hands out of windows since the curtain shield airbags could inflate with considerable speed and force. Otherwise, he/she may be killed or seriously injured. Special care should be taken especially when you have a small child in the vehicle.

▶ Do not attach a cup holder or any other device or object on or around the door. When the side airbag inflates, the cup holder or any other device or object will be thrown with great force or the side airbag may not activate correctly, resulting in death or serious injury. Likewise, the driver and front passenger should not hold objects in their arms or on their knees.

▶ Do not attach a microphone or any other device or object around the area where the curtain shield airbag activates such as on the windshield glass, side door glass, front and rear pillars, roof side rail and assist grips. When the curtain shield airbag inflates, the microphone or other device or object will be thrown away with great force or the curtain shield airbag may not activate correctly, resulting in death or serious injury.

- ▶ Do not hook a hanger, heavy or sharp pointed objects on the coat hook. If the curtain shield airbag inflates, those items will be thrown away with great force or the curtain shield airbag may not activate correctly, resulting in death or serious injury. When you hang clothes, hang them on the coat hook directly.
- ▶ Do not use seat accessories which cover the parts where the side airbags inflate. Such accessories may prevent the side airbags from activating correctly, causing death or serious injury.
- ▶ Do not modify or replace the seats or upholstery of the seats with side airbags. Such changes may prevent the side airbag system from activating correctly, disable the system or cause the side airbags to inflate accidentally, resulting in death or serious injury.

- ▶ Do not disassemble or repair the front and rear pillars and roof side rails containing the curtain shield airbags. Such changes may disable the system or cause the curtain shield airbags to inflate accidentally, resulting in death or serious injury.
 - ▶ Do not use tires or wheels other than the manufacturer's recommended size. Such a use may cause the curtain shield airbags to inflate accidentally, which could result in death or serious injury. For details, see "Checking and replacing tires" in Section 7-2.
- Failure to follow these instructions can result in death or serious injury. Consult your Toyota dealer about any repair and modification.
- If you wish to modify your vehicle for a person with physical disability, consult your Toyota dealer. It may dangerously interfere with the SRS side airbags and curtain shield airbags operation.

NOTICE

Do not perform any of the following changes without consulting your Toyota dealer. Such changes can interfere with proper operation of the SRS side airbag and curtain shield airbag system in some cases.

- ◆ *Installation of electronic devices such as a mobile two-way radio, cassette tape player or compact disc player*
- ◆ *Modification of the suspension system*
- ◆ *Modification of the side structure of the passenger compartment*
- ◆ *Repairs made on or near the console or front seat*

'05 TUNDRA_U (L/O 0409)

This indicator comes on when the ignition key is turned to the "ON" position. It goes off after about 6 seconds. This means the SRS side airbags and curtain shield airbags are operating properly.

This warning light system monitors the airbag sensor assembly, front airbag sensors, side and curtain shield airbag sensors, curtain shield airbag sensors, driver's seat position sensor, driver's seat belt buckle switch, front passenger occupant classification system and indicator light, front passenger's seat belt buckle switch, seat belt pretensioner assemblies, inflators, warning light, "RSCA OFF" indicator light, interconnecting wiring and power sources. (For details, see "Service reminder indicators and warning buzzers" in Section 1-6.)

If either of the following conditions occurs, this indicates a malfunction of the airbags or seat belt pretensioners. Contact your Toyota dealer as soon as possible.

- ▶ The light does not come on when the ignition key is turned to the "ON" position or remains on for more than 6 seconds.
- ▶ The light comes on while driving.

Vehicles with separate seat only—The SRS warning light will come on and front passenger occupant classification indicator light will indicate "OFF" if there is a malfunction in the front passenger occupant classification system.

In the following cases, contact your Toyota dealer as soon as possible:

- ▶ Any of the SRS side airbags and curtain shield airbags have been inflated.
- ▶ The portion of the doors (shaded in the illustration) was involved in an accident that was not severe enough to cause the SRS side airbags and curtain shield airbags to inflate.
- ▶ The surface of the seats with the side airbag (shaded in the illustration) is scratched, cracked, or otherwise damaged.
- ▶ The portion of the front pillars, rear pillars or roof side rail garnishes (padding) containing the curtain shield airbags inside (shaded in the illustration) is scratched, cracked, or otherwise damaged.

NOTICE

Do not disconnect the battery cables before contacting your Toyota dealer.

Front passenger occupant classification system (separate seat only)

Your vehicle is equipped with a front passenger occupant classification system. This system detects the conditions 1—4 in the table and based on these conditions activates or deactivates front passenger airbags. The system monitors the weight and load on the front passenger seat, and the seat belt buckle switch to determine conditions 1—4. In order for the system to detect the conditions correctly, do not do any of the following.

- ▶ Put a heavy load on the front passenger seat.
- ▶ Attach a seatback table to the front passenger seatback.
- ▶ Put weight on the front passenger by putting your hands or feet on the front passenger seatback from the rear passenger seat.

The front passenger occupant classification indicator light indicates the actuation of the front passenger airbag, side airbag on the front passenger seat and front passenger's seat belt pretensioner.

The indicator light will indicate "OFF" when the ignition switch is in the "ON" position with the condition 2 in the table shown below.

If the front passenger occupant classification system determines that a person of adult size sits in the front passenger seat but the "OFF" indicator is illuminated, one of the following is likely to have occurred:

'05 TUNDRA_U (L/O 0409)

- ▶ A rear passenger lifts the front passenger seat cushion with their legs.
- ▶ Objects are placed under the front passenger seat.
- ▶ The front passenger seatback is in contact with the rear seat.

To ensure the system correctly detects an adult sitting in the front passenger seat, make sure the above do not occur.

Make sure that the "ON" indicator is illuminated when an adult is seated in the front passenger seat. If the "OFF" indicator is illuminated, ask the passenger to sit up straight, well back in the seat, and with the seat belt worn correctly. If the "OFF" indicator still remains illuminated, either ask the passenger to move to the rear seat, or if that is not possible, move the front passenger seat fully rearward.

The front passenger occupant classification indicator light will indicate "ON" and "OFF" when the ignition key is turned to the "ON" position. After about four seconds, it will go off. After that, the front passenger occupant classification system operates and judges whether to indicate "ON" or "OFF".

Without tachometer

With tachometer

The SRS warning light will come on and front passenger occupant classification indicator light will indicate "OFF" if there is a malfunction in the front passenger occupant classification system.

'05 TUNDRA_U (L/O 0409)

Condition and operation in the front passenger occupant classification system

Access cab models

Condition detected by the front passenger occupant classification system	Passenger airbag on-off switch position	Indicator/warning light			Devices	
		Front passenger occupant classification indicator light	SRS warning light	Front passenger's seat belt reminder light	Front passenger airbag	Front passenger's seat belt pretensioner
1. Adult*1	"AUTO"	"ON"	Off	Flashing*4	Activated	Activated
	"OFF"	"OFF"			Deactivated	
2. Child*2 or child restraint system*3	"AUTO"	"OFF"	Off	Flashing*4	Deactivated	Activated
	"OFF"

3. Unoccupied	Not illuminated	Off	Off	Deactivated			Deactivated
4. There is a malfunction in the system	"OFF"	On	Off	Deactivated			Activated

*1: The system judges a person of adult size as an adult. When a smaller adult sits in the front passenger seat, the system may recognize him/her as a child depending on his/her physique and posture.

*2: When a larger child who has outgrown a child restraint system sits in the front passenger seat, the system may recognize him/her as an adult depending on his/her physique or posture.

*3: Never install a rear-facing child restraint system on the front passenger seat. A forward-facing child restraint system should only be installed on the front passenger seat when it is unavoidable. (See "Child restraint" in this Section as for installing the child restraint system.)

*4: In the event the front passenger does not wear a seat belt.

 CAUTION

To avoid potential death or serious injury when the front passenger occupant classification system does not detect the conditions correctly, observe the following.

- ▶ Make sure the front passenger occupant classification indicator light indicates "ON" when using the seat belt extender for the front passenger seat. If the indicator light indicates "OFF", disconnect the extender tongue from the seat belt buckle, then reconnect the seat belt. Reconnect the seat belt extender after making sure the indicator light indicates "ON". If you use the seat belt extender while the indicator light indicates "OFF", the front passenger airbag and side airbag on the front passenger side may not activate correctly, which could cause death or serious injury in the event of collision.

- ▶ Do not recline the front passenger seatback so far that it touches a rear seat. This may cause the "OFF" indicator to be illuminated, which indicates that the passenger's airbags will not deploy in the event of a severe accident. If the seatback touches the rear seat, return the seatback to a position where it does not touch the rear seat.

Keep the front passenger seatback as upright as possible when the vehicle is moving. Reclining the seatback excessively may lessen the effectiveness of the seat belt system.

- ▶ If an adult sits in the front passenger seat, the occupant classification indicator light should indicate "ON". If the "OFF" indicator is illuminated, ask the passenger to sit up straight, well back in the seat, feet on the floor, and with the seat belt worn correctly. If the "OFF" indicator still remains illuminated, either ask the passenger to move to the rear seat, or if that is not possible, move the front passenger seat fully rearward.

- ▶ Wear the seat belt properly.

- ▶ Make sure the front passenger's seat belt tab has not been left inserted into the buckle before someone sits in the front passenger seat.

- ▶ Do not put a heavy load in the front passenger seatback pocket or attach a seatback table to the front passenger seat seatback.

- ▶ Do not put weight on the front passenger seat by putting your hands or feet on the front passenger seat seatback from the rear passenger seat.

- ▶ Do not let a rear passenger lift the front passenger seat with their feet or press on the seatback with their legs.

- ▶ Do not put objects under the front passenger seat.

- ▶ Child restraint systems installed on the rear seat should not contact the front seatbacks.

Roll sensing of curtain shield airbags off switch

- ▶ When it is unavoidable to install the forward-facing child restraint system on the front passenger seat, install the child restraint system on the front passenger seat in the proper order. (As for the installation order, see “—Installation with seat belt” in this Section.)
- ▶ Do not remove the front seats.
- ▶ Do not kick the front passenger seat or subject it to severe impact. Otherwise, the SRS warning light may come on to indicate a malfunction of the detection system. In this case, contact your Toyota dealer immediately.

The front passenger occupant classification indicator light may indicate “ON” (the front passenger airbag and side airbag on the front passenger seat may deploy) even if observing the above cautions, when a child sits in, or a forward-facing child restraint system is installed on the front passenger seat. Refer to all the cautions in “SRS driver airbag and front passenger airbag”, “SRS side airbags and curtain shield airbags” and “Child restraint” in this Section.

The roll sensing of curtain shield airbags off switch (“RSCA OFF” switch) can turn off the curtain shield airbags and seat belt pretensioners in a vehicle rollover. This switch should only be used if inflation is not desired (such as extreme off-road driving).

When you push the “RSCA OFF” switch for a few seconds with the ignition switch on, the “RSCA OFF” indicator light comes on and the roll sensing function is turned off. When you push the switch again, the indicator light goes off and the roll sensing function is turned on. (For details about the roll sensing function, see “SRS side airbags and curtain shield airbags” in this Section.)

In a severe side impact, the curtain shield airbags on impacted side will inflate even if the roll sensing function is turned off. (For details about the curtain shield airbags, see “SRS side airbags and curtain shield airbags” in this Section.)

In a severe frontal impact, the seat belt pretensioners will work even if the roll sensing function is turned off. (For details about the seat belt pretensioners, see “—Seat belt pretensioners” in this Section.)

If the ignition switch is turned to “ACC” or “LOCK” with the roll sensing function off and then the ignition switch is turned back to “ON”, the roll sensing function will turn back on automatically.

 **CAUTION**

- ▶ Before normal driving, make sure the "RSCA OFF" indicator light is off.
- ▶ When the roll sensing function is turned off (and the "RSCA OFF" indicator light is on), the curtain shield airbags and seat belt pretensioners will not work in a vehicle rollover. Turning off the curtain shield airbags and seat belt pretensioners reduces occupant protection which your vehicle safety systems can provide in accidents and increase the likelihood of death or serious injuries.

**Child restraint—
—Child restraint precautions**

Toyota strongly urges the use of appropriate child restraint systems for children.

The laws of all 50 states in the U.S.A. and Canada now require the use of a child restraint system.

Your vehicle conforms to SAEJ1819.

If a child is too large for a child restraint system, the child should sit in the rear seat and must be restrained using the vehicle's seat belt. See "Seat belts" in this Section for details.

 **CAUTION**

- ▶ For effective protection in automobile accidents and sudden stops, a child must be properly restrained, using a seat belt or child restraint system depending on the age and size of the child. Holding a child in your arms is not a substitute for a child restraint system. In an accident, the child can be crushed against the windshield, or between you and the vehicle's interior.

Standard and access cab models—

- ▶ **STANDARD CAB MODELS—**
Toyota strongly urges use of a proper child restraint system which conforms to the size of the child.
- ▶ **ACCESS CAB MODELS—**
Toyota strongly urges use of a proper child restraint system which conforms to the size of the child, installed on the rear seat. According to accident statistics, the child is safer when properly restrained in the rear seat than in the front seat.

'05 TUNDRA_U (L/O 0409)

▶ Never put infant or child age 1 to 12 in a passenger risk group on the right front passenger seat with the passenger airbag manual on-off switch in the "ON" or "AUTO" position. In the event of an accident, the force of the rapid inflation of the front passenger airbag can cause death or serious injury to the child.

If you must put infant or child age 1 to 12 in a passenger risk group on the right front seat, make sure that the passenger airbag manual on-off switch is in the "OFF" position with the key removed and that the indicator light is on. (For details, see "SRS driver airbag and front passenger airbag" in this Section.)

▶ Do not use the seat belt extender when installing a child restraint system on the front or rear passenger seat. If installing a child restraint system with the seat belt extender connected to the seat belt, the seat belt will not securely hold the child restraint system, which could cause death or serious injury to the child or other passengers in the event of collision.

▶ Make sure you have complied with all installation instructions provided by the child restraint manufacturer and that the system is properly secured. If it is not secured properly, it may cause death or serious injury to the child in the event of a sudden stop or accident.

Double cab models—

▶ Toyota strongly urges use of a proper child restraint system which conforms to the size of the child, installed on the rear seat. According to accident statistics, the child is safer when properly restrained in the rear seat than in the front seat.

▶ Vehicles with separate seat—Never install a rear-facing child restraint system on the front passenger seat even if the front passenger occupant classification indicator light indicates "OFF". In the event of an accident, the impact of the rapid inflation of the front passenger airbag could cause death or serious injury to the child if the rear-facing child restraint system is installed on the front passenger seat.

- ▶ **Vehicles with separate seat**—A forward-facing child restraint system should be allowed to be installed on the front passenger seat only when it is unavoidable. Always move the seat as far back as possible even if the front passenger occupant classification indicator light indicates “OFF”, because the front passenger airbag could inflate with considerable speed and force. Otherwise, the child may be killed or seriously injured.
- ▶ **On vehicles with side airbags and curtain shield airbags**, do not allow the child to lean his/her head or any part of his/her body against the door or the area of the seat, front or rear pillar or roof side rail from which the side airbags or curtain shield airbags deploy even if the child is seated in the child restraint system. It is dangerous if the side airbag and curtain shield airbag inflate, and the impact could cause death or serious injury to the child.

- ▶ **Do not use the seat belt extender** when installing a child restraint system on the front or rear passenger seat. If installing a child restraint system with the seat belt extender connected to the seat belt, the seat belt will not securely hold the child restraint system, which could cause death or serious injury to the child or other passengers in the event of collision.
- ▶ **Make sure you have complied with all installation instructions provided by the child restraint manufacturer and that the system is properly secured.** If it is not secured properly, it may cause death or serious injury to the child in the event of a sudden stop or accident.

—Child restraint system

A child restraint system for a small child or baby must itself be properly restrained on the seat with the lap portion of the lap/shoulder belt. You must carefully consult the manufacturer’s instructions which accompany the child restraint system.

To provide proper restraint, use a child restraint system following the manufacturer’s instructions about the appropriate age and size of the child for the child restraint system.

Install the child restraint system correctly following the instructions provided by its manufacturer. General directions are also provided under the following illustrations.

The child restraint system should be installed on the rear seat if your vehicle is equipped with rear seats. According to accident statistics, the child is safer when properly restrained in the rear seat than in the front seat.

When not using the child restraint system, keep it secured with the seat belt or place it somewhere other than the passenger compartment. This will prevent it from injuring passengers in the event of a sudden stop or accident.

—Types of child restraint system

Child restraint systems are classified into the following 3 types depending on the child's age and size.

- (A) Infant seat
- (B) Convertible seat
- (C) Booster seat

Install the child restraint system following the instructions provided by its manufacturer.

Your vehicle has anchor brackets for securing the top strap of a child restraint system.

For instructions about how to use the anchor bracket, see “—Using a top strap” in this Section.

The child restraint lower anchorages approved for your vehicle may also be used. See “—Installation with child restraint lower anchorages” in this Section.

(A) Infant seat

(C) Booster seat

(B) Convertible seat

—Installation with seat belt
(standard cab models and
access cab models)

(A) INFANT SEAT INSTALLATION

An infant seat must be used in rear-facing position only.

Except for separate seat with automatic transmission

For separate seat with automatic transmission

CAUTION

Never install a rear-facing child restraint system on the front seat with the passenger airbag manual on-off switch in the "ON" or "AUTO" position. In the event of an accident, the force of the rapid inflation of the front passenger airbag can cause death or serious injury to the child if the rear-facing child system is installed on the front passenger seat.

'05 TUNDRA_U (L/O 0409)

Except for separate seat with automatic transmission

For separate seat with automatic transmission

When you install a rear-facing child restraint system which belongs to a passenger risk group on the right front seat, turn the passenger airbag manual on-off switch counterclockwise to the "OFF" position and remove the key. (For details, see "SRS driver airbag and front passenger airbag" in this Section.)

The indicator light comes on when the system is off.

CAUTION

If you must install a rear-facing child restraint system on the right front seat, make sure that the passenger airbag manual on-off switch is in the "OFF" position with the key removed and that the indicator light is on.

CAUTION

- ▶ Do not install a child restraint system on the rear seat if it interferes with the lock mechanism of the front seats. Otherwise, the child or front seat occupants, may be killed or seriously injured in case of sudden braking or a collision.
- ▶ If the driver's seat position does not allow sufficient space for safe installation, install the child restraint system on the rear right seat.

1. Run the lap and shoulder belt through or around the infant seat following the instructions provided by its manufacturer and insert the tab into the buckle taking care not to twist the belt. Keep the lap portion of the belt tight.

⚠ CAUTION

- ▶ After inserting the tab, make sure the tab and buckle are locked and that the lap and shoulder portions of the belt are not twisted.
- ▶ Do not insert coins, clips, etc. in the buckle as this may prevent your child from properly latching the tab and buckle.
- ▶ If the seat belt does not function normally, it cannot protect your child from death or serious injury. **Contact your Toyota dealer immediately. Do not install the child restraint system on the seat until the seat belt is fixed.**

2. Fully extend the shoulder belt to put it in the lock mode. When the belt is then retracted even slightly, it cannot be extended.

To hold the infant seat securely, make sure the belt is in the lock mode before letting the belt retract.

'05 TUNDRA_U (L/O 0409)

3. While pressing the infant seat firmly against the seat cushion and seatback, let the shoulder belt retract as far as it will go to hold the infant seat securely.

4. To remove the infant seat, press the buckle release button and allow the belt to retract completely. The belt will move freely again and be ready to work for an adult or older child passenger.

CAUTION

Push and pull the child restraint system in different directions to be sure it is secure. Follow all the installation instructions provided by its manufacturer.

(B) CONVERTIBLE SEAT INSTALLATION

A convertible seat must be used in forward-facing or rear-facing position depending on the child's age and size. When installing, follow the manufacturer's instruction about the applicable child's age and size as well as directions for installing the child restraint system.

Except for separate seat with automatic transmission

For separate seat with automatic transmission

CAUTION

Rear-facing child restraint system: Never install a rear-facing child restraint system on the front seat with the passenger airbag manual on-off switch in the "ON" or "AUTO" position. In the event of an accident, the force of the rapid inflation of the front passenger airbag can cause death or serious injury to the child if the rear-facing child system is installed on the front passenger seat.

'05 TUNDRA_U (L/O 0409)

Except for separate seat with automatic transmission

For separate seat with automatic transmission

When you install a rear-facing child restraint system which belongs to a passenger risk group on the right front seat, turn the passenger airbag manual on-off switch counterclockwise to the "OFF" position and remove the key. (For details, see "SRS driver airbag and front passenger airbag" in this Section.)

The indicator light comes on when the system is off.

! CAUTION

If you must install a rear-facing child restraint system on the right front seat, make sure that the passenger airbag manual on-off switch is in the "OFF" position with the key removed and that the indicator light is on.

! CAUTION

Forward-facing child restraint system:
A forward-facing child restraint system which belongs to a passenger risk group should never be installed on the right front passenger seat with the passenger airbag manual on-off switch in the "ON" or "AUTO" position, because the force of the deploying airbag could cause death or serious injury to the child in forward seating position. (For details, see "SRS driver airbag and front passenger airbag" in this Section.)

CAUTION

- ▶ Do not install a child restraint system on the rear seat if it interferes with the lock mechanism of the front seats. Otherwise, the child or front seat occupants, may be killed or seriously injured in case of sudden braking or a collision.
- ▶ If the driver's seat position does not allow sufficient space for safe installation, install the child restraint system on the rear right seat.

1. Run the lap and shoulder belt through or around the convertible seat following the instructions provided by its manufacturer and insert the tab into the buckle taking care not to twist the belt. Keep the lap portion of the belt tight.

CAUTION

- ▶ After inserting the tab, make sure the tab and buckle are locked and that the lap and shoulder portions of the belt are not twisted.
- ▶ Do not insert coins, clips, etc. in the buckle as this may prevent your child from properly latching the tab and buckle.
- ▶ If the seat belt does not function normally, it cannot protect your child from death or serious injury. Contact your Toyota dealer immediately. Do not install the child restraint system on the seat until the seat belt is fixed.

'05 TUNDRA_U (L/O 0409)

2. Fully extend the shoulder belt to put it in the lock mode. When the belt is then retracted slightly, it cannot be extended.

To hold the convertible seat securely, make sure the belt is in the lock mode before letting the belt retract.

3. While pressing the convertible seat firmly against the seat cushion and seatback, let the shoulder belt retract as far as it will go to hold the convertible seat securely.

 **CAUTION**

Push and pull the child restraint system in different directions to be sure it is secure. Follow all the installation instructions provided by its manufacturer.

4. To remove the convertible seat, press the buckle release button and allow the belt to retract completely. The belt will move freely again and be ready to work for an adult or older child passenger.

(C) BOOSTER SEAT INSTALLATION

A booster seat must be used in forward-facing position only.

⚠ CAUTION

A forward-facing child restraint system which belongs to a passenger risk group should never be installed on the front outside passenger seat with the passenger airbag manual on-off switch in the "ON" or "AUTO" position, because the force of the deploying airbag could cause death or serious injury to the child in forward seating position. (For details, see "SRS driver airbag and front passenger airbag" in this Section.)

1. Sit the child on a booster seat. Run the lap and shoulder belt through or around the booster seat and across the child following the instructions provided by its manufacturer and insert the tab into the buckle taking care not to twist the belt.

Make sure the shoulder belt is correctly across the child's shoulder and that the lap belt is positioned as low as possible on the child's hips. See "Seat belts" in this Section for details.

CAUTION

- ▶ Always make sure the shoulder belt is positioned across the center of child's shoulder. The belt should be kept away from child's neck, but not falling off child's shoulder. Otherwise, the child may be killed or seriously injured in case of sudden braking or a collision.
- ▶ Both high-positioned lap belts and loose-fitting belts could cause death or serious injuries due to sliding under the lap belt during a collision or other unintended event. Keep the lap belt positioned as low on a child's hips as possible.
- ▶ For child's safety, do not place the shoulder belt under child's arm.
- ▶ After inserting the tab, make sure the tab and buckle are locked and that the lap and shoulder portions of the belt are not twisted.
- ▶ Do not insert coins, clips, etc. in the buckle as this may prevent your child from properly latching the tab and buckle.

▶ If the seat belt does not function normally, it cannot protect your child from death or serious injury. Contact your Toyota dealer immediately. Do not install the child restraint system on the seat until the seat belt is fixed.

—Installation with seat belt
(double cab models)

2. To remove the child restraint system, press the buckle release button and allow the belt to retract.

(A) INFANT SEAT INSTALLATION

An infant seat must be used in rear-facing position only.

⚠ CAUTION

▶ Vehicles with split bench seat—Never install a rear-facing child restraint system on the front passenger seat. In the event of an accident, the force of the rapid inflation of the front passenger airbag can cause death or serious injury to the child if the rear-facing child restraint system is installed on the front passenger seat.

'05 TUNDRA_U (L/O 0409)

▶ Vehicles with separate seat—Never install a rear-facing child restraint system on the front passenger seat even if the front passenger occupant classification indicator light indicates “OFF”. In the event of an accident, the impact of the rapid inflation of the front passenger airbag could cause death or serious injury to the child if the rear-facing child restraint system is installed on the front passenger seat.

▶ Do not install a child restraint system on the rear seat if it interferes with the lock mechanism of the front seats. Otherwise, the child or front seat occupants, may be killed or seriously injured in case of sudden braking or a collision.

▶ If the driver's seat position does not allow sufficient space for safe installation, install the child restraint system on the rear right seat.

1. Run the lap and shoulder belt through or around the infant seat following the instructions provided by its manufacturer and insert the tab into the buckle taking care not to twist the belt. Keep the lap portion of the belt tight.

CAUTION

- ▶ After inserting the tab, make sure the tab and buckle are locked and that the lap and shoulder portions of the belt are not twisted.
- ▶ Do not insert coins, clips, etc. in the buckle as this may prevent your child from properly latching the tab and buckle.
- ▶ If the seat belt does not function normally, it cannot protect your child from death or serious injury. Contact your Toyota dealer immediately. Do not install the child restraint system on the seat until the seat belt is fixed.

2. Fully extend the shoulder belt to put it in the lock mode. When the belt is then retracted even slightly, it cannot be extended.

To hold the infant seat securely, make sure the belt is in the lock mode before letting the belt retract.

3. While pressing the infant seat firmly against the seat cushion and seatback, let the shoulder belt retract as far as it will go to hold the infant seat securely.

⚠ CAUTION
Push and pull the child restraint system in different directions to be sure it is secure. Follow all the installation instructions provided by its manufacturer.

4. To remove the infant seat, press the buckle release button and allow the belt to retract completely. The belt will move freely again and be ready to work for an adult or older child passenger.

(B) CONVERTIBLE SEAT INSTALLATION
A convertible seat must be used in forward-facing or rear-facing position depending on the age and size of the child. When installing, follow the manufacturer's instructions about the applicable age and size of the child as well as directions for installing the child restraint system.

'05 TUNDRA_U (L/O 0409)

Vehicles with separate seat only—

Install the child restraint system on the front passenger seat only when it is unavoidable. Your vehicle is equipped with a front passenger occupant classification system. In order to activate the occupant classification system correctly, install the forward-facing child restraint system on the front passenger seat in the following order:

1. Turn the ignition key to the "ON" position.
2. Move the front passenger seat to the rearward position.
3. Put the child restraint system on the front passenger seat without putting your weight on the front passenger seat.
4. Insert the seat belt tab into the seat belt buckle.
5. Fully extend the shoulder belt to put it in the lock mode. When the belt is then retracted even slightly, it cannot be extended. To hold the seat securely, make sure the belt is in the lock mode before letting the belt retract.

6. While pressing the convertible seat firmly against the seat cushion and seatback, let the shoulder belt retract as far as it will go to hold the convertible seat securely.

7. Put a child on the child restraint system and secure the child, complying with the instructions provided by the child restraint system manufacturer.

The occupant classification indicator light should indicate "OFF" when the ignition key is in the "ON" position and the child is in the child restraint system after following these procedures. The "OFF" indicator indicates the SRS front passenger airbag and side airbag on the passenger side will not deploy. If the indicator light indicates "ON", remove the child restraint system and reinstall it with the ignition key in the "ACC" or "LOCK" position. If the indicator light still indicates "ON" when the ignition key is turned to the "ON" position, then the SRS front passenger airbag and side airbag on the passenger side may deploy in an accident. Do not drive the vehicle in this condition. Remove the child restraint system and contact your Toyota dealer.

 CAUTION

▶ Vehicles with separate seat—Never install a rear-facing child restraint system on the front passenger seat. A forward-facing child restraint system should only be installed on the front passenger seat when unavoidable. If you must install the child restraint system on the front passenger seat, put the seat in its most rearward position, and install the forward-facing child restraint system in the proper order. Otherwise, the front passenger occupant classification system can not detect the presence of the child restraint system and the front passenger airbag and side airbag on the front passenger seat could deploy.

▶ Vehicles with split bench seat—Never install a rear-facing child restraint system on the front passenger seat. In the event of an accident, the force of the rapid inflation of the front passenger airbag can cause death or serious injury to the child if the rear-facing child restraint system is installed on the front passenger seat.

▶ Vehicles with separate seat—Never install a rear-facing child restraint system on the front passenger seat even if the front passenger occupant classification indicator light indicates "OFF". In the event of an accident, the impact of the rapid inflation of the front passenger airbag could cause death or serious injury to the child if the rear-facing child restraint system is installed on the front passenger seat.

▶Vehicles with split bench seat—A forward-facing child restraint system should be allowed to be installed on the front passenger seat only when it is unavoidable. Always move the seat as far back as possible, because the front passenger airbag could inflate with considerable speed and force. Otherwise, the child may be killed or seriously injured.

▶Vehicles with separate seat—A forward-facing child restraint system should be allowed to be installed on the front passenger seat only when it is unavoidable. Always move the seat as far back as possible even if the front passenger occupant classification indicator light indicates “OFF”, because the front passenger airbag could inflate with considerable speed and force. Otherwise, the child may be killed or seriously injured.

▶On vehicles with side airbags and curtain shield airbags, do not allow the child to lean his/her head or any part of his/her body against the door or the area of the seat, front or rear pillar or roof side rail from which the side airbags or curtain shield airbags deploy even if the child is seated in the child restraint system. It is dangerous if the side airbag and curtain shield airbag inflate, and the impact could cause death or serious injury to the child.

▶Do not install a child restraint system on the rear seat if it interferes with the lock mechanism of the front seats. Otherwise, the child or front seat occupants, may be killed or seriously injured in case of sudden braking or a collision.

▶If the driver's seat position does not allow sufficient space for safe installation, install the child restraint system on the rear right seat.

'05 TUNDRA_U (L/O 0409)

1. Run the lap and shoulder belt through or around the convertible seat following the instructions provided by its manufacturer and insert the tab into the buckle taking care not to twist the belt. Keep the lap portion of the belt tight.

CAUTION

- ▶ After inserting the tab, make sure the tab and buckle are locked and that the lap and shoulder portions of the belt are not twisted.
- ▶ Do not insert coins, clips, etc. in the buckle as this may prevent your child from properly latching the tab and buckle.
- ▶ If the seat belt does not function normally, it cannot protect your child from death or serious injury. **Contact your Toyota dealer immediately. Do not install the child restraint system on the seat until the seat belt is fixed.**

2. Fully extend the shoulder belt to put it in the lock mode. When the belt is then retracted slightly, it cannot be extended.

To hold the convertible seat securely, make sure the belt is in the lock mode before letting the belt retract.

'05 TUNDRA_U (L/O 0409)

3. While pressing the convertible seat firmly against the seat cushion and seatback, let the shoulder belt retract as far as it will go to hold the convertible seat securely.

⚠ CAUTION
Push and pull the child restraint system in different directions to be sure it is secure. Follow all the installation instructions provided by its manufacturer.

4. To remove the convertible seat, press the buckle release button and allow the belt to retract completely. The belt will move freely again and be ready to work for an adult or older child passenger.

(C) BOOSTER SEAT INSTALLATION

A booster seat must be used in forward-facing position only.

Move seat fully back

! CAUTION

▶ Vehicles with split bench seat—A forward-facing child restraint system should be allowed to be installed on the front passenger seat only when it is unavoidable. Always move the seat as far back as possible, because the front passenger airbag could inflate with considerable speed and force. Otherwise, the child may be killed or seriously injured.

▶ Vehicles with separate seat—A forward-facing child restraint system should be allowed to be installed on the front passenger seat only when it is unavoidable. Always move the seat as far back as possible even if the front passenger occupant classification indicator light indicates “OFF”, because the front passenger airbag could inflate with considerable speed and force. Otherwise, the child may be killed or seriously injured.

▶ On vehicles with side airbags and curtain shield airbags, do not allow the child to lean his/her head or any part of his/her body against the door or the area of the seat, front or rear pillar or roof side rail from which the side airbags or curtain shield airbags deploy even if the child is seated in the child restraint system. It is dangerous if the side airbag and curtain shield airbag inflate, and the impact could cause death or serious injury to the child.

1. Sit the child on a booster seat. Run the lap and shoulder belt through or around the booster seat and across the child following the instructions provided by its manufacturer and insert the tab into the buckle taking care not to twist the belt.

Make sure the shoulder belt is correctly across the child's shoulder and that the lap belt is positioned as low as possible on the child's hips. See "Seat belts" in this Section for details.

⚠ CAUTION

- ▶ Always make sure the shoulder belt is positioned across the center of child's shoulder. The belt should be kept away from child's neck, but not falling off child's shoulder. Otherwise, the child may be killed or seriously injured in case of sudden braking or a collision.
- ▶ Both high-positioned lap belts and loose-fitting belts could cause death or serious injuries due to sliding under the lap belt during a collision or other unintended event. Keep the lap belt positioned as low on a child's hips as possible.
- ▶ For child's safety, do not place the shoulder belt under child's arm.
- ▶ After inserting the tab, make sure the tab and buckle are locked and that the lap and shoulder portions of the belt are not twisted.
- ▶ Do not insert coins, clips, etc. in the buckle as this may prevent your child from properly latching the tab and buckle.

▶ If the seat belt does not function normally, it cannot protect your child from death or serious injury. Contact your Toyota dealer immediately. Do not install the child restraint system on the seat until the seat belt is fixed.

**—Using a top strap
(standard cab models)**

2. To remove the child restraint system, press the buckle-release button and allow the belt to retract.

Follow the procedure below for a child restraint system that requires the use of a top strap.

Use the anchor bracket on the back panel to attach the top strap.

Anchor brackets are installed for each passenger seating position.

This symbol indicates the locations of user ready anchor brackets.

'05 TUNDRA_U (L/O 0409)

TO USE THE ANCHOR BRACKET:
1. Remove the passenger head restraint.

2. Lightly push down on the top surface of the anchor bracket cover, then pull it forward to remove.

3. Fix the child restraint system with the seat belt.

Latch the hook onto the anchor bracket and tighten the top strap.

For instructions to install the child restraint system, see "Child restraint" in this Section.

⚠ CAUTION

Make sure the top strap is securely latched, and check that the child restraint system is secure by pushing and pulling it in different directions. Follow all the installation instructions provided by its manufacturer.

**—Using a top strap
(access cab models)**

4. Replace the passenger head restraint.

Store any removed covers in a safe place such as the glove box.

Be sure to replace all covers when the anchor bracket is not in use.

Outside position

Center position

Follow the procedure below for a child restraint system that requires the use of a top strap.

'05 TUNDRA_U (L/O 0409)

Use the routing device on the rear of the seat back and the anchor bracket on the side floor to attach the top strap.

Anchor brackets are installed for each rear seating position.

This symbol indicates the locations of user ready anchor brackets.

TO USE THE ANCHOR BRACKET:

Outside position

1. Remove the head restraint.

2. Route the top strap through the routing device as shown in the illustration.

CAUTION

Make sure the top strap is not twisted.

3. Fix the child restraint system with the seat belt.

Latch the hook onto the anchor bracket on the side floor and tighten the top strap.

For instructions to install the child restraint system, see "Child restraint" in this Section.

4. Replace the head restraint.

'05 TUNDRA_U (L/O 0409)

- Center position**
1. Remove the head restraint.

2. Fold down the cup holder, unfasten the Velcro that attaches the anchor bracket cover, and lift the cover.

3. Route the top strap through the slot on top of the seat, pass the strap through the seat, then latch the hook onto the anchor bracket.
Close the cover and return the cup holder to the original position.

4. Move the child restraint system to the correct position.

Then fix the child restraint system with the seat belt and tighten the top strap.

5. Replace the head restraint.

—Using a top strap
(double cab models)

Follow the procedure below for a child restraint system that requires the use of a top strap.

 **CAUTION**

Make sure the top strap is securely latched, and check that the child restraint system is secure by pushing and pulling it in different directions. Follow all the installation instructions provided by its manufacturer.

'05 TUNDRA_U (L/O 0409)

Use one anchor bracket on the back of rear seats and two anchor brackets on the floor as shown above to attach the top strap.

Anchor brackets are installed for each rear seating position.

TO USE THE ANCHORAGES:
1. Remove the head restraint.

Outside position

Center position

2. Fix the child restraint system with the seat belt.

Latch the hook onto the anchorages and tighten the top strap.

For instructions to install the child restraint system, see "Child restraint" in this Section.

CAUTION

Make sure the top strap is securely latched, and check that the child restraint system is secure by pushing and pulling it in different directions. Follow all the installation instructions provided by its manufacturer.

3. Replace the head restraint.

—Installation with child restraint lower anchorages (standard cab models)

Lower anchorages for the child restraint systems complying with the FMVSS225 or CMVSS210.2 specifications are installed in the front seat.

The anchorages are installed in the gap between the seat cushion and seatback of the right side of the seat as shown in the illustration.

Child restraint systems complying with the FMVSS213 or CMVSS213 specification can be fixed to these anchorages. In this case, it is not necessary to fix the child restraint system with a seat belt on the vehicle.

'05 TUNDRA_U (L/O 0409)

Type A

Type B

For owners in Canada

The symbol on a child restraint system indicates the presence of a lower connector system.

CHILD RESTRAINT SYSTEM INSTALLATION

Type A—

1. Widen the gap between the seat cushion and seatback slightly and confirm the position of the lower anchorages near the button on the seatback.
2. Latch the hooks of lower straps onto the anchorages and tighten the lower straps.

Type B—

1. Widen the gap between the seat cushion and seatback slightly and confirm the position of the lower anchorages near the button on the seatback.
2. Latch the buckles onto the anchorages.

—Installation with child restraint lower anchorages (access cab models)

If your child restraint system has a top strap, it should be anchored. (For the installation of the top strap, see “—Using a top strap” in this Section.)

For installation details, refer to the instruction manual equipped with each product.

CAUTION

- ▶ When using the lower anchorages for the child restraint system, be sure that there are no irregular objects around the anchorages or that the seat belt is not caught.
- ▶ Push and pull the child restraint system in different directions to be sure it is secure. Follow all the installation instructions provided by its manufacturer.
- ▶ After securing the child restraint system, never slide or recline the seat.

Lower anchorages for the child restraint systems complying with the FMVSS225 or CMVSS210.2 specifications are installed in the rear seat.

The anchorages are installed in the gap between the seat cushion and seatback of the outsides of the rear seat as shown in the illustration.

Child restraint systems complying with the FMVSS213 or CMVSS213 specification can be fixed to these anchorages. In this case, it is not necessary to fix the child restraint system with a seat belt on the vehicle.

Type A

Type B

For owners in Canada

The symbol on a child restraint system indicates the presence of a lower connector system.

CHILD RESTRAINT SYSTEM INSTALLATION

Type A—

1. Widen the gap between the seat cushion and seatback slightly and confirm the position of the lower anchorages near the button on the seatback.
2. Latch the hooks of lower straps onto the anchorages and tighten the lower straps.

Type B—

1. Widen the gap between the seat cushion and seatback slightly and confirm the position of the lower anchorages near the button on the seatback.
2. Latch the buckles onto the anchorages.

If your child restraint system has a top strap, it should be anchored. (For the installation of the top strap, see “—Using a top strap” in this Section.)

For installation details, refer to the instruction manual equipped with each product.

CAUTION

- ▶ When using the lower anchorages for the child restraint system, be sure that there are no irregular objects around the anchorages or that the seat belt is not caught.
- ▶ Push and pull the child restraint system in different directions to be sure it is secure. Follow all the installation instructions provided by its manufacturer.
- ▶ After securing the child restraint system, never slide or recline the seat.
- ▶ Do not install a child restraint system on the rear seat if it interferes with the lock mechanism of the front seats. Otherwise, the child or front seat occupant(s) may be killed or seriously injured in case of sudden braking or a collision.

—Installation with child restraint lower anchorages (double cab models)

Center

Left

Lower anchorages for the child restraint systems complying with the FMVSS225 or CMVSS210.2 specifications are installed in the center and left positions of the rear seats.

The anchorages are installed in the gap between the seat cushion and seatback for center and left positions of rear seats.

Child restraint systems complying with the FMVSS213 or CMVSS213 specification can be fixed to these anchorages. In this case, it is not necessary to fix the child restraint system with a seat belt on the vehicle.

Type A

Type B

For owners in Canada

The symbol on a child restraint system indicates the presence of a lower connector system.

CHILD RESTRAINT SYSTEM INSTALLATION

Type A—

1. Turn up the covers for left lower anchorage on the center position of the seats and for anchorages on the left side position of the seats, and remove the cap for the right lower anchorage of the center position of the seat as shown in the illustration.
2. Widen the gap between the seat cushion and seatback slightly and confirm the position of the lower anchorages below the button and cap in the seat cushion.
3. Latch the hooks of lower straps onto the anchorages and tighten the lower straps.

Type B—

1. Turn up the covers for left lower anchorage on the center position of the seats and for anchorages on the left side position of the seat, and remove the cap for the right lower anchorage of the center position of the seat as shown in the illustration.
2. Widen the clearance gap the seat cushion and seatback slightly and confirm the position of the lower anchorages below the button and cap in the seat cushion.
3. Latch the buckles onto the anchorages.

If your child restraint system has a top strap, it should be anchored. (For the installation of the top strap, see “—Using a top strap” in this Section.)

For installation details, refer to the instruction manual equipped with each product.

 **CAUTION**

- ▶ When using the lower anchorages for the child restraint system, be sure that there are no irregular objects around the anchorages or that the seat belt is not caught.
- ▶ Push and pull the child restraint system in different directions to be sure it is secure. Follow all the installation instructions provided by its manufacturer.
- ▶ After securing the child restraint system, never recline the seat.
- ▶ Do not install a child restraint system on the rear seat if it interferes with the lock mechanism of the front seats. Otherwise, the child or front seat occupant(s) may be killed or seriously injured in case of sudden braking or a collision.

'05 TUNDRA_U (L/O 0409)

SECTION 1-4

OPERATION OF INSTRUMENTS AND CONTROLS

Steering wheel and Mirrors

Tilt steering wheel	146
Outside rear view mirrors	146
Anti- glare inside rear view mirror	148
Auto anti- glare inside rear view mirror	149
Sun visors	150

Tilt steering wheel

To change the steering wheel angle, hold the steering wheel, pull the lock release lever toward you, tilt the steering wheel to the desired angle and release the lever.

When the steering wheel is in a low position, it will spring up as you release the lock release lever.

CAUTION

- ▶ Do not adjust the steering wheel while the vehicle is moving. Doing so may cause the driver to mishandle the vehicle and an accident may occur resulting in death or serious injuries.
- ▶ After adjusting the steering wheel, try moving it up and down to make sure it is locked in position.

Outside rear view mirrors—

Adjust the mirror so that you can just see the side of your vehicle in the mirror.

Be careful when judging the size or distance of any object seen in the outside rear view mirror on the passenger's side because it is a convex mirror. Any object seen in a convex mirror will look smaller and farther away than when seen in a flat mirror.

—Power rear view mirror control

On some models, when you push the outside rear view mirror heater switch or outside rear view mirror defogger switch, the heater panels in the outside rear view mirrors will quickly clear the mirror surface. (See “Back window and outside rear view mirror defoggers” in Section 1-5 and “Outside rear view mirror heaters” in Section 1-5.)

CAUTION

- ▶ Do not adjust the mirror while the vehicle is moving. Doing so may cause the driver to mishandle the vehicle and an accident may occur resulting in death or serious injuries.
- ▶ On some models, since the mirror surfaces can get hot, do not touch them when the outside rear view mirror heater or defogger switch is on.

Standard and access cab models

Double cab models

To adjust a mirror, use the switches.

1. Master switch—To select the mirror to be adjusted
Push the switch to “L” (left) or “R” (right).
2. Control switch—To move the mirror
Push the switch in the desired direction.

Mirrors can be adjusted when the key is in the “ACC” or “ON” position.

NOTICE

If ice should jam the mirror, do not operate the control or scrape the mirror face. Use a spray de-icer to free the mirror.

—Folding rear view mirrors

The rear view mirrors can be folded backward for parking in compact areas. To fold the rear view mirror, push backward.

CAUTION

Do not drive with the mirrors folded backward. Both the driver and passenger side rear view mirrors must be extended and properly adjusted before driving.

Anti-glare inside rear view mirror

Adjust the mirror so that you can just see the rear of your vehicle in the mirror.

To reduce glare from the headlights of the vehicle behind you during night driving, operate the lever on the lower edge of the mirror.

Daylight driving—Lever at position 1

The reflection in the mirror has greater clarity at this position.

Night driving—Lever at position 2

Remember that by reducing glare you also lose some rear view clarity.

CAUTION

Do not adjust the mirror while the vehicle is moving. Doing so may cause the driver to mishandle the vehicle and an accident may occur resulting in death or serious injuries.

Auto anti-glare inside rear view mirror

Adjust the mirror so that you can just see the rear of your vehicle in the mirror.

This mirror is equipped with auto anti-glare function. The function is designed to reduce glare from the headlights of the vehicle behind you during night driving.

When the ignition key is inserted and turned on, the inside rear view mirror always turns on in the automatic function mode.

The indicator illuminates to show you that the function is on.

In automatic function mode, if the mirror detects light from the headlights of the vehicle behind you, the mirror surface darkens slightly to reduce the reflected light.

To turn off the automatic function, push the "OFF" switch.

To turn on the automatic function again, push the "AUTO" switch.

Adjust it before driving so that the rear view is in the best condition.

When the inside air temperature is low, it may take a little longer for the mirror to darken in response to the detection of headlights.

 CAUTION
Do not adjust the mirror while the vehicle is moving. Doing so may cause the driver to mishandle the vehicle and an accident may occur resulting in death or serious injuries.

To ensure correct functioning of anti-glare mirror sensors located on both sides of the mirror, do not touch or cover the sensors with your finger or a piece of cloth, etc.

Sun visors—

Standard and access cab models

To block out glare, move the sun visor.

To block out glare from the front—Swing down the sun visor (position 1).

To block out glare from the side—Swing down the sun visor, remove it from the hook and swing it to the lateral side (position 2).

If glare comes from obliquely behind you, extend the plate at the end of the visor (to position 3).

Standard and access cab models

Double cab models

Double cab models

'05 TUNDRA_U (L/O 0409)

To block the glare from the front when the main sun visor is swung to the lateral side (position 2), swing down the sub visor.

CAUTION

Do not extend the plate at the end of the sun visor when the visor is in the position 1. It can cover the anti-glare inside rear view mirror and obstruct the rear view.

—Vanity mirrors

Standard and access cab models

To use the vanity mirrors, swing down the sun visor and open the cover.

The vanity light(s) comes on when you open the cover.

Double cab models

'05 TUNDRA_U (L/O 0409)

SECTION 1-5

OPERATION OF INSTRUMENTS AND CONTROLS

Lights and Wipers

Headlights and turn signals	154
Emergency flashers	155
Instrument panel light control	156
Front fog lights	156
Interior light	157
Personal lights	157
Center interior and personal lights	158
Ignition switch and step lights	159
Cargo lamp	160
Windshield wipers and washer	161
Outside rear view mirror heaters	162
Back window and outside rear view mirror defoggers	163

Headlights and turn signals

HEADLIGHTS

To turn on the following lights: Twist the headlight/turn signal lever knob.

Position 1—Parking, tail, license plate and instrument panel lights

Position 2—Headlights and all of the above

The lights automatically turn off when the driver's door is opened with the ignition turned off. To turn them on again, turn the key to the "ON" position or actuate the headlight switch. If you are going to park for over one week, make sure the headlight switch is off.

NOTICE

To prevent the battery from being discharged, do not leave the lights on for a long period when the engine is not running.

Daytime running light system (on some models)

The headlights turn on at reduced intensity when the parking brake is released with the engine started, even with the light switch in the "OFF" position. They will not go off until the ignition switch is turned off.

To turn on the other exterior lights and instrument panel lights, twist the knob to the position 1.

Twist the knob to the position 2 to turn the headlights to full intensity for driving at night.

High-Low beams—For high beams, turn the headlights on and push the lever away from you (position 1). Pull the lever toward you (position 2) for low beams.

The headlight high beam indicator light (blue light) on the instrument panel will tell you that the high beams are on.

Flashing the high beam headlights (position 3)—Pull the lever all the way back. The high beam headlights turn off when you release the lever.

You can flash the high beam headlights with the knob turned to "OFF".

Emergency flashers

TURN SIGNALS

To signal a turn, push the headlight/turn signal lever up or down to position 1.

The key must be in the "ON" position.

The lever automatically returns after you make a turn, but you may have to return it by hand after you change lanes.

To signal a lane change, move the lever up or down to the pressure point (position 2) and hold it.

If the turn signal indicator lights (green lights) on the instrument panel flash faster than normal, a front or rear turn signal bulb is burned out.

To turn on the emergency flashers, push the switch.

All the turn signal lights will flash. To turn them off, push the switch once again.

Turn on the emergency flashers to warn other drivers if your vehicle must be stopped where it might be a traffic hazard. Always pull as far off the road as possible.

The turn signal light switch will not work when the emergency flashers are operating.

NOTICE

To prevent the battery from being discharged, do not leave the switch on longer than necessary when the engine is not running.

Instrument panel light control

Standard and access cab models

To adjust the brightness of the instrument panel lights, turn the knob.

Double cab models

Front fog lights

To turn on the front fog lights, twist the band of the headlight/turn signal lever. They will come on only when the headlights are on low beam.

'05 TUNDRA_U (L/O 0409)

Interior light

To turn on the interior light, slide the switch.

The interior light switch has the following positions:

“ON”—Keeps the light on all the time.

“OFF”—Turns the light off.

“DOOR”—Turns the light on when any door is opened. The light goes off when all the doors are closed.

Standard cab and access cab models only (with wireless remote control)—When the switch is in the “DOOR” position and all the door are unlocked using the wireless remote control transmitter simultaneously, the lights will come on and remain for about 30 seconds unless any door is opened or closed.

Personal lights

Standard and access cab models

Double cab models

Center interior and personal lights

Standard and access cab models—

To turn on the light, push the lens on your side. To turn the light off, push the lens once again.

The personal light switch has the following positions:

“OFF”—Turns the lights off.

“DOOR”—Turns the lights on when any of the doors are opened.

With wireless remote control—When the switch is in the “DOOR” position and all the door are unlocked using the wireless remote control transmitter simultaneously, the lights will come on and remain for about 30 seconds unless any door is opened or closed.

Double cab models—

To turn on the personal light, push the switch. To turn the light off, push the switch once again.

Turn the light on when any door is opened. The light goes off when all the doors are closed.

Type A

Type B

CENTER INTERIOR LIGHT

Type A—

To turn on the interior light, slide the switch.

The interior light switch has the following positions:

“ON”—Keeps the light on all the time.

“OFF”—Turns the light off.

“DOOR”—Turns the light on when any of the doors is opened. The light remains on when all the doors are closed.

Type B—

To turn on the interior lights, push the switch.

The interior light switch has the following positions:

“DOOR”—Turns the lights on when any of the doors is opened. The light remains on when all the doors are closed.

“OFF”—The lights are off unless you operate either outside switch.

ILLUMINATED ENTRY SYSTEM

When the switch is in the "DOOR" position and any of the doors is opened, the light will come on. After all the doors are closed, the light remains on for a certain time before fading out.

However, in the following cases, the light goes out immediately:

- ▶ All the doors are closed when the ignition key is in "ACC" or "ON" position.
- ▶ The ignition key is turned to "ACC", "ON" or "START" after all the doors are closed.
- ▶ All the doors are locked when the light is still on.

When all the doors are unlocked using either the key or the wireless remote control transmitter simultaneously, the lights come on for about 15 seconds before fading out.

The following adjustments can be made in this system. For details, contact your Toyota dealer.

- ▶ Cancelling the door key or wireless remote control transmitter linked operation
- ▶ Changing the timing for the light turning off

To prevent the battery being discharged, the light will automatically turn off when the key is removed and the door is left opened with the switch at "DOOR" position for 20 minutes or more.

CENTER PERSONAL LIGHTS

To turn on the center personal light, push the switch. To turn the light off, push the switch once again.

Ignition switch and step lights

Standard and access cab models—

For easy access to the ignition switch, the ignition switch light comes on when the driver's door is opened. The step light also comes on when the driver's door is opened.

The ignition switch light remains on for some time after the driver's door is closed.

Double cab models—

For easy access to the ignition switch, the ignition switch light comes on when any of the doors are opened. The step light also comes on when any of the doors are opened.

Cargo lamp

The lights remain on for some time after all the doors are closed.

However, in the following cases, the lights go off immediately.

- ▶ All the doors are closed when the ignition key is in the "ACC" or "ON" position.
- ▶ The ignition key is turned to the "ACC", "ON", or "START" position after all the doors are closed.
- ▶ All the doors are closed and locked.

When all the doors are unlocked using either the key or the wireless remote control transmitter simultaneously, the lights will come on and remain on for about 15 seconds before fading out.

To prevent the battery being discharged, the lights will automatically turn off when the key is removed and the door is left opened for 20 minutes or more.

The following adjustments can be made in this system. For details, contact your Toyota dealer.

- ▶ Cancelling the door key or wireless remote control transmitter linked operation
- ▶ Changing the timing for the light turning off

The cargo lamp is designed to light up the rear deck of your vehicle.

CARGO LAMP OPERATION

By pushing the "CARGO LAMP" switch

To turn on: Push the "CARGO LAMP" switch once.

At this time, the indicator light on the instrument panel will come on.

To turn off: Push the "CARGO LAMP" switch once again.

By locking and unlocking the doors (vehicles with the power door lock system)

You can operate the cargo lamp by this method when all the doors are closed and the ignition switch is in the "ACC" or "LOCK" position or the key is removed.

To turn on: Unlock the doors with the key, the power door lock switch or the wireless remote control transmitter (double cab models).

The cargo lamp will automatically turn off after 20 seconds.

To turn off: Lock the doors with the key, the power door lock switch or the wireless remote control transmitter (double cab models).

By opening and closing the doors

To turn on: Open any of the doors.

To turn off: Close all the doors:

- ▶ When the ignition switch is in the "ON" position, the cargo lamp will go off immediately.
- ▶ When the ignition switch is in the "ACC" or "LOCK" position or the key is removed, the cargo lamp will automatically go off after 20 seconds.

CARGO LAMP AUTOMATIC POWER-OFF FUNCTION

To prevent the battery being discharged, the cargo lamp will automatically go off when the lamp remains on for 30 minutes or more.

Windshield wipers and washer (intermittent type)

To turn on the windshield wipers, move the lever to the desired setting.

The key must be in the "ON" position.

Lever position	Speed setting
Position 1	Intermittent
Position 2	Slow
Position 3	Fast

The "INT" band lets you adjust the wiping time interval when the wiper lever is in the intermittent position (position 1). Twist the band upward to increase the time between sweeps, and downward to decrease it.

To squirt washer fluid, pull the lever toward you and release it.

If the windshield wipers are off, they will operate a couple of times after the washer squirts.

For instructions on adding washer fluid, see "Adding washer fluid" in Section 7-3. In freezing weather, warm the windshield with the defroster before using the washer. This will help prevent the washer fluid from freezing on your windshield, which can block your vision.

NOTICE

Do not operate the wipers if the windshield is dry. It may scratch the glass.

Windshield wipers and washer (mist type)

In freezing weather, warm the windshield with the defroster before using the washer. This will help prevent the washer fluid from freezing on your windshield, which can block your vision.

NOTICE

Do not operate the wipers if the windshield is dry. It may scratch the glass.

To turn on the windshield wipers, move the lever to the desired setting.

The key must be in the "ON" position.

Lever position	Speed setting
Position 1	Slow
Position 2	Fast

For a single sweep of the windshield, push the lever up and release it.

To squirt washer fluid, pull the lever toward you and release it.

For instructions on adding washer fluid, see "Adding washer fluid" in Section 7-3.

Outside rear view mirror heaters

To defog or defrost the outside rear view mirrors, push the switch.

The key must be in the "ON" position.

The heater panels in the outside rear view mirrors will quickly clear the mirror surfaces. An indicator light will illuminate to indicate the mirror heaters are operating.

Push the switch once again to turn the mirror heaters off.

The system will automatically shut off after the mirror heaters have operated about 15 minutes.

CAUTION

Since the mirror surfaces can get hot, do not touch them when the switch is on.

Make sure you turn the mirror heaters off when the mirror surfaces are clear. Leaving the mirror heaters on for a long time could cause the battery to discharge, especially during stop-and-go driving. The mirror heaters are not designed for drying rain water or for melting snow.

If the outside rear view mirrors are heavily coated with ice, use a spray de-icer before operating the switch.

Back window and outside rear view mirror defoggers

To defog or defrost the back window, push the switch with the back window closed.

The key must be in the "ON" position.

The thin heater wires on the inside of the back window will quickly clear the surface. An indicator light will illuminate to indicate the defogger is operating.

Heater panels in the outside rear view mirrors will also quickly clear the surfaces.

Push the switch once again to turn the defogger off.

The system will automatically shut off after the defoggers have operated about 15 minutes.

Make sure you turn the defoggers off when the surfaces are clear. Leaving the defoggers on for a long time could cause the battery to discharge, especially during stop-and-go driving. The defoggers are not designed for drying rain water or for melting snow.

CAUTION

Since the mirror surfaces can get hot, do not touch them when the defogger switch is on.

NOTICE

When cleaning the inside of the back window, be careful not to scratch or damage the heater wires or connectors.

'05 TUNDRA_U (L/O 0409)

SECTION 1-6

OPERATION OF INSTRUMENTS AND CONTROLS

Gauges, Meters and Service reminder indicators

Fuel gauge	166
Engine coolant temperature gauge	166
Oil pressure gauge	167
Voltmeter	168
Tachometer	168
Odometer and two trip meters	169
Service reminder indicators and warning buzzers	170

Fuel gauge

Without tachometer

With tachometer

The gauge indicates the approximate quantity of fuel remaining in the tank when the ignition switch is on.

Nearly full—Needle at “F”
Nearly empty—Needle at “E”

It is a good idea to keep the tank over 1/4 full.

The needle moves when braking, accelerating or making turns. This is caused by the movement of the fuel in the tank.

If the fuel level approaches “E” or the low fuel level warning light comes on, fill the fuel tank as soon as possible.

On inclines or curves, due to the movement of fuel in the tank, the fuel gauge needle may fluctuate or the low fuel level warning light may come on earlier than usual.

If the fuel tank is completely empty, the malfunction indicator lamp comes on. Fill the fuel tank immediately.

The indicator lamp goes off after driving several times. If the indicator lamp does not go off, contact your Toyota dealer as soon as possible.

Engine coolant temperature gauge

Without tachometer

With tachometer

The gauge indicates the engine coolant temperature when the ignition switch is on. The engine operating temperature will vary with changes in weather and engine load.

If the needle moves into the red zone, your engine is too hot. If your vehicle overheats, stop your vehicle and allow the engine to cool.

Your vehicle may overheat during severe operating conditions, such as:

- ▶ Driving up a long hill on a hot day.
- ▶ Reducing speed or stopping after high speed driving.
- ▶ Idling for a long period with the air conditioning on in stop-and-go traffic.
- ▶ Towing a trailer.

NOTICE

◆ *Do not remove the thermostat in the engine cooling system as this may cause the engine to overheat. The thermostat is designed to control the flow of coolant to keep the temperature of the engine within the specified operating range.*

◆ *Do not continue driving with an overheated engine. See "If your vehicle overheats" in Section 4.*

Oil pressure gauge

The oil pressure gauge indicates engine oil pressure when the ignition switch is on. Check it while driving to make sure that the needle is in the proper range.

If the oil pressure should stay below the normal range, pull off the road to a safe place and stop the engine immediately. Call a Toyota dealer or qualified repair shop for assistance.

Oil pressure may not build up when the oil level is too low. The oil pressure gauge is not designed to indicate oil level, and the oil level must be checked using the level dipstick.

NOTICE

Do not drive the vehicle with the oil pressure below the normal range until the cause is fixed—it may ruin the engine.

Voltmeter

The voltmeter tells whether the battery is charged or discharged. Check it while the engine is running—the needle should always indicate as shown above.

If the needle reads below or above the normal range while the engine is running, it indicates the charging system needs immediate repair.

However, it is normal for the needle to drop below the normal range during engine starting.

Tachometer

The tachometer indicates engine speed in thousands of rpm (revolutions per minute). Use it while driving to select correct shift points and to prevent engine lugging and over-revving.

Driving with the engine running too fast causes excessive engine wear and poor fuel economy. Remember, in most cases the slower the engine speed, the greater the fuel economy.

NOTICE

Do not let the indicator needle get into the red zone. This may cause severe engine damage.

Odometer and two trip meters

This meter displays the odometer and two trip meters.

1. Odometer—Shows the total distance the vehicle has been driven.
2. Two trip meters—Show two different distances independently driven since the last time each trip meter was set to zero.

You can use one trip meter to calculate the fuel economy and the other to measure the distance on each trip. All trip meter data is cancelled if the electrical power source is disconnected.

3. Trip meter reset knob—Resets the two trip meters to zero, and also change the meter display.

To change the meter display, quickly push and release the knob. The meter display changes in the order from the odometer to trip meter A to trip meter B, then back to the odometer each time you push.

To reset the trip meter A to zero, display the meter A reading, then push and hold the knob until the meter is set to zero. The same process can be applied for resetting the trip meter B.

'05 TUNDRA_U (L/O 0409)

Service reminder indicators and warning buzzers

If the indicator or buzzer comes on...		Do this.
(a)	 BRAKE (indicator and buzzer*)	If parking brake is off, stop immediately and contact Toyota dealer. *: For vehicles with the vehicle stability control system only
(b)	 (indicator and buzzer)	Fasten driver's seat belt.
(c)	PASSENGER 	Fasten front passenger's seat belt.
(d)		Stop and check.
(e)		Stop and check.
(f)	 CHECK	Take vehicle to Toyota dealer.
(g)		Fill up tank.

'05 TUNDRA_U (L/O 0409)

If the indicator or buzzer comes on...		Do this.
(h)	ABS or 	Take vehicle to Toyota dealer.
(i)	VSC TRAC	Take vehicle to Toyota dealer.
(j)		Close all doors.
(k)		Take vehicle to Toyota dealer immediately.
(l)		Adjust tire inflation pressure (including spare tire). If the light blinks, contact Toyota dealer.
(m)	A/T OIL TEMP	Stop and check.
(n)		Add washer fluid.
(o)	MAINT REQD	Replace engine oil.

'05 TUNDRA_U (L/O 0409)

If the indicator or buzzer comes on...		Do this.
(p)	Key reminder buzzer	Remove key.
(q)	Four-wheel drive system warning buzzer	Shift the transfer mode correctly.

(a) Brake System Warning Light and Buzzer

This light comes on in the following cases when the ignition key is in the "ON" position.

►When the parking brake is applied...

With the vehicle stability control system—

This light comes on for a few seconds when the ignition key is turned to the "ON" position even after the parking brake is released.

►When the brake fluid level is low...

 **CAUTION**

It is dangerous to continue driving normally when the brake fluid level is low.

►When the hydraulic brake booster fails (with the vehicle stability control system)...

If the hydraulic booster causes a problem resulting in poor braking performance, the warning light comes on and buzzer sounds continuously.

Have your vehicle checked at your Toyota dealer in the following cases:

►The light does not come on even if the parking brake is applied when the ignition key is in the "ON" position.

With the vehicle stability control system—

►The light does not come on even if the ignition key is turned on with the parking brake released.

A warning light turning on briefly during operation does not indicate a problem.

 **CAUTION**

Without the vehicle stability control system—

If the light does not turn off even after the parking brake is released while the engine is running, immediately stop your vehicle at a safe place and contact your Toyota dealer. In this case, the brakes may not work properly and your stopping distance will become longer. Depress the brake pedal firmly and bring the vehicle to an immediate stop.

With the vehicle stability control system—

If any of the following conditions occurs, immediately stop your vehicle at a safe place and contact your Toyota dealer.

►The light does not turn off even after the parking brake is released while the engine is running.

►The warning buzzer comes on together with the warning light.

In either case, this can indicate that the brakes may not work properly and your stopping distance will become longer. Depress the brake pedal firmly and bring the vehicle to an immediate stop.

►The brake system warning light remains on together with the "ABS" warning light.

In this case, not only the anti-lock brake system will fail but also the vehicle will become extremely unstable during braking.

With the vehicle stability control system—

Any of the following conditions may occur, but do not indicate the malfunction:

- ▶ The light may stay on for about 60 seconds after the ignition key is turned to the "ON" position. It is normal if it turns off after a while.
- ▶ Depressing the brake pedal repeatedly may turn on the warning light and buzzer. It is normal if the light turns off and the buzzer stops sounding after a few seconds.
- ▶ You may hear a small sound in the engine compartment after the engine is started or the brake pedal is depressed repeatedly. This is a pump pulsating sound of the brake system, and it is not a malfunction.

(b) Driver's Seat Belt Reminder Light and Buzzer

The light and buzzer act as a reminder to buckle up the driver's seat belt.

Once the ignition key is turned to "ON" or "START", the reminder light flashes and buzzer sounds if the driver's seat belt is not fastened. Unless the driver fastens the belt, the light continues flashing and the buzzer stops after about 4 to 8 seconds.

(c) Front Passenger's Seat Belt Reminder Light

The light acts as a reminder to have the front passenger buckle up the seat belt.

Vehicles with bench seat—

Once the ignition key is turned to "ON" or "START", the reminder light flash if a passenger sits in the front passenger seat and does not fasten the seat belt. However, if a front passenger uses an additional seat cushion, the light may not flash even when the seat belt is not buckled up.

If luggage or other load is placed on the front passenger seat, depending on its weight and how it is placed on the seat, built-in sensors in the seat cushion may detect the pressure, causing the reminder light to flash.

Vehicles with separate seat—

Once the ignition key is turned to "ON", the reminder light flashes if a passenger sits in the front passenger seat and does not fasten the seat belt.

If luggage or other load is placed on the front passenger seat, depending on its weight, the reminder light may come on.

(d) Discharge Warning Light

This light warns that the battery is being discharged.

If it comes on while you are driving, there is a problem somewhere in the charging system.

The engine ignition will continue to operate, however, until the battery is discharged. Turn off the air conditioning, blower, radio, etc., and drive directly to the nearest Toyota dealer or repair shop.

NOTICE

Do not continue driving if the engine drive belt is broken or loose.

(e) Low Engine Oil Pressure Warning Light

This light warns that the engine oil pressure is too low.

If it flickers or stays on while you are driving, pull off the road to a safe place and stop the engine immediately. Call a Toyota dealer or qualified repair shop for assistance.

The light may occasionally flicker when the engine is idling or it may come on briefly after a hard stop. There is no cause for concern if it then goes out when the engine is accelerated slightly.

The light may come on when the oil level is extremely low. It is not designed to indicate low oil level, and the oil level must be checked using the level dipstick.

NOTICE

Do not drive the vehicle with the warning light on—even for one block. It may ruin the engine.

(f) Malfunction Indicator Lamp

This lamp comes on when the ignition key is turned to the “ON” position and goes off after the engine starts. This means that the warning light system is operating properly.

If the lamp remains on, or the lamp comes on while driving, first check the followings.

▶ Empty fuel tank

If the fuel tank is empty, refuel immediately.

▶ Loose fuel tank cap

If the fuel tank cap is loose, securely tighten it.

These cases are temporary malfunctions. The malfunction indicator lamp will go off after taking several driving trips.

If the lamp does not go off even after several trips, contact your Toyota dealer as soon as possible.

If the fuel tank is not empty or the fuel tank cap is not loose...

▶ There is a problem somewhere in the engine, emission control system, electronic throttle control system, automatic transmission electrical system or warning light system itself.

Contact your Toyota dealer as soon as possible to service the vehicle.

If engine speed does not increase when the accelerator pedal is depressed, there may be a problem somewhere in the electronic throttle control system.

At this time, vibration may occur. However, if you depress the accelerator pedal more firmly and slowly, you can drive your vehicle at low speeds. Have your vehicle checked by your Toyota dealer as soon as possible.

Even if the abnormality of the electronic throttle control system is corrected during low speed driving, the system may not be recovered until the engine is stopped and the ignition key is turned to “ACC” or “LOCK” position.

Emissions Inspection and Maintenance (I/M) programs

Your vehicle may not pass a state emission inspection if the malfunction indicator lamp remains on. Contact your Toyota dealer to check your vehicle's emission control system and OBD (On-Board Diagnostics) system before taking your vehicle for the inspection.

For details, see "Emissions Inspection and Maintenance (I/M) programs" in Section 6.

(g) Low Fuel Level Warning Light

This light comes on when the fuel level in the tank becomes nearly empty. Fill up the tank as soon as possible.

On inclines or curves, due to the movement of fuel in the tank, the low fuel level warning light may come on earlier than usual.

(h) "ABS" Warning Light

Vehicles without vehicle stability control system—

The light comes on when the ignition key is turned to the "ON" position. If the anti-lock brake system works properly, the light turns off after a few seconds. Thereafter, if the system malfunctions, the light comes on again.

When the "ABS" warning light is on (and the brake system warning light is off), the anti-lock brake system does not operate, but the brake system still operates conventionally.

When the "ABS" warning light is on (and the brake system warning light is off), the anti-lock brake system does not operate so that the wheels could lock up during a sudden braking or braking on slippery road surfaces.

If either of the following conditions occurs, this indicates a malfunction somewhere in the components monitored by the warning light system. Contact your Toyota dealer as soon as possible to service the vehicle.

▶ The light does not come on when the ignition key is turned to the "ON" position, or the light remains on.

▶ The light comes on while you are driving.

A warning light turning on briefly during operation does not indicate a problem.

Vehicles with vehicle stability control system—

The light comes on when the ignition key is turned to the "ON" position. If the anti-lock brake system and the brake assist system work properly, the light turns off after a few seconds. Thereafter, if either of the systems malfunctions, the light comes on again.

When the "ABS" warning light is on (and the brake system warning light is off), the following systems do not operate, but the brake system still operates conventionally.

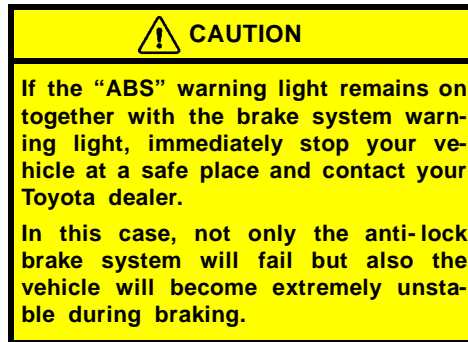

- ▶ Anti-lock brake system
- ▶ Brake assist system
- ▶ Traction control system
- ▶ "AUTO LSD" system
- ▶ Vehicle stability control system

When the "ABS" warning light is on (and the brake system warning light is off), the anti-lock brake system does not operate, so that the wheels will lock up during a sudden braking or braking on slippery road surfaces.

If either of the following conditions occurs, this indicates a malfunction somewhere in the components monitored by the warning light system. Contact your Toyota dealer as soon as possible to service the vehicle.

- ▶ The light does not come on when the ignition key is turned to the "ON" position, or remains on.
- ▶ The light comes on while you are driving.

A warning light turning on briefly during operation does not indicate a problem.

Either of the following conditions may occur, but do not indicate a malfunction:

- ▶ The light may stay on for about 60 seconds after the ignition key is turned to the "ON" position. It is normal if it turns off after a while.
- ▶ Depressing the brake pedal repeatedly may turn on the light. It is normal if it turns off after a few seconds.

(i) "VSC TRAC" Warning Light

The light warns that there is a problem somewhere in the following.

- ▶ Vehicle stability control system
- ▶ Traction control system
- ▶ "AUTO LSD" system

The light will come on when the ignition key turned to "ON", and will go off after a few seconds.

It is not a malfunction that the warning light may stay on for 60 seconds after the ignition key is turned to the "ON" position.

Depressing the brake pedal repeatedly may turn on the lights. It is normal if they go out after a few seconds.

If the light comes on while driving, the above mentioned systems do not work. However, as the brakes operate normally when applied, it is no problem to continue your driving.

In the following cases, contact your Toyota dealer:

- ▶ The warning light does not come on after the ignition key is turned to "ON".
- ▶ The warning light remains on after the ignition key is turned to "ON".
- ▶ The warning light comes on while driving.

'05 TUNDRA_U (L/O 0409)

When the brake fluid level is too low, the traction control system, "AUTO LSD" system and vehicle stability control system will not operate and the warning light comes on.

(j) Open Door Warning Light

This light remains on until all the doors are completely closed.

(k) SRS Warning Light

This light will come on when the ignition key is turned to the "ON" position. After about 6 seconds, the light will go off. This means the system of the airbag and front seat belt pretensioners are operating properly.

This warning light system monitors the airbag sensor assembly, front airbag sensors, side and curtain shield airbag sensors, curtain shield airbag sensors, driver's seat position sensor, driver's seat belt buckle switch, front passenger occupant classification system and indicator light, passenger airbag manual on-off switch, front passenger's seat belt buckle switch, seat belt pretensioner assemblies, inflators, warning light, "RSCA OFF" indicator light, interconnecting wiring and power sources.

If either of the following conditions occurs, this indicates a malfunction somewhere in the parts monitored by the warning light system. Contact your Toyota dealer as soon as possible to service the vehicle.

▶The light does not come on when the ignition key is turned to the "ON" position or remains on for more than 6 seconds.

▶The light comes on while driving.

(l) Low Tire Pressure Warning Light

This light warns that the tire pressure of one or more of your tires (including the spare tire) is low. The light comes on when the ignition key is turned to the "ON" position. It goes off after a few seconds. This indicates that the tire pressure warning system is functioning properly.

If the warning light comes on, stop your vehicle in a safe place as soon as possible and check that the inflation pressure of all tires (including the spare tire) is as specified on the tire and loading information label. (See "Checking tire inflation pressure" in Section 7-2.) The light should go off a few minutes after the tire pressure is adjusted.

If the warning light blinks, the tire pressure warning system may be malfunctioning. Contact your Toyota dealer.

For details, see "Tire pressure warning system" in Section 1-7.

(m) Automatic Transmission Fluid Temperature Warning Light (four-wheel drive models)

This light warns that the automatic transmission fluid temperature is too high.

If this light comes on while you are driving, slow down and pull off the road. Stop the vehicle at a safe place and put the selector lever in "P". With the engine idling, wait until the light goes off. If the light goes off, you may start the vehicle again. If the light does not go off, call a Toyota dealer or qualified repair shop for assistance.

(n) Low Windshield Washer Fluid Level Warning Light

This light warns that the windshield washer fluid level is too low. Add washer fluid at your earliest opportunity. (For instructions, see "Adding washer fluid" in Section 7-3.)

'05 TUNDRA_U (L/O 0409)

(o) Engine Oil Replacement Reminder Light (for vehicles sold in U.S.A.)

This light acts as a reminder when to replace the engine oil.

This light will come on when the ignition key is turned to "ON" and will go off after about a few seconds.

When you drive for about 7200 km (4500 miles) after the engine oil replacement, this light illuminates for about 3 seconds and then flashes for about 12 seconds with the ignition key turned to the "ON" position. If you continue driving without replacing the engine oil, and if the distance driven exceeds 8000 km (5000 miles), the light will come on after the ignition key is turned to "ON" position. The light will remain on thereafter.

If the light is flashing, we recommend that you replace the engine oil at an early opportunity depending on the driving and road conditions. If the light comes on, replace it as soon as possible.

The system must be reset after the engine oil replacement. Reset the system by the following procedure:

1. Turn the ignition key to the "ACC" or "LOCK" position with the odometer reading shown. (For details, see "Odometer and two trip meters" in this Section.)
2. Turn the ignition key to the "ON" position while holding down the trip meter reset knob.

Hold down the knob for at least 5 seconds. The odometer indicates "000000" and the light goes off.

If the system fails to reset, the light will continue flashing.

(p) Key Reminder Buzzer

This buzzer acts as a reminder to remove the key when you open the driver's door with the ignition key in the "ACC" or "LOCK" position.

(q) Four-wheel Drive System Warning Buzzer

This buzzer reminds you that the transfer mode is not selected correctly.

If the buzzer sounds when you shift the transfer from "2WD" to "4HI", "4LO" to "4HI", "4HI" to "4LO", or "4LO" to "2WD" mode, follow the instructions in "Four-wheel drive system" in Section 1-7.

'05 TUNDRA_U (L/O 0409)

CHECKING SERVICE REMINDER INDICATORS (except the low fuel level warning light and low windshield washer fluid level warning light)

1. Apply the parking brake.
2. Open one of the doors.
The open door warning light should come on.
3. Close the door.
The open door warning light should go off.
4. Turn the ignition key to "ON", but do not start the engine.
All the service reminder indicators except the open door warning light should come on.

The following service reminder indicators go off after a few seconds:

- ▶ "ABS" warning light
- ▶ "VSC TRAC" warning light
- ▶ Low tire pressure warning light
- ▶ Engine oil replacement reminder light
- ▶ Roll sensing of curtain shield airbag off indicator light
- ▶ "AUTO LSD" indicator light
- ▶ "VSC OFF" indicator light (four-wheel drive models)

▶ Slip indicator light

The SRS warning light goes off after about 6 seconds.

There may be the case that the "ABS" warning light (brake assist system warning light), "VSC TRAC" warning light, slip indicator light and "VSC OFF" (four-wheel drive models) indicator light stay on for about 60 seconds after the ignition key is turned to the "ON" position. It is normal if they go out after a while.

If any service reminder indicator or warning buzzer does not function as described above, have it checked by your Toyota dealer as soon as possible.

SECTION 1-7

OPERATION OF INSTRUMENTS AND CONTROLS

Ignition switch, Transmission and Parking brake

Ignition switch with steering lock	182
Automatic transmission	183
Manual transmission	187
Four-wheel drive system	188
Traction control system	191
"AUTO LSD" system	193
Vehicle stability control system	197
Tire pressure warning system	200
Parking brake	205
Cruise control	206

Ignition switch with steering lock

“START”—Starter motor on. The key will return to the “ON” position when released.

For starting tips, see Section 3.

“ON”—Engine on and all accessories on.

This is the normal driving position.

It is not a malfunction if the needle on all meters and gauges move slightly when the ignition switch is turned to the “ON” position.

“ACC”—Accessories such as the radio operate, but the engine is off.

If you leave the key in the “ACC” or “LOCK” position and open the driver’s door, a buzzer will remind you to remove the key.

“LOCK”—Engine is off and the steering wheel is locked. The key can be removed only at this position.

You must push in the key to turn the key from “ACC” to the “LOCK” position. On vehicles with an automatic transmission, the selector lever must be in the “P” position before pushing the key.

When starting the engine, the key may seem stuck at the “LOCK” position. To free it, first be sure the key is pushed all the way in, and then rock the steering wheel slightly while turning the key gently.

Approximately five hours after the engine is turned off, you may hear sound coming from underneath the rear deck for several minutes. This is normal operation and does not indicate a malfunction. (See “Leak detection pump.”)

CAUTION

For manual transmission:

Never remove the key when the vehicle is moving, as this will lock the steering wheel and result in loss of steering control.

NOTICE

Do not leave the key in the “ON” position if the engine is not running. The battery will discharge and the ignition could be damaged.

Automatic transmission

Your automatic transmission has a shift lock system to minimize the possibility of incorrect operation. This means you can only shift out of "P" position when the brake pedal is depressed (with the ignition switch in "ON" or "ACC" position and the selector lever pulled toward you).

(a) Selector lever

The shift position is displayed on the instrument cluster.

P: Parking, engine starting and key removal

R: Reverse

N: Neutral

D: Normal driving (with overdrive on)

3,2: Stronger engine braking

(b) Shift position "L" switch ("SHIFT L" switch)

To down shift to first gear ("L" position), push this switch with the shift lever in the "2" position. The "►L" is displayed on the instrument cluster and engine braking will be maximized.

To shift up to the "2" position, push this switch again.

To shift up to a position other than "2", move the selector lever to that position.

(c) Overdrive switch

You can select either fourth gear (with overdrive off) or fifth gear (with overdrive on) by pushing this switch.

To turn the overdrive off, push the switch. The "O/D OFF" indicator light should come on. To turn the overdrive on again, push the switch again. The "O/D OFF" indicator light should go off.

Always drive your vehicle with the overdrive on for better fuel economy and quieter driving.

If the engine is turned off when the overdrive is off and restarted, the overdrive will automatically be on.

Vehicles with cruise control—When the cruise control is being used, even if you downshift the transmission by pushing and releasing the overdrive switch, engine braking will not be enabled because the cruise control is not cancelled.

For ways to decrease the vehicle speed, see "Cruise control" in this Section.

(d) Normal driving

1. Start the engine as instructed in "How to start the engine" in Section 3. The transmission must be in "P" or "N".
2. With your foot holding down the brake pedal, shift the selector lever to "D".

When the lever is in the "D" position, the automatic transmission system will select the most suitable gear for running conditions such as normal cruising, hill climbing, hard towing, etc.

Always turn the overdrive on for better fuel economy and quieter driving. If the engine coolant temperature is low, the transmission will not shift into the overdrive gear even with the overdrive on.

 **CAUTION**

Never put your foot on the accelerator pedal while shifting.

3. Release the parking brake and brake pedal. Depress the accelerator pedal slowly for smooth starting.

(e) Using engine braking

To use engine braking, you can downshift the transmission as follows:

- ▶ Push the overdrive switch. The "O/D OFF" indicator light will come on and the transmission will downshift to third gear.
- ▶ Shift into the "3" position. The transmission will downshift to third gear when the vehicle speed drops down to or lower than the following speed, and stronger engine braking will be enabled.

- Two-wheel drive models
127 km/h (79 mph)
- Four-wheel drive models
 - "4HI" mode is selected
127 km/h (79 mph)
 - "4LO" mode is selected
49 km/h (30 mph)

- ▶ Shift into the "2" position. The transmission will downshift to second gear when the vehicle speed drops down to or lower than the following speed, and stronger engine braking will be enabled.

Two-wheel drive models
84 km/h (52 mph)

Four-wheel drive models
"4HI" mode is selected
84 km/h (52 mph)

"4LO" mode is selected
32 km/h (20 mph)

- ▶ Push the "SHIFT L" switch. The transmission will downshift to first gear when the vehicle speed drops down to or lower than the following speed, and maximum engine braking will be enabled.

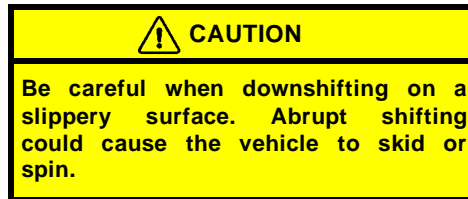

Two-wheel drive models
1GR-FE engine 40 km/h (25 mph)

2UZ-FE engine
"2WD" or "4HI" mode is selected
36 km/h (22 mph)

"4LO" mode is selected
14 km/h (8 mph)

Vehicles with cruise control—When the cruise control is being used, even if you downshift the transmission by pushing and releasing the overdrive switch, engine braking will not be enabled because the cruise control is not cancelled.

For ways to decrease the vehicle speed, see "Cruise control" in this Section.

(f) Using "3", "2" and "L" positions

The "3", "2" and "L" positions are used for strong engine braking as described previously.

With the selector lever in "3", "2" or "SHIFT L" switch depressed, the vehicle can move just as if the lever was in "D".

With the selector lever in "3", "2", the vehicle will start in first gear and automatically shift to second gear.

With the "SHIFT L" switch depressed, the transmission is engaged in first gear.

NOTICE

◆ **Be careful not to over-rev the engine. Watch the tachometer to keep engine rpm from going into the red zone. The approximate maximum allowable speed for each position is given below for your reference:**

Two-wheel drive models

1GR-FE engine—

"3" 140 km/h (87 mph)
"2" 95 km/h (59 mph)
"L" 55 km/h (34 mph)

2UZ-FE engine—

Access cab models

"3" 140 km/h (87 mph)
"2" 95 km/h (59 mph)
"L" 55 km/h (34 mph)

Double cab models

"3" 135 km/h (84 mph)
"2" 90 km/h (56 mph)
"L" 50 km/h (31 mph)

Four-wheel drive models
"2WD" or "4HI" mode is selected
Standard and access cab models
"3" 140 km/h (87 mph)
"2" 95 km/h (59 mph)
"L" 55 km/h (34 mph)
Double cab models
"3" 135 km/h (84 mph)
"2" 90 km/h (56 mph)
"L" 50 km/h (31 mph)
"4LO" mode is selected
"3" 55 km/h (34 mph)
"2" 35 km/h (22 mph)
"L" 20 km/h (12 mph)
◆ **Do not continue hill climbing or hard towing for a long time in the "3", "2" or "L" position. This may cause severe automatic transmission damage from overheating. To prevent such damage, "D" position should be used in hill climbing or hard towing.**

(g) Backing up

1. Bring the vehicle to a complete stop.
2. With the brake pedal held down with your foot, shift the selector lever to the "R" position.

NOTICE
Never shift into reverse while the vehicle is moving.

(h) Parking

1. Bring the vehicle to a complete stop.
2. With the brake pedal pressed down, fully depress the parking brake pedal to apply the parking brake securely.
3. With the brake pedal pressed down, shift the selector lever to the "P" position.

CAUTION
Never attempt to move the selector lever into "P" position under any circumstances while the vehicle is moving. Serious mechanical damage and loss of vehicle control may result.

(i) Good driving practice

- ▶ If the transmission repeatedly shifts up and down between fourth gear and overdrive when climbing a gentle slope, the overdrive should be turned off. Be sure to turn the switch on immediately afterward.
- ▶ When towing a trailer, in order to maintain engine braking efficiency, do not use overdrive.

CAUTION
Always keep your foot on the brake pedal while stopped with the engine running. This prevents the vehicle from creeping.

NOTICE
Always use the brake pedal or the parking brake to hold the vehicle on an upgrade. Do not attempt to hold the vehicle using the accelerator pedal, as this can cause the transmission to overheat.

Manual transmission

The shift pattern is as shown above.

In case of driving your vehicle, the buzzer will sound when you shift the gear into "R" (reverse).

Press the clutch pedal down fully while shifting, and then release it slowly. Do not rest your foot on the pedal while driving, because it will cause clutch trouble. Do not use the clutch to hold the vehicle when stopped on an uphill grade—use the parking brake.

Recommended shifting speeds

The transmission is fully synchronized and upshifting or downshifting is easy.

For the best compromise between fuel economy and vehicle performance, you should upshift or downshift at the following speeds:

gear	km/h (mph)
1 to 2 or 2 to 1	24 (15)
2 to 3 or 3 to 2	40 (25)
3 to 4 or 4 to 3	64 (40)
4 to 5 or 5 to 4	72 (45)
5 to 6 or 6 to 5	80 (50)

Downshift to the appropriate gear if acceleration is needed when you are cruising below the above downshifting speeds.

Upshifting too soon or downshifting too late will cause lugging, and possibly pinging. Regularly revving the engine to maximum speed in each gear will cause excessive engine wear and high fuel consumption.

Maximum allowable speeds

To get on a highway or to pass slower traffic, maximum acceleration may be necessary. Make sure you observe the following maximum allowable speeds in each gear:

gear	km/h (mph)
1	45 (28)
2	90 (56)
3	130 (81)
4	165 (112)

NOTICE

Do not downshift if you are going faster than the maximum allowable speed for the next lower gear.

**Four-wheel drive system—
(a) Front drive control**

Good driving practice

- ▶ If it is difficult to shift into reverse, put the transmission in neutral, release the clutch pedal momentarily, and then try again.
- ▶ When towing a trailer, in order to maintain engine braking efficiency, do not use sixth gear.

CAUTION
Be careful when downshifting on a slippery surface. Abrupt shifting could cause the vehicle to skid or spin.

NOTICE
Make sure the vehicle is completely stopped before shifting into reverse.

Use the “2WD/4HI” and “4LO” switches to select the following transfer modes.

1. “2WD” (high speed position, two-wheel drive): “2WD/4HI” and “4LO” switches left out
Use this for normal driving on dry, hard-surfaced roads. This position gives greater economy, the quietest ride and least wear.

2. “4HI” (high speed position, four-wheel drive): “2WD/4HI” switch pushed in
The “4HI” (high speed four-wheel drive) indicator light comes on when the “4HI” mode is selected.
Use this for normal driving on wet, icy or snow-covered roads. This position provides greater traction than two-wheel drive.

In this mode, the vehicle stability control system is off. (See “Vehicle stability control system” in this Section.)

3. **“4LO” (low speed position, four-wheel drive):** With the “2WD/4HI” switch pressed in, push the “4LO” switch

The “4LO” (low speed four-wheel drive) indicator light comes on when the “4LO” mode is selected.

Use this for maximum power and traction. Use “4LO” mode for climbing or descending steep hills, off-road driving, and hard pulling in sand, mud or deep snow.

In this mode, the vehicle stability control system is off. (See “Vehicle stability control system” in this Section.)

See “(c) Shifting procedure” for further instructions.

**(b) A.D.D.
(automatic disconnecting
differential)**

The A.D.D. can be engaged or disengaged by the shifting operations described in “(c) Shifting procedure”.

You should drive in four-wheel drive for at least 16 km (10 miles) each month. This will assure that the front drive components are lubricated.

(c) Shifting procedure

SHIFTING BETWEEN “2WD” AND “4HI”

To shift from “2WD” to “4HI”, reduce the vehicle speed to less than 100 km/h (62 mph) and push in the “2WD/4HI” switch.

If the “4HI” (high speed four-wheel drive) indicator light flashes when you push in the “2WD/4HI” switch, this reminds you that the transfer mode is not securely in “4HI” mode. Drive straight ahead while accelerating or decelerating.

If the “4HI” (high speed four-wheel drive) indicator light flashes and the buzzer sounds when you push in the “2WD/4HI” switch, this reminds you that the transfer mode is not in “4HI” mode. Reduce the vehicle speed to less than 100 km/h (62 mph). Push the switch to turn it off, then once again to turn it back on.

Never push the “2WD/4HI” switch if the wheels are slipping. Stop the slipping or spinning before shifting.

'05 TUNDRA_U (L/O 0409)

To shift from "4HI" to "2WD", push the "2WD/4HI" switch again to turn it off.

This can be done at any speed.

If the "4HI" (high speed four-wheel drive) indicator light flashes when you push the "2WD/4HI" switch again to return to "2WD" mode, this reminds you that the transfer mode is not securely in "2WD" mode. Drive straight ahead while accelerating or decelerating, or drive forward or backward in a short distance.

SHIFTING BETWEEN "4HI" AND "4LO"

To shift from "4HI" to "4LO", stop the vehicle and put the transmission into "N". With the brake pedal depressed, push the "4LO" switch. If the "2WD/4HI" switch left out, push in the "2WD/4HI" switch to select the "4HI" mode.

If the "4LO" (low speed four-wheel drive) indicator light flashes and the buzzer sounds for three times when you push the "4LO" switch, this reminds you that the transfer mode is not in "4LO" mode. Drive forward or backward in a short distance, then stop the vehicle completely, put the transmission securely into "N" and push the switch again.

To shift from "4LO" to "4HI", stop the vehicle and put the transmission into "N". With the brake pedal depressed, push the "4LO" switch.

If the "4LO" (low speed four-wheel drive) indicator light flashes and the buzzer sounds for three times when you push the "4LO" switch, this reminds you that the transfer mode is not in "4HI" mode. Drive forward or backward in a short distance, then stop the vehicle completely, put the transmission securely into "N" and push the switch again.

SHIFTING BETWEEN "2WD" AND "4LO"

To shift from "2WD" to "4LO", stop the vehicle and put the transmission into "N". With the brake pedal depressed, push the "2WD/4HI" switch in to select the "4HI" mode, then push the "4LO" switch.

If the "4LO" (low speed four-wheel drive) indicator light flashes and the buzzer sounds for three times when you push the "4LO" switch, this reminds you that the transfer mode is not in "4LO" mode. Drive forward or backward in a short distance, then stop the vehicle completely, put the transmission securely into "N" and push the switch again.

To shift from "4LO" to "2WD", stop the vehicle and put the transmission into "N". With the brake pedal depressed, push the "2WD/4HI" switch again to turn it off.

If the "4LO" (low speed four-wheel drive) indicator light flashes and the buzzer sounds when you push the "2WD/4HI" switch, this reminds you that the transfer mode is not in "2WD" mode. Push the "2WD/4HI" switch in to return to "4LO" mode, drive forward or backward in a short distance, then stop the vehicle completely, put the transmission securely into "N" and push the "2WD/4HI" switch once again.

If the "4LO" (low speed four-wheel drive) indicator light flashes when you push the "2WD/4HI" switch, this reminds you that the transfer mode is not in "2WD" mode. Drive straight ahead while accelerating or decelerating, or drive forward or backward in a short distance.

Traction control system

The traction control system automatically helps prevent the spinning of rear wheels (two-wheel drive models) or 4 wheels (four-wheel drive models) when the vehicle is started or accelerated on slippery road surfaces.

When the ignition key is turned to "ON", the system automatically turns on.

CAUTION

Under certain slippery road conditions, full traction of the vehicle and power to the rear wheels (two-wheel drive models) or 4 wheels (four-wheel drive models) cannot be maintained, even though the traction control system is in operation. Do not drive the vehicle under any speed or maneuvering conditions which may cause the vehicle to lose traction control. In situations where the road surface is covered with ice or snow, your vehicle should be fitted with snow tires or tire chains. Always drive at an appropriate and cautious speed for the present road conditions.

Without tachometer

With tachometer

'05 TUNDRA_U (L/O 0409)

Leave the system on during the ordinary driving so that it can operate when needed.

You may hear a sound in the engine compartment for a few seconds when the engine is started or just after the vehicle begins to move. This means that the traction control system is in the self-check mode, but does not indicate a malfunction.

When the traction control system is operating, the following conditions occur:

- ▶ The system controls the spinning of the rear wheels (two-wheel drive models) or 4 wheels (four-wheel drive models). At this time, the slip indicator light blinks.
- ▶ You may feel vibration or noise in your vehicle, caused by operation of the brakes. This indicates the system is functioning properly.

The slip indicator light comes on for a few seconds when the ignition key is turned to "ON". If the indicator light does not come on when the ignition is turned on, contact your Toyota dealer.

The brake actuator temperature increases during the traction control system, vehicle stability control system or "AUTO LSD" system operating. If the brake actuator temperature becomes too high while any of the systems is operating, a buzzer will start to sound intermittently to indicate that the traction control system can no longer operate. In this case, immediately stop your vehicle at a safe place.

If the system continues to operate, the buzzer sound changes from intermittent to continuous. (The continuous buzzer sounds for about 3 seconds.)

At the time, the slip indicator light will come on and the traction control system temporarily stops operating in order to protect the brake actuator. (Although the traction control system does not operate, it is no problem to continue driving.) The system will be automatically restored after a short time and the slip indicator light goes off.

Without tachometer

With tachometer

'05 TUNDRA_U (L/O 0409)

“VSC TRAC” warning light

This light warns that there is a problem somewhere in the following.

- ▶ Traction control system
- ▶ Vehicle stability control system
- ▶ “AUTO LSD” system

When the system is normal and the ignition key is turned to “ON”, the light will come on and will go off after a few seconds.

It is not a malfunction that the warning light may stay on for 60 seconds after the ignition key is turned to “ON”.

Depressing the brake pedal repeatedly may turn on the light. It is normal if it goes out after a few seconds.

If the “VSC TRAC” warning light and slip indicator light comes on while driving, the traction control system does not work. However, as the brakes operate normally when applied, it is no problem to continue your driving.

In the following cases, contact your Toyota dealer:

- ▶ The warning light does not come on after the ignition key is turned to “ON”.
- ▶ The warning light remains on after the ignition key is turned to “ON”.
- ▶ The warning light comes on while driving.

“AUTO LSD” system

The “AUTO LSD” system aids traction by using the traction control system to control engine performance and braking when one of the rear wheels begins to spin.

This system is used only when wheel spinning occurs in a ditch or rough surface.

This system is effective in case one of the rear wheels is spinning.

'05 TUNDRA_U (L/O 0409)

NOTICE

Do not use the "AUTO LSD" system in conditions other than the above. A much greater steering effort and more careful cornering control will be required.

If the engine is turned off while the "AUTO LSD" indicator light is on and then restarted, the indicator light will turn off automatically.

To activate the system, push the "AUTO LSD" switch with the vehicle stopped.

The "AUTO LSD" is activated under the following condition. At this time, the "AUTO LSD" indicator light will come on.

- ▶ The driving mode is set in the two-wheel drive mode (in the four-wheel drive mode, the system does not work.)
- ▶ Driving at a speed under 100 km/h (62 mph)

To cancel the system, push the "AUTO LSD" switch once again.

'05 TUNDRA_U (L/O 0409)

Without tachometer

With tachometer

Make sure the "AUTO LSD" indicator light comes on under the above condition when you use the "AUTO LSD" system.

The slip indicator light blinks when the system is controlling the spinning of the rear wheels.

The "AUTO LSD" and slip indicator lights come on for a few seconds when the ignition key is turned to "ON". If the indicator lights does not come on when the ignition key is turned to "ON", contact your Toyota dealer.

The brake actuator temperature increases during the traction control system, vehicle stability control system or "AUTO LSD" system operating. If the brake actuator temperature becomes too high while any of the systems is operating, a buzzer will start to sound intermittently to indicate that the "AUTO LSD" system can no longer operate. In this case, immediately stop your vehicle at a safe place.

If the system continues to operate, the buzzer sound changes from intermittent to continuous. (The continuous buzzer sounds for about 3 seconds.)

At the time the slip indicator light will come on and the "AUTO LSD" system temporarily stops operating in order to protect the brake actuator. (Although the "AUTO LSD" system does not operate, it is no problem to continue driving.) The system will be automatically restored after a short time and the slip indicator light goes off.

“VSC TRAC” warning light

This light warns that there is a problem somewhere in the following.

- ▶ “AUTO LSD” system
- ▶ Traction control system
- ▶ Vehicle stability control system

When the system is normal and the ignition key is turned to “ON”, the light will come on and will go off after a few seconds.

It is not a malfunction that the warning light may stay on for 60 seconds after the ignition key is turned to “ON”.

Depressing the brake pedal repeatedly may turn on the light. It is normal if it goes out after a few seconds.

If the “VSC TRAC” warning light and slip indicator light comes on while driving, the “AUTO LSD” system does not work. However, as the brakes operate normally when applied, it is no problem to continue your driving.

In the following cases, contact your Toyota dealer:

- ▶ The warning light does not come on after the ignition key is turned to “ON”.
- ▶ The warning light remains on after the ignition key is turned to “ON”.
- ▶ The warning light comes on while driving.

NOTICE

Do not drive with the “AUTO LSD” switch continuously turned on.

Vehicle stability control system

The vehicle stability control system helps provide integrated control of the systems such as anti-lock brake system, traction control, engine control, etc. This system automatically controls the output of the brakes or engine to help prevent the vehicle from skidding when cornering on a slippery road surface or operating steering wheel abruptly.

The vehicle stability control activates when the vehicle speed is more than 15 km/h (9 mph).

You may hear a sound in the engine compartment for a few seconds when the engine is started or just after the vehicle begins to move. This means that the system is in the self-check mode, but does not indicate a malfunction.

CAUTION

- ▶ Do not rely excessively on the vehicle stability control system. Even if the vehicle stability control system is operating, you must always drive carefully and attentively to avoid serious injury. Reckless driving will result in an unexpected accident. If the slip indicator light blinks and an alarm sounds, special care should be taken while driving.
- ▶ Only use tires of specified size. The size, manufacturer, brand and tread pattern for all 4 tires should be the same. If you use the tires other than specified, or different type or size, the vehicle stability control system may not function correctly. When replacing the tires or wheels, contact your Toyota dealer. (See "Checking and replacing tires" in Section 7-2.)

Without tachometer

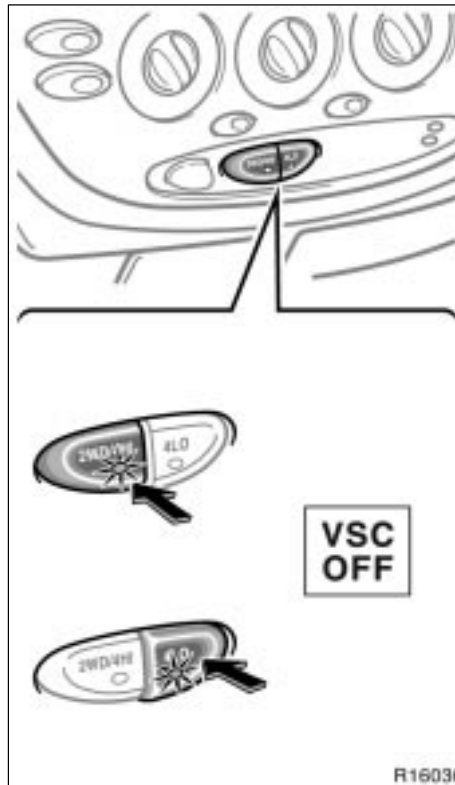

With tachometer

'05 TUNDRA_U (L/O 0409)

If the vehicle is going to skid during driving, the slip indicator light blinks and an alarm sounds intermittently. Special care should be taken while driving.

If the brake pedal is depressed while the vehicle stability control system is active, the brake pedal will become hard at an earlier position than usual. However, the brakes will respond to the pedal force if depressed further.

The slip indicator light comes on for a few seconds when the ignition key is turned to "ON". If the indicator light does not come on when the ignition is turned on, contact your Toyota dealer.

Four-wheel drive models only—

Shifting the driving mode into the four-wheel drive mode automatically turns the vehicle stability control system off. At this time, the "VSC OFF" indicator comes on.

"VSC OFF" indicator light comes on for a few seconds when the ignition key is turned to "ON". It will come on again when you shift the driving mode into the four-wheel drive mode.

In the following cases, contact your Toyota dealer:

- ▶ The indicator light does not come on when the ignition key is turned to "ON".
- ▶ The indicator light remains on after the ignition key is turned to "ON".
- ▶ The indicator light comes on when the system is on while driving.

'05 TUNDRA_U (L/O 0409)

Without tachometer

With tachometer

“VSC TRAC” warning light

This light warns that when there is a problem somewhere in the following.

- ▶ Vehicle stability control system
- ▶ Traction control system
- ▶ “AUTO LSD” system

The light will come on when the ignition key is turned to “ON”, and will go off after about a few seconds.

The light may come on for 60 seconds after the ignition key is turned to “ON”. It is normal if they go out after a while.

Depressing the brake pedal repeatedly may turn on the light. It is normal if they go out after a few seconds.

If the light comes on while driving, the vehicle stability control system does not work. However, as the brakes operate normally when applied, it is no problem to continue your driving.

In the following cases, contact your Toyota dealer:

- ▶ The warning light does not come on after the ignition key is turned to “ON”.
- ▶ The warning light remains on after the ignition key is turned to “ON”.
- ▶ The warning light comes on while driving.

The “VSC OFF” indicator light will come on when the “VSC TRAC” warning light comes on even if the “2WD/4HI” or “4LO” switch is not pushed.

Tire pressure warning system—

The tire pressure warning system is designed to provide warning when tire inflation pressure of one or more of your tires (including the spare tire) is low. The low tire pressure warning light comes on to inform you that low tire inflation pressure may hamper driving.

Without tachometer

With tachometer

LOW TIRE PRESSURE WARNING LIGHT

This light comes on when the ignition key is turned to the "ON" position. It goes off after a few seconds. This indicates that the tire pressure warning system is functioning properly.

If the low tire pressure warning light comes on or blinks, do the following.

If the warning light comes on:

Stop your vehicle in a safe place as soon as possible and check that the inflation pressure of all tires (including the spare tire) is as specified on the tire and loading information label. (See "Checking tire inflation pressure" in Section 7-2.) If the warning light comes on even after tire inflation pressure adjustment, you may have a flat tire. If you have a flat tire, replace it with the spare tire. For details, see "If you have a flat tire" in Section 4.

The warning light goes off a few minutes after air is put into the deflated tire.

This warning light may turn on due to natural causes such as natural air leaks or tire pressure changes caused by temperature. In this case, adjusting the tire pressure will turn off the warning light.

 **CAUTION**

When the tire pressure warning light comes on, observe the following instructions:

- ▶ Depending on the conditions, reduce to an appropriate speed as soon as possible.
- ▶ Adjust the tire pressure to the specified level as soon as possible.
- ▶ Avoid abrupt steering wheel maneuvering and braking. Tire deterioration may reduce steering wheel control and brake effectiveness. This may lead to serious injury or death.
- ▶ The tire pressure warning system may not activate immediately if sudden bursts of air leakage occur.

NOTICE

- ◆ *Do not use liquid sealants for a flat tire as air pressure sensors will be damaged.*
- ◆ *When the tires must be repaired or replaced, have them repaired or replaced by the nearest Toyota dealer or authorized tire dealer. The tire pressure sensors will be affected by the installation or removal of tires.*
- ◆ *The tire pressure warning system is not to be used as a substitute for regular inspections. Be sure to check the air pressure in the tires on a regular basis.*
- ◆ *When the tires must be replaced, replace the grommets for air pressure sensors as well.*

If the warning light blinks:

The tire pressure warning system may be malfunctioning. Contact your Toyota dealer.

SYSTEM MALFUNCTION

The tire pressure warning system does not function properly under certain circumstances. In the following cases, the low tire pressure warning light may not come on even if the tire inflation pressure is low, or it may come on when the tire inflation pressure is actually normal.

- ▶ Electric devices or facilities using similar radio wave frequencies are nearby.
- ▶ A radio set to similar frequencies is in use.
- ▶ A lot of snow or ice covers the vehicle, in particular, around the wheels or wheel housings.
- ▶ The tires are not equipped with an air pressure sensor.
- ▶ Snow tires or tire chains are used.
- ▶ Non-genuine Toyota wheels are used.
- ▶ The sensor battery is expired.
- ▶ Radio waves from the air pressure sensor installed on the spare tire cannot be received.

'05 TUNDRA_U (L/O 0409)

⚠ CAUTION

- ▶ The use of non-genuine wheels will cause the air pressure sensors to transmit the electronic code in different manner, resulting in the system failure.
- ▶ The use of different type of tires with genuine wheels may also cause the malfunction of the system.

⚠ CAUTION

When the tire pressure monitoring system warning light is lit, one or more of your tires is significantly under-inflated. You should stop and check your tires as soon as possible, and inflate them to the proper pressure as indicated on the vehicle's tire information placard. Driving on a significantly under-inflated tire causes the tire to overheat and can lead to tire failure. Under-inflation also reduces fuel efficiency and tire tread life, and may affect the vehicle's handling and stopping ability. Each tire, including the spare, should be checked monthly when cold and set to the recommended inflation pressure as specified in the vehicle placard and owner's manual.

'05 TUNDRA_U (L/O 0409)

For vehicles sold in U.S.A.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

(1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

NOTICE:

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- ▶ Reorient or relocate the receiving antenna.
- ▶ Increase the separation between the equipment and receiver.
- ▶ Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- ▶ Consult the dealer or an experienced radio/TV technician for help.

FCC WARNING:

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

For vehicles sold in Canada

Operation is subject to the following two conditions:

(1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

—Replacing tires and wheels

When replacing the wheels, be sure to install air pressure sensors on the wheels.

There are 3 ways to set up the air pressure sensors:

- a. Remove the sensor from the old wheel and install it to the new wheel.
- b. Keep the same wheel with air pressure sensor and replace only the tire.
- c. Use a new wheel and sensor. In this case, you have to register an ID code for a new sensor.

CAUTION

Have the tires, wheels or sensors replaced and ID codes registered by a Toyota dealer. If you need sensors, purchase from a Toyota dealer.

TIRE PRESSURE WARNING SYSTEM RESET SWITCH

The tire pressure warning system need to be initialized in the following conditions:

- ▶ After replacing or rotating tires or wheels
- ▶ After replacing an air pressure sensor.

When initializing the system, the present tire condition is stored as a standard.

To initialize the system, perform the following:

1. Park the vehicle at a safe place and apply the parking brake. Stop the engine.
2. Adjust the pressure of all the installed tires to the specified level. (See "Tires" in Section 8.)
3. Turn the ignition key to "ON".
4. Push and hold the reset switch until the low tire pressure warning light blinks three times.

Initialization is completed over for more than 20 minute.

'05 TUNDRA_U (L/O 0409)

Without tachometer

With tachometer

When initializing the system, make sure the low tire pressure warning light blinks three times. If the warning light does not blink three times, initialization failed and the tire pressure warning system will not function properly. In this case, initialize the system again.

Do not push the reset switch without adjusting the tire inflation pressure to the specified level. Otherwise, the low tire pressure warning light may not come on even if the tire pressure is low, or it may come on when the tire inflation pressure is actually normal.

If you push the reset switch while the vehicle is moving, initialization is not performed.

If the low tire pressure warning light does not blink when you push and hold the reset switch, have the low pressure warning system checked at your Toyota dealer.

Parking brake

Pedal type

Lever type

When parking, firmly apply the parking brake to avoid inadvertent creeping.

Pedal type—

To set: Fully depress the parking brake pedal. For better holding power, first depress the brake pedal and hold it while setting the parking brake.

To release: Depress the parking brake pedal once again.

Lever type—

To set: Pull out on the lever. For better holding power, first depress the brake pedal and hold it while setting the parking brake.

To release: Press the lock release button (1), turn the lever (2), then push it in (3).

To remind you that the parking brake is set, the parking brake reminder light in the instrument panel remains on until you release the parking brake.

CAUTION
Before driving, be sure the parking brake is fully released and the parking brake reminder light is off.

Cruise control

The cruise control allows you to cruise the vehicle at a desired speed over 40 km/h (25 mph) even with your foot off the accelerator pedal.

Your cruising speed can be maintained up or down grades within the limits of engine performance, although a slight speed change may occur when driving up or down the grades. On steeper hills, a greater speed change will occur so it is better to drive without the cruise control.

CAUTION

- ▶ **To help maintain maximum control of your vehicle, do not use the cruise control when driving in heavy or varying traffic, or on slippery (rainy, icy or snow-covered) or winding roads.**
- ▶ **Avoid vehicle speed increases when driving downhill. If the vehicle speed is too fast in relation to the cruise control set speed, cancel the cruise control then downshift the transmission to use engine braking to slow down.**

TURNING THE SYSTEM ON

To operate the cruise control, press the "ON-OFF" button. This turns the system on. The indicator light in the instrument panel shows that you can now set the vehicle at a desired cruising speed. Another press will turn the system completely off.

CAUTION
To avoid accidental cruise control engagement, keep the "ON-OFF" button off when not using the cruise control.

SETTING AT A DESIRED SPEED

The transmission must be in "D" before you set the cruise control speed.

Bring your vehicle to the desired speed, push the lever down in the "- SET" direction and release it. This sets the vehicle at that speed. If the speed is not satisfactory, tap the lever up for a faster speed, or tap it down for a slower speed. Each tap changes the set speed by 1.6 km/h (1.0 mph). You can now take your foot off the accelerator pedal.

If you need acceleration—for example, when passing—depress the accelerator pedal enough for the vehicle to exceed the set speed. When you release it, the vehicle will return to the speed set prior to the acceleration.

CANCELLING THE PRESET SPEED

You can cancel the preset speed by:

- Pulling the lever in the "CANCEL" direction and releasing it
- Depressing the brake pedal
- Pushing the "ON-OFF" button.

If the vehicle speed falls below about 40 km/h (25 mph), the preset speed will automatically cancel out.

If the vehicle speed drops 16 km/h (10 mph) below the preset speed, the preset speed will also automatically cancel out.

If the preset speed automatically cancels out other than for the above cases, have your vehicle checked by your Toyota dealer at the earliest opportunity.

RESETTING TO A FASTER SPEED

Push the lever up in the "+ RES" direction and hold it. Release the lever when the desired speed is attained. While the lever is held up, the vehicle will gradually gain speed.

However, a faster way to reset is to accelerate the vehicle and then push the lever down in the "- SET" direction.

RESETTING TO A SLOWER SPEED

Push the lever down in the "- SET" direction and hold it. Release the lever when the desired speed is attained. While the lever is held down, the vehicle speed will gradually decrease.

However, a faster way to reset is to depress the brake pedal and then push the lever down in the "- SET" direction.

Even if you turn off the overdrive switch with the cruise control on, engine braking will not be applied because the cruise control is not cancelled. To decrease the vehicle speed, reset to a slower speed with the cruise control lever or depress the brake pedal. If you use the brake pedal, cruise control is cancelled.

'05 TUNDRA_U (L/O 0409)

RESUMING THE PRESET SPEED

If the preset speed is cancelled by pulling the control lever or by depressing the brake pedal, pushing the lever up in the "+ RES" direction will restore the speed set prior to cancellation.

CRUISE CONTROL FAILURE WARNING

If the "CRUISE" indicator light in the instrument cluster flashes when using the cruise control, press the "ON-OFF" button to turn the system off and then press it again to turn it on.

If any of the following conditions then occurs, there is some trouble in the cruise control system.

- ▶ The indicator light does not come on.
- ▶ The indicator light flashes again.
- ▶ The indicator light goes out after it comes on.

If this is the case, contact your Toyota dealer and have your vehicle inspected.

Reference

Type 1: AM-FM radio/compact disc player (with compact disc changer controller)

Type 2: AM-FM radio/cassette player/compact disc player (with compact disc changer controller)

Type 3: AM-FM radio/cassette player/compact disc player with changer

Using your audio system— —Some basics

This section describes some of the basic features on Toyota audio systems. Some information may not pertain to your system.

Your audio system works when the ignition key is in the “ACC” or “ON” position.

TURNING THE SYSTEM ON AND OFF

Push “PWR·VOL” to turn the audio system on and off.

Push “AM”, “FM”, “FM1”, “FM2”, “TAPE”, “DISC” or “LOAD” to turn on that function without pushing “PWR·VOL”. To turn on the cassette or compact disc player, a cassette or compact disc must be loaded in the player.

You can turn on each player by inserting a cassette tape or compact disc.

You can turn off each player by ejecting the cassette tape or compact disc. If the audio system was previously off, then the entire audio system will be turned off when you eject the cassette tape or compact disc. If another function was previously playing, it will come on again.

SWITCHING BETWEEN FUNCTIONS

Push “AM”, “FM”, “FM1”, “FM2”, “TAPE”, “DISC” or “LOAD” if the system is already on but you want to switch from one function to another.

TONE AND BALANCE

For details about your system’s tone and balance controls, see the description of your own system.

Tone

How good an audio program sounds to you is largely determined by the mix of the treble, midrange, and bass levels. In fact, different kinds of music and vocal programs usually sound better with different mixes of treble, midrange and bass.

Balance

A good balance of the left and right stereo channels and of the front and rear sound levels is also important.

Keep in mind that if you are listening to a stereo recording or broadcast, changing the right/left balance will increase the volume of one group of sounds while decreasing the volume of another.

YOUR RADIO ANTENNA

To remove an antenna, carefully turn it counterclockwise.

YOUR CASSETTE PLAYER

When you insert a cassette, the exposed tape should face to the right.

NOTICE

Do not oil any part of the player and do not insert anything other than cassette tapes into the slot, or the tape player may be damaged.

YOUR COMPACT DISC PLAYER (type 1 and type 2)

When you insert a disc, gently push it in with the label side up. (The player will automatically eject a disc if the label side is down.) The player will play from track 1 through the end of the disc. Then it will play from track 1 again.

NOTICE

Never try to disassemble or oil any part of the compact disc player. Do not insert anything other than compact discs into the slot.

8 cm (3 in.) compact disc singles

Type 1—

Your compact disc player does not need an adaptor to play compact disc singles. Compact disc singles are about 8 cm (3 in.) in diameter—smaller than standard discs.

After you eject a compact disc single, do not insert a standard 12 cm (4.7 in.) disc until “DISC” disappears from the display.

NOTICE

Do not use an adaptor for compact disc singles—it could cause tracking errors or interfere with the ejection of compact discs.

Type 2—

The player is intended for use with 12 cm (4.7 in.) discs only.

YOUR COMPACT DISC PLAYER WITH CHANGER (type 3)

When you insert a disc, push the “LOAD” button and gently push the disc in with the label side up. (The player will automatically eject a disc if the label side is down.) This compact disc player can store up to six discs. The player will play from track 1 through the end of the disc. Then it will play from track 1 of the next disc.

The player is intended for use with 12 cm (4.7 in.) discs only.

NOTICE

- ◆ *Do not stack up two discs for insertion, or it will cause damage to the compact disc changer. Insert only one compact disc into slot at a time.*
- ◆ *Never try to disassemble or oil any part of the compact disc player. Do not insert anything other than compact discs into the slot.*

'05 TUNDRA_U (L/O 0409)

—Controls and features

►Type 1

Details of specific buttons, controls and features are described in the alphabetical list that follows.

1 2 3 4 5 6 (Preset buttons)

These buttons are used to preset and tune in radio stations.

To preset a station to a button: Tune in the desired station. (See "TUNE" or "SEEK/TRACK".) Push and hold down the button until you hear a beep—this will set the station to the button. The button number will appear on the display.

To recall a preset station: Push the button for the station you want. The button number and station frequency will appear on the display.

These systems can store one AM and two FM stations for each button. (The display will show "AM", "FM1" or "FM2" when you push "AM", "FM1" or "FM2" button.)

▲ (Eject button)

Push the compact disc eject button to eject a compact disc.

◀◀/▶▶ (Reverse/Fast-forward button)

Push and hold "▶▶" (preset button 6) or "◀◀" (preset button 5) to fast forward or reverse within a compact disc. When you release the button, the compact disc player will resume playing.

AM

Push the "AM" button to turn on the radio and select the AM band. "AM" will appear on the display.

AUDIO CONTROL (Tone and sound balance adjustment function)

Each time you push the "AUDIO CONTROL" knob, the mode changes. To adjust the tone and balance, turn the knob.

BAS: Adjusts low-pitched tones. The display ranges from -5 to 5.

TRE: Adjusts high-pitched tones. The display ranges from -5 to 5.

FAD: Adjusts the sound balance between the front and rear speakers. The display ranges from F7 to R7.

BAL: Adjusts the sound balance between the right and left speakers. The display ranges from L7 to R7.

DISC (Compact disc)

Push the "DISC" button to play a compact disc.

When the audio system is set into compact disc operation, the display shows the track, or track and disc number currently being played.

Vehicles with rear seat entertainment system—

The "DISC" button may also be used to operate a DVD player when a disc is loaded in the DVD player. Pressing the "DISC" button changes between the CD player and DVD player. When the DVD player is in operation, "AUX" appears on the display.

Error messages

If the player malfunctions, your audio system will display one of the following error messages.

"WAIT": The compact disc player unit may be too hot. Allow the player to cool down.

"ERROR 1": The disc may be dirty, damaged or inserted incorrectly (up-side down). Clean the disc and re-insert it.

"NO DISC": The compact disc changer of separate unit is empty. Insert a disc.

'05 TUNDRA_U (L/O 0409)

“ERROR 3”: There is a problem inside the system. Eject the disc or magazine. Set the disc or magazine again.

“ERROR 4”: Over-current. Ask your Toyota dealer to inspect.

“CD OPEN”: The compact disc changer lid of separate unit is open. Close the compact disc changer lid.

If the malfunction still exists, take your vehicle to your Toyota dealer.

∨ DISC ×

With compact disc changer only—

Use these buttons to select a disc you want to listen to.

Push “∨” (preset button 3) or “×” (preset button 4) until the number of the disc you want to listen appears on the display.

FM1 FM2

Push the “FM1” or “FM2” button to turn on the radio and select the FM band. “FM1” or “FM2” will appear on the display. This system allows you to set twelve FM stations, two for each of the preset button.

PWR-VOL (Power and Volume)

Push “PWR-VOL” to turn the audio system on and off. Turn “PWR-VOL” to adjust the volume.

RAND (Random)

There are two random features—you can either listen to the tracks on one compact disc in random order, or listen to the tracks on all the compact discs in the magazine in random order.

To play the tracks on one disc in random order:

Quickly push and release “RAND” (preset button 1). “ RAND” will appear on the display and the player will perform the tracks on the disc you are listening to in random order. To turn off the random feature, push this button again.

With compact disc changer only—

To play all the tracks in the magazine in random order:

Push and hold “RAND” (preset button 1) until you hear a beep. “ RAND” will appear on the display and the player will perform all the tracks on all the discs in the magazine in random order. To turn off the random feature, push this button again.

RPT (Repeat)

There are two repeat features—you can either replay a disc track or a whole compact disc.

Repeating a track:

Quickly push and release “RPT” (preset button 2) while the track is playing. “ RPT” will appear on the display. When the track ends, it will automatically replay. To turn off the repeat feature, push this button again.

With compact disc changer only—

Repeating a disc:

Push and hold “RPT” (preset button 2) until you hear a beep. “ RPT” will appear on the display. The player will repeat all the tracks on the disc you are listening to. When the disc ends, the player will automatically go back to the first track on the disc and replay. To turn off the repeat feature, push this button again.

SCAN

Radio

You can either scan all the frequencies on a band or scan only the preset stations for that band.

To scan the preset stations:

Push and hold the "SCAN" button until you hear a beep. The radio will tune in the next preset station up the band, stay there for 5 seconds, and then move to the next preset station. To stop scanning, push this button again.

To scan all the frequencies:

Quickly push and release the "SCAN" button. The radio will find the next station up the station band, stay there for 5 seconds, and then scan again to the next station. To stop scanning, push this button again.

Compact disc player

There are two scan features—you can either scan the tracks on a specific disc or scan the first tracks of all the discs in the magazine.

Scanning the tracks on a disc:

Quickly push and release the "SCAN" button. "SCAN" will appear on the display and the player will scan all the tracks on the disc you are listening to. To stop scanning, push this button again. If the player scanned all the tracks on the disc, it will stop scanning.

With compact disc changer only—

Scanning the first tracks of all the discs in the magazine:

Push the "SCAN" button until you hear a beep. "SCAN" will appear on the display and the player will scan the first track of the next disc. To stop scanning, push this button again. If the player has scanned all the discs, it will stop scanning.

SEEK/TRACK (Seeking/Track up/down)

Radio

In the seek mode, the radio finds and plays the next station up or down the station band.

To seek the next station, quickly push and release "x" or "v" side of the "SEEK/TRACK" button. Do this again to find the station after that.

Compact disc player

Use this button to skip up or down to a different track.

Push "x" or "v" side of the "SEEK/TRACK" button until the number of the track you want to listen to appears on the display. If you want to return to the beginning of the current track, quickly push the down side of the button one time.

Vehicles with rear seat entertainment system—

While the DVD player is in operation, the chapter or track can be changed by pushing the "x" or "v" side of the "SEEK/TRACK" button.

'05 TUNDRA_U (L/O 0409)

ST (Stereo reception) display

Your radio automatically changes to stereo reception when a stereo broadcast is received. "ST" appears on the display. If the signal becomes weak, the radio reduces the amount of channel separation to prevent the weak signal from creating noise. If the signal becomes extremely weak, the radio switches from stereo to mono reception.

TEXT

This button is used to change the display for the compact disc that contains text data.

To change the display, quickly push and release the "TEXT" button while the compact disc is playing. The display changes in the order from the elapsed time to disc title to track title, then back to the elapsed time.

If this button is pushed while a compact disc that does not contain text data is playing, "NO TITLE" will appear on the display.

If the entire disc or track title does not appear on the display, push and hold the button until you hear a beep. The rest of the title will appear.

TUNE (Tuning)

Turn the "TUNE" knob clockwise to step up the frequency. Turn the knob counterclockwise to step down the frequency.

'05 TUNDRA_U (L/O 0409)

►Type 2

Details of specific buttons, controls and features are described in the alphabetical list that follows.

1 2 3 4 5 6 (Preset buttons)

These buttons are used to preset and tune in radio stations.

To preset a station to a button: Tune in the desired station. (See "TUNE" or "SEEK/TRACK".) Push and hold down the button until you hear a beep—this will set the station to the button. The button number will appear on the display.

To recall a preset station: Push the button for the station you want. The button number and station frequency will appear on the display.

These systems can store one AM and two FM stations for each button. (The display will show "AM", "FM1" or "FM2" when you push "AM" or "FM" button.)

▲ (Eject button)

Push the cassette tape eject button to eject a cassette. Push the compact disc eject button to eject a compact disc.

◀▶ (Program)

Push "◀▶" (preset button 4) to select the other side of a cassette tape. The display indicates which side is currently selected ("▲" indicates the top side, "▼" indicates the bottom side).

Auto-reverse feature: After the cassette player reaches the end of a tape side, it automatically reverses and begins to play the other side. This is true whether the cassette was playing or fast forwarding.

◀◀/▶▶ (Reverse/Fast-forward button)

Cassette player

Push "▶▶" (preset button 6) to fast-forward a cassette tape. "FF" will appear on the display. Push "◀◀" (preset button 5) to rewind a tape. "REW" will appear on the display.

To stop the tape while it is fast-forwarding, push "▶▶" or "TAPE" button. To stop the tape while it is rewinding, push "◀◀" or "TAPE" button.

If a tape rewinds completely, the cassette player will stop and then play that same side. If a tape fast-forwards completely, the cassette will play the other side of the tape using the auto-reverse feature.

Compact disc player

Push and hold "▶▶" (preset button 6) or "◀◀" (preset button 5) to fast forward or reverse within a compact disc. When you release the button, the compact disc player will resume playing.

AM

Push the "AM" button to turn on the radio and select the AM band. "AM" will appear on the display.

AUDIO CONTROL (Tone and sound balance adjustment function)

Each time you push the "AUDIO CONTROL" knob, the mode changes. To adjust the tone and balance, turn the knob.

BAS: Adjusts low-pitched tones. The display ranges from -5 to 5.

MID (access cab models): Adjusts mid-pitched tones. The display ranges from -5 to 5.

TRE: Adjusts high-pitched tones. The display ranges from -5 to 5.

FAD: Adjusts the sound balance between the front and rear speakers. The display ranges from F7 to R7.

'05 TUNDRA_U (L/O 0409)

BAL: Adjusts the sound balance between the right and left speakers. The display ranges from L7 to R7.

DISC (Compact disc)

Push the "DISC" button to play a compact disc.

When the audio system is set into compact disc operation, the display shows the track, or track and disc number currently being played.

Vehicles with rear seat entertainment system—

The "DISC" button may also be used to operate a DVD player when a disc is loaded in the DVD player. Pressing the "DISC" button changes between the CD player and DVD player. When the DVD player is in operation, "AUX" appears on the display.

Error messages

If the player malfunctions, your audio system will display one of the six following error messages.

"WAIT": The compact disc player unit may be too hot. Allow the player to cool down.

"ERROR 1": The disc may be dirty, damaged or inserted incorrectly (up-side down). Clean the disc and re-insert it.

220

"NO DISC": The compact disc changer of separate unit is empty. Insert a disc.

"ERROR 3": There is a problem inside the system. Eject the disc or magazine. Set the disc or magazine again.

"ERROR 4": Over-current. Ask your Toyota dealer to inspect.

"CD OPEN": The compact disc changer lid of separate unit is open. Close the compact disc changer lid.

If the malfunction still exists, take your vehicle to your Toyota dealer.

∨ **DISC** ×

With compact disc changer only—

Use these buttons to select the disc you want to listen to.

Push "∨" (preset button 3) or "×" (preset button 4) until the number of the disc you want to listen appears on the display.

Dolby® DD B NR*

If you are listening to a tape that was recorded with Dolby® B Noise Reduction, push "DD" (preset button 3). "DD" will appear on the display. Push the button again to turn off Dolby® B NR.

The Dolby NR mode reduces tape noise by about 10 dB. For best sound reproduction, play your tapes with this button on or off according to the mode used to record the tape.

*: Dolby noise reduction manufactured under license from Dolby Laboratories Licensing Corporation. "DOLBY" and the double D symbol DD are trademarks of Dolby Laboratories Licensing Corporation.

FM

Push the "FM" button to turn on the radio and select the FM band. "FM1" or "FM2" will appear on the display. This system allows you to set twelve FM stations, two for each of the preset button.

PWR·VOL (Power and Volume)

Push "PWR·VOL" to turn the audio system on and off. Turn "PWR·VOL" to adjust the volume.

RAND (Random)

There are two random features—you can either listen to the tracks on one compact disc in random order, or listen to the tracks on all the compact discs in the magazine in random order.

To play the tracks on one disc in random order:

Quickly push and release “RAND” (preset button 1). “RAND” will appear on the display and the player will perform the tracks on the disc you are listening to in random order. To turn off the random feature, push this button again.

With compact disc changer only—

To play all the tracks in the magazine in random order:

Push and hold “RAND” (preset button 1) until you hear a beep. “RAND” will appear on the display and the player will perform all the tracks on all the discs in the magazine in random order. To turn off the random feature, push this button again.

RPT (Repeat)

Cassette player

Push “RPT” (preset button 2) while the track is playing. “RPT” will appear on the display. When the track ends, it will automatically rewind and replay. To turn off the repeat feature, push this button again.

There must be at least 3 seconds of blank space between tracks in order for the repeat feature to work correctly.

Compact disc player

There are two repeat features—you can either replay a disc track or a whole compact disc.

Repeating a track:

Quickly push and release “RPT” (preset button 2) while the track is playing. “RPT” will appear on the display. When the track ends, it will automatically replay. To turn off the repeat feature, push this button again.

With compact disc changer only—

Repeating a disc:

Push and hold “RPT” (preset button 2) until you hear a beep. “RPT” will appear on the display. The player will repeat all the tracks on the disc you are listening to. When the disc ends, the player will automatically go back to the first track on the disc and replay. To turn off the repeat feature, push this button again.

SCAN

Radio

You can either scan all the frequencies on a band or scan only the preset stations for that band.

To scan the preset stations:

Push and hold the “SCAN” button until you hear a beep. The radio will tune in the next preset station up the band, stay there for 5 seconds, and then move to the next preset station. To stop scanning, push this button again.

To scan all the frequencies:

Quickly push and release the “SCAN” button. The radio will find the next station up the station band, stay there for 5 seconds, and then scan again to the next station. To stop scanning, push this button again.

'05 TUNDRA_U (L/O 0409)

Compact disc player

There are two scan features—you can either scan the tracks on a specific disc or scan the first tracks of all the discs in the magazine.

Scanning the tracks on a disc:

Quickly push and release the “SCAN” button. “SCAN” will appear on the display and the player will scan all the tracks on the disc you are listening to. To stop scanning, push this button again. If the player scanned all the tracks on the disc, it will stop scanning.

With compact disc changer only—

Scanning the first tracks of all the discs in the magazine:

Push the “SCAN” button until you hear a beep. “SCAN” will appear on the display and the player will scan the first track of the next disc. To stop scanning, push this button again. If the player has scanned all the discs, it will stop scanning.

SEEK/TRACK (Seeking/Track up/down)

Radio

In the seek mode, the radio finds and plays the next station up or down the station band.

To seek the next station, quickly push and release “x” or “v” side of the “SEEK/TRACK” button. Do this again to find the station after that.

Cassette Player

Use this button to skip up or down to locate a song or recording.

You can select up to nine recordings (including current one).

A blank space of at least 3 seconds is considered to be a start of a recording.

When the beginning of a tape is reached, the player automatically resumes play.

When the end of the tape is reached, the player automatically reverses sides and resumes normal play.

In addition, the feature may not work well with some spoken word, live, or classical recordings.

Compact disc player

Use this button to skip up or down to a different track.

Push “x” or “v” side of the “SEEK/TRACK” button until the number of the track you want to listen to appears on the display. If you want to return to the beginning of the current track, quickly push the down side of the button one time.

Vehicles with rear seat entertainment system—

While the DVD player is in operation, the chapter or track can be changed by pushing the “x” or “v” side of the “SEEK/TRACK” button.

ST (Stereo reception) display

Your radio automatically changes to stereo reception when a stereo broadcast is received. “ST” appears on the display. If the signal becomes weak, the radio reduces the amount of channel separation to prevent the weak signal from creating noise. If the signal becomes extremely weak, the radio switches from stereo to mono reception.

TAPE

Push the “TAPE” button to play a cassette tape.

'05 TUNDRA_U (L/O 0409)

TEXT

This button is used to change the display for the compact disc that contains text data.

To change the display, quickly push and release the "TEXT" button while the compact disc is playing. The display changes in the order from the elapsed time to disc title to track title, then back to the elapsed time.

If this button is pushed while a compact disc that does not contain text data is playing, "NO TITLE" will appear on the display.

If the entire disc or track title does not appear on the display, push and hold the button until you hear a beep. The rest of the title will appear.

TUNE (Tuning)

Turn the "TUNE" knob clockwise to step up the frequency. Turn the knob counter-clockwise to step down the frequency.

'05 TUNDRA_U (L/O 0409)

►Type 3

Details of specific buttons, controls and features are described in the alphabetical list that follows.

1 2 3 4 5 6 (Preset buttons)

These buttons are used to preset and tune in radio stations.

To preset a station to a button: Tune in the desired station. (See "TUNE" or "SEEK/TRACK".) Push and hold down the button until you hear a beep—this will set the station to the button. The preset button number will appear on the display.

RDS stations will be preset to the buttons when you turn on the RDS. (See "RDS" button.)

To recall a preset station: Push the button for the station you want. The preset button number and station frequency will appear on the display.

This radio can store one AM, two FM and RDS stations for each button. (The display will show "AM", "FM1", "FM2" or "FM TYPE" when you push "AM" or "FM" button.)

▲ (Eject button)

Cassette player

This button is used to eject a cassette.

Compact disc player

This button is used to eject one or all compact discs.

To eject the current compact disc, push and release the compact disc eject button.

To eject a specific disc, push "√" (preset button 3) or "×" (preset button 4) until the number of the disc you want to eject is displayed. Push and release the eject button.

To eject all discs at a time, press and hold the eject button until you hear a beep. The last compact disc played before pushing the button will be ejected first. If the ejected disc is not removed for a long time, the eject function will be cancelled.

◀▶ (Program)

Push "◀▶" (preset button 4) to select the other side of a cassette tape. The display indicates which side is currently selected ("▲" indicates the top side, "▼" indicates the bottom side).

Auto-reverse feature: After the cassette player reaches the end of a tape side, it automatically reverses and begins to play the other side. This is true whether the cassette was playing or fast forwarding.

◀◀/▶▶ (Reverse/Fast-forward button)

Cassette player

Push "▶▶" (preset button 6) to fast-forward a cassette tape. "FF" will appear on the display. Push "◀◀" (preset button 5) to rewind a tape. "REW" will appear on the display.

To stop the tape while it is fast-forwarding, push "▶▶" or "TAPE" button. To stop the tape while it is rewinding, push "◀◀" or "TAPE" button.

If a tape rewinds completely, the cassette player will stop and then play that same side. If a tape fast-forwards completely, the cassette will play the other side of the tape using the auto-reverse feature.

Compact disc player

Push and hold "▶▶" (preset button 6) or "◀◀" (preset button 5) to fast forward or reverse within a compact disc. When you release the button, the compact disc player will resume playing.

AM

Push the "AM" button to turn on the radio and select the AM band. "AM" will appear on the display.

AUDIO CONTROL (Tone and sound balance adjustment function)

Each time you push the "AUDIO CONTROL" knob, the mode changes. To adjust the tone and balance, turn the knob.

BAS: Adjusts low-pitched tones. The display ranges from -5 to 5.

MID: Adjusts mid-pitched tones. The display ranges from -5 to 5.

TRE: Adjusts high-pitched tones. The display ranges from -5 to 5.

FAD: Adjusts the sound balance between the front and rear speakers. The display ranges from F7 to R7.

BAL: Adjusts the sound balance between the right and left speakers. The display ranges from L7 to R7.

DISC (Compact disc)

Push the "DISC" button to play a compact disc.

When the audio system is set into compact disc operation, the display shows the track, or track and disc number currently being played.

Vehicles with rear seat entertainment system—

The "DISC" button may also be used to operate a DVD player when a disc is loaded in the DVD player. Pressing the "DISC" button changes between the CD player and DVD player. When the DVD player is in operation, "AUX" appears on the display.

Error messages

If the player malfunctions, your audio system will display one of the six following error messages.

"**WAIT**": The compact disc player unit may be too hot. Allow the player to cool down.

"**ERROR 1**": The disc may be dirty, damaged or inserted incorrectly (up-side down). Clean the disc and re-insert it.

"**NO DISC**": The compact disc changer of separate unit is empty. Insert a disc.

"**ERROR 3**": There is a problem inside the system. Eject the disc or magazine. Set the disc or magazine again.

"**ERROR 4**": Over-current. Ask your Toyota dealer to inspect.

"**CD OPEN**": The compact disc changer lid of separate unit is open. Close the compact disc changer lid.

If the malfunction still exists, take your vehicle to your Toyota dealer.

∨ DISC ×

Use these buttons to select a disc you want to listen to.

Push "∨" (preset button 3) or "×" (preset button 4) until the number of the disc you want to listen appears on the display.

'05 TUNDRA_U (L/O 0409)

Dolby® B NR*

If you are listening to a tape that was recorded with Dolby® B Noise Reduction, push “” (preset button 3). “” will appear on the display. Push the button again to turn off Dolby® B NR.

The Dolby NR mode reduces tape noise by about 10 dB. For best sound reproduction, play your tapes with this button on or off according to the mode used to record the tape.

*: Dolby noise reduction manufactured under license from Dolby Laboratories Licensing Corporation. “DOLBY” and the double D symbol  are trademarks of Dolby Laboratories Licensing Corporation.

FM

Push the “FM” button to turn on the radio and select the FM band. “FM1”, “FM2” or “FM TYPE” will appear on the display. This system allows you to set twelve FM and six RDS stations, three for each of the preset button. If the RDS is off or RDS stations are not preset to the preset buttons, “FM TYPE” will not appear on the display.

LOAD

This button is used to load the compact discs in the compact disc player. This player can store up to six discs.

To load one compact disc only, quickly push and release the button, then insert a compact disc. After the disc is loaded, the shutter of the slot will close.

If no compact disc is inserted, the shutter will close after 15 seconds.

To load multiple compact discs, push and hold the button (until you hear a beep when the audio system is on), then insert the first compact disc. After the disc is loaded, the shutter of the slot will close. After a few seconds, the shutter will automatically open again so the next disc can be inserted. The same process can be applied for loading the rest of the discs. If the player is full of discs, “DISC FULL” will appear on the display.

If no compact disc is inserted, the shutter will close after 15 seconds.

PWR·VOL (Power and Volume)

Push “PWR·VOL” to turn the audio system on and off. Turn “PWR·VOL” to adjust the volume.

RAND (Random)

There are two random features—you can either listen to the tracks on one compact disc in random order, or listen to the tracks on all the compact discs in the magazine in random order.

To play the tracks on one disc in random order:

Quickly push and release “RAND” (preset button 1). “” will appear on the display and the player will perform the tracks on the disc you are listening to in random order. To turn off the random feature, push this button again.

To play all the tracks in the magazine in random order:

Push and hold “RAND” (preset button 1) until you hear a beep. “” will appear on the display and the player will perform all the tracks on all the discs in the magazine in random order. To turn off the random feature, push this button again.

'05 TUNDRA_U (L/O 0409)

RDS (Radio Data System)

Your audio system is equipped with Radio Data System (RDS). RDS station providing good reception is automatically selected if current reception worsens.

The "RDS" button turns the RDS on and off. This button is operational except in AM mode.

To turn on the RDS, push and hold this button until you hear a beep and "RDS" will appear on the display. At this time, the radio starts to search the RDS stations and "RDS SEARCH" will flash on the display.

Quickly push and release this button when the RDS turns on, the radio starts to search the RDS stations and "RDS SEARCH" will flash on the display.

When the RDS stations are found, "FOUND" and the number of the RDS stations will appear on the display, and you will hear two beeps. The stations will be preset to the preset buttons.

If the RDS stations can not be found, "NO RDS ST" will appear on the display and you will hear a beep, and the display returns to the previous mode.

To turn the RDS off, push the button until you hear a beep again.

RPT (Repeat)

Cassette player

Push "RPT" (preset button 2) while the track is playing. "RPT" will appear on the display. When the track ends, it will automatically rewind and replay. To turn off the repeat feature, push this button again.

There must be at least 3 seconds of blank space between tracks in order for the repeat feature to work correctly.

Compact disc player

There are two repeat features—you can either replay a disc track or a whole compact disc.

Repeating a track:

Quickly push and release "RPT" (preset button 2) while the track is playing. "RPT" will appear on the display. When the track ends, it will automatically replay. To turn off the repeat feature, push this button again.

Repeating a disc:

Push and hold "RPT" (preset button 2) until you hear a beep. "RPT" will appear on the display. The player will repeat all the tracks on the disc you are listening to. When the disc ends, the player will automatically go back to the top track of the disc and replay. To turn off the repeat feature, push this button again.

SCAN

Radio

You can either scan all the frequencies on a band or scan only the preset stations for that band.

To scan the preset stations:

Push and hold the "SCAN" button until you hear a beep. The radio will tune in the next preset station up the band, stay there for 5 seconds, and then move to the next preset station. To stop scanning, push this button again.

To scan all the frequencies:

Quickly push and release the "SCAN" button. The radio will find the next station up the station band, stay there for 5 seconds, and then scan again to the next station. To stop scanning, push this button again.

Compact disc player

There are two scan features—you can either scan the tracks on a specific disc or scan the first tracks of all the discs in the magazine.

Scanning the tracks on a disc:

Quickly push and release the “SCAN” button. “SCAN” will appear on the display and the player will scan all the tracks on the disc you are listening to. To stop scanning, push this button again. If the player scanned all the tracks on the disc, it will stop scanning.

Scanning the first tracks of all the discs in the magazine:

Push the “SCAN” button until you hear a beep. “SCAN” will appear on the display and the player will scan the first track of the next disc. To stop scanning, push this button again. If the auto changer has scanned all the discs, it will stop scanning.

SEEK/TRACK (Seeking/Track up/down)

Radio

In the seek mode, the radio finds and plays the next station up or down the station band.

To seek the next station, quickly push and release “x” or “v” side of the “SEEK/TRACK” button. Do this again to find the station after that.

Cassette Player

Use this button to skip up or down to locate a song or recording.

You can select up to nine recordings (including current one).

A blank space of at least 3 seconds is considered to be a start of a recording.

When beginning of a tape is reached, the player automatically resumes play.

When the end of the tape is reached, the player automatically reverses sides and resumes normal play.

In addition, the feature may not work well with some spoken word, live, or classical recordings.

Compact disc player

Use this button to skip up or down to a different track.

Push “x” or “v” side of the “SEEK/TRACK” button until the number of the track you want to listen to appears on the display. If you want to return to the beginning of the current track, quickly push the down side of the button one time.

Vehicles with rear seat entertainment system—

While the DVD player is in operation, the chapter or track can be changed by pushing the “x” or “v” side of the “SEEK/TRACK” button.

ST (Stereo reception) display

Your radio automatically changes to stereo reception when a stereo broadcast is received. “ST” appears on the display. If the signal becomes weak, the radio reduces the amount of channel separation to prevent the weak signal from creating noise. If the signal becomes extremely weak, the radio switches from stereo to mono reception.

TAPE

Push the “TAPE” button to play a cassette tape.

'05 TUNDRA_U (L/O 0409)

TEXT

Radio

This button is operational only in RDS mode.

When an RDS radio station transmits a text message, "TEXT" will be displayed. At this time, push the "TEXT" button to view the text message. The message display will be canceled if any button that affects the display is pushed. To view the message again, push this button again. After the entire message has been displayed, the message will disappear.

The RDS audio system has memory to store three 64-character messages. To store a message in memory, push and hold the "TEXT" button until you hear a beep.

If three messages are already stored in memory, the oldest message will be overwritten by the new message.

To recall a radio text message, push the "TEXT" button momentarily. This will display the most recent message. Each push of the button will display messages in the order of most to least recent.

If no messages have been stored, or if there are no more messages to be recalled, "NO MESSAGE" will appear on the display, and the message display will be canceled.

The message display will be canceled if you activate any function that affects the display.

Compact disc player

This button is used to change the display for the compact disc that contains text data.

To change the display, quickly push and release the "TEXT" button while the compact disc is playing. The display changes in the order from the elapsed time to disc title to track title, then back to the elapsed time.

If this button is pushed while a compact disc that does not contain text data is playing, "NO TITLE" will appear on the display.

If the entire disc or track title does not appear on the display, push and hold the button until you hear a beep. The rest of the title will appear.

TRAF (Traffic)

This button turns the traffic announcement (TA) feature on and off. This button is operational only in FM mode.

By pushing the "TRAF" button, "TRAF SEEK" will flash on the display and the radio will start seeking any traffic program station.

When a traffic program station is found, "TRAF" will be displayed and you will hear a beep.

After the traffic announcement program is over, the display returns to the previous mode.

If no traffic program station is found, "NO TRAF INFO" appears on the display for a few seconds and the display returns to the previous mode.

To cancel the traffic announcement, push this button again.

TUNE (Tuning)

Turn the "TUNE" knob clockwise to step up the frequency. Turn the knob counter-clockwise to step down the frequency.

'05 TUNDRA_U (L/O 0409)

TYPE (Program Types)

When you push the "TYPE" button while receiving an RDS station, the current program type appears on the display.

Each time you push this button, the program type changes as in the following:

- ▼ROCK
- ▼EASY LIS (Easy listening)
- ▼CLS/JAZZ (Classical music and Jazz)
- ▼R&B (Rhythm and Blues)
- ▼INFORM (Information)
- ▼RELIGION
- ▼MISC (Miscellaneous)
- ▼ALERT (Emergency message)

Audio remote controls (steering switches)

Some parts of the audio system can be adjusted using the switches on the steering wheel.

Details of the specific switches, controls, and features are described below.

1. Volume control switch
2. "x v" switch
3. "MODE" switch

1. Volume control switch

Push "+" to increase the volume. The volume continues to increase while the switch is being pushed.

Push "-" to decrease the volume. The volume continues to decrease while the switch is being pushed.

2. "× √" switch

Radio

This switch has the following features—

To select a preset station:

Quickly push and release the "×" or "√" side of the switch. Do this again to select the next preset station.

To seek a station:

Push and hold the "×" or "√" side of the switch until you hear a beep. Do this again to find the next station. If you push the switch on either side during the seek mode, seeking will be cancelled.

Cassette player

This switch has the following features—

To skip to a different track in either direction:

Quickly push and release the "×" or "√" side of the switch. "FF 1" or "REW 1" will appear on the display.

Next, push either side of the track switch until the track you want to listen to is set. If you push the switch ten times, the skip function will turn off. (You can skip up to nine tracks at a time.)

When counting the number of the tracks you want to rewind, remember to count the current track as well. For example, if you want to rewind to a song that is two tracks before the song you are listening to, push the "√" side of the switch three times.

If you push the track switch further than you wanted to, push the other side of the switch. The track number will be increased or reduced.

The track number you select is not valid if it is higher than the number of the tracks remaining on the current side of the cassette.

▼When the tape reaches to the beginning, the player will automatically start playing that side.

▼After the tape reaches to the end, the player will automatically reverse and start playing the other side.

There must be at least 3 seconds of blank space between tracks for the track switch to work correctly. In addition, the feature may not work well with some spoken, live, or classical recordings.

To fast-forward or reverse:

Push and hold the "×" side of the switch to fast-forward a cassette tape. "FF" will appear on the display. Push and hold the "√" side of the switch to rewind a tape. "REW" will appear on the display.

To stop the tape while it is fast-forwarding, push the "×" side of the switch. To stop the tape while it is rewinding, push the "√" side of the switch.

If a tape rewinds completely, the cassette player will stop and then play that same side. If a tape fast-forwards completely, the cassette will play the other side of the tape using the auto-reverse feature.

Compact disc player

Use this switch to skip up or down to a different track in either direction.

Quickly push and release the "×" or "√" side of the switch until the track you want to listen to is set. If you want to return to the beginning of the current track, push the "√" side of the switch once, quickly.

With compact disc changer only—

Push and hold the “×” or “√” side of the switch until the disc you want to listen to is set.

3. “MODE” switch

Push “MODE” switch to select an audio mode. Each push changes the mode sequentially if the desired mode is ready to use. The DVD player will be selectable if a rear seat entertainment system is installed in your vehicle.

To turn the audio system on, push the “MODE” switch.

To turn the audio system off, push and hold the “MODE” switch until the system turns off.

Rear seat audio system—

The rear seat audio system is designed for the rear seat passengers to enjoy the audio sound separately between the front seats and the rear seats.

The rear seat audio system can be turned on with the rear audio system controller even if the front audio system is off. When the front audio is turned off, the rear audio system will be turned off simultaneously.

The rear passengers can enjoy all the modes (AM and FM radio, cassette tape player and compact disc player with changer) with the rear seat audio system when a cassette tape and a compact disc are loaded in the front audio system.

When the same mode is selected on the front and rear audio systems at the same time, the system can be operated on the front audio system.

If the radio mode is selected on the front and rear audio systems at the same time, AM and FM modes cannot be changed on the rear seat audio system.

You can enjoy the rear seat entertainment system with commercial headphone. See “—Headphone input jacks” in this Section for details.

You can also enjoy the rear seat entertainment system with a wireless headphone. The wireless headphone can be used within rear seat. If the signal becomes weak, the headphone will mute. For details, refer to the manufacturer's instructions.

With some wireless headphone generally available in the market, it may be difficult to catch sound properly. Toyota recommends the use of Toyota genuine wireless headphone.

You can purchase a wireless headphone at a Toyota dealer.

CAUTION

Do not drive with using the headphone. Otherwise, you may be hard to hear the sound from the outside while using the headphone and may cause an accident.

The rear seat audio system consists of following components.

1. Front audio system
2. Rear seat audio system display
3. Rear seat audio system controller
4. Headphone volume control dials
5. Headphone input jacks
6. Controller holder

—Rear seat audio system controller

The rear seat audio system can be operated with the rear seat audio system controller.

CAUTION

Do not disassemble or modify the controller. It may cause an accident, fire or electric shock.

NOTICE

Keep the controller away from direct sunlight, high heat and high humidity. These conditions could cause the case to deform or the battery to explode or leak.

**BEFORE USING THE CONTROLLER
(for new vehicle owners)**

A battery is already set in the controller with an insulating sheet, which prevents the battery from being discharged. Before using the controller, remove the insulating sheet.

USING THE CONTROLLER

To use the rear seat audio system controller, direct the signal output portion of the controller to the signal reception portion of the rear seat audio system display.

The rear seat audio system controller can be operated when the ignition switch is in the "ACC" or "ON" position.

The controller does not operate properly when the signal reception portion of the display is exposed to direct sunlight. Block the display from direct sunlight.

Details of specific buttons, controls, and features of the controller, see "CONTROLLER FEATURES" in this Section.

NOTICE

Observe the followings, otherwise the controller may be damaged.

- ◆ *Do not drop or strongly knock the controller against hard objects.*
- ◆ *Do not sit on or place heavy objects on the controller.*

CONTROLLER HOLDER

The controller can be stowed in the holder when it is not in use. The holder can be hooked on the back of the driver's or front passenger's seatback.

⚠ CAUTION

To reduce the chance of injury in case of an accident or a sudden stop while driving, stow the controller in the holder when it is not in use.

NOTICE

Do not leave the controller exposed to high temperatures (such as on the instrument panel) for a long time, otherwise the controller may be damaged.

CONTROLLER FEATURES

1. "▼" and "▲" (DISC/CH/PROG) buttons
2. "▼" and "▲" (TUNE/TRACK) buttons
3. "ON/SOURCE" button
4. "OFF" button

1. "▼" and "▲" (DISC/CH/PROG) buttons

Radio

You can scan only the preset stations for the band of the front audio system. (For instructions, see "—Controls and features" in this Section.)

To scan the preset stations:

Push the "▼" or "▲" (DISC/CH/PROG) button. The radio will tune in the next preset station up or down the band. The station frequency will appear on the display.

Cassette tape player

Push the "▼" or "▲" (DISC/CH/PROG) button to select the other side of a cassette tape. The display indicates which side is currently selected. ("▲" indicates the top side, "▼" indicates the bottom side.)

Auto-reverse feature: After the cassette player reaches the end of a tape side, it automatically reverses and begins to play the other side. This is true whether the cassette was playing or fast forwarding.

Compact disc player with changer

Use these buttons to select a disc you want to listen to.

Push the "▼" or "▲" (DISC/CH/PROG) button until the number of the disc you want to listen appears on the display.

2. "▼" and "▲" (TUNE/TRACK) buttons

Radio

Push the "▼" or "▲" (TUNE/TRACK) button to tune or seek.

Tuning:

Quickly push and release the "▼" or "▲" (TUNE/TRACK) button. Each time you push the button, the radio will step up or down to another frequency. If you push and hold the button, and the radio will go into the seek mode.

Seeking:

Push and hold the "▼" or "▲" (TUNE/TRACK) button. The radio will seek up or down for a station of the nearest frequency and will stop on reception. Each time you push the button, the stations will be searched one after another.

Cassette tape player

This button has the following features—

To fast forward or reverse:

Push and hold the “^” (TUNE/TRACK) button until “FF” will appears on the display to forward a tape. Push and hold the “v” (TUNE/TRACK) button until “REW” appears on the display to rewind a tape.

To stop the tape while it is fast forwarding, push the “^” (TUNE/TRACK) button. To stop the tape while it is rewinding, push the “v” (TUNE/TRACK) button.

If a tape rewinds completely, the cassette player will stop and then play that same side. If a tape fast forwards completely, the cassette will play the other side of the tape using the auto-reverse feature.

To skip up or down to locate a song or recording:

You can select up to nine recordings (including current one).

Push the “v” or “^” (TUNE/TRACK) button. “FF 1” or “REW 1” will appear on the display.

Next, push either side of the track button until the number on the display reaches the number of tracks you want to skip. If you push the button 10 times, the skip feature will be turned off.

For the skip feature to work correctly a blank space of at least 3 seconds is considered to be a start of a recording.

When a beginning of a tape is reached, the player automatically resumes play.

When the end of the tape is reached, the player automatically reverses sides and resumes normal play.

In addition, the feature may not work well with some spoken, live, or classical recordings.

Compact disc player

This button has the following features—

To skip up or down to a different track: Push the “v” or “^” (TUNE/TRACK) button until the number of the track you want to listen to appears on the display. If you want to return to the beginning of the current track, quickly push the “v” (TUNE/TRACK) button one time.

To fast forward or reverse:

Push and hold the “v” or “^” (TUNE/TRACK) button to fast forward or reverse within a compact disc. When you release the button, the compact disc player will resume playing.

3. “ON/SOURCE” button

Push “ON/SOURCE” button to turn on the rear seat audio system.

Use “ON/SOURCE” button to select an audio mode when the rear seat audio system is on. Each time you push this button, the system changes between the radio, cassette player and compact disc player.

When you change the mode, the display indicates which mode is selected.

When a cassette tape and compact discs are not loaded in the front audio system, only a radio mode can be selected in the rear seat audio system.

If you push “ON/SOURCE” button to select the cassette tape player mode or compact disc player mode in that case, a beep sounds from front audio system and “INVALID” flashes on the screen for 6 seconds, and then the rear audio system returns to the radio mode.

If you push “ON/SOURCE” button while receiving an emergency broadcast, a beep sounds and “INVALID” appears on the screen to indicate that no button can be operated.

Radio

AM mode

When you select the AM mode, "AM" will appear on the screen.

FM mode

When you select the FM mode, "FM1" or "FM2" will appear on the display.

If the front audio system receives a traffic announcement (TA) while the rear seat audio system is in the radio mode, "TRAF" will flash on the screen and the rear seat audio system will turn off. When the front audio receives a traffic announcement (TA), the rear seat audio system cannot select the AM/FM mode.

Tape mode

"TAPE" appears on the screen while this mode is selected.

Compact disc mode

"CD" appears on the screen while this mode is selected.

The screen shows the track, or track and disc number currently being played.

Error messages

If the player malfunctions, your audio system will screen one of the four following error messages.

"WAIT": The compact disc player unit may be too hot. Allow the player to cool down.

"ERR 1": The disc may be dirty, damaged or inserted incorrectly (up-side down). Clean the disc and re-insert it.

"ERR 3": There is a problem inside the system. Eject the disc. Set the disc again.

"ERR 4": Over-current. Ask your Toyota dealer to inspect.

If the malfunction still exists, take your vehicle to your Toyota dealer.

4. "OFF" button

Push "OFF" button to turn off the rear seat audio system.

REPLACING CONTROLLER BATTERY

For replacement, use a CR2025 lithium battery or equivalent.

Special care should be taken that small children do not swallow the removed battery or components.

NOTICE

- ◆ *When replacing the battery, be careful not to lose the components.*
- ◆ *Replace only with the same or equivalent type of battery recommended by a Toyota dealer.*
- ◆ *Dispose of used batteries according to the local regulations.*

'05 TUNDRA_U (L/O 0409)

Replace the battery by using the following procedures:

1. Pull the case out while pushing the lock release button to the side.

2. Remove the discharged battery.
3. Put in a new battery with the positive (+) side up.
Put in the case securely.

NOTICE

- ◆ **Make sure that the positive side of the controller battery is facing correctly.**
- ◆ **Do not replace the battery with wet hands. Water may cause rust.**
- ◆ **Do not touch or move any components inside of the controller, or it may interfere with proper operation.**

- ◆ **Be careful not to bend the electrode of the controller battery insertion and that dust or oil does not adhere to the transmitter case.**
- ◆ **Close the battery case securely.**

After replacing the battery, check that the controller operates properly. If the controller still does not operate properly, contact your Toyota dealer.

—Headphone input jacks

CAUTION

Adjust the volume when you connect the headphones to the jack. Loud sounds may have a significant impact on the human body.

You can enjoy the rear seat audio system with commercial headphone.

To use the headphones, connect them to the jack.

The key must be in the "ACC" or "ON" position.

To adjust the volume of the headphones, turn the knob. Turn right to increase the volume. Turn left to decrease the volume.

The maximum volume depends on the type of headphones.

With some headphone generally available in the market, it may be difficult to catch sound properly. Toyota recommends the use of Toyota genuine headphone.

Please contact your Toyota dealer for further details.

'05 TUNDRA_U (L/O 0409)

Rear seat entertainment system—

The rear seat entertainment system consists of the following components.

1. Front audio system
2. Rear seat entertainment system display
3. Rear seat entertainment system controller
4. DVD player
5. Headphone input jacks
6. Input terminal adapter
7. Power outlet
8. Headphone volume control dials
9. Controller holder
10. Power outlet main switch

'05 TUNDRA_U (L/O 0409)

The rear seat entertainment system is designed for the rear passengers to enjoy audio and DVD video separately from the front audio system.

The rear seat entertainment system can be operated when the ignition key is in the "ACC" or "ON" position.

The rear passengers can enjoy all modes (AM and FM radio, cassette tape player, compact disc player with changer and DVD player) on the rear seat entertainment system only if a cassette tape and a compact disc are loaded in the front audio system.

The rear seat entertainment system can play DVD video, audio CD, video CD, CD text, dts-CD or DVD audio only when a disc is loaded in the DVD player.

You can enjoy videos and sound when your personal audio system is connected to the input terminal adapter on the rear console box. For details, refer to the manufacturer's instructions.

You can enjoy the rear seat entertainment system with commercial headphone. See "—Headphone input jacks" in this Section for details.

You can also enjoy the rear seat entertainment system with a wireless headphone. The wireless headphone can be used within rear seat. If the signal becomes weak, the headphone will mute. For details, refer to the manufacturer's instructions.

With some wireless headphone generally available in the market, it may be difficult to catch sound properly. Toyota recommends the use of Toyota genuine wireless headphone.

You can purchase a wireless headphone at a Toyota dealer.

CAUTION

▼Do not drive with using the headphone. Otherwise, you may be hard to hear the sound from the outside while using the headphone and may cause an accident.

▼Conversational speech on some DVDs is recorded at a low volume to emphasize the impact of sound effects. If you adjust the volume assuming that the conversations represent the maximum volume level that the DVD will play, you may be startled by louder sound effects or when you change to a different audio source. Be sure to adjust the volume with this in mind.

Make sure the volume is not increased, before you turn on the headphone.

—Display

To open the display, push the lock release button.

Push down the display to the desired angle.

To close, push up the display until you hear a click.

The illumination of the screen is automatically turned off when the display is closed. However, the rear seat entertainment system is not turned off.

NOTICE

The screen should be cleaned with a dry soft cloth. If the screen is pushed by hand or wiped with a hard cloth, the surface of the screen may be scratched.

CAUTION

To reduce the chance of injury in case of an accident or sudden stop while driving, close the display when it is not in use.

NOTICE

- ◆ *The screen should be cleaned with a dry soft cloth. If the screen is pushed by hand or wiped with a hard cloth, the surface of the screen may be scratched.*
- ◆ *Benzene or alkaline solutions may damage the coated surface of the screen.*
- ◆ *To prevent the battery from being discharged, do not turn on the rear seat entertainment system longer than necessary when the engine is not running.*

—Rear seat entertainment system controller

The rear seat entertainment system can be operated with the rear seat entertainment system controller. The system cannot be operated by touching the switches on the screen directly.

CAUTION

Do not disassemble or modify the controller. It may cause an accident, fire or electric shock.

NOTICE

Keep the controller away from direct sunlight, high heat and high humidity. These conditions could cause the case to deform or the battery to explode or leak.

BEFORE USING THE CONTROLLER
(for new vehicle owners)

A battery is already set in the controller with an insulating sheet, which prevents the battery from being discharged. Before using the controller, remove the insulating sheet.

USING THE CONTROLLER

To use the rear seat entertainment system controller, direct the signal output portion of the controller to the signal reception portion of the rear seat entertainment system display.

The controller does not operate properly when the signal reception portion of the display is exposed to direct sunlight. Block the display from direct sunlight.

NOTICE

Observe the followings, otherwise the controller may be damaged.

- ◆ *Do not drop or strongly knock the controller against hard objects.*
- ◆ *Do not sit on or place heavy objects on the controller.*

CONTROLLER HOLDER

The controller can be stowed in the holder when it is not in use. The holder can be hooked on the back of the driver's or front passenger's seatback.

CAUTION

To reduce the chance of injury in case of an accident or a sudden stop while driving, stow the controller in the holder when it is not in use.

NOTICE

Do not leave the controller exposed to high temperatures (such as on the instrument panel) for a long time, otherwise the controller may be damaged.

'05 TUNDRA_U (L/O 0409)

CONTROL BUTTONS

1. "V" and "A" (TUNE/TRACK) buttons
These buttons operate the front audio system or select the track/chapter when the DVD player is operated.
2. "V" and "A" (DISC/CH/PROG) buttons
These buttons skip directly to a desired preset station, disc, track or chapter.
3. "CURSOR" button
This button indicates the control switches on the screen when the DVD player is operated.
4. Joy stick
This joy stick selects a control switch, mode switch on the screen or the menu for the disc.
5. "ENT" button
This button inputs the selected switch or the selected menu for the disc.
6. "SOURCE" button
This button turns on the rear seat entertainment system and selects the mode.
7. "DISPLAY" button
This button adjusts the color, tone, contrast and brightness of the screen.

'05 TUNDRA_U (L/O 0409)

8. "VIDEO" button
This button turns on the video mode when your personal audio device is connected.
9. "DVD" button
This button turns on the DVD mode.
10. "RETURN" button
This button skips to the predetermined scene for the disc when the DVD player is operated.
11. "SET UP" button
This button indicates the initial set up screen when the DVD player is operated.
12. "SEARCH" button
This button indicates the title search screen when the DVD player is operated.
13. "ANGLE" button
This button selects the angle of the screen when the DVD player is operated.
14. "▶▶" button
This button fast forwards a screen when the DVD player is operated.
15. "▶" button
This button plays a screen when the DVD player is operated.
16. "▮▮" button
This button pauses a screen when the DVD player is operated.
17. "◀◀" button
This button reverse a screen when the DVD player is operated.
18. "TOP MENU" button
This button indicates the title selection screen for DVD video when the DVD player is operated.
19. "AUDIO" button
This button indicates the changing audio screen when the DVD player is operated.
20. "SUB TITLE" button
This button indicates the changing subtitle screen when the DVD player is operated.
21. "MENU" button
This button indicates the menu screen for DVD video when the DVD player is operated.
22. "OFF" button
This button turns off the rear seat entertainment system.

—Turning the rear seat entertainment system on and off

To turn on the system, push the “SOURCE” button.

The screen indicates which mode can be selected. Push the “DVD” or “VIDEO” button when the connected DVD player or your personal audio machine is on. The rear seat entertainment system will be turned on.

The rear seat entertainment system can select all the modes.

When a cassette tape, a compact disc, a DVD video disc, an audio CD, a video CD, a CD text, a dts-CD or a DVD audio disc is not loaded on the front audio system or the DVD player, only the radio mode can be selected on the rear seat entertainment system.

To turn off the system, push the “OFF” button.

When the front audio system is turned off, the rear audio system and the DVD player will be turned off simultaneously.

—Front audio system operation

All the modes of the front audio system can be operated on the rear seat entertainment system.

When the same mode is selected on the front and rear audio systems simultaneously, the system can be operated on the front audio system.

If the radio mode is selected on the front and rear audio systems at the same time, AM and FM modes cannot be changed on the rear seat audio system.

'05 TUNDRA_U (L/O 0409)

SELECTING THE MODE

Use the joy stick to select the mode. Push the "ENT" button to enter the mode.

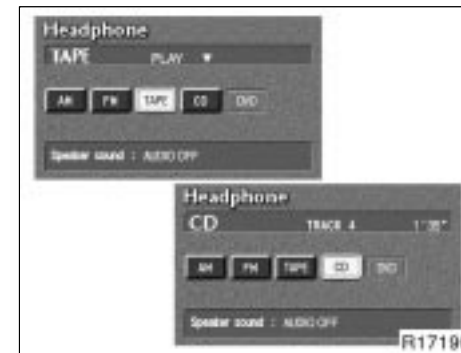

The mode display which is selected by the joy stick is colored blue. When the "ENT" button is pushed, the mode display changes to green. If the mode display is gray, it cannot be selected.

The "Speaker sound" on the mode display is selected on the front audio system.

Radio

Cassette tape player and compact disc player

'05 TUNDRA_U (L/O 0409)

When you select a mode, the screen indicates which is selected.

Radio

AM mode:

When you select the AM mode, "AM" will appear on the screen.

FM mode:

When you select the FM mode, "FM1" or "FM2" will appear on the screen.

Tape mode

"TAPE" appears on the screen while this mode is selected.

Compact disc mode

"CD" appears on the screen while this mode is selected.

The screen shows the track, or track and disc number currently being played.

OPERATING FRONT AUDIO SYSTEM

To operate the front audio system, use the following switches.

1. "V" and "^" (DISC/CH/PROG) buttons

Radio

You can scan only the preset stations for the band of the front audio system. (For instructions, see "—Controls and features" in this Section.)

To scan the preset stations:

Push the "V" or "^" (DISC/CH/PROG) button. The radio will tune in the next preset station up or down the band. The station frequency will appear on the screen.

Cassette tape player

Push the "V" or "^" (DISC/CH/PROG) button to select the other side of a cassette tape. The screen indicates which side is currently selected. ("^" indicates the top side, "V" indicates the bottom side.)

Auto-reverse feature: After the cassette player reaches the end of a tape side, it automatically reverses and begins to play the other side. This is true whether the cassette was playing or fast forwarding.

Compact disc player with changer

Use these buttons to select a disc you want to listen to.

Push the "V" or "^" (DISC/CH/PROG) button until the number of the disc you want to listen appears on the display.

2. “V” and “^” (TUNE/TRACK) buttons Radio

Push the “V” or “^” (TUNE/TRACK) button to tune or seek.

Tuning:

Quickly push and release the “V” or “^” (TUNE/TRACK) button. Each time you push the button, the radio will step up or down to another frequency. If you push and hold the button, and the radio will go into the seek mode.

Seeking:

Push and hold the “V” or “^” (TUNE/TRACK) button. The radio will seek up or down for a station of the nearest frequency and will stop on reception. Each time you push the button, the stations will be searched one after another.

Cassette tape player

This button has the following features—

To fast forward or reverse:

Push and hold the “^” (TUNE/TRACK) button until “FF” will appear on the display to forward a tape. Push and hold the “V” (TUNE/TRACK) button until “REW” appears on the display to rewind a tape.

To stop the tape while it is fast forwarding, push the “^” (TUNE/TRACK) button. To stop the tape while it is rewinding, push the “V” (TUNE/TRACK) button.

If a tape rewinds completely, the cassette player will stop and then play that same side. If a tape fast forwards completely, the cassette will play the other side of the tape using the auto-reverse feature.

To skip up or down to locate a song or recording:

You can select up to nine recordings (including current one).

Push the “V” or “^” (TUNE/TRACK) button. “FF 1” or “REW 1” will appear on the screen.

Next, push either side of the track button until the number on the screen reaches the number of tracks you want to skip. If you push the button 10 times, the skip feature will be turned off.

For the skip feature to work correctly a blank space of at least 3 seconds is considered to be a start of a recording.

When a beginning of a tape is reached, the player automatically resumes play.

When the end of the tape is reached, the player automatically reverses sides and resumes normal play.

In addition, the feature may not work well with some spoken, live, or classical recordings.

Compact disc player

This button has the following features—

To skip up or down to a different track: Push the “V” or “^” (TUNE/TRACK) button until the number of the track you want to listen to appears on the display. If you want to return to the beginning of the current track, quickly push the “V” (TUNE/TRACK) button one time.

To fast forward or reverse:

Push and hold the “V” or “^” (TUNE/TRACK) button to fast forward or reverse within a compact disc. When you release the button, the compact disc player will resume playing.

'05 TUNDRA_U (L/O 0409)

REPLACING CONTROLLER BATTERY

For replacement, use a CR2025 lithium battery or equivalent.

CAUTION

Special care should be taken that small children do not swallow the removed battery or components.

NOTICE

- ◆ *When replacing the battery, be careful not to lose the components.*
- ◆ *Replace only with the same or equivalent type of battery recommended by a Toyota dealer.*
- ◆ *Dispose of used batteries according to local regulations.*

Replace the battery by using the following procedures:

1. Pull the case out while pushing the lock release button to the side.

2. Remove the discharged battery.
3. Put in a new battery with the positive (+) side up.
Put it in the case securely.

NOTICE

- ◆ *Be sure that the positive side of the controller battery is facing correctly.*
- ◆ *Do not replace the battery with wet hands. Water may cause rust.*
- ◆ *Do not touch or move any components inside of the controller, or it may interfere with proper operation.*

◆ *Be careful not to bend the electrode of the controller battery insertion and that dust or oil does not adhere to the transmitter case.*

◆ *Close the battery case securely.*

After replacing the battery, check that the controller operates properly. If the controller still does not operate properly, contact your Toyota dealer.

—DVD player

The DVD player is set in the console box.

The DVD player can play audio CDs, DVD video discs, CD texts, dts-CDs and video CDs.

For appropriate discs for this player, see "Audio/video system operating hints".

To access the DVD player, pull up the console box lid while pushing the lock release button.

The DVD player works when the ignition key is in the "ACC" or "ON" position.

To turn on the DVD player, a disc must be loaded in the player.

To turn off the player, eject the disc.

Error messages

If the player malfunctions, your audio system will display one of the three following error messages.

If "DISC CHECK" appears on the screen: It indicates that the disc is dirty, damaged or it was inserted upside down. Clean the disc or insert it correctly.

If "REGION CODE ERROR" appears on the screen: It indicates that the DVD region code is not set properly.

'05 TUNDRA_U (L/O 0409)

If “DVD ERROR” appears on the screen: There is a problem inside the player. Eject the disc. Set the disc again. If the malfunction still exists, take your vehicle to your Toyota dealer.

INSERTING THE DISC

To open the DVD player, push the lid backward.

Insert a disc and push the lid forward to close the DVD player.

When you insert a disc, push it in gently with the label side up.

If the label faces down, the disc cannot be played. In this case, “DISC CHECK” and disc number appear on the screen.

If a disc which is not playable is inserted, “DISC CHECK” will also appear on the screen. For appropriate discs for this player, see “Audio/video system operating hints”.

The player is intended for the use with 12 cm (4.7 in.) discs only.

The indicator light turns on while the disc is loaded.

The player will play the track or chapter, and it will play from the beginning of the track or chapter again after it reaches the end.

NOTICE

Never try to disassemble or oil any part of the DVD player. Do not insert anything other than a disc into the slot.

EJECTING THE DISC

Push the lid backward to open the DVD player. Push the disc eject button to eject a disc.

CAUTION

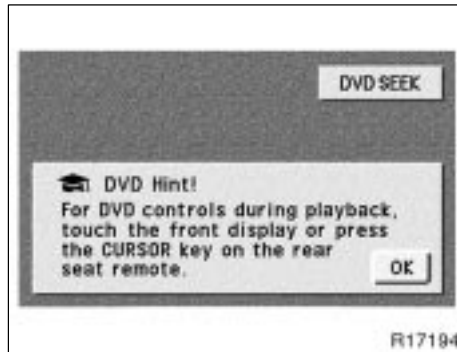

To reduce the chance of injury in case of an accident or a sudden stop, always keep the console box closed while driving.

—Selecting the DVD mode

To select the DVD mode, push the "DVD" button on the controller.

You can also select the DVD mode on the mode selection screen mentioned above.

Vehicles with navigation system—The "DVD Hint!" screen appears when the DVD mode is first selected after you turn the ignition key to the "ACC" or "ON" position.

Push the "OK" switch when you read the message.

—DVD player operation switches

The DVD player can be operated with the controller buttons directly.

1. "DVD" button
2. "MENU" button
3. "TOP MENU" button
4. "RETURN" button
5. "SET UP" button
6. "SEARCH" button
7. "ANGLE" button
8. "AUDIO" button
9. "SUB TITLE" button
10. "||", "▶", "◀◀" and "▶▶" buttons

'05 TUNDRA_U (L/O 0409)

The player can also be operated with the switches on the screen.

To operate the switches on the screen, select the switch by the joy stick and push the "ENT" button. You cannot select the switches on the screen by touching them directly.

When the switch is selected by the joy stick, the outline of the switch changes to blue. Push the "ENT" button, and the switch will be highlighted in green.

TURNING THE OPERATION SWITCHES ON AND OFF

To turn on the operation switches, push the "CURSOR" button on the controller.

Top page (DVD video operation switch)

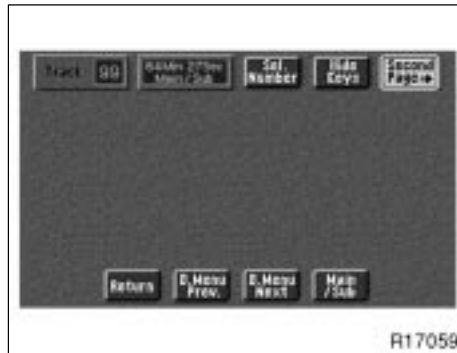

Second page (DVD video operation switch)

'05 TUNDRA_U (L/O 0409)

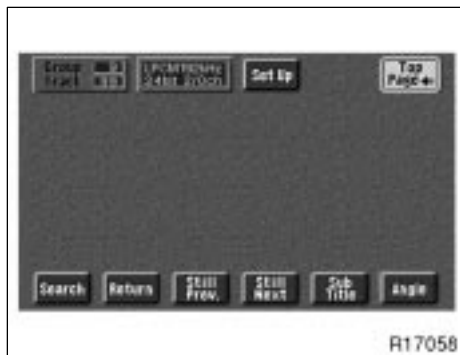

Top page (DVD audio operation switch)

Top page (video CD)

There are operation switches on the "Top Page" and "Second Page" screens.

To change the screen, push the "Top Page" or "Second Page" switch on the screen.

Second page (DVD audio operation switch)

Second page (video CD)

'05 TUNDRA_U (L/O 0409)

If “⊘” appears on the screen when you select a switch, it indicates that the switch cannot work.

To turn off the switches on the screen, push the “CURSOR” button on the controller once again or push the “Hide Keys” on the screen.

—DVD player operation (DVD video/DVD audio)

NOTE: The playback condition of some DVD video discs may be determined by a DVD video software producer. This DVD player plays a disc as the software producer intended. So, some functions may not work properly. Be sure to read the instruction manual for the DVD video disc separately provided. For detailed information about DVD video discs, see “—DVD video disc information” in this Section.

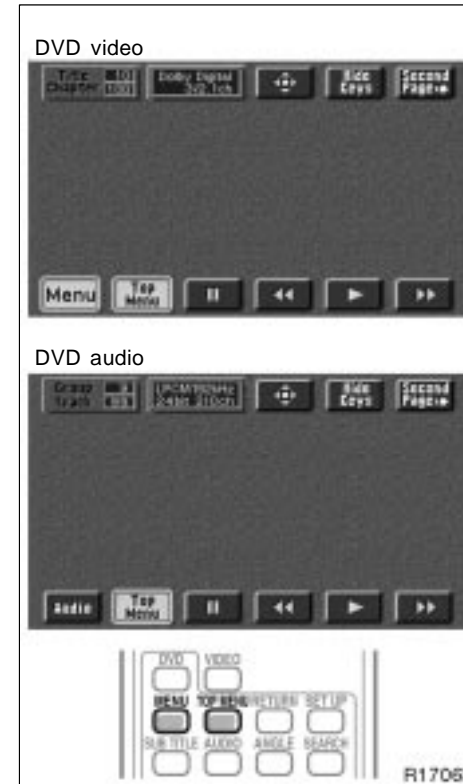

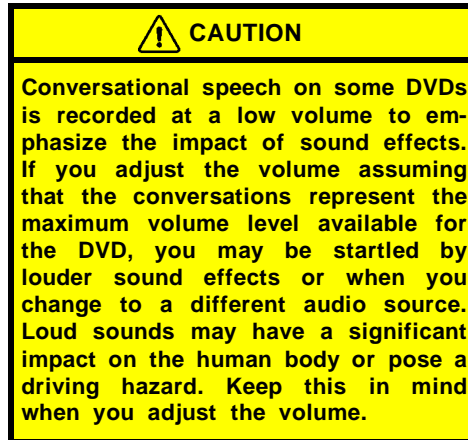

Precautions for DVD video discs

When recording on a DVD video, DVD audio, video CD or audio tracks may not record in some cases while the menu is displayed. As audio will not play in this case, verify that the video tracks are playing and then activate playback.

When playback of a disc is completed:

- ▼ If an audio CD is playing, the first track starts.
- ▼ If a DVD video, DVD audio or video CD is playing, playback will stop or the menu screen will be displayed.

The title/chapter number and playback time display may not appear while playing back certain DVD video discs.

'05 TUNDRA_U (L/O 0409)

TURNING THE MENU SCREEN FOR THE DISC ON OR OFF

DVD video—

To turn on the menu screen for the disc, push the "Top Menu" or the "Menu" switch on the screen. You can also turn on the menu screen by pushing the "MENU" or "TOP MENU" switch on the controller.

DVD audio—

To turn on the menu screen for the disc, push the "Top Menu" switch on the screen. You can also turn on the menu screen by pushing the "TOP MENU" switch on the controller.

For the operation of the menu screen, see the separate manual for the DVD disc.

To turn on the selecting switch, push the "SELECT" switch.

'05 TUNDRA_U (L/O 0409)

To select the menu for the disc, push the “◀”, “▲”, “▶” or “▼” switches on the screen. Push the “Enter” switch to select the menu for the disc.

You can also select the menu for the disc by the joy stick and the “ENT” button on the controller when the control switches are not indicated on the screen.

Push the “Shift Keys” on the screen, and the switches (“◀”, “▲”, “▶”, “▼”, “Enter” and “Shift Keys” switches) will move up and down.

To turn off the switch, push the “OFF” switch on the screen. To turn on the switch again, push the “ON” switch on the screen.

To return to the previous screen, push the “Back” switch on the screen.

OPERATING THE “II”, “▶”, “◀◀” AND “▶▶” SWITCHES/BUTTONS

“II” switch/button: Push this switch/button to pause the disc.

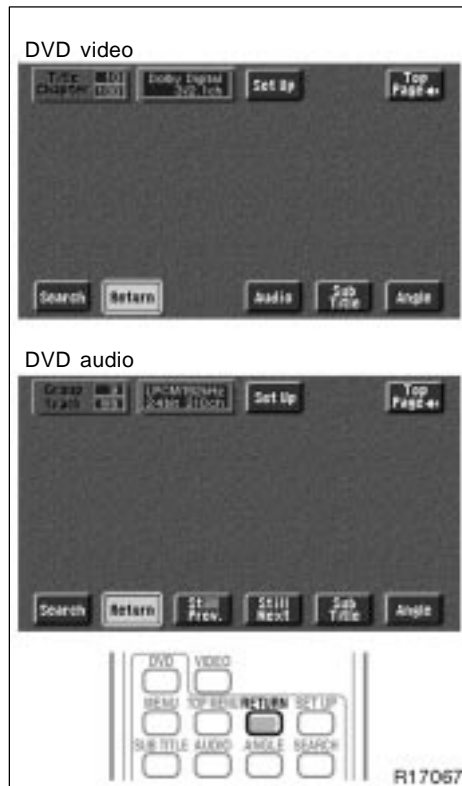

“▶” switch/button: Push this switch/button to cancel the pause and return to normal playing.

“◀◀” and “▶▶” switches/buttons: Push and hold the “◀◀” or “▶▶” switch/button to fast forward or reverse. When you release the switch/button, the DVD player will resume playing.

DVD video only—

Push the “◀◀” or “▶▶” switch/button while pausing, the DVD video plays the slow-motion video replay or the slow-motion video replay in reverse.

'05 TUNDRA_U (L/O 0409)

SKIPPING TO THE PREDETERMINED SCREEN

To skip to the predetermined screen, push the "Return" switch. The DVD player starts playing from the beginning of the predetermined screen. You can also display the screen by pushing the "RETURN" button on the controller.

For further details of the predetermined screen, see the separate manual for the DVD disc.

'05 TUNDRA_U (L/O 0409)

SELECTING THE TITLE/GROUP

To display the searching title (DVD video) or group (DVD audio) screen, push the "Search" switch on the screen. You can also display the screen by pushing the "SEARCH" button on the controller.

DVD video

DVD audio

DVD video—

Select the title number by using the "-", "+" and "+10" switches and push the "Enter" switch to enter the number. The player starts playing disc for that title number. The selected title number will appear on the screen.

Push the "Back" switch to return to the menu screen.

DVD audio—

Enter the group number by using the "-" and "+" switches. The selected group number will appear on the screen. Push the "Enter" switch. The player starts playing the disc from the entered group number.

Push the "Back" switch to return to the previous screen.

'05 TUNDRA_U (L/O 0409)

SELECTING THE BONUS GROUP

DVD audio only—

Enter the bonus group number on the searching group screen and push the “Enter” switch. The “Enter Key Code” screen will appear. To enter the number of the group you want to play, push the group number. If you enter the wrong number, push the “Clear” switch to delete the number.

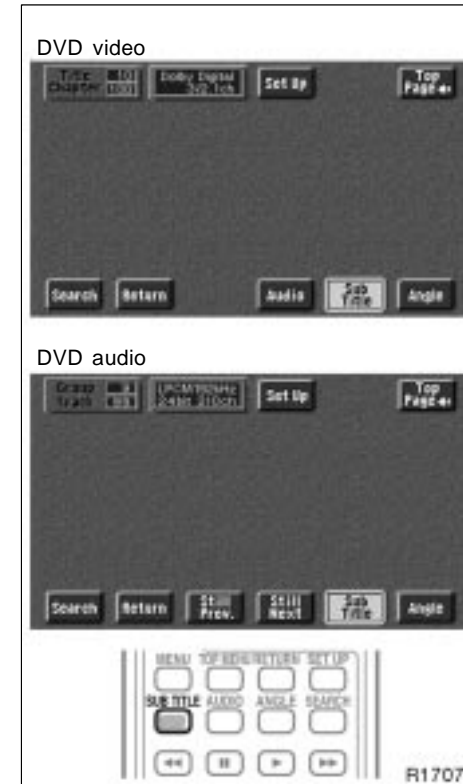

Push the “Enter” switch on the screen. The player starts playing the disc from the selected bonus group number.

CHANGING THE STILL PICTURE

DVD audio only—

Push the “Still Prev.” or “Still Next” switch on the screen to forward or reverse the still pictures.

'05 TUNDRA_U (L/O 0409)

CHANGING THE SUBTITLE LANGUAGE

Push the "Sub Title" switch on the screen, and then the changing subtitle language screen will appear. You can also display the screen by pushing the "SUB TITLE" button on the controller.

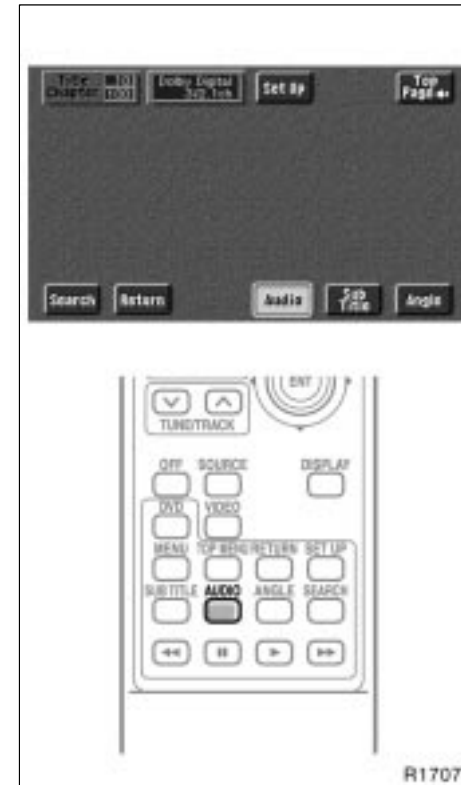

Each time you push the "Sub Title" switch, another language stored on the disc is selected.

To turn off the subtitles, push the "Hide" switch.

Push the "Back" switch to return to the previous screen.

The selected subtitle language will appear on the screen.

'05 TUNDRA_U (L/O 0409)

CHANGING AUDIO LANGUAGE (DVD video only)

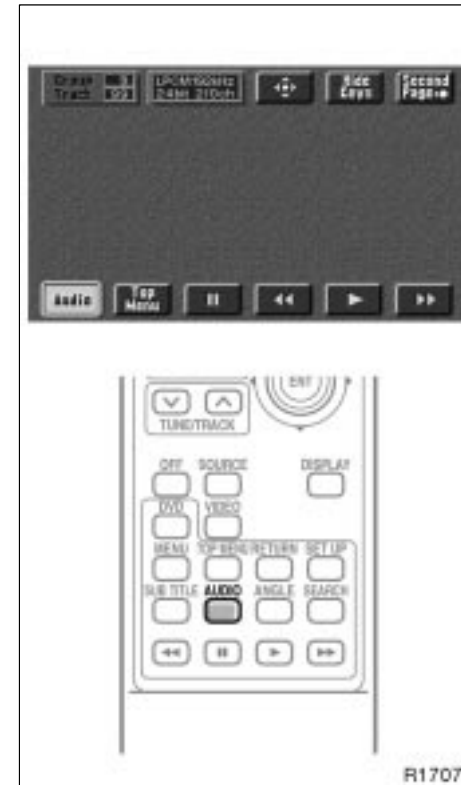

Push the "Audio" switch on the screen and then the changing audio language screen will appear. You can also display the screen by pushing the "AUDIO" button on the controller.

Each time you push the "Audio" switch, another language stored on the disc is selected.

The selected audio language will appear on the screen.

Push the "Back" switch to return to the previous screen.

'05 TUNDRA_U (L/O 0409)

CHANGING AUDIO FORMAT (DVD audio only)

Push the "Audio" switch on the screen or the "AUDIO" button on the controller and the changing audio format screen will appear.

Each time you touch the "Audio" switch, another audio format stored on the disc is selected.

Push the "Back" switch to return to the previous screen.

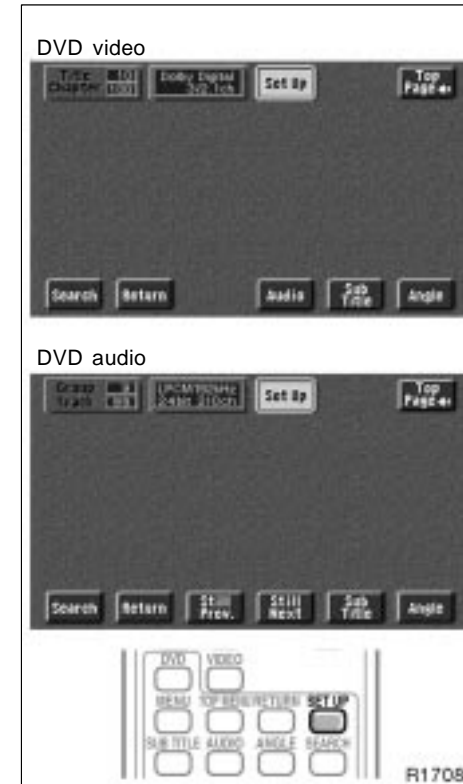

'05 TUNDRA_U (L/O 0409)

CHANGING ANGLE SCREEN

Push the "Angle" switch on the screen, and then the changing angle screen will appear. You can also display the screen by pushing the "ANGLE" button on the controller.

The angle can be selected for discs that are multi-angle compatible when the "📹" mark appears on the screen. Each time you push the "Angle" switch, the angle changes. The angle number which you can select will appear on the screen. Push the "Back" switch to return to the previous screen.

'05 TUNDRA_U (L/O 0409)

CHANGING THE INITIAL SETTING

Push the "Set Up" switch on the screen, and then the initial setting screen will appear. You can also display the screen by pushing the "SET UP" button on the controller. You can change the initial setting.

After the setting is done, the player plays from the beginning of the chapter or the track.

Setup Menu 1 screen

Setup Menu 2 screen

There are initial setting switches on the "Setup Menu 1" and "Setup Menu 2" screens.

To change the screen, push the "Top Page" or "Second Page" switch on the screen.

After you change the initial setting, push the "Enter" switch. The initial setting switch will be turned off and return to the picture previously.

When the "Initial Setting" switch on "Setup Menu 2" is pushed, all menus are initialized.

'05 TUNDRA_U (L/O 0409)

CHANGING THE AUDIO LANGUAGE

Push the "Audio Lang." switch on the "Setup Menu 1" and the "Select Audio Language" screen appear.

Select the language you want to hear on the screen.

To return to the "Setup Menu 1" screen, push the "Back" switch.

If you cannot find a language you want to hear, push the "Others" switch. The "Enter Audio Lang. Code" screen will appear.

To enter the code of the language you want to hear, push the number of the language code. For details about the language codes, see the language code list. If you enter a wrong number, push the "Clear" switch to delete the number.

If numbers which are not on the list are entered and the "Enter" switch is pushed, the "Incorrect Code" screen will appear. Push the language code you want to hear again.

To return to the "Select Audio Language" screen, push the "Back" switch.

CHANGING THE SUBTITLE LANGUAGE

To display the "Select Subtitle Lang.", push the "Subtitle Lang." switch on the "Setup Menu 1" screen.

Select the language you want to read on the screen.

To return to the "Setup Menu 1" screen, push the "Back" switch.

If you cannot find a language you want to read, push the "Others" switch. The "Enter Subtitle Lang. Code" screen will appear.

To enter the code of the language you want to read, push the number of the language code. For details about the language codes, see the language code list. If you enter a wrong number, push the "Clear" switch to delete the number.

Push the "Enter" switch on the screen. If numbers which are not on the list are entered and the "Enter" switch is pushed, the "Incorrect code" screen will appear. Push the language code you want to read again.

To return to the "Select Subtitle Lang." screen, push the "Back" switch on the screen.

CHANGING THE DVD LANGUAGE

To display the "Select DVD Language" screen, push the "DVD Language" switch on the "Setup Menu 1" screen.

Select the language you want to read on the screen.

To return to the "Setup Menu 1" screen, push the "Back" switch.

If you cannot find a language you want to read, push the "Others" switch. The "Enter DVD Language Code" screen will appear.

To enter the code of the language you want to read, push the number of the language code. For details about the language codes, see the language code list. If you enter a wrong number, push the "Clear" switch to delete the number.

Push the "Enter" switch on the screen. If numbers which are not on the list are entered and the "Enter" switch is pushed, the "Incorrect code" screen will appear. Push the language code you want to read again.

To return to the "Select DVD Language" screen, push the "Back" switch on the screen.

'05 TUNDRA_U (L/O 0409)

TURNING THE ANGLE MARK ON OR OFF

The angle mark can be turned on for discs that are multi-angle compatible.

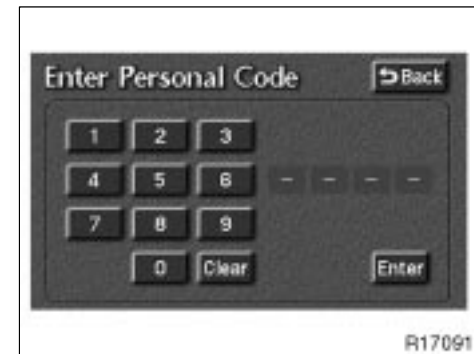

Each time you push the "Angle Mark" switch on the screen, the angle mark turns on or off alternately.

SETTING LEVEL OF VIEWER RESTRICTIONS

You can restrict the play back screen by setting the viewer restrictions. You can prevent the restriction with a password. Some discs do not supply a restriction.

To set the level of viewer restriction, push the "Parental" switch on the "Setup Menu 1" screen. The "Enter Personal Code" screen will appear.

Push the number for the password and the "Enter" switch. The "Select Restriction Level" screen will appear.

If you enter a wrong number, push the "Clear" switch to delete the number.

You cannot change the setting without inputting the password. When you forget or change the password, push the "Clear" switch ten times to initialize the password.

To return to the "Setup Menu 1" screen, push the "Back" switch.

'05 TUNDRA_U (L/O 0409)

Push a parental level (1—8). The smaller the level number, the stricter the age limit. Push the “Back” switch to return to the “Setup Menu 1” screen.

SETTING THE DISPLAY MODE

Each time you push the “Display Mode” switch on the “Setup Menu 2” screen, the display mode is changed from wide mode to auto mode.

SELECTING THE CHAPTER/TRACK

To select the chapter/track, push the “V” or “^” (TUNE/TRACK) button on the controller until the number of the chapter/track you want to select appears on the screen.

DVD video

DVD audio

USING THE CONTROL SCREEN

When playing a disc, push the “DVD” button on the controller. The control screen will appear on the screen.

Details of the specific switches, controls and features are described below.

1. “PICTURE” switch

Push the “PICTURE” switch to turn off the control screen and return to the picture previously displayed.

2. “RPT” switch (DVD audio only)

Push the “RPT” switch while the track is playing. When the track ends, it will automatically replay. To turn off the repeat feature, push this switch again.

3. “RAND” switch (DVD audio only)

Push the “RAND” switch. The player will play the tracks on the disc in random order. To turn off the random feature, push this switch again.

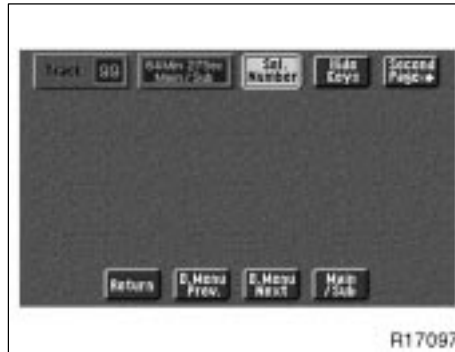

4. “SCAN” switch (DVD audio only)

Push the “SCAN” switch. The player will scan all the tracks on the disc you are listening to. To stop scanning, push this switch again. If the player scanned all the tracks on the disc, it will stop scanning.

—DVD player operation (video CD/audio CD/CD text)

5. “▲” and “▼” switches

Push and hold the “▲” or “▼” switch to fast forward or reverse a disc. When you release the switch, the DVD player will resume playing.

SELECTING THE DISC MENU NUMBER (video CD only)

Push the “Sel. Number” switch and then the disc menu number search screen will appear. You can also display the screen by pushing the “SEARCH” switch on the controller.

Enter the disc menu number by using the “-”, “+” and “+10” switches and push the “Enter” switch. The player starts playing the disc from the entered disc menu number. The entered disc menu number will appear on the screen.

Push the “Back” switch to return to the menu screen.

Move up and down the switches by pushing “Shift keys” on the screen.

'05 TUNDRA_U (L/O 0409)

OPERATING THE “||”, “▶”, “◀◀” AND “▶▶” SWITCHES

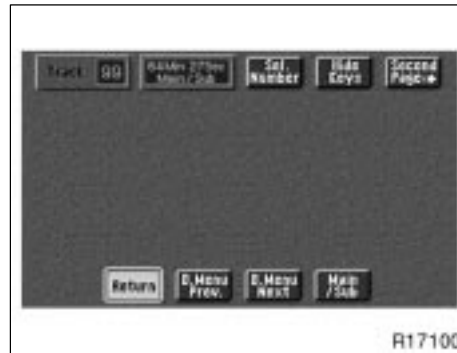

“||” switch: Push this switch to pause the disc.

“▶” switch: Push this switch to cancel the pause and return to normal playing.

“◀◀” and “▶▶” switches: Push this switch to fast forward or reverse. When you release the switch/button, the DVD player will resume playing.

Video CD only—

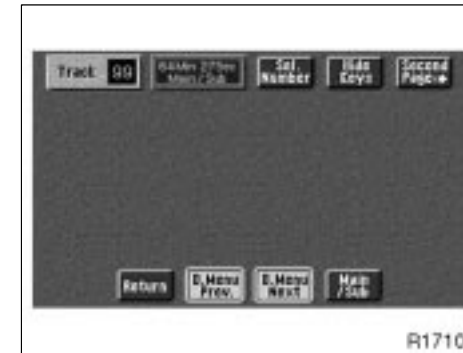

Push the “▶▶” switch/button while pausing, the video CD plays the slow-motion video replay.

TURNING ON THE DISC MENU (video CD only)

Push the “Return” switch to turn on the menu screen for the disc. You can also turn on the menu screen by pushing the “RETURN” button on the controller.

For the operation of the menu screen, see the manual for the video CD.

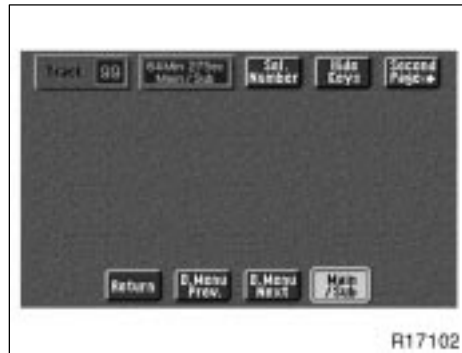

CHANGING MENU PAGE OR TRACK (video CD only)

Push the “D. Menu Next” or “D. Menu Prev.” switch while the disc menu is displayed. The next or previous page will appear on the screen.

Push the “D. Menu Next” or “D. Menu Prev.” switch while the player is playing video. The next or previous track will be searched and played.

'05 TUNDRA_U (L/O 0409)

CHANGING A MULTIPLEX TRANSMISSION (video CD only)

Push the "Main/Sub" switch to change a multiplex transmission. The mode changes from Main/Sub to Main to Sub and back to Main/Sub by pushing the "Main/Sub" switch.

CHANGING THE INITIAL SETTING (video CD only)

Push the "Set Up" switch on the screen and then the initial setting screen will appear. You can also display the screen by pushing the "SET UP" button on the controller. You can change the initial setting. (See "CHANGING THE INITIAL SETTING" in this Section for details.)

After the setting is done, the player plays from the beginning of the chapter or the track.

Video CD

Audio CD

CD text

USING THE CONTROL SCREEN

When playing a disc, push the "DVD" button on the controller. The control screen will appear on the screen.

CD text only—

The disc title and track title will appear on the screen when pushing the "DVD" button.

Details of the specific switches, controls and features are described below.

1. "PICTURE" switch (video CD only)
Push the "PICTURE" switch to turn off the control screen and return to the picture previously displayed.
2. "RPT" switch (audio CD and CD text)
Push the "RPT" switch while the track is playing. When the track ends, it will automatically replay. To turn off the repeat feature, push this switch again.
3. "RAND" switch (audio CD and CD text)
Push the "RAND" switch. The player will play the tracks on the disc in random order. To turn off the random feature, push this switch again.
4. "SCAN" switch (audio CD and CD text)
Push the "SCAN" switch. The player will scan all the tracks on the disc. To stop scanning, push this switch again. When the player has scanned all the tracks on the disc, it will stop scanning.
5. "▲" and "▼" switches
Push the "▲" or "▼" switch to fast forward or reverse the disc. When you push the switch again, the DVD player will resume playing.

—Screen adjustment

You can adjust the color, contrast, tone and brightness of the screen.

Push the "DISPLAY" switch on the controller and then the "Display" screen will appear.

The screen may turn purple to deflect the sunlight. This is not a malfunction.

'05 TUNDRA_U (L/O 0409)

After adjusting the screen, push the “OK” switch to return to the previous screen.

Each time you push the “+” or “-” switch, you can adjust the color, contrast, tone and brightness of the screen.

	+ or GREEN	- or RED
COLOR	Strengthens the green color	Strengthens the red color
CONTRAST	Strengthens the contrast	Weakens the contrast
TONE	Strengthens the tone	Weakens the tone
BRIGHTNESS	Brightens	Darkens

—Selecting the video mode

—DVD video disc information

The audio machine connected to the input terminal adapter can be played in the video mode.

To select the video mode, push the "VIDEO" button on the controller. You can also select the video mode on the mode selection screen mentioned above.

DVD PLAYER AND DVD VIDEO DISCS

This DVD player conforms to NTSC color TV formats. DVD video discs conforming to other formats such as PAL or SECAM cannot be used.

Region codes: Some DVD video discs have a region code indicating where you can use. If the DVD video disc is not labeled "ALL" or "1", you cannot use it in this DVD player. If you attempt to play an inappropriate DVD video disc in this player, "REGION CODE ERROR" appears on the screen. Even if the DVD video disc does not have a region code, in some cases you cannot use it.

Marks shown on DVD video discs:

	Indicates NTSC format of color TV.
	Indicates the number of audio tracks.
	Indicates the number of language subtitles.
	Indicates the number of angles.
	Indicates the screen to be selected. Wide screen: 16:9 Standard: 4:3
	Indicates regions in which this video disc can be played. ALL: all countries Number: region code

DVD VIDEO DISC GLOSSARY

DVD video discs: Digital Versatile Disc that holds video. DVD video discs have adopted "MPEG2", one of the world standards of digital compression technologies. The picture data is compressed by 1/40 on average and stored. Variable rate encoded technology in which the volume of data assigned to the picture is changed depending on the picture format has also been adopted. Audio data is stored using PCM and Dolby digital, which enables higher quality of sound. Furthermore, multi-angle and multi-language features will also help you enjoy the more advanced technology of DVD video.

Viewer restrictions: This feature limits what can be viewed in conformity with the level of restrictions of the country. The level of restrictions varies depending on the DVD video disc. Some DVD video discs cannot be played at all, or violent scenes are skipped or replaced with other scenes.

Level 1: DVD video discs for children can be played.

Level 2—7: DVD video discs for children and G-rated movies can be played.

Level 8: All types of DVD video discs can be played.

Multi-angle feature: You can enjoy the same scene at different angles.

Multi-language feature: You can select the language of the subtitles and audio.

Region codes: Region codes are provided on DVD players and DVD discs. If the DVD video disc does not have the same region code as the DVD player, you cannot play the disc on the DVD player. For region codes.

Audio: This DVD player can play liner PCM, Dolby digital, dts and MPEG audio format DVD. Other decoded type cannot be played.

Title and chapter: Video and audio programs stored on DVD video discs are divided in parts by title and chapter.

Title: The largest unit of the video and audio programs stored on DVD video discs. Usually, one piece of a movie, one album, or one audio program is assigned as a title.

Chapter: A unit smaller than a title. A title comprises plural chapters.

—Input terminal adapter

The rear entertainment system plays videos and sound when your audio system is connected to the input terminal adapter on the rear console box. For details, refer to the manufacturer's instructions.

To use the input terminal adapter, open the lid.

The input terminal adapter is composed of 3 input terminal adapters.

Yellow: Image input adapter

Red: Audio input adapter

White: Audio input adapter

NOTICE

Close the input terminal adapter lid when the input terminal adapter is not in use. Inserting anything other than an appropriate plug that fits the adapter may cause electrical failure or short circuit.

—Power outlet

This power outlet is designed for use as a power supply for the audio device connected to the input terminal adapter.

The key must be in the "ON" position for the power outlet to be used.

The maximum capacity for this power outlet is 115 VAC/100W. If you attempt to use an appliance that requires more than 115 VAC or 100W, the protection circuit will activate and cut the power supply. The power supply will restart automatically when you use an appliance that operates within the 115 VAC/100W limits.

Main switch

To use the power outlet, push the main switch on the instrument panel.

An indicator light will illuminate to indicate that the power outlet is ready for use.

Push the main switch once again to turn the power outlet off. When the power outlet is not in use, make sure that the main switch is turned off.

NOTICE

- ◆ To prevent the battery from being discharged, do not use the power outlet longer than necessary when the engine is not running.
- ◆ Close the power outlet lid when the power outlet is not in use. Inserting anything other than an appropriate plug that fits the outlet may cause electrical failure or short circuit.

The power outlet is not designed for the following electric appliances even if their power consumption is under 115 VAC/100W. These appliances may not operate properly.

- ▼ Appliances with high initial peak wattage: cathode-ray tube type televisions, compressor-driven refrigerators, electric pumps, electric tools, etc.
- ▼ Measuring devices which process precise data: medical equipment, measuring instruments, etc.
- ▼ Other appliances requiring an extremely stable power supply: microcomputer-controlled electric blankets, touch sensor lamps, etc.

Certain electrical appliances may cause radio noise.

—Headphone input jacks

You can enjoy the rear seat entertainment system with commercial headphones.

To use the headphones, connect them to the jack.

The key must be in the "ACC" or "ON" position.

To adjust the volume of the headphones, turn the knob. Turn right to increase the volume. Turn left to decrease the volume.

The maximum volume depends on the type of headphones.

With some headphones generally available in the market, it may be difficult to catch sound properly. Toyota recommends the use of Toyota genuine headphone.

Please contact your Toyota dealer for further details.

CAUTION

Adjust the volume when you connect the headphones to the jack. Loud sounds may have a significant impact on the human body.

Audio/video system operating hints

NOTICE

To ensure correct audio/video system operations:

- ◆ *Be careful not to spill beverages over the audio system.*
- ◆ *Do not put anything other than a cassette tape or Compact Disc into the slot.*
- ◆ *Do not put anything other than a DVD video, DVD audio, video CD, dts-CD and audio CD into the DVD player.*
- ◆ *The use of a cellular phone inside or near the vehicle may cause a noise from the speakers of the audio system which you are listening to. However, this does not indicate a malfunction.*

RADIO RECEPTION

Usually, a problem with radio reception does not mean there is a problem with your radio—it is just the normal result of conditions outside the vehicle.

For example, nearby buildings and terrain can interfere with FM reception. Power lines or telephone wires can interfere with AM signals. And of course, radio signals have a limited range. The farther you are from a station, the weaker its signal will be. In addition, reception conditions change constantly as your vehicle moves.

Here are some common reception problems that probably do not indicate a problem with your radio:

FM

Fading and drifting stations—Generally, the effective range of FM is about 40 km (25 miles). Once outside this range, you may notice fading and drifting, which increase with the distance from the radio transmitter. They are often accompanied by distortion.

Multi-path—FM signals are reflective, making it possible for two signals to reach your antenna at the same time. If this happens, the signals will cancel each other out, causing a momentary flutter or loss of reception.

Static and fluttering—These occur when signals are blocked by buildings, trees, or other large objects. Increasing the bass level may reduce static and fluttering.

Station swapping—If the FM signal you are listening to is interrupted or weakened, and there is another strong station nearby on the FM band, your radio may tune in the second station until the original signal can be picked up again.

AM

Fading—AM broadcasts are reflected by the upper atmosphere—especially at night. These reflected signals can interfere with those received directly from the radio station, causing the radio station to sound alternately strong and weak.

Station interference—When a reflected signal and a signal received directly from a radio station are very nearly the same frequency, they can interfere with each other, making it difficult to hear the broadcast.

Static—AM is easily affected by external sources of electrical noise, such as high tension power lines, lightning, or electrical motors. This results in static.

CARING FOR YOUR CASSETTE PLAYER AND TAPES

For the best performance for your cassette player and tapes:

Clean the tape head and other parts regularly.

- ▼ A dirty tape head or tape path can decrease sound quality and tangle your cassette tapes. The easiest way to clean them is by using a cleaning tape. (A wet type is recommended.)

Use high-quality cassettes.

- ▼ Low-quality cassette tapes can cause many problems, including poor sound, inconsistent playing speed, and constant auto-reversing. They can also get stuck or tangled in the cassette player.
- ▼ Do not use a cassette if it has been damaged or tangled or if its label is peeling off.
- ▼ Do not leave a cassette in the player if you are not listening to it, especially if it is hot outside.
- ▼ Store cassettes in their cases and out of direct sunlight.
- ▼ Avoid using cassettes with a total playing time longer than 100 minutes (50 minutes per side). The tape used in these cassettes is thin and could get stuck or tangled in the cassette player.

CARING FOR YOUR COMPACT DISC PLAYER AND DISCS

- ▼ Type 2 and 3—Your compact disc player is intended for use with 12 cm (4.7 in.) discs only.
- ▼ Extremely high temperatures can keep your compact disc player from working. On hot days, use the air conditioning to cool the vehicle interior before you listen to a disc.
- ▼ Bumpy roads or other vibrations may cause your compact disc player to skip.
- ▼ If moisture gets into your compact disc player, you may not hear any sound even though your compact disc player appears to be working. Remove the disc from the player and wait until it dries.

 **CAUTION**

Compact disc players use an invisible laser beam which could cause hazardous radiation exposure if directed outside the unit. Be sure to operate the player correctly.

'05 TUNDRA_U (L/O 0409)

Compact disc player

▼Use only compact discs marked as shown above. The following products may not be playable on your compact disc player.

- Copy-protected CD
- CD-R (CD-Recordable)
- CD-RW (CD-Re-writable)
- CD-ROM

Audio CDs	 
DVD video discs	 
DVD audio discs

- DVD-RW
- DVD-ROM
- DVD-RAM

Special shaped discs

Low quality discs

Transparent/translucent discs

Labeled discs

NOTICE

Do not use special shaped, transparent/translucent, low quality or labeled discs such as those shown in the illustrations. The use of such discs may damage the player or changer, or it may be impossible to eject the disc.

'05 TUNDRA_U (L/O 0409)

▼ Handle compact discs carefully, especially when you are inserting them. Hold them on the edge and do not bend them. Avoid getting fingerprints on them, particularly on the shiny side.

▼ Dirt, scratches, warping, pin holes, or other disc damage could cause the player to skip or to repeat a section of a track. (To see a pin hole, hold the disc up to the light.)

▼ Remove discs from the compact disc player when you are not listening to them. Store them in their plastic cases away from moisture, heat, and direct sunlight.

To clean a compact disc: Wipe it with a soft, lint-free cloth that has been dampened with water. Wipe in a straight line from the center to the edge of the disc (not in circles). Dry it with another soft, lint-free cloth. Do not use a conventional record cleaner or anti-static device.

'05 TUNDRA_U (L/O 0409)

SECTION 1-9

OPERATION OF INSTRUMENTS AND CONTROLS

Air conditioning system

Controls	298
Air flow selector settings	301
Operating tips	303
Instrument panel and rear vents	305

'05 TUNDRA_U (L/O 0409)

Controls

1. Fan speed selector
2. Temperature selector
3. Air flow selector
4. "A/C" button (on some models)
5. Air intake selector button

'05 TUNDRA_U (L/O 0409)

Fan speed selector

Turn the knob to adjust the fan speed—to the right to increase, to the left to decrease.

Temperature selector

Turn the knob to adjust the temperature—to the right to warm, to the left to cool.

Air flow selector

Turn the knob to select the vents used for air flow.

- 1. Panel**—Air flows mainly from the instrument panel vents.
- 2. Bi-level**—Air flows from both the floor vents and the instrument panel vents.
- 3. Floor**—Air flows mainly from the floor vents.

It is recommended that you close the lower vent. For details about this, see “Instrument panel vents” in this Section.

- 4. Floor/Windshield**—Air flows mainly from the floor vents and windshield vents.

Turning the air flow selector to the floor/windshield position turns on the defogging function with the purpose of clearing the front view.

This position allows the air intake to select FRESH automatically. This is to clean up the front view more quickly. If you want to return the setting to RECIRCULATE mode, press the air intake selector button once again.

It is recommended that you close the lower vent. For details about this, see “Instrument panel and rear vents” in this Section.

Vehicles with “A/C” button—

Press the “A/C” button for dehumidified heating or cooling. This setting clears the front view more quickly.

5. Windshield—Air flows mainly from the windshield vents.

Turning the air flow selector to the windshield position turns on the defogging function with the purpose of clearing the front view.

In this position, air intake selector mode changes to FRESH automatically to clean up the front view quickly. It is not possible to return to RECIRCULATE in this position.

It is recommended that you close the lower vent. For details about this, see “Instrument panel vents” in this Section.

Vehicles with “A/C” button—

Press the “A/C” button for dehumidified heating or cooling. This setting clears the front view more quickly.

For details about air flow selector settings, see “Air flow selector settings” described below.

Air intake selector button

The air intake selector button is used to switch the air intake FRESH mode that draws outside air into the system and RECIRCULATED mode that recirculates the air inside vehicle.

To turn the air source to RECIRCULATED mode, press the button. The indicator will come on. To turn the air source to FRESH mode, press the button again. The indicator will go off.

To prevent fogging up of the windshield, the air intake mode may change automatically to FRESH depending on the condition of the air conditioning system.

“A/C” button (on some models)

To turn on the air conditioning, press the “A/C” button. The “A/C” button indicator will come on. To turn the air conditioning off, press the button again.

If the “A/C” button indicator flashes, there is a problem in the air conditioning system and the air conditioning automatically shuts off. If this happens, take your vehicle to a Toyota dealer for service.

Air flow selector settings

► Standard and access cab models without rear console box

⇒ : See "Instrument panel vents" in this Section.

'05 TUNDRA_U (L/O 0409)

► Standard and access cab models with rear console box

⇒ : See "Instrument panel vents" in this Section.

*: On some models

'05 TUNDRA_U (L/O 0409)

► Double cab models

⇒ : See "Instrument panel vents" in this Section.

Operating tips

- ◀ To cool off your Toyota after it has been parked in the hot sun, drive with the windows open for a few minutes. This vents the hot air, allowing the air conditioning to cool the interior more quickly.
- ◀ Make sure the air intake grilles in front of the windshield are not blocked (by leaves or snow, for example).
- ◀ On humid days, do not blow cold air on the windshield. The windshield could fog up because of the difference in air temperature on the inside and outside of the windshield.
- ◀ Keep the area under the front seats clear to allow air to circulate throughout the vehicle.
- ◀ On cold days, set the fan speed to high for a minute to help clear the intake ducts of snow or moisture. This can reduce the amount of fogging on the windows.
- ◀ When driving on dusty roads, close all windows. If dust thrown up by the vehicle is still drawn into the vehicle after closing the windows, it is recommended that the air intake selector be set to FRESH and the fan speed selector to any setting except "OFF".

'05 TUNDRA_U (L/O 0409)

◀ If following another vehicle on a dusty road, or driving in windy and dusty conditions, it is recommended that the air intake selector be temporarily set to RECIRCULATE, which will close off the outside passage and prevent outside air and dust from entering the vehicle interior.

Heating

For best results, set controls to:

Fan speed—Any setting except "OFF"
Temperature—Towards **WARM**
(red zone)
Air intake—**FRESH** (outside air)
Air flow—**FLOOR**
Lower vent—**CLOSED**
Air conditioning—**OFF**

◀ For quick heating, select recirculated air for a few minutes. To keep the windows from fogging, select fresh after the vehicle interior has been warmed.

◀ Press the "A/C" button on for dehumidified heating.

◀ Choose floor/windshield air flow to heat the vehicle interior while defrosting or defogging the windshield.

Air conditioning

For best results, set controls to:

Fan speed—Any setting except "OFF"
Temperature—Towards **COLD**
(blue zone)
Air intake—**FRESH** (outside air)
Air flow—**PANEL**
Air conditioning—**ON**

◀ For quick cooling, move the air intake selector to recirculate for a few minutes.

Ventilation

For best results, set controls to:

Fan speed—Any setting except "OFF"
Temperature—Towards **COLD**
(blue zone)
Air intake—**FRESH** (outside air)
Air flow—**PANEL**
Air conditioning—**OFF**

Defogging

The inside of the windshield

For best results, set controls to:

Fan speed—Any setting except "OFF"
Temperature—Towards **WARM** (red zone) to heat; **COLD**
(blue zone) to cool
Air intake—**FRESH** (outside air)
Air flow—**WINDSHIELD**
Lower vent—**CLOSED**

Turning the air flow selector to the windshield or floor/windshield position turns on the defogging function and fan speed may increase with the purpose of clearing the front view.

When turning the air flow selector to windshield position, the air intake selects FRESH automatically. This is to clean up the front view more quickly. It is not possible to return to RECIRCULATE in this position.

Vehicles with "A/C" button—

Press the "A/C" button for dehumidified heating or cooling. This setting clears the front view more quickly.

'05 TUNDRA_U (L/O 0409)

◀ On humid days, do not blow cold air on the windshield—the difference between the outside and inside temperatures could make the fogging worse.

Defrosting

The outside of the windshield

For best results, set controls to:

Fan speed—Any setting except “OFF”
Temperature—Towards **WARM**
(red zone)
Air intake—**FRESH** (outside air)
Air flow—**WINDSHIELD**
Lower vent—**CLOSED**

Turning the air flow selector to the windshield or floor/windshield position turns on the defrosting function and fan speed may with the purpose of clearing the front view.

When turning the air flow selector to windshield position, the air intake selects FRESH automatically. This is to clean up the front view more quickly. It is not possible to return to RECIRCULATE in this position.

Vehicles with “A/C” button—

Press the “A/C” button for dehumidified heating or cooling. This setting clears the front view more quickly.

◀ To heat the vehicle interior while defrosting the windshield, choose floor/windshield air flow.

Instrument panel and rear vents

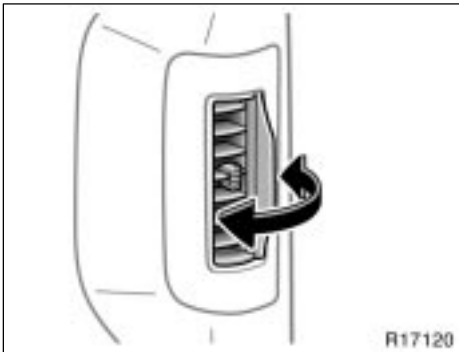

Side vents

Lower vent

'05 TUNDRA_U (L/O 0409)

Rear vents (double cab models only)

If air flow control is not satisfactory, check the instrument panel and rear vents. The instrument panel and rear vents may be opened or closed as shown.

For removing frost or fog, it is recommended that you close the lower vent when using the "Floor", "Floor/Windshield" or "Windshield" mode.

SECTION 1- 10

OPERATION OF INSTRUMENTS AND CONTROLS

Other equipment

Multi- information display	308
Clock	318
Cigarette lighter and ashtrays	318
Power outlets (12 VDC)	319
Power outlet (115 VAC)	320
Glove box	322
Garage door opener box	322
Auxiliary boxes	325
Rear console box	327
Coin holder	329
Compact disc and cassette tape holder	332
Cassette tape holder	333
Cup holders	334
Note pad holder	336
Grocery bag/cargo net hooks	336
Floor mat	337

'05 TUNDRA_U (L/O 0409)

Multi-information display—

—Before using the multi-information display

Operate the multi-information display with the ignition switch on.

When the ignition switch is turned to "ON", the last previously used mode displayed just before the ignition switch is turned off will appear.

When the instrument panel lights are turned on, the brightness of the display will be reduced.

"E/M" button

This button is used to switch between English/U.S. Customary System and metric units of the outside temperature display.

Each time you push this button, the display switches. This is also linked to the multi-information display. The display variations are as follows;

Indication	Outside temperature
English/U.S. Customary System (E)	°F
Metric (M)	°C

The initial mode will be English/U.S. Customary System units, however, if the unit is switched to metric and the ignition switch is off, it will display metric units when the ignition switch is turned to "ON".

"MODE" button

This button is used to select the item.

Every time you push the "MODE" button, the display toggles.

For more details, see "—Outside temperature display" in this Section.

Do not adjust the display while the vehicle is moving. Be sure to adjust the display only when the vehicle is stopped.

—Garage door opener

The garage door opener (**HomeLink** Universal Transceiver) is manufactured under license from HomeLink and can be programmed to operate garage doors, gates, entry doors, door locks, home lighting systems, and security systems, etc.

(a) Programming the HomeLink

The HomeLink in your vehicle has 3 buttons and you can store one program for each button.

To ensure correct programming into the HomeLink, install a new battery in the hand-held transmitter prior to programming.

The battery side of the hand-held transmitter must be pointed away from the HomeLink during the programming process.

For Canadian users, follow the procedure in "Programming an entrance gate/programming all devices in the Canadian market".

1. Decide which of 3 HomeLink buttons you want to program. Push and hold down one of the buttons until the indicator corresponding to the selected channel begins to flash.

2. Place your hand-held garage transmitter 25 to 75 mm (1 to 3 in.) away from the surface of the HomeLink.

Keep the indicator light on the HomeLink in view while programming.

3. Simultaneously press and hold the hand-held garage transmitter button along with the selected HomeLink button.

4. When the indicator light on the HomeLink changes from a slow to a rapid flash after 20 seconds, you can release both buttons.

5. Test the operation of the HomeLink by pressing the newly programmed button. If programming a garage door opener, check to see if the garage door opens and closes.

If the garage door does not operate, identify if your garage transmitter is of the "Rolling Code" type. Press and hold the programmed HomeLink button. The garage door has the rolling code feature if the indicator light (on the HomeLink) flashes rapidly and then remains lit after 2 seconds. If your garage transmitter is the "Rolling Code" type, proceed to the heading "Programming a rolling code system".

'05 TUNDRA_U (L/O 0409)

6. Repeat steps 2 through 5 for each remaining HomeLink▼ button to program another device.

Programming a rolling code system

If your device is “Rolling Code” equipped, it is necessary to follow steps 1 through 4 under the heading “Programming the HomeLink▼” before proceeding with the steps listed below.

1. Locate the “training” button on the ceiling mounted garage door opener motor. The exact location and color of the button may vary by brand of garage door opener. Refer to the owner’s guide supplied by the garage door opener manufacturer for the location of this “training” button.
2. Press the “training” button on the ceiling mounted garage door opener motor.

Following this step, you have 30 seconds in which to initiate step 3 below.

3. Press and release the vehicle’s programmed HomeLink▼ button twice. The garage door may open. If the door does open, the programming process is complete. If the door does not open, press and release the button a third time. This third press and release will complete the programming process by opening the garage door.

The ceiling mounted garage door opener motor should now recognize the HomeLink▼ unit and be able activate the garage door up/down.

4. Repeat steps 1 through 3 for each remaining HomeLink▼ button to program another rolling code system.

Programming an entrance gate/programming all devices in the Canadian market

1. Decide which of the 3 HomeLink▼ buttons you want to program.
2. Place your hand-held gate/device transmitter 25 to 75 mm (1 to 3 in.) away from the surface of the HomeLink▼.

Keep the indicator light on the HomeLink▼ in view while programming.

3. Press and hold the selected HomeLink▼ button.

4. Continuously press and release (cycle) the hand-held gate/device transmitter button every two seconds until step 5 is complete.
5. When the indicator light on the HomeLink▼ changes from a slow to a rapid flash after 20 seconds, you can release both buttons.
6. Test the operation of the HomeLink▼ by pressing the newly programmed button. Check to see if the gate/device operates correctly.
7. Repeat steps 1 through 6 for each remaining HomeLink▼ button to program another device.

Programming other devices

To program other devices such as home security systems, home door locks or lighting, contact your authorized Toyota dealer for assistance.

Reprogramming a button

Individual HomeLink▼ buttons cannot be erased, however, to reprogram a single button, follow the procedure “Programming the HomeLink▼”.

(b) Operating the HomeLink▼

To operate the HomeLink▼, press the appropriate HomeLink▼ button to activate the programmed device. The HomeLink▼ indicator light should come on. The HomeLink▼ continues to send the signal for up to 20 seconds as long as the button is pressed.

(c) Erasing the entire HomeLink▼ memory (all three programs)

To erase all previously programmed codes at one time, press and hold down the 2 outside buttons for 20 seconds until the indicator light flashes.

If you sell your vehicle, be sure to erase the programs stored in the HomeLink▼ memory.

 **CAUTION**

◀ **When programming the HomeLink▼ Universal Transceiver, you may be operating a garage door or other device. Make sure people and objects are out of the way of the garage door or other device to prevent potential harm or damage.**

◀ **Do not use this HomeLink▼ Universal Transceiver with any garage door opener that lacks the safety stop and reverse feature as required by federal safety standards. (This includes any garage door opener model manufactured before April 1, 1982.) A garage door opener which cannot detect an object (signaling the door to stop and reverse), does not meet current federal safety standards. Using a garage door opener without these features increases risk of serious injury or death.**

This device complies with Part 15 of the FCC Rules and with RSS-210 of the IC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

WARNING: This transmitter has been tested and complies with FCC and IC rules. Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the device.

—Outside temperature display

The outside temperature display indicates the outside air temperature.

Every time you push the "MODE" button, the display toggles through the following information. To use the outside temperature display, push the "MODE" button until the outside air temperature is displayed.

1. Compass and outside temperature
2. Display off (no compass)
3. Compass
4. Outside temperature

To set the unit, push the "E/M" button until the desired unit display appears.

The displayed value is updated every 2 second.

The displayed temperature ranges from -30°C (-22°F) up to 50°C (122°F).

If an abnormality exists in the connection of the outside air temperature sensor, "-- °C" ("-- °F") will appear on the display. If "-- °C" ("-- °F") appears on the display, contact your Toyota dealer.

There may be a case that "-- °C" ("-- °F") appears momentarily when the ignition is quickly turned to "ON". It is normal if it goes out soon.

—Compass

The compass indicates the direction that the vehicle is heading. In the above case, it shows that the vehicle is heading south.

The direction display is updated every 2 seconds.

Displays	Directions
N	North
NE	Northeast
E	East
SE	Southeast
S	South
SW	Southwest
W	West
NW	Northwest

'05 TUNDRA_U (L/O 0409)

The compass may not show the correct direction in the following conditions:

◀ The vehicle is stopped immediately after turning.

The compass does not adjust while the vehicle is stopped.

◀ The ignition switch is turned off immediately after turning.

◀ The vehicle is on an inclined surface.

◀ The vehicle is in a place where the earth's magnetic field is subject to interference by artificial magnetic fields (underground parking, under a steel tower, between buildings, roof parking, near a crossing, near a large vehicle, etc.).

◀ The vehicle is magnetized. (There is a magnet or a metal object on or near the roof.)

◀ The battery has been disconnected.

The compass works to calibrate the direction automatically while the vehicle is in motion, if deviation is small.

For additional precision or for complete calibrating, see "CALIBRATING THE COMPASS" below.

If the direction is not indicated or the system does not operate properly, contact your Toyota dealer.

Compass sensor

The compass sensor is on the inside of the roof.

NOTICE

Do not put magnets or a metal object on or near the roof of the vehicle. Doing this may cause malfunction of the compass sensor.

CALIBRATING THE COMPASS (deviation calibration)

The direction display on the compass deviates from the true direction determined by the earth's magnetic field. The angle of deviation varies according to the geographic position of the vehicle.

To adjust for this deviation;

1. Stop the vehicle in a level place and switch the display to the outside temperature. (To switch to this mode, see "—Outside temperature display" in this Section.)
2. Push and hold both the "MODE" and "E/M" buttons simultaneously for 5 seconds until the "VAR" indication appears on the compass display.
3. Push the "E/M" button several times until the desired zone number appears on the compass display.

If the button is not pushed for 10 seconds, the display returns to the compass/outside temperature mode and the number that is last set is memorized.

To select the zone where the vehicle is currently located, refer to the following map.

'05 TUNDRA_U (L/O 0409)

Zone numbers

316

After calibration, leaving the system for several seconds returns to the compass mode.

⚠ CAUTION

Do not adjust the display while the vehicle is moving. Be sure to adjust the display only when the vehicle is stopped.

'05 TUNDRA_U (L/O 0409)

CALIBRATING THE COMPASS (circling calibration)

Sometimes the direction display on the compass may not change after a turn. In this case, the compass needs to be calibrated.

To calibrate the compass manually, do the following;

1. Stop the vehicle in a level place and switch the display to the outside temperature. (To switch to this mode, see “—Outside temperature display” in this Section.)

2. Push and hold both the “MODE” and “E/M” buttons simultaneously for 10 seconds until the “CAL” indication appears on the compass display. (At this time, the compass display is locked in “N”.)

3. Drive the vehicle in a circle at 8 km/h (5 mph) or less. If there is not enough space to drive in a circle, drive around the block.

When the “CAL” indication goes off and the compass returns to the normal mode, calibration is complete.

If you want to restart the calibration before it is complete, push both of the “MODE” and “E/M” buttons simultaneously for 10 seconds again.

Perform circling calibration just after you have purchased your Toyota. And then always perform circling calibration after the battery has been removed, replaced or disconnected.

◀ Do not perform circling calibration of the compass in a place where the earth's magnetic field is subject to interference by artificial magnetic fields (underground parking, under a steel tower, between buildings, roof parking, near a crossing, near a large vehicle, etc.).

◀ During calibration, do not operate electric systems (moon roof, power windows, etc.) as they may interfere with the calibration.

⚠ CAUTION

◀ When doing the circling calibration, be sure to secure a wide space, and watch out for people and vehicles in the neighborhood. Do not violate any local traffic rules while performing circling calibration.

◀ Do not adjust the display while the vehicle is moving. Be sure to adjust the display only when the vehicle is stopped.

Clock

To reset the hour: Push the "H" button.
To reset the minutes: Push the "M" button.
The key must be in the "ACC" or "ON" position.

If the electrical power source has been disconnected from the clock, the time display will automatically be set to 1:00 (one o'clock).

When the instrument panel lights are turned on, the brightness of the time indication will be reduced.

Cigarette lighter and ashtrays

Cigarette lighter and front ashtray

Rear ashtray

CIGARETTE LIGHTER

To use the cigarette lighter, press it in. After it finishes heating up, it automatically pops out ready for use.

Do not hold the cigarette lighter pressed in.

Use a Toyota genuine cigarette lighter or equivalent for replacement.

ASHTRAYS

Front: To use the ashtray, pull it out.

Rear: To use the ashtray, raise the lid.

When finished with your cigarette, thoroughly extinguish it in the ashtray to prevent other cigarette butts from catching fire. After using the ashtray, push it back in completely.

Front—To remove the ashtray, press down on the lock spring plate and pull out.

Rear—To remove the ashtray, pull it out.

⚠ CAUTION

To reduce the chance of injury in case of an accident or sudden stop while driving, always completely close the ashtray after use.

Power outlets (12 VDC)

Type A

Type C

Type B

Type D

Type E

The power outlets (12 VDC) are designed for power supply for car accessories.

NOTICE

- ◆ *To prevent the fuse from being blown, do not use the electricity over the total vehicle capacity of 12V/120W.*
- ◆ *To prevent the battery from being discharged, do not use the power outlets longer than necessary when the engine is not running.*
- ◆ *Close the power outlet lids when the power outlets are not in use. Inserting anything other than an appropriate plug that fits the outlet, or allowing any liquid to get into the outlet may cause electrical failure or short circuits.*

Power outlet (115 VAC)

This power outlet (115 VAC) is designed for use as a power supply for electric appliances in the vehicle.

The key must be in the "ON" position for the power outlet to be used.

The maximum capacity for this power outlet is 115 VAC/100W. If you attempt to use an appliance that requires more than 115 VAC or 100W, the protection circuit will activate and cut the power supply. The power supply will restart automatically when you use an appliance that operates within the 115 VAC/100W limits.

Main switch

To use the power outlet, push the main switch on the instrument panel.

An indicator light will illuminate to indicate that the power outlet is ready for use.

Push the main switch once again to turn the power outlet off. When the power outlet is not in use, make sure that the main switch is turned off.

NOTICE

- ◆ To prevent the battery from being discharged, do not use the power outlet longer than necessary when the engine is not running.
- ◆ Close the power outlet lid when the power outlet is not in use. Inserting anything other than an appropriate plug that fits the outlet may cause electrical failure or short circuits.

The power outlet is not designed for the following electric appliances even though their power consumption is under 115 VAC/100W. These appliances may not operate properly.

- ◀ Appliances with high initial peak wattage: cathode-ray tube type televisions, compressor-driven refrigerators, electric pumps, electric tools, etc.
- ◀ Measuring devices which process precise data: medical equipment, measuring instruments, etc.
- ◀ Other appliances requiring an extremely stable power supply: microcomputer-controlled electric blankets, touch sensor lamps, etc.

Certain electrical appliances may cause radio noise.

Glove box

To use the glove box, do this.

To open: Pull the lever.

To lock: Insert the master key and turn it clockwise.

On some models, the glove box light will come on when the glove box is opened with the headlight switch on.

CAUTION

To reduce the chance of injury in case of an accident or a sudden stop, always keep the glove box door closed while driving.

Garage door opener box

The box is designed to store a garage door opener transmitter.

Open the cover and remove the Velcro square.

Remove the paper strip covering the adhesive on back side of square and adhere the square to back side of the transmitter near the center.

'05 TUNDRA_U (L/O 0409)

Please note if transmitter has wire clip for sun visor, this clip must be removed prior to adhesion of the Velcro.

Place the transmitter with Velcro square facing inside of box into the box. Make sure the transmitter button is located above button pins.

Remove spacers from the center panel. Place the largest spacer on the pin that would be below transmitter button when the cover is closed. Close the cover.

'05 TUNDRA_U (L/O 0409)

When the garage door opener transmitter is properly installed, you can operate the transmitter by pushing the center panel of the cover.

If the center panel does not contact your garage door opener transmitter:

- ◀ Check to see if spacer is on the correct pin.
- ◀ Attach another spacer to the top of original spacer. Check operation. If required, continue to add spacers until contact is achieved.

If the transmitter is clattering during driving, fill in a piece of felt or pad to prevent the transmitter from clattering.

CAUTION

◀ To reduce the chance of injury in case of an accident or a sudden stop, always keep the garage door opener box closed while driving.

◀ Keep the remaining spacers away from children.

Standard and access cab models only—
The auxiliary box (stored in the glove box) and garage door opener box are interchangeable.

Removing the cover—

Half open the cover. Pinch each hinge and pull it out of its pivot one at a time as shown above.

Do not remove the cover forcibly.

Installing the cover—

Align the hinges to the pivots, and press each hinge until you hear a click.

Make sure that the cover opens and closes smoothly.

Auxiliary boxes

To use the auxiliary boxes, open the lids as shown in the following illustrations.

⚠ CAUTION

◀ To reduce the chance of injury in case of an accident or a sudden stop, always keep the auxiliary box closed while driving.

◀ Type A and B only—As these holders are designed for holding a light object such as an eyeglass, do not place any heavy objects in them. Heavy objects may cause the holder to open and contents to fly out resulting in injuries.

NOTICE

Type A and B only—During hot weather, the interior of the vehicle becomes very hot. Do not leave anything flammable or deformable such as a lighter, glasses, etc. inside.

'05 TUNDRA_U (L/O 0409)

Type A

Type C

Type D

Type B

Type E (under the rear seat of access cab models)

Rear console box (type A)

Type F (under the rear seat of double cab models)

UPPER TRAY

To access the upper tray, raise the console box lid.

 CAUTION

To reduce the chance of injury in case of an accident or a sudden stop, always keep the upper tray closed while driving.

Rear console box (type B)

CONSOLE BOX

To access the rear console box, raise the upper tray by pulling up the lock release lever.

! CAUTION

To reduce the chance of injury in case of an accident or a sudden stop, always keep the console box closed while driving.

UPPER TRAY

To access the upper tray, raise the console box upper lid while pushing the lock release button.

! CAUTION

To reduce the chance of injury in case of an accident or a sudden stop, always keep the upper tray closed while driving.

CONSOLE BOX

To access the rear console box, raise the console box lid by pulling up the lock release lever.

⚠ CAUTION
To reduce the chance of injury in case of an accident or a sudden stop, always keep the console box closed while driving.

Coin holder (type A)

The rear console box is equipped with a coin holder.

To use the coin holder:

1. Raise the console box lid.
2. Push coins down into the holder.

Coin holder (type B)

The rear console box is equipped with a coin holder.

To use the coin holder:

1. Raise the console box upper lid while pushing the lock release button.
2. Push coins down into the holder.

The coin holder is detachable.

Coin holder (type C)

The coin holder can be set in the console box.

To set the coin holder in the console box, raise the console box lid by pulling up the lock release lever.

The auxiliary box is equipped with a coin holder.

To use the coin holder:

1. Raise the auxiliary box lid while pushing the lock release button.
2. Push coins down into the holder.

The coin holder is detachable.

**Compact disc and cassette
tape holder (type A)**

The rear console box is equipped with compact disc and cassette tape holders.

To use the holders, raise the console box lid and upper tray by pulling up the lock release lever.

The plates for the compact disc and cassette tape holders are detachable.

**Compact disc and cassette
tape holder (type B)**

Cassette tape holder

The rear console box is equipped with a compact disc and cassette tape holder.

To use the holder, raise the console box lid by pulling up the lock release lever.

The compact disc and cassette tape holder is detachable.

The auxiliary box is equipped with a cassette tape holder.

To use the holder, raise the auxiliary box lid while pushing the lock release button.

The plate for the cassette tape holder is detachable.

Cup holders

The cup holder is designed for holding cups or drink-cans securely. To use them, observe the following illustrations.

CAUTION

Do not place anything else other than cups or drink-cans in the cup holder, as such items may be thrown about and possibly injure people in the vehicle during sudden braking or in an accident.

To reduce the chance of injury in case of an accident or a sudden stop while driving, keep the cup holder closed when it is not in use.

NOTICE

Type A only—As this holder is designed for holding soft cups only, do not place too heavy a cup, drink-can or bottle in it.

Type A

Type B

Type C

'05 TUNDRA_U (L/O 0409)

Type C cup holders are equipped with a detachable adapter for each holder. When you remove the adapter, a bigger cup can be held in the holder.

Type D

Type F

Type E

Type G

Note pad holder

The rear console box is equipped with a note pad holder. This is designed to hold small paper such as note pads.

To use the holder, raise the console box upper lid while pushing the lock release button.

! CAUTION

- ◀ Do not write on the note pad holder while the vehicle is moving.
- ◀ Do not place anything else on the note pad holder. Such items may be thrown about in the compartment and possibly cause injury during sudden braking or an accident.
- ◀ To reduce the chance of injury in case of an accident or a sudden stop while driving, keep the console box upper lid closed when it is not in use.

Grocery bag/cargo net hooks

These hooks are designed to hang things like grocery bags or cargo net.

Although the cargo net itself is not included as an original equipment, these hooks can be used to hang the cargo net.

NOTICE

- ◆ *To prevent damage to the hooks, avoid hanging heavy loads on them when using them as grocery bag hooks.*
- ◆ *To prevent damage to the hook, avoid hanging things other than a cargo net on it when using them as cargo net hooks.*

Floor mat

Use a floor mat of the correct size.

If the floor carpet and floor mat have a hole, then it is designed for use with a locking clip. Fix the floor mat with locking clip into the hole in the floor carpet.

CAUTION

Make sure the floor mat is properly placed on the floor carpet. If the floor mat slips and interferes with the movement of the pedals during driving, it may cause an accident.

'05 TUNDRA_U (L/O 0409)

Off-road vehicle precautions

This vehicle has higher ground clearance and narrower tread in relation to the height of its center of gravity to make it capable of performing in a wide variety of off-road applications. Specific design characteristics give it a higher center of gravity than ordinary passenger cars. This vehicle design feature causes this type of vehicle to be more likely to rollover. And, it has a significantly higher rollover rate than other types of vehicles. An advantage of the higher ground clearance is a better view of the road allowing you to anticipate problems. It is not designed for cornering at the same speeds as ordinary passenger cars any more than low-slung sports cars designed to perform satisfactorily under off-road conditions. Therefore, sharp turns at excessive speeds may cause rollover.

CAUTION

Always observe the following precautions to minimize the risk of serious personal injury or damage to your vehicle:

- ▶ In a rollover crash, an unbelted person is significantly more likely to die than a person wearing a seat belt. Therefore, the driver and all passengers should fasten their seat belts whenever the vehicle is moving.
- ▶ Avoid sharp turns or abrupt maneuvers, if at all possible. Failure to operate this vehicle correctly may result in loss of control or vehicle rollover causing death or serious injury.
- ▶ Avoid loading any items on the roof that will raise the vehicle's center of gravity.
- ▶ Always slow down in gusty crosswinds. Because of its profile and higher center of gravity, your vehicle is more sensitive to side winds than an ordinary passenger car. Slowing down will allow you to have better control.

▶When driving off-road or in rugged terrain, do not drive at excessive speeds, jump, make sharp turns, strike objects, etc. This may cause loss of control or vehicle rollover causing death or serious injury. You are also risking expensive damage to your vehicle's suspension and chassis.

▶Do not drive horizontally across steep slopes. Driving straight up or straight down is preferred. Your vehicle (or any similar off-road vehicle) can tip over sideways much more easily than forward or backward.

Break-in period

Drive gently and avoid high speeds.

Your vehicle does not need an elaborate break-in. But following a few simple tips for the first 1600 km (1000 miles) can add to the future economy and long life of your vehicle:

- ▶Avoid full throttle acceleration when starting and driving.
- ▶Avoid racing the engine.
- ▶Try to avoid hard stops during the first 300 km (200 miles).
- ▶Do not drive slowly with the manual transmission in a high gear.
- ▶Do not drive for a long time at any single speed, either fast or slow.
- ▶Do not tow a trailer during the first 800 km (500 miles).

Fuel

FUEL TYPE

Your new vehicle must use only unleaded gasoline.

To help prevent gas station mix-ups, your Toyota has a smaller fuel tank opening. The special nozzle on pumps with unleaded fuel will fit it, but the larger standard nozzle on pumps with leaded gas will not.

At a minimum, the gasoline you use should meet specifications of ASTM D4814 in the U.S.A. and CGSB 3.5-M93 in Canada.

NOTICE

Do not use leaded gasoline. Use of leaded gasoline will cause the three-way catalytic converter to lose its effectiveness and the emission control system to function improperly. Also, this can increase maintenance costs.

'05 TUNDRA_U (L/O 0409)

OCTANE RATING

1GR-FE engine: Select Octane Rating 87 (Research Octane Number 91) or higher. For improved vehicle performance, the use of premium unleaded gasoline with an Octane Rating of 91 (Research Octane Number 96) or higher is recommended.

2UZ-FE engine: Select Octane Rating 87 (Research Octane Number 91) or higher.

Use of unleaded gasoline with an octane rating or research octane number lower than stated above will cause persistent heavy knocking. If it is severe, this will lead to engine damage.

If your engine knocks...

If you detect heavy knocking even when using the recommended fuel, or if you hear steady knocking while holding a steady speed on level roads, consult your Toyota dealer.

However, occasionally, you may notice light knocking for a short time while accelerating or driving up hills. This is normal and there is no need for concern.

GASOLINE CONTAINING DETERGENT ADDITIVES

Toyota recommends the use of gasoline that contains detergent additives to avoid build-up of engine deposits.

However, all gasoline sold in the U.S. contains detergent additives to keep clean and/or clean intake systems.

QUALITY GASOLINE

Automotive manufacturers in the U.S., Europe and Japan have developed a specification for quality fuel named World-Wide Fuel Charter (WWFC) that is expected to be applied world wide. The WWFC consists of four categories that depend on required emission levels. In the U.S., category 4 has been adopted. The WWFC improves air quality by providing for better emissions in vehicle fleets, and customer satisfaction through better vehicle performance.

CLEANER BURNING GASOLINE

Cleaner burning gasoline, including reformulated gasoline that contains oxygenates such as ethanol or MTBE is available in many areas.

Toyota recommends the use of cleaner burning gasoline and appropriately blended reformulated gasoline. These types of gasoline provide excellent vehicle performance, reduce vehicle emissions, and improve air quality.

OXYGENATES IN GASOLINE

Toyota allows the use of oxygenate blended gasoline where the oxygenate content is up to 10% ethanol or 15% MTBE. If you use gasohol in your Toyota, be sure that it has an octane rating no lower than 87.

Toyota does not recommend the use of gasoline containing methanol.

GASOLINE CONTAINING MMT

Some gasoline contain an octane enhancing additive called MMT (Methylcyclopentadienyl Manganese Tricarbonyl).

Toyota does not recommend the use of gasoline that contains MMT. If fuel containing MMT is used, your emission control system may be adversely affected. The Malfunction Indicator Lamp on the instrument cluster may come on. If this happens, contact your Toyota dealer for service.

GASOLINE QUALITY

In a very few cases, you may experience driveability problems caused by the particular gasoline that you are using. If you continue to have unacceptable driveability, try changing gasoline brands. If this does not rectify your problem, then consult your Toyota dealer.

NOTICE

- ◆ *Do not use gasohol other than stated above. It will cause fuel system damage or vehicle performance problems.*
- ◆ *If driveability problems occur (poor hot starting, vaporizing, engine knock, etc.), discontinue the use.*
- ◆ *Take care not to spill gasohol during refueling. Gasohol may cause paint damage.*

FUEL TANK CAPACITY

100 L (26.4 gal., 22.0 Imp. gal.)

Fuel pump shut off system

The fuel pump shut off system stops supplying fuel to the engine to minimize the risk of fuel leakage when the engine stalls or an airbag inflates upon collision. To restart the engine after the fuel pump shut off system activates, turn the ignition switch to "ACC" or "LOCK" once and start it.

CAUTION

Inspect the ground under the vehicle before restarting the engine. If you find that liquid has leaked onto the ground, it is the fuel system has been damaged and it is in need of repair. In this case, do not restart the engine.

Operation in foreign countries

If you plan to drive your Toyota in another country...

First, comply with the vehicle registration laws.

Second, confirm the availability of the correct fuel (unleaded and minimum octane number).

Three- way catalytic converters

1GR-FE engine

2UZ-FE engine

The three-way catalytic converter is an emission control device installed in the exhaust system.

The purpose is to reduce pollutants in the exhaust gas.

CAUTION

- ▶ Keep people and combustible materials away from the exhaust pipe while the engine is running. The exhaust gas is very hot.
- ▶ Do not idle or park your vehicle over anything that might burn easily such as grass, leaves, paper or rags.

NOTICE

A large amount of unburned gases flowing into the three-way catalytic converter may cause it to overheat and create a fire hazard. To prevent this and other damage, observe the following precautions:

- ◆ Use only unleaded gasoline.
- ◆ Do not drive with an extremely low fuel level; running out of fuel could cause the engine to misfire, creating an excessive load on the three-way catalytic converter.
- ◆ Do not allow the engine to run at idle speed for more than 20 minutes.
- ◆ Avoid racing the engine.
- ◆ Do not push-start or pull-start your vehicle.
- ◆ Do not turn off the ignition while the vehicle is moving.

- ◆ Keep your engine in good running order. Malfunctions in the engine electrical system, electronic ignition system/distributor ignition system or fuel systems could cause an extremely high three-way catalytic converter temperature.
- ◆ If the engine becomes difficult to start or stalls frequently, take your vehicle in for a check-up as soon as possible. Remember, your Toyota dealer knows your vehicle and its three-way catalytic converter system best.
- ◆ To ensure that the three-way catalytic converter and the entire emission control system operate properly, your vehicle must receive the periodic inspections required by the Toyota Maintenance Schedule. For scheduled maintenance information, refer to the "Scheduled Maintenance Guide" or "Owner's Manual Supplement".

Engine exhaust cautions

 **CAUTION**

- ▶ Avoid inhaling the engine exhaust. It contains carbon monoxide, which is a colorless and odorless gas. It can cause unconsciousness or even death.
- ▶ Make sure the exhaust system has no holes or loose connections. The system should be checked from time to time. If you hit something, or notice a change in the sound of the exhaust, have the system checked immediately.
- ▶ Do not run the engine in a garage or enclosed area except for the time needed to drive the vehicle in or out. The exhaust gases cannot escape, making this a particularly dangerous situation.
- ▶ Do not remain for a long time in a parked vehicle with the engine running. If it is unavoidable, however, do so only in an unconfined area and adjust the heating or cooling system to force outside air into the vehicle.

- ▶ To allow proper operation of your vehicle's ventilation system, keep the inlet grilles in front of the windshield clear of snow, leaves, or other obstructions.
- ▶ If you smell exhaust fumes in the vehicle, drive with the windows open. Have the cause immediately located and corrected.
- ▶ Toyota does not recommend occupying the rear cargo area when it is fitted with a slide-in camper, camper shell or other type cover while the engine is running. This caution applies to both driving and stopped or parked situations with the engine running. Particular care should be taken to prevent exhaust gases from entering camper bodies, trailers or other enclosures on or around your vehicle. If exhaust fumes are detected, open all windows and thoroughly ventilate the area.

Facts about engine oil consumption

FUNCTIONS OF ENGINE OIL

Engine oil has the primary functions of lubricating and cooling the inside of the engine, and plays a major role in maintaining the engine in proper working order.

ENGINE OIL CONSUMPTION

It is normal that an engine should consume some engine oil during normal engine operation. The causes of oil consumption in a normal engine are as follows.

- ▶ Oil is used to lubricate pistons, piston rings and cylinders. A thin film of oil is left on the cylinder wall when a piston moves downwards in the cylinder. High negative pressure generated when the vehicle is decelerating sucks some of this oil into the combustion chamber. This oil as well as some part of the oil film left on the cylinder wall is burned by the high temperature combustion gases during the combustion process.
- ▶ Oil is also used to lubricate the stems of the intake valves. Some of this oil is sucked into the combustion chamber together with the intake air and is burned along with the fuel. High temperature exhaust gases also burn the oil used to lubricate the exhaust valve stems.

The amount of engine oil consumed depends on the viscosity of the oil, the quality of the oil and the conditions the vehicle is driven under.

More oil is consumed by high-speed driving and frequent acceleration and deceleration.

A new engine consumes more oil, since its pistons, piston rings and cylinder walls have not become conditioned.

Oil consumption: Max. 1.0 L per 1000 km (1.1 qt./600 miles, 0.9 Imp. qt./600 miles)

When judging the amount of oil consumption, note that the oil may become diluted and make it difficult to judge the true level accurately.

As an example, if a vehicle is used for repeated short trips, and consumes a normal amount of oil, the dipstick may not show any drop in the oil level at all, even after 1000 km (600 miles) or more. This is because the oil is gradually becoming diluted with fuel or moisture, making it appear that the oil level has not changed.

The diluting ingredients evaporate out when the vehicle is then driven at high speeds, as on an expressway, making it appear that oil is excessively consumed after driving at high speeds.

IMPORTANCE OF ENGINE OIL LEVEL CHECK

One of the most important points in proper vehicle maintenance is to keep the engine oil at the optimum level so that oil function will not be impaired. Therefore, it is essential that the oil level be checked regularly. Toyota recommends that the oil level be checked every time you refuel the vehicle.

NOTICE

Failure to check the oil level regularly could lead to serious engine trouble due to insufficient oil.

For detailed information on oil level check, see "Checking the engine oil level" in Section 7-2.

Iridium-tipped spark plugs (2UZ- FE engine)

Your engine is fitted with iridium-tipped spark plugs.

NOTICE

Use only iridium-tipped spark plugs and do not adjust gaps for your engine performance and smooth driveability.

Brake system

Without the vehicle stability control system—

The tandem master cylinder brake system is a hydraulic system with two separate sub-systems. If either sub-system should fail, the other will still work. However, the pedal will be harder to press, and your stopping distance will increase. Also, the brake system warning light may come on.

CAUTION

Do not drive your vehicle with only a single brake system. Have your brakes fixed immediately.

With the vehicle stability control system—

This brake system has 2 independent hydraulic circuits. If either circuit should fail, the other will still work. However, the pedal will be harder to press, and your stopping distance will increase. Also, the brake system warning light may come on.

CAUTION

Do not drive your vehicle with only a single brake system. Have your brakes fixed immediately.

BRAKE BOOSTER (without the vehicle stability control system)

The brake booster uses engine vacuum to power-assist the brakes. If the engine should quit while you are driving, you can bring the vehicle to a stop with normal pedal pressure. There is enough reserved vacuum for one or two stops—but no more!

 **CAUTION**

- ▶ **Do not pump the brake pedal if the engine stalls. Each push on the pedal uses up your reserved vacuum.**
- ▶ **Even if the power assist is completely lost, the brakes will still work. But you will have to push the pedal hard, much harder than normal. And your braking distance will increase.**

BRAKE BOOSTER (with the vehicle stability control system)

The brake booster uses brake fluid pressurized by the pump to power-assist the brakes. If the brake booster fails during driving, the brake system warning light comes on and buzzer sounds continuously. In this case, the brakes may not work properly. If they do not work well, depress the brake pedal firmly. If the brake system warning light comes on, immediately stop your vehicle and contact your Toyota dealer.

The brake system warning light may stay on for about 60 seconds after the ignition key is turned to the "ON" position. It is normal if the light turns off after a while.

Depressing the brake pedal repeatedly may turn on the brake system warning light and buzzer. It is normal if the light turns off and the buzzer stops sounding after a few seconds.

You may hear a small sound in the engine compartment after the engine is started or the brake pedal is depressed repeatedly. This is a pump pulsating sound of the brake system, and it is not a malfunction.

 **CAUTION**

- ▶ **Do not pump the brake pedal if the engine stalls. Each push on the pedal uses up your brake fluid pressure reserve.**
- ▶ **Even if the power assist is completely lost, the brakes will still work. But you will have to push the pedal hard, much harder than normal. And your braking distance will increase.**

ANTI-LOCK BRAKE SYSTEM (without the vehicle stability control system)

The anti-lock brake system is designed to help prevent lock-up of the wheels during a sudden braking or braking on slippery road surfaces. This assists in providing directional stability and steering performance of the vehicle under these circumstances.

Effective way to press the ABS brake pedal: When the anti-lock brake system function is in action, you may feel the brake pedal pulsating and hear a noise. In this situation, to let the anti-lock brake system work for you, just hold the brake pedal down more firmly. Do not pump the brake in a panic stop. This will result in reduced braking performance.

The anti-lock brake system becomes operative after the vehicle has accelerated to a speed in excess of approximately 10 km/h (6 mph). It stops operating when the vehicle decelerates to a speed below approximately 5 km/h (3 mph).

Depressing the brake pedal on slippery road surfaces such as on a manhole cover, a steel plate at a construction site, joints in a bridge, etc. on a rainy day tends to activate the anti-lock brake system.

You may hear a click or motor sound in the engine compartment for a few seconds when the engine is started or just after the vehicle begins to move. This means that the anti-lock brake system is in the self-check mode, and does not indicate a malfunction.

When the anti-lock brake system is activated, the following conditions may occur. They do not indicate a malfunction of the system:

- ▶ You may hear the anti-lock brake system operating and feel the brake pedal pulsating and the vibrations of the vehicle body and steering wheel. You may also hear the motor sound in the engine compartment even after the vehicle is stopped.
- ▶ At the end of the anti-lock brake system activation, the brake pedal may move a little forward.

 **CAUTION**

Do not overestimate the anti-lock brake system: Although the anti-lock brake system assists in providing vehicle control, it is still important to drive with all due care and maintain a moderate speed and safe distance from the vehicle in front of you, because there are limits to the vehicle stability and effectiveness of steering wheel operation even with the anti-lock brake system on.

If tire grip performance exceeds its capability, or if hydroplaning occurs during high speed driving in the rain, the anti-lock brake system does not provide vehicle control.

Anti-lock brake system is not designed to shorten the stopping distance: Always drive at a moderate speed and maintain a safe distance from the vehicle in front of you. Compared with vehicles without an anti-lock brake system, your vehicle may require a longer stopping distance in the following cases:

- ▶ Driving on rough, gravel or snow-covered roads.
- ▶ Driving with tire chains installed.
- ▶ Driving over the steps such as the joints on the road.
- ▶ Driving on roads where the road surface is pitted or has other differences in surface height.

Install all 4 tires of specified size at appropriate pressure: The anti-lock brake system detects vehicle speeds using the speed sensors for respective wheels' turning speeds. The use of tires other than specified may fail to detect the accurate turning speed resulting in a longer stopping distance.

Type A

Type B

“ABS” Warning light

The light comes on when the ignition key is turned to the “ON” position. If the anti-lock brake system works properly, the light turns off after a few seconds. Thereafter, if the system malfunctions, the light comes on again.

When the “ABS” warning light is on (and the brake system warning light is off), the anti-lock brake system does not operate, but the brake system still operates conventionally.

When the “ABS” warning light is on (and the brake system warning light is off), the anti-lock brake system does not operate so that the wheels could lock up during a sudden braking or braking on slippery road surfaces.

If either of the following conditions occurs, this indicates a malfunction somewhere in the components monitored by the warning light system. Contact your Toyota dealer as soon as possible to service the vehicle.

- ▶ The light does not come on when the ignition key is turned to the “ON” position, or remains on.
- ▶ The light comes on while you are driving.

A warning light turning on briefly during operation does not indicate a problem.

ANTI-LOCK BRAKE SYSTEM (with the vehicle stability control system)

The anti-lock brake system is designed to help prevent lock-up of the wheels during a sudden braking or braking on slippery road surfaces. This assists in providing directional stability and steering performance of the vehicle under these circumstances.

Effective way to press the ABS brake pedal: When the anti-lock brake system function is in action, you may feel the brake pedal pulsating and hear a noise. In this situation, to let the anti-lock brake system work for you, just hold the brake pedal down more firmly. Do not pump the brake in a panic stop. This will result in reduced braking performance.

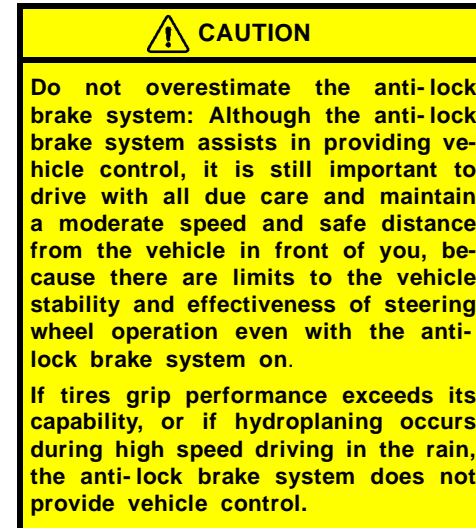

The anti-lock brake system becomes operative after the vehicle has accelerated to a speed in excess of approximately 10 km/h (6 mph). It stops operating when the vehicle decelerates to a speed below approximately 5 km/h (3 mph).

Depressing the brake pedal on slippery road surfaces such as on a manhole cover, a steel plate at a construction site, joints in a bridge, etc. on a rainy day tends to activate the anti-lock brake system.

You may hear a click or motor sound in the engine compartment for a few seconds when the engine is started or just after the vehicle begins to move. This means that the anti-lock brake system is in the self-check mode, and does not indicate a malfunction.

When the anti-lock brake system is activated, the following conditions may occur. They do not indicate a malfunction of the system:

- ▶ You may hear the anti-lock brake system operating and feel the brake pedal pulsating and the vibrations of the vehicle body and steering wheel. You may also hear the motor sound in the engine compartment even after the vehicle is stopped.
- ▶ At the end of the anti-lock brake system activation, the brake pedal may move a little forward.

Anti-lock brake system is not designed to shorten the stopping distance: Always drive at a moderate speed and maintain a safe distance from the vehicle in front of you. Compared with vehicles without an anti-lock brake system, your vehicle may require a longer stopping distance in the following cases:

- ▶ Driving on rough, gravel or snow-covered roads.
- ▶ Driving with tire chains installed.
- ▶ Driving over the steps such as the joints on the road.
- ▶ Driving on roads where the road surface is pitted or has other differences in surface height.

Install all 4 tires of specified size at appropriate pressure: The anti-lock brake system detects vehicle speeds using the speed sensors for respective wheels' turning speed. The use of tires other than specified may fail to detect the accurate turning speed resulting in a longer stopping distance.

Type A

Type B

“ABS” warning light

The light comes on when the ignition key is turned to the “ON” position. If the anti-lock brake system and the brake assist system work properly, the light turns off after a few seconds. Thereafter, if the systems malfunction, the light comes on again.

When the “ABS” warning light is on (and the brake system warning light is off), the anti-lock brake system, the brake assist system, the traction control system, “AUTO LSD” system, the vehicle stability control system do not operate, but the brake system still operates conventionally.

When the “ABS” warning light is on (and the brake system warning light is off), the anti-lock brake system does not operate so that the wheels could lock up during a sudden braking or braking on slippery road surfaces.

“VSC TRC” warning light may come on with the “ABS” warning light (brake assist system warning light) when there is a malfunction somewhere in the anti-lock brake system (brake assist system).

'05 TUNDRA_U (L/O 0409)

If either of the following conditions occurs, this indicates a malfunction somewhere in the components monitored by the warning light system. Contact your Toyota dealer as soon as possible to service the vehicle.

- ▶ The light does not come on when the ignition key is turned to the "ON" position, or remains on.
- ▶ The light comes on while you are driving.

A warning light turning on briefly during operation does not indicate a problem.

CAUTION

If the "ABS" warning light remains on together with the brake system warning light, immediately stop your vehicle at a safe place and contact your Toyota dealer.

In this case, not only the anti-lock brake system will fail but also the vehicle will become extremely unstable during braking.

Either of the following conditions may occur, but do not indicate a malfunction:

- ▶ The light may stay on for about 60 seconds after the ignition key is turned to the "ON" position. It is normal if it turns off after a while.
- ▶ Depressing the brake pedal repeatedly may turn on the light. It is normal if it turns off after about a few seconds.

BRAKE ASSIST SYSTEM (with the vehicle stability control system)

When you slam the brakes on, the brake assist system judges as an emergency stop and provides more powerful braking for a driver who cannot hold down the brake pedal firmly.

When you slam the brakes on, more powerful braking will be applied. At this time, you may hear a sound in the engine compartment and feel the vibrations of the brake pedal. This does not indicate a malfunction.

The brake assist system becomes operative after the vehicle has accelerated to a speed in excess of approximately 10 km/h (6 mph). It stops operating when the vehicle decelerates to a speed below approximately 5 km/h (3 mph).

For an explanation of this system's warning light, see "Service reminder indicators and warning buzzers" in Section 1-6.

Brake pad wear limit indicators

The brake pad wear limit indicators on your disc brakes give a warning noise when the brake pads are worn to where replacement is required.

If you hear a squealing or scraping noise while driving, have the brake pads checked and replaced by your Toyota dealer as soon as possible. Expensive rotor damage can result if the pads are not replaced when necessary.

Rear step bumper

The rear step bumper is for rear end protection and easier step-up loading.

⚠ CAUTION

- ▶ Do not allow more than one person to get on the rear step bumper at a time. It is designed for only one person.
- ▶ Never drive the vehicle with anyone on the rear step bumper.

StepSide bed

The side step is for easier step-up loading.

⚠ CAUTION

For models equipped with a StepSide bed:

- ▶ Do not allow more than one person to get on the side step. Do not exceed the maximum weight limit of 136 kg (300 lb.) on the side step.
- ▶ Never drive the vehicle with anyone on the side steps.
- ▶ Do not stand on the side steps while the vehicle is moving.

Limited-slip differential

Some Toyotas are equipped with a limited-slip differential. If one of the rear wheels begins to spin, the limited-slip differential is designed to aid traction by automatically transmitting driving force to the other rear wheel. If you are not sure whether your vehicle is equipped with one, you can ask your Toyota dealer.

CAUTION

Do not start or run the engine while your vehicle is supported by a jack. The vehicle could be driven off the jack and could pose a danger or result in serious injury.

NOTICE

Use only a spare tire of the same size, construction and load capacity as the original tires on your Toyota because damage to the limited-slip differential could possibly occur with another tire type.

Your Toyota's identification— —Vehicle identification number

The vehicle identification number (VIN) is the legal identifier for your vehicle. This number is on the left top of the instrument panel, and can be seen through the windshield from outside.

This is the primary identification number for your Toyota. It is used in registering the ownership of your vehicle.

The vehicle identification number (VIN) is also on the Certification Label.

'05 TUNDRA_U (L/O 0409)

—Engine number

1GR-FE engine

2UZ-FE engine

The engine number is stamped on the engine block as shown.

Theft prevention labels (except for Canada)

Your new vehicle carries theft prevention labels which are approximately 47 mm (1.85 in.) by 12 mm (0.47 in.).

The purpose of these labels is to reduce the incidence of vehicle thefts by facilitating the tracing and recovery of parts from stolen vehicles. The label is designed so that once it is applied to a surface, any attempt to remove it will result in destroying the integrity of the label. Transferring these labels intact from one part to another, will be impossible.

NOTICE

You should not attempt to remove the theft prevention labels as it may violate certain state or federal laws.

Suspension and chassis

**Tire information—
—Tire symbols**

This illustration indicates typical tire symbols.

- 1. Tire size**—For details, see “—Tire size” in this Section.
- 2. DOT and Tire Identification Number (TIN)**—For details, see “—DOT and Tire Identification Number (TIN)” in this Section.
- 3. Uniform tire quality grading**—For details, see “Uniform tire quality grading” that follows
- 4. The location of the tread wear indicators**—For details, see “Checking and replacing tires” in Section 7- 2.
- 5. Tire ply composition and materials**—Plies mean a layer of rubber- coated parallel cords. Cords mean the strands forming the plies in the tire.
- 6. Radial tires or bias- ply tires**—A radial tire has “RADIAL” on the sidewall. A tire not marked with “RADIAL” is a bias- ply tire.

—DOT and Tire Identification Number (TIN)

7. **“TUBELESS” or “TUBE TYPE”**—A tubeless tire does not have a tube inside the tire and air is directly filled in the tire. A tube type tire has a tube inside the tire and the tube maintains the air pressure.
8. **Load limit at maximum cold tire inflation pressure**—For details, see “Checking and replacing tires” in Section 7- 2.
9. **Maximum cold tire inflation pressure**—This means the pressure to which a tire may be inflated. For details about recommended cold tire inflation pressure, see “Tires” in Section 8.
10. **Summer tire or all season tire**—An all season tire has “M+S” on the sidewall. The tire not marked with “M+S” is a summer tire. For details, see “Types of tires” in this Section.

The “DOT” symbol certifies that the tire conforms to applicable Federal Motor Vehicle Safety Standards.

This illustration indicates typical DOT and Tire Identification Number (TIN).

1. “DOT” symbol
2. Tire Identification Number (TIN)
3. Tire manufacturer’s identification mark
4. Tire size code
5. Manufacturer’s optional tire type code
6. Manufacturing week
7. Manufacturing year

—Tire size

This illustration indicates typical tire size.

1. Tire use (P=Passenger car, T=Temporary use)
2. Section width (in millimeters)
3. Aspect ratio (tire height to section width)
4. Tire construction code (R=Radial, D=Diagonal)
5. Wheel diameter (in inches)
6. Load index (2 digits or 3 digits)
7. Speed symbol (alphabet with one letter)

1. Section width
2. Tire height
3. Wheel diameter

—Name of each section of tire

1. Bead
2. Sidewall
3. Shoulder
4. Tread
5. Belt
6. Inner liner
7. Reinforcing rubber
8. Carcass
9. Rim lines
10. Bead wires
11. Chafer

—Uniform tire quality grading

This information has been prepared in accordance with regulations issued by the National Highway Traffic Safety Administration of the U.S. Department of Transportation. It provides the purchasers and/or prospective purchasers of Toyota vehicles with information on uniform tire quality grading.

Your Toyota dealer will help answer any questions you may have as you read this information.

DOT quality grades—All passenger vehicle tires must conform to Federal Safety Requirements in addition to these grades. Quality grades can be found where applicable on the tire sidewall between tread shoulder and maximum section width. For example: Treadwear 200 Traction AA Temperature A

Treadwear—The treadwear grade is a comparative rating based on the wear rate of the tire when tested under controlled conditions on a specified government test course. For example, a tire graded 150 would wear one and a half (1- 1/2) times as well on the government course as a tire graded 100. The relative performance of tires depends upon the actual conditions of their use, however, and may depart significantly from the norm due to variations in driving habits, service practices and differences in road characteristics and climate.

Traction AA, A, B, C—The traction grades, from highest to lowest, are AA, A, B, and C, and they represent the tire's ability to stop on wet pavement as measured under controlled conditions on specified government test surfaces of asphalt and concrete. A tire marked C may have poor traction performance.

Warning: The traction grade assigned to this tire is based on braking (straight ahead) traction tests and does not include cornering (turning) traction.

Temperature A, B, C—The temperature grades are A (the highest), B, and C, representing the tire's resistance to the generation of heat and its ability to dissipate heat when tested under controlled conditions on a specified indoor laboratory test wheel. Sustained high temperature can cause the material of the tire to degenerate and reduce tire life, and excessive temperature can lead to sudden tire failure. The grade C corresponds to a level of performance which all passenger car tires must meet under the Federal Motor Vehicle Safety Standard No.109. Grades B and A represent higher levels of performance on the laboratory test wheel than the minimum required by law.

Warning: The temperature grades for this tire are established for a tire that is properly inflated and not overloaded. Excessive speed, underinflation, or excessive loading, either separately or in combination, can cause heat buildup and possible tire failure.

'05 TUNDRA_U (L/O 0409)

—Glossary of tire terminology

Tire related term	Meaning
Accessory weight	the combined weight (in excess of those standard items which may be replaced) of automatic transmission, power steering, power brakes, power windows, power seats, radio, and heater, to the extent that these items are available as factory-installed equipment (whether installed or not)
Cold tire inflation pressure	tire inflation pressure when the vehicle has been parked for at least 3 hours or more, or it has not been driven more than 1.5 km or 1 mile under that condition
Curb weight	the weight of a motor vehicle with standard equipment including the maximum capacity of fuel, oil, and coolant, and, if so equipped, air conditioning and additional weight optional engine
Intended outboard sidewall	(A) the sidewall that contains a whitewall, bears white lettering or bears manufacturer, brand, and/or model name molding that is higher or deeper than the same molding on the other sidewall of the tire, or (B) the outward facing sidewall of an asymmetrical tire that has a particular side that must always face outward when mounted on a vehicle
Maximum inflation pressure	the maximum cold inflation pressure to which a tire may be inflated and it is shown on the sidewall of the tire
Maximum loaded vehicle weight	the sum of— (a) curb weight; (b) accessory weight; (c) vehicle capacity weight; and (d) production options weight

'05 TUNDRA_U (L/O 0409)

Tire related term	Meaning
Normal occupant weight	68 kg (150 lb.) times the number of occupants specified in the second column of Table 1 that follows
Occupant distribution	distribution of occupants in a vehicle as specified in the third column of Table 1 that follows
Production options weight	the combined weight of those installed regular production options weighing over 2.3 kg (5 lb.) in excess of those standard items which they replace, not previously considered in curb weight or accessory weight, including heavy duty brakes, ride levelers, roof rack, heavy duty battery, and special trim
Recommended inflation pressure	cold tire inflation pressure recommended by a manufacturer
Rim	a metal support for a tire or a tire and tube assembly upon which the tire beads are seated
Rim diameter (Wheel diameter)	nominal diameter of the bead seat
Rim size designation	rim diameter and width
Rim type designation	the industry of manufacturer's designation for a rim by style or code
Rim width	nominal distance between rim flanges
Vehicle capacity weight (Total load capacity or payload)	the rated cargo and luggage load plus 68 kg (150 lb.) times the vehicle's designated seating capacity
Vehicle maximum load on the tire	the load on an individual tire that is determined by distributing to each axle its share of the maximum loaded vehicle weight and dividing by two

'05 TUNDRA_U (L/O 0409)

Tire related term	Meaning
Vehicle normal load on the tire	the load on an individual tire that is determined by distributing to each axle its share of the curb weight, accessory weight, and normal occupant weight (distributed in accordance with Table 1 that follows) and dividing by two
Weather side	the surface area of the rim not covered by the inflated tire

Table 1—Occupant loading and distribution for vehicle normal load for various designated seating capacities

Designated seating capacity, number of occupants	Vehicle normal load, number of occupants	Occupant distribution in a normally loaded vehicle
2 through 4	2	2 in front
5 through 10	3	2 in front, 1 in second seat

Vehicle load limits

Vehicle load limits include total load capacity, seating capacity, towing capacity and cargo capacity. Follow the load limits shown below.

Total load capacity (payload)

Total load capacity means combined weight of occupants, cargo and luggage. Tongue load is included when trailer towing. For the total load capacity about your vehicle, see "Payload" in Section 8.

Seating capacity:

Standard cab models
Total 3

Access cab and double cab models
Models with bench type front seats:

Total 6 (Front 3, Rear 3)
Models with separate front seats:
Total 5 (Front 2, Rear 3)

Seating capacity means the maximum number of occupants whose estimated average weight is 68 kg (150 lb.) per person. Depending on the weight of each person, the seating capacity given may exceed the total load capacity.

NOTICE

Even if the number of occupants are within the seating capacity, do not exceed the total load capacity.

Towing capacity

Towing capacity means the maximum gross trailer weight (trailer weight plus its cargo weight) that your vehicle is able to tow. For the towing capacity about your vehicle, see "Towing capacity" in Section 8.

Cargo capacity

Cargo capacity may increase or decrease depending on the size (weight) and the number of occupants. For details, see "Capacity and distribution" that follows.

CAUTION

Do not apply the load more than each load limit. That may cause not only damage to the tires, but also deterioration to the steering ability and braking ability, which may cause an accident.

**Cargo and luggage—
—Stowage precautions**

When stowing cargo and luggage in the vehicle, observe the following:

- ▶ Put cargo and luggage in the rear deck when at all possible. Be sure all items are secured in place.
- ▶ Be careful to keep the vehicle balanced. Locating the weight as far forward as possible helps maintain balance.
- ▶ For better fuel economy, do not carry unneeded weight.

 **CAUTION**

- ▶ **To prevent cargo and luggage from sliding forward during braking, do not stack anything behind the front seats higher than the seatbacks (access and double cab models). Keep cargo and luggage low, as close to the floor as possible.**

- ▶ **Never allow anyone to ride in the rear deck or luggage compartment (double cab models only). It is not designed for passengers. They should ride in their seats with their seat belts properly fastened. Otherwise, they are much more likely to suffer serious bodily injury, in the event of sudden braking or a collision.**
- ▶ **Do not drive with objects left on top of the instrument panel. They may interfere with the driver's field of view. Or they may move during sharp vehicle acceleration or turning, and impair the driver's control of the vehicle. In an accident they may injure the vehicle occupants.**

—Capacity and distribution

Cargo capacity depends on the total weight of the occupants.

(Cargo capacity) = (Total load capacity) – (Total weight of occupants)

**STEPS FOR DETERMINING
CORRECT LOAD LIMIT**

1. Locate the statement “The combined weight of occupants and cargo should never exceed XXX pounds” on your vehicle’s placard.
2. Determine the combined weight of the driver and passengers that will be riding in your vehicle.
3. Subtract the combined weight of the driver and passengers from XXX kilograms or XXX pounds.
4. The resulting figure equals the available amount of cargo and luggage load capacity. For example, if the “XXX” amount equals 1400 lbs. and there will be five 150 lb. passengers in your vehicle, the amount of available cargo and luggage load capacity is 650 lbs. (1400–750 (5x150)=650 lbs).

5. Determine the combined weight of luggage and cargo being loaded on the vehicle. That weight may not safely exceed the available cargo and luggage load capacity calculated in Step 4.
6. If your vehicle will be towing a trailer, load from your trailer will be transferred to your vehicle. Consult this manual to determine how this reduces the available cargo and luggage load capacity of your vehicle.

For details about trailer towing, see "Trailer towing" in Section 3.

EXAMPLE ON YOUR VEHICLE

In case that 2 people with the combined weight of A kg (lb.) are riding in your vehicle with the total load capacity of B kg (lb.), the available amount of cargo and luggage load capacity will be C kg (lb.) as follows:

$$B \text{ kg (lb.)} - A \text{ kg (lb.)} = C \text{ kg (lb.)}$$

From this condition, if 3 more passengers with the combined weight of D kg (lb.) get on, the available cargo and luggage load will be reduced E kg (lb.) as follows:

$$C \text{ kg (lb.)} - D \text{ kg (lb.)} = E \text{ kg (lb.)}$$

As shown in the above example, if the number of occupants increases, the cargo and luggage load equaling the combined weight of occupants who got on later must be reduced. In other words, if the increase in the number of occupants causes the excess of the total load capacity (combined weight of occupants plus cargo and luggage load), you have to reduce the cargo and luggage on your vehicle.

For details about total load capacity, see "Vehicle load limits" in this Section.

CAUTION

Even if the total load of occupant's weight and the cargo load is less than the total load capacity, do not apply the load unevenly. That may cause not only damage to the tire but also deterioration to the steering ability due to unbalance of the vehicle, causing an accident.

Types of tires

Determine what kind of tires your vehicle is originally equipped with.

1. Summer tires

Summer tires are high- speed capability tires best suited to highway driving under dry conditions.

Since summer tires do not have the same traction performance as snow tires, summer tires are inadequate for driving on snow- covered or icy roads. For driving on snow- covered or icy roads, we recommend using snow tires. If installing snow tires, be sure to replace all four tires.

2. All season tires

All season tires are designed to provide better traction in snow and to be adequate for driving in most winter conditions, as well as for use all year round.

All season tires, however, do not have adequate traction performance compared with snow tires in heavy or loose snow. Also, all season tires fall short in acceleration and handling performance compared with summer tires in highway driving.

The details about how to distinguish summer tires from all season tires are described “—Tire symbols” in Section 2.

CAUTION

- ▶ **Do not mix summer and all season tires on your vehicle as this can cause dangerous handling characteristics, resulting in loss of control.**
- ▶ **Do not use tires other than the manufacturer's designated tires, and never mix tires or wheels of the sizes different from the originals.**

'05 TUNDRA_U (L/O 0409)

SECTION 3

STARTING AND DRIVING

Starting and driving

Before starting the engine	372
How to start the engine	372
Tips for driving in various conditions	373
Off- road driving precautions	375
Winter driving tips	376
Dinghy towing	377
Trailer towing	378
How to save fuel and make your vehicle last longer	389

Before starting the engine

1. Check the area around the vehicle before entering it.
2. Adjust seat position, seatback angle, seat cushion angle, head restraint height and steering wheel angle.
3. Adjust the inside and outside rear view mirrors.
4. Lock all doors.
5. Fasten seat belts.

How to start the engine— —Cranking hold function (with automatic transmission)

Once you turn the ignition key to "START" position and release it, the cranking hold function continues to crank the engine in "ON" position until it starts.

The function stops cranking the engine after about 25 seconds maximum if the engine has not started yet. When you crank the engine again, wait a few seconds and restart it.

If you hold the key in "START" position, the function will keep cranking for about 30 seconds maximum.

(a) Before cranking

1. Apply the parking brake firmly.
2. Turn off unnecessary lights and accessories.
3. **Manual transmission:** Press the clutch pedal to the floor and shift the transmission into neutral. Hold the clutch pedal to the floor until the engine is started. A starter safety device will prevent the starter from operating if the clutch pedal is not fully depressed.
Automatic transmission: Put the selector lever in "P". If you need to restart the engine while the vehicle is moving, put the selector lever in "N". A starter safety device will prevent the starter from operating if the selector lever is in any drive position.
4. **Automatic transmission only:** Depress the brake pedal and hold it to the floor until driving off.

(b) Starting the engine

Before starting the engine, be sure to follow the instructions in "(a) Before cranking".

Normal starting procedure

The multiport fuel injection system/sequential multiport fuel injection system in your engine automatically controls the proper air-fuel mixture for starting. You can start a cold or hot engine as follows:

With manual transmission—With your foot off the accelerator pedal, crank the engine by turning the ignition key to "START" position. Release it when the engine starts.

With automatic transmission—With your foot off the accelerator pedal, turn the ignition key to "START" position, then release it.

Engine should be warmed up by driving, not in idle. For warming up, drive with smoothly turning engine until engine coolant temperature is within normal range.

If the engine stalls...

Simply restart it, using the correct procedure given in normal starting.

If the engine will not start...

See "If your vehicle will not start" in Section 4.

NOTICE

◆ *With manual transmission only—Do not crank for more than 30 seconds at a time. This may overheat the starter and wiring systems.*

◆ *Do not race a cold engine.*

◆ *If the engine becomes difficult to start or stalls frequently, have the engine checked immediately.*

Tips for driving in various conditions

- ▶ Always slow down in gusty crosswinds. This will allow you much better control.
- ▶ Drive slowly onto curbs and, if possible, at a right angle. Avoid driving onto high, sharp-edged objects and other road hazards. Failure to do so can lead to severe tire damage such as a tire burst.

Drive slowly when passing over bumps or travelling on a bumpy road. Otherwise, the impact could cause severe damage to the tires and/or wheels.
- ▶ When parking on a hill, turn the front wheels until they touch the curb so that the vehicle will not roll. Apply the parking brake, and place the transmission in "P" (automatic) or in first or reverse (manual). If necessary, block the wheels.

- ▶ Washing your vehicle or driving through deep water may get the brakes wet. To see whether they are wet, check that there is no traffic near you, and then press the pedal lightly. If you do not feel a normal braking force, the brakes are probably wet. To dry them, drive the vehicle cautiously while lightly pressing the brake pedal with the parking brake applied. If they still do not work safely, pull to the side of the road and call a Toyota dealer for assistance.
- ▶ Four-wheel drive models only—Toyota recommends not using four-wheel drive on dry hard-surfaced roads, because four-wheel driving will cause unnecessary noise and wear, and poor fuel economy.
- ▶ Four-wheel drive models only—In cold temperatures, noise may occur when driving in two-wheel drive before the transfer is warmed up. Therefore, first drive in four-wheel drive until the transfer is warmed up.

 **CAUTION**

- ▶ Before driving off, make sure that the parking brake is fully released and the parking brake reminder light is off.
- ▶ Do not leave your vehicle unattended while the engine is running.
- ▶ Do not rest your foot on the brake pedal while driving. It can cause dangerous overheating, needless wear, and poor fuel economy.
- ▶ To drive down a long or steep hill, reduce your speed and downshift. Remember, if you ride the brakes excessively, they may overheat and not work properly.
- ▶ Be careful when accelerating, upshifting, downshifting or braking on a slippery surface. Sudden acceleration or engine braking could cause the vehicle to skid or spin.

- ▶ Do not drive in excess of the speed limit. Even if the legal speed limit permits it, do not drive over 140 km/h (85 mph) unless your vehicle has high-speed capability tires. Driving over 140 km/h (85 mph) may result in tire failure, loss of control and possible injury. Be sure to consult a tire dealer to determine whether the tires on your vehicle are high-speed capability tires or not before driving at such speeds.
- ▶ Do not continue normal driving when the brakes are wet. If they are wet, your vehicle will require a longer stopping distance, and it may pull to one side when the brakes are applied. Also, the parking brake will not hold the vehicle securely.

Off-road driving precautions

When driving your vehicle off-road, please observe the following precautions to ensure your driving enjoyment and to help prevent the closure of areas to off-road vehicles.

- a. Drive your vehicle only in areas where off-road vehicles are permitted to travel.
- b. Respect private property. Get owner's permission before entering private property.
- c. Do not enter areas that are closed. Honor gates, barriers and signs that restrict travel.
- d. Stay on established roads. When conditions are wet, driving techniques should be changed or travel delayed to prevent damage to roads.

For owners in U.S. mainland, Hawaii and Puerto Rico:

To obtain additional information pertaining to driving your vehicle off-road, consult the following organizations.

- ▶ State and Local Parks and Recreation Departments
- ▶ State Motor Vehicle Bureau
- ▶ Recreational Vehicle Clubs

- ▶ U.S. Forest Service and Bureau of Land Management

 **CAUTION**

Always observe the following precautions to minimize the risk of serious personal injury or damage to your vehicle:

- ▶ Drive carefully when off the road. Do not take unnecessary risks by driving in dangerous places.
- ▶ Do not grip the steering wheel spokes when driving off-road. A bad bump could jerk the wheel and injure your hands. Keep both hands and especially your thumbs on the outside of the rim.
- ▶ Always check your brakes for effectiveness immediately after driving in sand, mud, water or snow.

- ▶ After driving through tall grass, mud, rock, sand, rivers, etc., check that there is no grass, bush, paper, rags, stone, sand, etc. adhering or trapped on the underbody. Clear off any such matter from the underbody. If the vehicle is used with these materials trapped or adhering to the underbody, a breakdown or fire could occur.
 - ▶ In a rollover crash, an unbelted person is significantly more likely to die than a person wearing a seat belt. Therefore, the driver and all passengers should fasten their seat belts whenever the vehicle is moving.
 - ▶ When driving off-road or in rugged terrain, do not drive at excessive speeds, jump, make sharp turns, strike objects, etc. This may cause loss of control or vehicle rollover causing death or serious injury. You are also risking expensive damage to your vehicle's suspension and chassis.

NOTICE

- ◆ *If driving through water, such as when crossing shallow streams, first check the depth of the water and the bottom of the river bed for firmness. Drive slowly and avoid deep water.*
- ◆ *Take all necessary safety measures to ensure that water damage to the engine or other components does not occur.*

Water entering the engine air intake will cause severe engine damage.

Water can wash the grease from wheel bearings, causing rusting and premature failure, and may also enter the differentials, transmission and transfer case, reducing the gear oil's lubricating qualities.
- ◆ *Sand and mud that has accumulated in brake drums and around brake discs may affect braking efficiency and may damage brake system components.*

◆ *Always perform a maintenance inspection after each day of off-road driving that has taken you through rough terrain, sand, mud, or water. For scheduled maintenance information, refer to the "Scheduled Maintenance Guide" or "Owner's Manual Supplement".*

Winter driving tips

Make sure your coolant is properly protected against freezing.

Only use "Toyota Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, and non-borate coolant with long-life hybrid organic acid technology. (Coolant with long-life hybrid organic acid technology is a combination of low phosphates and organic acids.)

See "Checking the engine coolant level" in Section 7-2 for details of coolant type selection.

For the U.S.A.—"Toyota Super Long Life Coolant" is a mixture of 50% coolant and 50% deionized water. This coolant provides protection down to about -35◄ (-31◄).

For Canada—"Toyota Super Long Life Coolant" is a mixture of 55% coolant and 45% deionized water. This coolant provides protection down to about -42◄ (-44◄).

NOTICE

Do not use plain water alone.

Check the condition of the battery and cables.

Cold temperatures reduce the capacity of any battery, so it must be in top shape to provide enough power for winter starting. Section 7-3 tells you how to visually inspect the battery. Your Toyota dealer and most service stations will be pleased to check the level of charge.

Make sure the engine oil viscosity is suitable for the cold weather.

See Section 7-2 for recommended viscosity. Leaving a heavy summer oil in your vehicle during winter months may cause harder starting. If you are not sure about which oil to use, call your Toyota dealer—they will be pleased to help.

Keep the door locks from freezing.

Squirt lock de-icer or glycerine into the locks to keep them from freezing. To open a frozen lock, try heating the key before inserting it.

Use a washer fluid containing an anti-freeze solution.

This product is available at your Toyota dealer and most auto parts stores. Follow the manufacturer's directions for how much to mix with water.

NOTICE

Do not use engine antifreeze or any other substitute because it may damage your vehicle's paint.

Do not use your parking brake when there is a possibility it could freeze.

When parking, put the transmission into "P" (automatic) or into first or reverse (manual) and block the front wheels. Do not use the parking brake, or snow or water accumulated in and around the parking brake mechanism may freeze, making it hard to release.

Keep ice and snow from accumulating under the fenders.

Ice and snow built up under your fenders can make steering difficult. During bad winter driving, stop and check under the fenders occasionally.

Depending on where you are driving, we recommend you carry some emergency equipment.

Some of the things you might put in the vehicle are tire chains, window scraper, bag of sand or salt, flares, small shovel, jumper cables, etc.

Dinghy towing

Your vehicle is not designed to be dinghy towed (with four wheels on the ground) behind a motorhome.

NOTICE

Do not tow your vehicle with four wheels on the ground. This may cause serious damage to your vehicle.

Trailer towing

Your vehicle is designed primarily as a passenger- and load-carrying vehicle. Towing a trailer will have an adverse effect on handling, performance, braking, durability and driving economy (fuel consumption, etc.). Your safety and satisfaction depend on the proper use of correct equipment and cautious driving habits. For your safety and the safety of others, you must not overload your vehicle or trailer. Ask your local Toyota dealer for further details before towing.

We recommend you use a weight distributing hitch when towing to keep your vehicle level with the ground.

NOTICE

When towing a trailer, be sure to consult your Toyota dealer for further information on additional requirements such as a towing kit, etc.

WEIGHT LIMITS

Before towing, make sure the total trailer weight, gross combination weight, gross vehicle weight, gross axle weight and trailer tongue load are all within the limits.

The total trailer weight and tongue load can be measured with platform scales found at highway weighing stations, building supply companies, trucking companies, junk yards, etc.

CAUTION

▶ **The maximum gross trailer weight (trailer weight plus cargo weight) must never exceed the following.**

1GR-FE engine

Standard cab models
2358 kg (5200 lb.)
Access cab models
2268 kg (5000 lb.)

2UZ-FE engine

Two-wheel drive models

Standard cab models

Without towing package
2494 kg (5500 lb.)

With towing package
3311 kg (7300 lb.)

Access cab models

Without towing package
2494 kg (5500 lb.)

With towing package
3311 kg (7300 lb.)

Double cab models

Without towing package
2358 kg (5200 lb.)

With towing package
3175 kg (7000 lb.)

'05 TUNDRA_U (L/O 0409)

Four-wheel drive models	
Standard cab models	
Without towing package	2494 kg (5500 lb.)
With towing package	3311 kg (7300 lb.)
Access cab models	
Without towing package	2358 kg (5200 lb.)
With towing package	3175 kg (7000 lb.)
Double cab models	
Without towing package	2222 kg (4900 lb.)
With towing package	3039 kg (6700 lb.)

If towing a trailer and cargo weighing over 907 kg (2000 lb.), it is necessary to use a sway control device with sufficient capacity. The combination of the gross trailer weight added to the total weight of the vehicle, occupants and vehicle cargo must never exceed a total of the following.

1GR-FE engine
4173 kg (9200 lb.)

2UZ-FE engine
Without towing package
4536 kg (10000 lb.)
With towing package
5352 kg (11800 lb.)

Exceeding the maximum weight of the trailer, the vehicle, or the vehicle and trailer combination, can cause an accident resulting in serious personal injuries.

► Trailer hitch assemblies have different weight capacities established by the hitch manufacturer. Even though the vehicle may be physically capable of towing a higher weight, the operator must determine the maximum weight rating of the particular hitch assembly and never exceed the maximum weight rating specified for the trailer-hitch. Exceeding the maximum weight rating set by the trailer hitch manufacturer can cause an accident resulting in serious personal injuries.

'05 TUNDRA_U (L/O 0409)

► The gross vehicle weight must not exceed the Gross Vehicle Weight Rating (GVWR) indicated on the Certification Label. The gross vehicle weight is the sum of weights of the unloaded vehicle, driver, passengers, luggage, hitch and trailer tongue load. It also includes the weight of any special equipment installed on your vehicle.

► The load on either the front or rear axle resulting from distribution of the gross vehicle weight on both axles must not exceed the Gross Axle Weight Rating (GAWR) listed on the Certification Label.

► The trailer cargo load should be distributed so that the tongue load is 9 to 11% of the total trailer weight, not exceeding the maximum load of the following.

Weight carrying hitch or distributing hitch

1GR-FE engine

Standard cab models

236 kg (520 lb.)

Access cab models

227 kg (500 lb.)

2UZ-FE engine

Two-wheel drive models

Standard cab models

Without towing package

249 kg (550 lb.)

With towing package

331 kg (730 lb.)

Access cab models

With towing package
318 kg (700 lb.)

Four-wheel drive models

Standard cab models

Without towing package
249 kg (550 lb.)

With towing package
331 kg (730 lb.)

Access cab models

Without towing package
236 kg (520 lb.)

With towing package
318 kg (700 lb.)

Double cab models

Without towing package
222 kg (490 lb.)

With towing package
304 kg (670 lb.)

However, if towing with a fifth wheel trailer, the cargo load must be distributed so that the tongue load is 19 to 21% of the total trailer weight. Never load the trailer with more weight in the back than in the front. About 60% of the trailer load should be in the front half of the trailer and the remaining 40% in the rear.

HITCHES

- ▶ If you wish to install a trailer hitch, you should consult with your Toyota dealer.
- ▶ Use only a hitch recommended by the hitch manufacturer and the one which conforms to the total trailer weight requirement.
- ▶ The hitch must be bolted securely to the vehicle frame and installed according to the hitch manufacturer's instructions.
- ▶ The hitch ball and king pin should have a light coat of grease.
- ▶ Toyota recommends removing the trailer hitch whenever you are not towing a trailer to reduce the possibility of additional damage caused by the hitch if your vehicle is struck from behind. After removing the hitch, seal any mounting holes in the vehicle body to prevent entry of pollutants such as exhaust fumes, dirt, water, etc.

NOTICE

Do not use axle-mounted hitches as they can cause damage to the axle housing, wheel bearings, wheels or tires. Also, never install a hitch which may interfere with the normal function of an Energy Absorbing Bumper, if so equipped.

- 1 Trailer ball load rating
- 2 Ball diameter
- 3 Shank length
- 4 Shank diameter

TRAILER BALL

Follow these easy steps to properly determine the correct trailer ball for your application:

1. Determine the correct trailer ball size for the trailer coupler. Most couplers are stamped with the required trailer ball size. The sizes you will most likely find stamped on the coupler are:

Trailer class	Typical trailer ball size
IV	2 5/16 in.
II and III	2 in.
I	1 7/8 in.

2. Select the appropriate trailer ball to match or exceed the gross trailer weight rating of the trailer. The trailer ball load rating should be printed on the top of the ball.
3. When mounted in the ball mount, the threaded ball shank must protrude beyond the bottom of the lock washer and nut at least 2 threads. The trailer ball shank must be matched to the ball mount hole diameter size.

NOTICE

Vehicles with 2UZ-FE engine (with towing package)—Only use a ball mount attachment specified for the Toyota Tundra.

BUMPER TOWING

The rear bumper of your vehicle is equipped with a hole to install a trailer ball. The maximum gross trailer weight is 2268 kg (5000 lb.).

! CAUTION

The maximum gross trailer weight (trailer weight plus cargo weight) when towing with the bumper must never exceed 2268 kg (5000 lb.).

FIFTH WHEEL TRAILER

NOTICE

When towing a fifth wheel trailer, be careful not to hit the cabin or deck by the trailer while making a sharp turn.

MATCHING TRAILER BALL HEIGHT TO TRAILER COUPLER HEIGHT

No matter which class of tow hitch applies, for a safe trailer hookup, the trailer ball setup on must be the proper height for the coupler on the trailer.

BRAKES AND SAFETY CHAINS

- ▶ Toyota recommends trailers with brakes that conform to any applicable federal and state/provincial regulations.
- ▶ A safety chain must always be used between the towing vehicle and the trailer. Leave sufficient slack in the chain for turns. The chain should cross under the trailer tongue to prevent the tongue from dropping to the ground in case it becomes damaged or separated. For correct safety chain procedures, follow the hitch or trailer manufacturer's recommendations.

- 1 Coupler
- 2 Trailer ball

CAUTION

- ▶ If the total trailer weight exceeds 453 kg (1000 lb.), trailer brakes are required.
- ▶ Never tap into your vehicle's hydraulic system as it would lower its braking effectiveness.
- ▶ Never tow a trailer without using a safety chain securely attached to both the trailer and the vehicle. If damage occurs to the coupling unit or hitch ball, there is danger of the trailer wandering over into another lane.

'05 TUNDRA_U (L/O 0409)

Standard and access cab models

Double cab models

SERVICE CONNECTOR FOR TOWING BRAKE CONTROLLER (with towing package)

Your vehicle is equipped with a service connector for the trailer brake controller as shown. Link the connector to the trailer brake controller via the sub wire harness stored in the glove box. The detailed explanation of the sub wire harness circuit is packed together with the sub wire harness.

Be sure to position the trailer brake controller where it does not prevent the driver from operating the pedal.

Toyota recommends that the sub wire harness be stored in the glove box when it is not in use.

TIRES

- ▶ Ensure that your vehicle's tires are properly inflated. See Section 7-2 and Section 8 for instructions.
- ▶ The trailer tires should be inflated to the pressure recommended by the trailer manufacturer in respect to the total trailer weight.

4-pin connector

7-pin connector

TOWING CONNECTOR FOR TRAILER LIGHTS

- ▶ Your vehicle is equipped with a wire harness stored in the rear end under body. Some models are fitted with a socket for trailer lights under the rear bumper. Use either of them to connect and operate the trailer lights. However, the trailer lights must comply with federal, state/provincial and local regulations. See your local recreational vehicle dealer or rental agency for the correct type of wiring and relays for your trailer. Check for correct operation of the turn signals and stop lights each time you hitch up. Direct splicing may damage your vehicle's electrical system and cause a malfunction of your lights. 7-pin connector (with towing package)—This can be also connected to the trailer brake and trailer sub battery.

BREAK-IN SCHEDULE

- ▶ Toyota recommends that you do not tow a trailer with a new vehicle or a vehicle with any new power train component (engine, transmission, differential, wheel bearings, etc.) for the first 800 km (500 miles) of driving.

MAINTENANCE

- ▶ If you tow a trailer, your vehicle will require more frequent maintenance due to the additional load. For this information, please refer to the scheduled maintenance information in the "Scheduled Maintenance Guide" or "Owner's Manual Supplement".
- ▶ Retighten all fixing bolts of the towing ball and bracket after approximately 1000 km (600 miles) of trailer driving.

PRE-TOWING SAFETY CHECK

- ▶ Check that your vehicle remains level when a loaded or unloaded trailer is hitched. Do not drive if the vehicle has an abnormal nose-up or nose-down condition, and check for improper tongue load, overload, worn suspension or other possible causes.
- ▶ Make sure the trailer cargo is securely loaded so that it cannot shift.

- ▶ Check that your rear view mirrors conform to any applicable federal, state/provincial or local regulations. If not, install the rear view mirrors required for towing purposes.

TRAILER TOWING TIPS

When towing a trailer, your vehicle will handle differently than when not towing. The three main causes of vehicle-trailer accidents are driver error, excessive speed and improper trailer loading. Keep these in mind when towing:

- ▶ Before starting out, check operation of the lights and all vehicle-trailer connections. After driving a short distance, stop and recheck the lights and connections. Before actually towing a trailer, practice turning, stopping and backing with a trailer in an area away from traffic until you learn the feel.

'05 TUNDRA_U (L/O 0409)

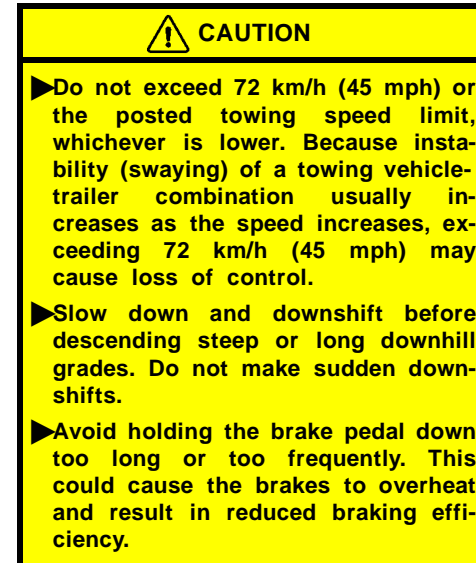

- ▶ Backing with a trailer is difficult and requires practice. Grip the bottom of the steering wheel and move your hand to the left to move the trailer to the left. Move your hand to the right to move the trailer to the right. (This procedure is generally opposite to that when backing without a trailer). Also, just turn the steering wheel a little at a time, avoiding sharp or prolonged turning. Have someone guide you when backing to reduce the risk of an accident.
- ▶ Because stopping distance may be increased, vehicle-to-vehicle distance should be increased when towing a trailer. For each 16 km/h (10 mph) of speed, allow at least one vehicle and trailer length between you and the vehicle ahead. Avoid sudden braking as you may skid, resulting in jackknifing and loss of control. This is especially true on wet or slippery surfaces.
- ▶ Avoid jerky starts or sudden acceleration. If your vehicle has a manual transmission, prevent excessive clutch slippage by keeping engine rpm low and not racing the engine. Always start out in first gear.
- ▶ Avoid jerky steering and sharp turns. The trailer could hit your vehicle in a tight turn. Slow down before making a turn to avoid the necessity of sudden braking.
- ▶ Remember that when making a turn, the trailer wheels will be closer than the vehicle wheels to the inside of the turn. Therefore, compensate for this by making a larger than normal turning radius with your vehicle.
- ▶ Crosswinds and rough roads will adversely affect handling of your vehicle and trailer, causing sway. Pay attention to the rear from time to time to prepare yourself for being passed by large trucks or buses, which may cause your vehicle and trailer to sway. If swaying happens, firmly grip the steering wheel and reduce speed immediately but gradually. Never increase speed. Steer straight ahead. If you make no extreme correction with the steering or brakes, the vehicle and trailer will stabilize.
- ▶ Be careful when passing other vehicles. Passing requires considerable distance. After passing a vehicle, do not forget the length of your trailer and be sure you have plenty of room before changing lanes.
- ▶ In order to maintain engine braking efficiency, do not use sixth gear (manual transmission) or overdrive (automatic transmission).
- ▶ Because of the added load of the trailer, your vehicle's engine may overheat on hot days (at temperatures over 30°C [85°F]) when going up a long or steep grade with a trailer. If the engine coolant temperature gauge indicates overheating, immediately turn off the air conditioning (if in use), pull off the road and stop in a safe spot. Refer to "If your vehicle overheats" in Section 4.

'05 TUNDRA_U (L/O 0409)

- Always place wheel blocks under both the vehicle and trailer wheels when parking. Apply the parking brake firmly. Put the transmission in "P" (automatic) or in first or reverse (manual). Avoid parking on a slope with a trailer, but if it cannot be avoided, do so only after performing the following:
1. Apply the brakes and hold.
 2. Have someone place wheel blocks under both the vehicle and trailer wheels.
 3. When the wheel blocks are in place, release your brakes slowly until the blocks absorb the load.
 4. Apply the parking brake firmly.
 5. Shift into first or reverse (manual) or "P" (automatic) and turn off the engine.

When restarting out after parking on a slope:

1. With the transmission in "P" position (automatic) or the clutch pedal depressed (manual), start the engine. (With an automatic transmission, be sure to keep the brake pedal depressed.)
2. Shift into gear.
3. Release the parking brake (also foot brake on automatic transmission vehicles) and slowly pull or back away from the wheel blocks. Stop and apply your brakes.
4. Have someone retrieve the blocks.

How to save fuel and make your vehicle last longer

Improving fuel economy is easy—just take it easy. It will help make your vehicle last longer, too. Here are some specific tips on how to save money on both fuel and repairs:

- ▶ **Keep your tires inflated at the correct pressure.** Underinflation causes tire wear and wastes fuel. See Section 7-2 for instructions.
- ▶ **Do not carry unneeded weight in your vehicle.** Excess weight puts a heavier load on the engine, causing greater fuel consumption.
- ▶ **Avoid lengthy warm-up idling.** Once the engine is running smoothly, begin driving—but gently. Remember, however, that on cold winter days this may take a little longer.
- ▶ **Always keep the automatic transmission overdrive switch turned on.** Driving with the overdrive switch off will reduce the fuel economy. (For details, see “Automatic transmission” in Section 1-7.)
- ▶ **Accelerate slowly and smoothly.** Avoid jackrabbit starts. Get into high gear as quickly as possible.
- ▶ **Avoid long engine idling.** If you have a long wait and you are not in traffic, it is better to turn off the engine and start again later.
- ▶ **Avoid engine lugging or over-revving.** Use a gear position suitable for the road on which you are travelling.
- ▶ **Avoid continuous speeding up and slowing down.** Stop-and-go driving wastes fuel.
- ▶ **Avoid unnecessary stopping and braking.** Maintain a steady pace. Try to time the traffic signals so you only need to stop as little as possible or take advantage of through streets to avoid traffic lights. Keep a proper distance from other vehicles to avoid sudden braking. This will also reduce wear on your brakes.
- ▶ **Avoid heavy traffic or traffic jams whenever possible.**
- ▶ **Do not rest your foot on the clutch or brake pedal.** This causes premature wear, overheating and poor fuel economy.
- ▶ **Maintain a moderate speed on highways.** The faster you drive, the greater the fuel consumption. By reducing your speed, you will cut down on fuel consumption.
- ▶ **Keep the front wheels in proper alignment.** Avoid hitting the curb and slow down on rough roads. Improper alignment not only causes faster tire wear but also puts an extra load on the engine, which, in turn, wastes fuel.
- ▶ **Keep the bottom of your vehicle free from mud, etc.** This not only lessens weight but also helps prevent corrosion.
- ▶ **Keep your vehicle tuned-up and in top shape.** A dirty air cleaner, improper valve clearance, dirty plugs, dirty oil and grease, brakes not adjusted, etc. all lower engine performance and contribute to poor fuel economy. For longer life of all parts and lower operating costs, keep all maintenance work on schedule, and if you often drive under severe conditions, see that your vehicle receives more frequent maintenance. (For scheduled maintenance information, please refer to the “Scheduled Maintenance Guide” or “Owner’s Manual Supplement”.)

CAUTION

Never turn off the engine to coast down hills. Your power steering and brake booster will not function without the engine running. Also, the emission control system operates properly only when the engine is running.

SECTION 4

IN CASE OF AN EMERGENCY

In case of an emergency

If your vehicle will not start	392
If your engine stalls while driving	396
If you cannot increase engine speed	396
If your vehicle overheats	396
If you have a flat tire	397
If your vehicle becomes stuck	409
If your vehicle needs to be towed	410
If you lose your keys	415
If you lose your wireless remote control transmitter	416

**If your vehicle will not start—
(a) Simple checks**

Before making these checks, make sure you have followed the correct starting procedure given in "How to start the engine" in Section 3 and that you have sufficient fuel.

If the engine is not turning over or is turning over too slowly—

1. Check that the battery terminals are tight and clean.
2. If the battery terminals are O.K., switch on the interior light.
3. If the light is out, dim or goes out when the starter is cranked, the battery is discharged. You may try jump starting. See "(c) Jump starting" for further instructions.

If the light is O.K., but the engine still will not start, it needs adjustment or repair. Call a Toyota dealer or qualified repair shop.

NOTICE

Do not pull- or push-start the vehicle. Your vehicle may suddenly move when the engine starts, and may damage itself or cause a collision. Also the three-way catalytic converter may overheat and become a fire hazard.

If the engine turns over at its normal speed but will not start—

1. Turn the ignition key to "ACC" or "LOCK" and try starting the engine again.
2. If the engine will not start, the engine may be flooded because of repeated cranking. See "(b) Starting a flooded engine" for further instructions.
3. If the engine still will not start, it needs adjustment or repair. Call a Toyota dealer or qualified repair shop.

(b) Starting a flooded engine

If the engine will not start, your engine may be flooded because of repeated cranking.

With manual transmission—

If this happens, turn the ignition key to "START" with the accelerator pedal fully depressed. Keep the key and accelerator pedal in these positions for 15 seconds and release them. Then try starting the engine with your foot off the accelerator pedal.

If the engine does not start after 15 seconds of cranking, release the key, wait a few minutes and try again.

If the engine still will not start, it needs adjustment or repair. Call a Toyota dealer or qualified repair shop for assistance.

NOTICE

Do not crank for more than 30 seconds at a time. This may overheat the starter and wiring systems.

With automatic transmission—

If this happens, turn the ignition key to "START" with the accelerator pedal fully depressed, and hold the key at this position for about 30 seconds. Then the cranking hold function stops cranking automatically, and you can try starting the engine with your foot off the accelerator pedal.

If the engine does not start, wait a few minutes and try again.

If the engine still will not start, it needs adjustment or repair. Call a Toyota dealer or qualified repair shop for assistance.

(c) Jump starting

To avoid serious personal injury and damage to your vehicle which might result from battery explosion, acid burns, electrical burns, or damaged electronic components, these instructions must be followed precisely.

If you are unsure about how to follow this procedure, we strongly recommend that you seek the help of a competent mechanic or towing service.

 CAUTION
<p>▶ Batteries contain sulfuric acid which is poisonous and corrosive. Wear protective safety glasses when jump starting, and avoid spilling acid on your skin, clothing, or vehicle.</p> <p>▶ If you should accidentally get acid on yourself or in your eyes, remove any contaminated clothing and flush the affected area with water immediately. Then get immediate medical attention. If possible, continue to apply water with a sponge or cloth while en route to the medical office.</p>

▶ **The gas normally produced by a battery will explode if a flame or spark is brought near. Use only standardized jumper cables and do not smoke or light a match while jump starting.**

NOTICE
<p><i>The battery used for boosting must be 12 V. Do not jump start unless you are sure that the booster battery is correct.</i></p>

JUMP STARTING PROCEDURE

1. If the booster battery is installed in another vehicle, make sure the vehicles are not touching. Turn off all unnecessary lights and accessories.

When boosting, use the battery of matching or higher quality. Any other battery may be difficult to jump start with.

If jump starting is difficult, charge the battery for several minutes.

2. If required, remove all the vent plugs from the booster and discharged batteries. Lay a cloth over the open vents on the batteries. (This helps reduce the explosion hazard, personal injuries and burns.)
3. If the engine in the vehicle with the booster battery is not running, start it and let it run for a few minutes. During jump starting, run the engine at about 2000 rpm with the accelerator pedal lightly depressed.

4. Make the cable connections in the order a, b, c, d.

a. Connect the clamp of the positive (red) jumper cable to the positive (+) terminal on the discharged battery.

b. Connect the clamp at the other end of the positive (red) jumper cable to the positive (+) terminal on the booster battery.

c. Connect the clamp of the negative (black) jumper cable to the negative (-) terminal on the booster battery.

d. Connect the clamp at the other end of the negative (black) jumper cable to a solid, stationary, unpainted, metallic point of the vehicle with the discharged battery.

The recommended connecting points are shown in the following illustrations:

'05 TUNDRA_U (L/O 0409)

Connecting point for 1GR-FE engine

Connecting point for 2UZ-FE engine

Do not connect the cable to or near any part that moves when the engine is cranked.

CAUTION

When making the connections, to avoid serious injury, do not lean over the battery or accidentally let the jumper cables or clamps touch anything except the correct battery terminals or the ground.

5. With automatic transmission—Charge the discharged battery with the jumper cables connected for approximately 5 minutes. At this time, run the engine in the vehicle with the booster battery at about 2000 rpm with the accelerator pedal lightly depressed.
6. Start your engine in the normal way. After starting, run it at about 2000 rpm for several minutes with the accelerator pedal lightly depressed.
7. Carefully disconnect the cables in the exact reverse order: the negative cable and then the positive cable.
8. Carefully dispose of the battery cover cloths—they may now contain sulfuric acid.

9. If removed, replace all the battery vent plugs.

If the cause of your battery discharging is not apparent (for example, lights left on), you should have it checked at your Toyota dealer.

If the first start attempt is not successful...

Check that the clamp on the jumper cables are tight. Recharge the discharged battery with the jumper cables connected for several minutes and restart your engine in the normal way.

If the another attempt is not successful, the battery may be depleted. Have it checked at your Toyota dealer.

If your engine stalls while driving

If your engine stalls while driving...

1. Reduce your speed gradually, keeping a straight line. Move cautiously off the road to a safe place.
2. Turn on your emergency flashers.
3. Turn the ignition key to "ACC" or "LOCK", and try starting the engine again.

If the engine will not start, see "If your vehicle will not start".

If the engine is not running, the power assist for the brakes and steering will not work, so steering and braking will be much harder than usual.

If you cannot increase engine speed

If engine speed does not increase when the accelerator pedal is depressed, there may be a problem somewhere in the electronic throttle control system.

At this time, vibration may occur. However, if you depress the accelerator pedal more firmly and slowly, you can drive your vehicle at low speeds. Have your vehicle checked by your Toyota dealer as soon as possible.

Even if the abnormality of the electronic throttle control system is corrected during low speed driving, the system may not be recovered until the engine is stopped and the ignition key is turned to "ACC" or "LOCK" position.

Be especially careful to prevent erroneous pedal operation.

If your vehicle overheats

If your engine coolant temperature gauge indicates overheating, if you experience a loss of power, or if you hear a loud knocking or pinging noise, the engine has probably overheated. You should follow this procedure...

1. Pull safely off the road, stop the vehicle and turn on your emergency flashers. Put the transmission in "P" (automatic) or neutral (manual) and apply the parking brake. Turn off the air conditioning if it is being used.
2. If coolant or steam is boiling out of the radiator or reservoir, stop the engine. Wait until the steam subsides before opening the hood. If there is no coolant boiling over or steam, leave the engine running.

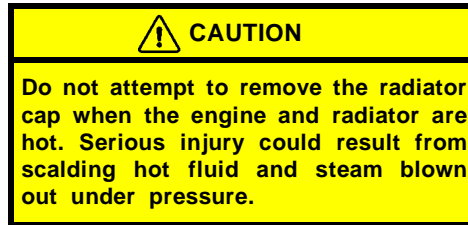

To help avoid personal injury, keep the hood closed until there is no steam. Escaping steam or coolant is a sign of very high pressure.

3. Visually check to see if the engine drive belt (fan belt) is broken or loose. Look for obvious coolant leaks from the radiator, hoses, and under the vehicle. However, note that water draining from the air conditioning is normal if it has been used.

4. If the engine drive belt is broken or the coolant is leaking, stop the engine immediately. Call a Toyota dealer for assistance.
5. If the engine drive belt is O.K. and there are no obvious leaks, you may help the engine cool down more quickly by running it at about 1500 rpm for a few minutes with the accelerator pedal lightly depressed.
6. Check the coolant reservoir. If it is dry, add coolant to the reservoir while the engine is running. Fill it about half full. For the coolant type, see "Coolant type selection" in Section 7-2.

7. After the engine coolant temperature has cooled to normal, again check the coolant level in the reservoir. If necessary, bring it up to half full again. Serious coolant loss indicates a leak in the system. You should have it checked as soon as possible at your Toyota dealer.

If you have a flat tire—

1. Reduce your speed gradually, keeping a straight line. Move cautiously off the road to a safe place well away from the traffic. Avoid stopping on the center divider of a highway. Park on a level spot with firm ground.
2. Stop the engine and turn on your emergency flashers.
3. Firmly set the parking brake and put the transmission in "P" (automatic) or reverse (manual).
4. Have everyone get out of the vehicle on the side away from traffic.
5. Read the following instructions thoroughly.

 CAUTION

When jacking, be sure to observe the following to reduce the possibility of personal injury:

- ▶ Follow jacking instructions.
- ▶ Do not put any part of your body under the vehicle supported by the jack. Otherwise, personal injury may occur.
- ▶ Do not start or run the engine while your vehicle is supported by the jack.
- ▶ Stop the vehicle on a level firm ground, firmly set the parking brake and put the transmission in "P" (automatic) or reverse (manual). Block the wheel diagonally opposite to the one being changed if necessary.

- ▶ Make sure to set the jack properly in the jack point. Raising the vehicle with jack improperly positioned will damage the vehicle or may allow the vehicle to fall off the jack and cause personal injury.
- ▶ Never get under the vehicle when the vehicle is supported by the jack alone.
- ▶ Use the jack only for lifting your vehicle during wheel changing.
- ▶ Do not raise the vehicle with someone in the vehicle.
- ▶ When raising the vehicle, do not place any objects on top of or underneath the jack.
- ▶ Raise the vehicle only high enough to remove and change the tire.

NOTICE

Do not continue driving with a deflated tire. Driving even a short distance can damage a tire and wheel beyond repair.

—Required tools and spare tire
(standard cab models)

1. Get the required tools and spare tire.

- 1 Jack handle
- 2 Wheel nut wrench
- 3 Jack

To prepare yourself for an emergency, you should familiarize yourself with the use of the jack, each of the tools and their storage locations.

Turn the jack joint by hand.

To remove: Turn the joint in direction 1 until the jack is free.

To store: Turn the joint in direction 2 until the jack is firmly secured to prevent it flying forward during a collision or sudden braking.

To remove the spare tire:

- 1. Insert the end of the jack handle into the lowering screw and turn it counterclockwise.
- 2. After the tire is lowered completely to the ground, remove the holding bracket.

When storing the spare tire, put it in place with the outer side of the wheel facing up. Then secure the tire, taking care that the tire goes straight up without catching on any other part, to prevent it from flying forward during a collision or sudden braking.

—Required tools and spare tire
(access and double cab models)

Access cab models

Double cab models

1. Get the required tools and spare tire.

- 1 Tool bag
- 2 Jack

To prepare yourself for an emergency, you should familiarize yourself with the use of the jack, each of the tools and their storage locations.

Turn the jack joint by hand.

To remove: Turn the joint in direction 1 until the jack is free.

To store: Turn the joint in direction 2 until the jack is firmly secured to prevent it flying forward during a collision or sudden braking.

To remove the spare tire:

1. Put a jack handle, jack handle extension and jack handle end together as shown in the illustration.

- 1 Jack handle end
- 2 Jack handle extension
- 3 Jack handle

⚠ CAUTION

Make sure they are securely fixed with the screw.

2. Insert the end of the jack handle extension into the lowering screw and turn it counterclockwise with the handle.
3. After the tire is lowered completely to the ground, remove the holding bracket.

When storing the spare tire, put it in place with the outer side of the wheel facing up. Then secure the tire, taking care that the tire goes straight up without catching on any other part, to prevent it from flying forward during a collision or sudden braking.

—Blocking the wheel

2. **Block the wheel diagonally opposite the flat tire to keep the vehicle from rolling when it is jacked up.**

When blocking the wheel, place a wheel block in front of one of the front wheels or behind one of the rear wheels.

—Removing wheel ornament

Type A

Type C

Type E

Type B

Type D

3. Remove the wheel ornament.

Pry off the wheel ornament, using the beveled end of the wheel nut wrench as shown.

Type B only—To protect the wheel surface, place sufficient paper or cloth between the wheel and wrench.

⚠ CAUTION

Do not try to pull off the ornament by hand. Take due care in handling the ornament to avoid unexpected personal injury.

—Loosening wheel nuts

⚠ CAUTION

Never use oil or grease on the bolts or nuts. The nuts may loose and the wheels may fall off, which could cause a serious accident.

4. Loosen all the wheel nuts.

Always loosen the wheel nuts before raising the vehicle.

Turn the wheel nuts counterclockwise to loosen. To get maximum leverage, fit the wrench to the nut so that the handle is on the right side, as shown above. Grab the wrench near the end of the handle and pull up on the handle. Be careful that the wrench does not slip off the nut.

Do not remove the nuts yet—just unscrew them about one-half turn.

—Positioning the jack

5. Position the jack at the correct jack point as shown.

Make sure the jack is positioned on a level and solid place.

JACK POINTS:

- Front—Under the frame side rail
- Rear—Under the rear axle housing

Access and double cab models—Put a jack handle, jack handle extension and jack handle end together as shown in the illustration.

- 1 Jack handle end
- 2 Jack handle extension
- 3 Jack handle

CAUTION
Make sure they are each securely fixed with screws.

—Raising your vehicle

Standard cab models

Access and double cab models

6. After making sure that no one is in the vehicle, raise it high enough so that the spare tire can be installed.

Remember you will need more ground clearance when putting on the spare tire than when removing the flat tire.

Standard cab models—To raise the vehicle, insert the jack handle into the jack (it is a loose fit) and turn it clockwise. As the jack touches the vehicle and begins to lift, double-check that it is properly positioned.

Access cab and double cab models—To raise the vehicle, insert the jack handle extension into the jack (it is a loose fit) and turn it clockwise with the handle, making sure the handle remains firmly fitted onto the jack handle extension. As the jack touches the vehicle and begins to lift, double-check that it is properly positioned.

Never get under the vehicle when the vehicle is supported by the jack alone.

—Changing wheels

7. Remove the wheel nuts and change tires.

Lift the flat tire straight off and put it aside.

Roll the spare wheel into position and align the holes in the wheel with the bolts. Then lift up the wheel and get at least the top bolt started through its hole. Wiggle the tire and press it back over the other bolts.

—Reinstalling wheel nuts

Before putting on wheels, remove any corrosion on the mounting surfaces with a wire brush or such. Installation of wheels without good metal- to- metal contact at the mounting surface can cause wheel nuts to loosen and eventually cause a wheel to come off while driving.

8. Reinstall all the wheel nuts finger tight.

Reinstall the wheel nuts (tapered end inward) and tighten them as much as you can by hand. Press back on the tire back and see if you can tighten them more.

⚠ CAUTION

Never use oil or grease on the bolts or nuts. Doing so may lead to overtightening the nuts and damaging the bolts. The nuts may loose and the wheels may fall off, which could cause a serious accident. If there is oil or grease on any bolt or nut, clean it.

—Lowering your vehicle

9. Lower the vehicle completely and tighten the wheel nuts.

Standard cab models—Turn the jack handle counterclockwise to lower the vehicle.

Access cab and double cab models—Turn the jack handle extension counterclockwise with handle to lower the vehicle, making sure the handle remains firmly fitted onto the jack handle extension.

Use only the wheel nut wrench and turn it clockwise to tighten the nuts. Do not use other tools or any additional leverage other than your hands, such as a hammer, pipe or your foot. Make sure the wrench is securely engaged over the nut.

Tighten each nut a little at a time in the order shown. Repeat the process until all the nuts are tight.

⚠ CAUTION

▶ **When lowering the vehicle, make sure all portions of your body and all other persons around will not be injured as the vehicle is lowered to the ground.**

▶ **Have the wheel nuts tightened with torque wrench to 110 N·m (11.5 kgf·m, 83 ft·lbf), as soon as possible after changing wheels. Otherwise, the nuts may loosen and the wheels may fall off, which could cause a serious accident.**

—Reinstalling wheel ornament

Type A

Type B

Type C

Type E

 CAUTION

Take due care in handling the ornament to avoid unexpected personal injury.

Type D

10. Reinstall the wheel ornament.

1. Put the wheel ornament in position.

Type A—Align the cutout of the wheel ornament with the valve stem as shown.

2. Then firmly tap the outer edge of the wheel cap with the side or heel of your hand to snap it into place.

—After changing wheels

11. Check the air pressure of the replaced tire.

Adjust the air pressure to the specification designated in Section 8. If the pressure is lower, drive slowly to the nearest service station and fill to the correct pressure.

Do not forget to reinstall the tire inflation valve cap as dirt and moisture could get into the valve core and possibly cause air leakage. If the cap is missing, have a new one put on as soon as possible.

12. Restow all the tools, jack and flat tire securely.

With a spare tire of the same wheel type as the installed tires—

As soon after changing wheels as possible, tighten the wheel nuts to the torque specified in Section 8 with a torque wrench. Have a technician repair the flat tire.

With a spare tire of different wheel type from the installed tires—

As soon after changing wheels as possible, tighten the wheel nuts to the torque specified in Section 8 with a torque wrench. Have a technician repair the flat tire and replace the spare tire with it.

 CAUTION
Before driving, make sure all the tools, jack and flat tire are securely in place in their storage location to reduce the possibility of personal injury during a collision or sudden braking.

Initial adjustment of the tire pressure warning system is necessary after you have rotated your tires. See “Tire pressure warning system” in Section 1-7.

If your vehicle becomes stuck

If your vehicle becomes stuck in snow, mud, sand, etc., then you may attempt to rock the vehicle free by moving it forward and backward.

If your vehicle is equipped with the “AUTO LSD” system, you can use it in this situation. (For details, see “AUTO LSD system” in Section 1-7.)

 CAUTION
Do not attempt to rock the vehicle free by moving it forward and backward if people or objects are anywhere near the vehicle. During the rocking operation the vehicle may suddenly move forward or backward as it becomes unstuck, causing injury or damage to nearby people or objects.

If your vehicle needs to be towed—

NOTICE

If you rock your vehicle, observe the following precautions to prevent damage to the transmission and other parts.

- ◆ *Do not depress the accelerator pedal while shifting the selector lever or before the transmission is completely shifted to forward or reverse gear.*
- ◆ *Do not race the engine and avoid spinning the wheels.*
- ◆ *If your vehicle remains stuck after rocking the vehicle several times, consider other ways such as towing.*

Two-wheel drive models

Four-wheel drive models

'05 TUNDRA_U (L/O 0409)

If towing is necessary, we recommend you have it done by your Toyota dealer or a commercial tow truck service. In consultation with them, have your vehicle towed using either (a) or (b).

Only when you cannot receive a towing service from a Toyota dealer or commercial tow truck service, tow your vehicle carefully in accordance with the instructions given in “—Emergency towing” in this Section.

Proper equipment will help ensure that your vehicle is not damaged while being towed. Commercial operators are generally aware of the state/provincial and local laws pertaining to towing.

Your vehicle can be damaged if it is towed incorrectly. Although most operators know the correct procedure, it is possible to make a mistake. To avoid damage to your vehicle, make sure the following precautions are observed. If necessary, show this page to the tow truck driver.

TOWING PRECAUTIONS:

Use a safety chain system for all towing, and abide by the state/provincial and local laws. The wheels and axle on the ground must be in good condition. If they are damaged, use a towing dolly.

Two-wheel drive models—

(a) Towing with wheel lift type truck

From front—

▶ Manual transmission:

We recommend using a towing dolly under the rear wheels. If you do not use a towing dolly, release the parking brake and put the transmission in neutral.

▶ Automatic transmission:

Use a towing dolly under the rear wheels.

NOTICE

Never tow a vehicle with an automatic transmission from the front with the rear wheels on the ground, as this may cause serious damage to the transmission.

From rear—Place the ignition key in the “ACC” position.

NOTICE

◆ **When lifting wheels, take care to ensure adequate ground clearance for towing at the opposite end of the raised vehicle. Otherwise, the bumper and/or underbody of the towed vehicle will be damaged during towing.**

◆ **Do not tow with the key removed or in the “LOCK” position, as the steering lock mechanism is not strong enough to hold the front wheels straight while towing.**

(b) Using flat bed truck

Four-wheel drive models—

(a) Towing with wheel lift type truck

From front—Use a towing dolly under the rear wheels.

NOTICE

Never tow a vehicle from the front with the rear wheels on the ground, as this may cause serious damage to the transmission.

From rear—We recommend using a towing dolly under the front wheels. If you do not use a towing dolly, place the ignition key in the “ACC” position, put the transmission in neutral and set the transfer in “2WD” mode.

NOTICE

Do not tow with the key removed or in the “LOCK” position when towing from the rear without a towing dolly. The steering lock mechanism is not strong enough to hold the front wheels straight.

(b) Using flat bed truck

All models—

(c) Towing with sling type truck

NOTICE

Do not tow with sling type truck, either from the front or rear. This may cause body damage.

**—Emergency towing
(two-wheel drive models
without off-road package)**

If towing is necessary, we recommend you to have it done by your Toyota dealer or a commercial tow truck service.

If towing service is not available in an emergency, your vehicle may be temporarily towed by a cable or chain secured to one of the emergency towing eyelets under the front of the vehicle. Use extreme caution when towing the vehicle.

NOTICE

Only use specified towing eyelet; otherwise your vehicle may be damaged.

'05 TUNDRA_U (L/O 0409)

A driver must be in the vehicle to steer it and operate the brakes.

Towing in this manner may be done only on hard-surfaced roads for a short distance and at low speeds. Also, the wheels, axles, drive train, steering and brakes must all be in good condition.

CAUTION

Use extreme caution when towing the vehicle. Avoid sudden starts or erratic driving maneuvers which would place excessive stress on the emergency towing eyelet and towing cable or chain. The eyelet and towing cable or chain may break and cause serious injury or damage.

NOTICE

Use only a cable or chain specifically intended for use in towing vehicles. Securely fasten the cable or chain to the towing eyelet provided.

Before towing, release the parking brake and put the transmission in neutral (manual) or "N" (automatic). The key must be in "ACC" (engine off) or "ON" (engine running).

CAUTION

If the engine is not running, the power assist for the brakes and steering will not work so steering and braking will be much harder than usual.

—Emergency towing (four-wheel drive models and two-wheel drive models with off-road package)

If towing is necessary, we recommend you to have it done by your Toyota dealer or a commercial tow truck service.

If towing service is not available in an emergency, your vehicle may be temporarily towed by a cable or chain secured to the emergency towing hook under the front of the vehicle. Use extreme caution when towing the vehicle.

NOTICE

Only use specified towing hook; otherwise your vehicle may be damaged.

A driver must be in the vehicle to steer it and operate the brakes.

Towing in this manner may be done only on hard-surfaced roads for a short distance and at low speeds. Also, the wheels, axles, drive train, steering and brakes must all be in good condition.

 CAUTION
<p>Use extreme caution when towing the vehicle. Avoid sudden starts or erratic driving maneuvers which would place excessive stress on the emergency towing hook and towing cable or chain. The hook and towing cable or chain may break and cause serious injury or damage.</p>

NOTICE
<p><i>Use only a cable or chain specifically intended for use in towing vehicles. Securely fasten the cable or chain to the towing hook provided.</i></p>

Before towing, release the parking brake, put the transmission in neutral (manual) or "N" (automatic) and set the transfer in "2WD" mode. The key must be in "ACC" (engine off) or "ON" (engine running).

 CAUTION
<p>If the engine is not running, the power assist for the brakes and steering will not work so steering and braking will be much harder than usual.</p>

—Emergency towing hook precautions

- ▶ Before emergency towing, check that the hook is not broken or damaged and that the installation bolts are not loose.
- ▶ Fasten the towing cable or chain securely to the hook.
- ▶ Do not jerk the hook. Apply steady and even force.
- ▶ To avoid damaging the hook, do not pull from the side or at a vertical angle. Always pull straight ahead.

 **CAUTION**

If the emergency towing hook is used to get out when your vehicle becomes stuck in the mud, sand or other condition from which the vehicle cannot be driven out under its own power, make sure to observe the precautions mentioned below. Otherwise, excessive stress will be put on the hook and the towing cable or chain may break, causing serious injury or damage.

- ▶ If the towing vehicle can hardly move, do not forcibly continue the towing. Contact your Toyota dealer or a commercial tow truck service for assistance.
- ▶ Tow the vehicle as straight ahead as possible.
- ▶ Keep away from the vehicle during towing.

—Tips for towing a stuck vehicle

The following methods are effective to use when your vehicle is stuck in the mud, sand or other condition from which the vehicle cannot be driven out under its own power. Use extreme caution when towing the vehicle. In addition, keep away from the vehicles and towing cable or chain when towing.

- ▶ Remove the sand and soil in the front and the back of the tires.
- ▶ Place stones or wood under the tires.

If you lose your keys

You can purchase a new key at your Toyota dealer if you can give them the key number.

See the suggestion given in “Keys” in Section 1-2.

If your keys are locked in the vehicle and you cannot get a duplicate, many Toyota dealers can still open the door for you, using their special tools. If you must break a window to get in, we suggest breaking the smallest side window because it is the least expensive to replace. Be extremely cautious to avoid cuts from the glass.

If you lose your wireless remote control transmitter

You can purchase a new wireless remote control transmitter at your Toyota dealer.

Have the registered identification numbers of your transmitters deleted from your vehicle by your Toyota dealer as soon as possible to avoid the possibility of theft or an accident. Then, have the identification number of your new transmitter registered. At the same time, you must bring all of the remaining transmitters to have them registered again as well.

You can use the wireless remote control system with the new transmitter. Contact your Toyota dealer for detailed information.

SECTION 5

CORROSION PREVENTION AND APPEARANCE CARE

Corrosion prevention and appearance care

Protecting your Toyota from corrosion	418
Washing and waxing your Toyota	419
Cleaning the interior	420

Protecting your Toyota from corrosion

Toyota, through the diligent research, design and use of the most advanced technology available, helps prevent corrosion and provides you with the finest quality vehicle construction. Now, it is up to you. Proper care of your Toyota can help ensure long-term corrosion prevention.

The most common causes of corrosion to your vehicle are:

- ▶ The accumulation of road salt, dirt and moisture in hard-to-reach areas under the vehicle.
- ▶ Chipping of paint, or undercoating caused by minor accidents or by stones and gravel.

Care is especially important if you live in particular areas or operate your vehicle under certain environmental conditions:

- ▶ Road salt or dust control chemicals will accelerate corrosion, as will the presence of salt in the air near the seacoast or in areas of industrial pollution.
- ▶ High humidity accelerates corrosion especially when temperatures range just above the freezing point.

- ▶ Wetness or dampness to certain parts of your vehicle for an extended period of time, may cause corrosion even though other parts of the vehicle may be dry.
- ▶ High ambient temperatures can cause corrosion to those components of the vehicle which do not dry quickly due to lack of proper ventilation.

The above signifies the necessity to keep your vehicle, particularly the underside, as clean as possible and to repair any damage to paint or protective coatings as soon as possible.

To help prevent corrosion on your Toyota, follow these guidelines:

Wash your vehicle frequently. It is, of course, necessary to keep your vehicle clean by regular washing, but to prevent corrosion, the following points should be observed:

- ▶ If you drive on salted roads in the winter or if you live near the ocean, you should hose off the undercarriage at least once a month to minimize corrosion.

- ▶ High pressure water or steam is effective for cleaning the vehicle's underside and wheel housings. Pay particular attention to these areas as it is difficult to see all the mud and dirt. It will do more harm than good to simply wet the mud and debris without removing. The lower edge of doors, rocker panels and frame members have drain holes which should not be allowed to clog with dirt as trapped water in these areas can cause corrosion.

- ▶ Wash the underside of the vehicle thoroughly when winter is over.

See "Washing and waxing your Toyota" for more tips.

Check the condition of your vehicle's paint and trim. If you find any chips or scratches in the paint, touch them up immediately to prevent corrosion from starting. If the chips or scratches have gone through the bare metal, have a qualified body shop make the repair.

Check the interior of your vehicle. Water and dirt can accumulate under the floor mats and could cause corrosion. Occasionally check under the mats to make sure the area is dry. Be particularly careful when transporting chemicals, cleansers, fertilizers, salt, etc.; these should be transported in proper containers. If a spill or leak should occur, immediately clean and dry the area.

Use mud shields on your wheels. If you drive on salted or gravel roads, mud shields help protect your vehicle. Full-size shields, which come as near to the ground as possible, are the best. We recommend that the fittings and the area where the shields are installed be treated to resist corrosion. Your Toyota dealer will be happy to assist in supplying and installing the shields if they are recommended for your area.

Keep your vehicle in a well ventilated garage or a roofed place. Do not park your vehicle in a damp, poorly ventilated garage. If you wash your vehicle in the garage, or if you drive it covered with water or snow, your garage may be so damp as to cause corrosion. Even if your garage is heated, a wet vehicle can corrode if the ventilation is poor.

Washing and waxing your Toyota

Washing your Toyota

Keep your vehicle clean by regular washing.

The following cases may cause weakness to the paint or corrosion to the body and parts. Wash your vehicle as soon as possible.

- ▶ When driving in a coastal area
- ▶ When driving on a road sprinkled with antifreeze
- ▶ When exposed to coal tar, tree sap, bird droppings and carcass of an insect
- ▶ When driving in areas where there is a lot of smoke, soot, dust, iron dust or chemical substances
- ▶ When the vehicle becomes remarkably dirty with dust and mud

Hand-washing your Toyota

Work in the shade and wait until the vehicle body is not hot to the touch.

When cleaning under floor or chassis, be careful not to injure your hands.

1. Rinse off loose dirt with a hose. Remove any mud or road salt from the underside of the vehicle or in the wheel wells.
2. Wash with a mild car-wash soap, mixed according to the manufacturer's instructions. Use a soft cotton mitt and keep it wet by dipping it frequently into the wash water. Do not rub hard—let the soap and water remove the dirt.

Fuel filler door: Do not apply water (high-pressure car wash, for example) at or near the fuel tank inlet with the fuel filler door opened. If the water enters the air vent, you may experience trouble with refueling or rough engine idling.

Plastic wheel ornaments: The plastic wheel ornaments are damaged easily by organic substances. If any organic substances splashes an ornament, be sure to wash it off with water and check if the ornament is damaged.

Do not attach the heavily damaged plastic wheel ornament. It may fly off the wheel and cause accidents while the vehicle is moving.

Aluminum wheels: Use only a mild soap or neutral detergent.

Plastic bumpers: Wash carefully. Do not scrub with abrasive cleaners. The bumper faces are soft.

Road tar: Remove with turpentine or cleaners that are marked safe for painted surfaces.

NOTICE

Do not use organic substances (gasoline, kerosene, benzine or strong solvents), which may be toxic or cause damage.

3. Rinse thoroughly—dried soap can cause streaking. In hot weather you may need to rinse each section right after you wash it.
4. To prevent water spots, dry the vehicle using a clean soft cotton towel. Do not rub or press hard—you might scratch the paint.

Waxing your Toyota

Polishing and waxing is recommended to maintain the original beauty of your Toyota's finish.

Apply wax once a month or if the vehicle surface does not repel water well.

1. Always wash and dry the vehicle before you begin waxing, even if you are using a combined cleaner and wax.
2. Use a good quality polish and wax. If the finish has become extremely weathered, use a car-cleaning polish, followed by a separate wax. Carefully follow the manufacturer's instructions and precautions. Be sure to polish and wax the chrome trim as well as the paint.
3. Wax the vehicle again when water does not bead but remains on the surface in large patches.

NOTICE

Always remove the plastic bumpers if your vehicle is re-painted and placed in a high heat paint waxing booth. High temperatures could damage the bumpers.

Cleaning the interior

CAUTION

▶ **Vehicles with side airbags and curtain shield airbags:**

Be careful not to splash water or spill liquid on the floor. This may prevent the side airbags and curtain shield airbags from activating correctly, resulting in serious injury.

▶ **Do not wash the vehicle floor with water, or allow water to get onto the floor when cleaning the vehicle interior or exterior. Water may get into audio components or other electrical components above or under the floor carpet (or mat) and cause a malfunction; and it may cause body corrosion.**

'05 TUNDRA_U (L/O 0409)

Vinyl interior

The vinyl upholstery may be easily cleaned with a mild soap or detergent and water.

First vacuum over the upholstery to remove loose dirt. Then, using a sponge or soft cloth, apply the soap solution to the vinyl. After allowing it to soak in for a few minutes to loosen the dirt, remove the dirt and wipe off the soap with a clean damp cloth. If all the dirt do not come off, repeat the procedure. Commercial foaming-type vinyl cleaners are also available which work well. Follow the manufacturer's instructions.

NOTICE

Do not use solvent, thinner, gasoline or window cleaner on the interior.

Carpets

Use a good foam-type shampoo to clean the carpets.

Begin by vacuuming thoroughly to remove as much dirt as possible. Several types of foam cleaners are available; some are in aerosol cans and others are powders or liquids which you mix with water to produce a foam. To shampoo the carpets, use a sponge or brush to apply the foam. Rub in overlapping circles.

Do not apply water—the best results are obtained by keeping the carpet as dry as possible. Read the shampoo instructions and follow them closely.

Seat belts

The seat belts may be cleaned with mild soap and water or with lukewarm water.

Use a cloth or sponge. As you are cleaning, check the belts for excessive wear, fraying, or cuts.

NOTICE

- ◆ *Do not use dye or bleach on the belts—it may weaken them.*
- ◆ *Do not use the belts until they become dry.*

Windows

The windows may be cleaned with any household window cleaner.

NOTICE

When cleaning the inside of the back window, be careful not to scratch or damage the heater wires or connectors.

Air conditioning control panel, audio panel, instrument panel, console panel, and switches

Use a soft damp cloth for cleaning.

Soak a clean soft cloth in water or lukewarm water then lightly wipe off dirt.

NOTICE

- ◆ *Do not use organic substances (solvents, kerosene, alcohol, gasoline, etc.) or alkaline or acidic solutions. These chemicals can cause discoloring, staining or peeling of the surface.*
- ◆ *If you use cleaners or polishing agents, make sure their ingredients do not include the substances mentioned above.*

◆ *If you use a liquid car freshener, do not spill the liquid onto the vehicle's interior surfaces. It may contain the ingredients mentioned above. Immediately clean any spill using the method mentioned above.*

Leather Interior

The leather upholstery may be cleaned with neutral detergent for wool.

Remove dirt using a soft cloth dampened with 5% solution of neutral detergent for wool. Then thoroughly wipe off all traces of detergent with a clean damp cloth.

After cleaning or whenever any part of the leather gets wet, dry with a soft clean cloth. Allow the leather to dry in a ventilated shaded area.

NOTICE

- ◆ *If a stain should fail to come out with a neutral detergent, apply a cleaner that does not contain an organic solvent.*
- ◆ *Never use organic substances such as benzene, alcohol or gasoline or alkaline or acid solutions for cleaning the leather as these could cause discoloring.*
- ◆ *Use of a nylon brush or synthetic fiber cloth, etc. may scratch the fine grained surface of the leather.*
- ◆ *Mildew may develop on soiled leather upholstery. Be especially careful to avoid oil spots. Try to keep your upholstery always clean.*
- ◆ *Long exposure to direct sunlight may cause the leather surface to harden and shrink. Keep your vehicle in a shaded area, especially in the summer.*

- ◆ *The interior of your vehicle is apt to heat up on hot summer days, so avoid placing on the upholstery items made of vinyl or plastic or containing wax as these tend to stick to leather when warm.*
- ◆ *Improper cleaning of the leather upholstery could result in discoloration or staining.*

If you have any questions about the cleaning of your Toyota, your local Toyota dealer will be pleased to answer them.

SECTION 6

VEHICLE MAINTENANCE AND CARE

Vehicle maintenance and care

Maintenance requirements	424
General maintenance	425
Does your vehicle need repairing?	427
Emissions Inspection and Maintenance (I/M) programs	428

For scheduled maintenance information, please refer to the “Scheduled Maintenance Guide” or “Owner’s Manual Supplement”.

Maintenance requirements

Your Toyota vehicle has been designed for fewer maintenance requirements with longer service intervals to save both your time and money. However, each regular maintenance, as well as day-to-day care, is more important than ever before to ensure smooth, trouble-free, safe, and economical drivings.

It is the owner's responsibility to make sure the specified maintenance, including general maintenance service, is performed. Note that both the new vehicle and emission control system warranties specify that proper maintenance and care must be performed. See "Owner's Warranty Information Booklet" or "Owner's Manual Supplement" for complete warranty information.

General maintenance

General maintenance items are those day-to-day care practices that are important to your vehicle for proper operation. It is the owner's responsibility to ensure that the general maintenance items are performed regularly.

These checks or inspections can be done either by yourself or a qualified technician, or if you prefer, your Toyota dealer will be pleased to do them at a nominal cost.

Scheduled maintenance

The scheduled maintenance items listed in the "Scheduled Maintenance Guide" or "Owner's Manual Supplement" are those required to be serviced at regular intervals.

For details of your maintenance schedule, read the "Scheduled Maintenance Guide" or "Owner's Manual Supplement".

It is recommended that any replacement parts used for maintenance or for the repair of the emission control system be Toyota supplied.

The owner may elect to use non-Toyota supplied parts for replacement purposes without invalidating the emission control system warranty. However, use of replacement parts which are not of equivalent quality may impair the effectiveness of the emission control systems.

You may also elect to have maintenance, replacement, or repair of the emission control devices and system performed by any automotive repair establishment or individual without invalidating this warranty. See "Owner's Warranty Information Booklet" or "Owner's Manual Supplement" for complete warranty information.

Where to go for service?

Toyota technicians are well-trained specialists and are kept up to date with the latest service information through technical bulletins, service tips, and in-dealership training programs. They learn to work on Toyotas before they work on your vehicle, rather than while they are working on it.

You can be confident that your Toyota dealer's service department performs the best job to meet the maintenance requirements on your vehicle—reliably and economically.

Your copy of the repair order is proof that all required maintenance has been performed for warranty coverage. If any problems should arise with your vehicle while under warranty, your Toyota dealer will promptly take care of it. Again, be sure to keep a copy of the repair order for any service performed on your Toyota.

What about do-it-yourself maintenance?

Many of the maintenance items are easy to do yourself if you have a little mechanical ability and a few basic automotive tools. Simple instructions for how to perform them are presented in Section 7.

If you are a skilled do-it-yourself mechanic, the Toyota service manuals are recommended. Please be aware that do-it-yourself maintenance can affect your warranty coverage. See "Owner's Warranty Information Booklet" or "Owner's Manual Supplement" for the details.

General maintenance

Listed below are the general maintenance items that should be performed as frequently as specified. In addition to checking the items listed, if you notice any unusual noise, smell or vibration, you should investigate the cause or take your vehicle to your Toyota dealer or a qualified service shop immediately. It is recommended that any problem you notice be brought to the attention of your dealer or the qualified service shop for their advice.

IN THE ENGINE COMPARTMENT

Items listed below should be checked from time to time, e.g. each time when refueling.

Washer fluid

Make sure there is sufficient fluid in the tank. See Section 7-3 for additional information.

Engine coolant level

Make sure the coolant level is between the "F" and "L" lines on the see-through reservoir when the engine is cold. See Section 7-2 for additional information.

Radiator, condenser and hoses

Check that the front of the radiator and condenser are clean and not blocked with leaves, dirt, or insects. See Section 7-2 for additional information.

Battery condition

Check the battery condition by the indicator color. See Section 7-3 for additional information.

Brake fluid level

Make sure the brake fluid level is correct. See Section 7-2 for additional information.

Engine oil level

Check the level on the dipstick with the engine turned off and the vehicle parked on a level spot. See Section 7-2 for additional information.

'05 TUNDRA_U (L/O 0409)

Power steering fluid level

Check the level through the reservoir. The level should be in the "HOT" or "COLD" range depending on the fluid temperature. See Section 7-2 for additional information.

Exhaust system

If you notice any change in the sound of the exhaust or smell exhaust fumes, have the cause located and corrected immediately. (See "Engine exhaust cautions" in Section 2.)

INSIDE THE VEHICLE

Items listed below should be checked regularly, e.g. while performing periodic services, cleaning the vehicle, etc.

Lights

Make sure the headlights, stop lights, tail lights, turn signal lights, and other lights are all working. Check headlight aim.

Service reminder indicators and warning buzzers

Check that all service reminder indicators and warning buzzers function properly.

Steering wheel

Be alert for changes in steering condition, such as hard steering or strange noise.

Seats

Check that all seat controls such as seat adjusters, seatback recliner, etc. operate smoothly and that all latches lock securely in any position. Check that the head restraints move up and down smoothly and that the locks hold securely in any latched position. For folding-down seatback, check that the latches lock securely.

Seat belts

Check that the seat belt system such as buckles, retractors and anchors operate properly and smoothly. Make sure the belt webbing is not cut, frayed, worn or damaged.

Accelerator pedal

Check the pedal for smooth operation and uneven pedal effort or catching.

Clutch pedal

Check the pedal for smooth operation.

Brake pedal

Check the pedal for smooth operation and that the pedal has the proper clearance. Check the brake booster function.

Brakes

In a safe place, check that the brakes do not pull to one side when applied.

Parking brake (pedal type)

Check that the pedal has the proper travel and that, on a safe incline, your vehicle is held securely with only the parking brake applied.

Parking brake (lever type)

Check that the lever has the proper travel and that, on a safe incline, your vehicle is held securely with only the parking brake applied.

Automatic transmission "Park" mechanism

On a safe incline, check that your vehicle is held securely with the selector lever in "P" position and all brakes released.

OUTSIDE THE VEHICLE

Items listed below should be performed from time to time, unless otherwise specified.

Fluid leaks

Check underneath for leaking fuel, oil, water or other fluid after the vehicle has been parked for a while. If you smell fuel fumes or notice any leak, have the cause found and corrected immediately.

Doors and engine hood

Check that all doors including tailgate operate smoothly and all latches lock securely. Make sure the engine hood secondary latch secures the hood from opening when the primary latch is released.

Tire inflation pressure

Check the pressure with a gauge every two weeks, or at least once a month. See Section 7- 2 for additional information.

Tire surface and wheel nuts

Check the tires carefully for cuts, damage or excessive wear. See Section 7-2 for additional information. When checking the tires, make sure no nuts are missing, and check the nuts for looseness. Tighten them if necessary.

Tire rotation

Rotate the tires according to the maintenance schedule. (For scheduled maintenance information, please refer to the "Scheduled Maintenance Guide" or "Owner's Manual Supplement".) See Section 7- 2 for additional information.

Does your vehicle need repairing?

Be on the alert for changes in performance, sounds, and visual tip-offs that indicate service is needed. Some important clues are as follows:

- ▶ Engine missing, stumbling, or pinging
- ▶ Appreciable loss of power
- ▶ Strange engine noises
- ▶ A leak under the vehicle (however, water dripping from the air conditioning after use is normal.)
- ▶ Change in exhaust sound (This may indicate a dangerous carbon monoxide leak. Drive with the windows open and have the exhaust system checked immediately.)
- ▶ Flat-looking tire; excessive tire squeal when cornering; uneven tire wear
- ▶ Vehicle pulls to one side when driving straight on a level road
- ▶ Strange noises related to suspension movement
- ▶ Loss of brake effectiveness; spongy feeling brake or clutch pedal; pedal almost touches floor; vehicle pulls to one side when braking
- ▶ Engine coolant temperature continually higher than normal

- ▶ Engine continually runs hot; oil pressure gauge stays low

If you notice any of these clues, take your vehicle to your Toyota dealer as soon as possible. It probably needs adjustment or repair.

Do not continue driving with the vehicle unchecked. It could result in serious vehicle damage and possibly personal injury.

Emissions Inspection and Maintenance (I/M) programs

Some states have vehicle emission inspection programs which include OBD (On-Board Diagnostics) checks.

The OBD system monitors the operation of the emission control system. When the OBD system determines that a problem exists somewhere in the emission control system, the malfunction indicator lamp comes on. In this case, your vehicle may not pass the I/M test and need to be repaired. Contact your Toyota dealer to service the vehicle.

Even if the malfunction indicator lamp does not come on, your vehicle may not pass the I/M test as readiness codes have not been set in the OBD system.

Readiness codes are automatically set during ordinary driving. However, when the battery is disconnected or run down, the codes are erased. Also, depending on your driving habits, the codes may not be completely set.

Also, if the malfunction indicator lamp had come on recently due to temporary malfunction such as a loose fuel tank cap, your vehicle may not pass the I/M test.

The malfunction indicator lamp will go off after taking several driving trips, but the error code in the OBD system will not be cleared unless about 40 trips or more are taken.

If your vehicle does not pass the I/M test even the malfunction indicator lamp does not come on, contact your Toyota dealer to prepare the vehicle for re-testing.

Do-it-yourself service precautions

If you perform maintenance by yourself, be sure to follow the correct procedure given in this Section.

You should be aware that improper or incomplete servicing may result in operating problems.

Performing do-it-yourself maintenance during the warranty period may affect your warranty coverage. Read the separate Toyota Warranty statement for details and suggestions.

This Section gives instructions only for those items that are relatively easy for an owner to perform. As explained in Section 6, there are still a number of items that must be done by a qualified technician with special tools.

For information on tools and parts for do-it-yourself maintenance, see "Parts and tools".

Utmost care should be taken when working on your vehicle to prevent accidental injury. Here are a few precautions that you should be especially careful to observe:

 CAUTION

- ◀ When the engine is running, keep hands, clothing, and tools away from the moving fan and engine drive belts. (Removing rings, watches, and ties is advisable.)
- ◀ Right after driving, the engine compartment—the engine, radiator, exhaust manifold, power steering fluid reservoir and spark plug boots, etc.—will be hot. So be careful not to touch them. Oil, fluids and spark plugs may also be hot.
- ◀ If the engine is hot, do not remove the radiator cap or loosen the drain plugs to prevent burning yourself.
- ◀ Do not leave anything that may burn easily, such as paper or rags, in the engine compartment.
- ◀ Do not smoke, cause sparks or allow open flames around fuel or the battery. Their fumes are flammable.
- ◀ Do not get under your vehicle with just the body jack supporting it. Always use automotive jack stands or other solid supports.

- ◀ Use eye protection whenever you work on or under your vehicle where you may be exposed to flying or falling material, fluid spray, etc.
- ◀ Used engine oil contains potentially harmful contaminants which may cause skin disorders such as inflammation or skin cancer, so care should be taken to avoid prolonged and repeated contact with it. To remove used engine oil from your skin, wash thoroughly with soap and water.
- ◀ Do not leave used oil within the reach of children.
- ◀ Dispose of used oil and filter only in a safe and acceptable manner. Do not dispose of used oil and filter in household trash, in sewers or onto the ground. Call your dealer or a service station for information concerning recycling or disposal.
- ◀ Be extremely cautious when working on the battery. It contains poisonous and corrosive sulfuric acid.

NOTICE

- ◆ Remember that battery and ignition cables carry high currents or voltages. Be careful of accidentally causing a short circuit.
- ◆ Add only “Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, and non-borate coolant with long-life hybrid organic acid technology to fill the radiator. “Toyota Super Long Life Coolant” is a mixture of 50% coolant and 50% deionized water (for the U.S.A.) or 55% coolant and 45% deionized water (for Canada).
- ◆ If you spill some of the coolant, be sure to wash it off with water to prevent it from damaging the parts or paint.
- ◆ Do not allow dirt or anything else to fall through the spark plug holes.
- ◆ Do not pry the outer electrode of a spark plug against the center electrode.

- ◆ *Use only spark plugs of the specified type. Using other types will cause engine damage, loss of performance or radio noise.*
- ◆ *Do not reuse iridium-tipped spark plugs by cleaning or regapping.*
- ◆ *Do not overfill automatic transmission fluid, or the transmission could be damaged.*
- ◆ *Do not drive with the air cleaner filter removed, or excessive engine wear could result. Also backfiring could cause a fire in the engine compartment.*
- ◆ *Be careful not to scratch the glass surface with the wiper frame.*
- ◆ *When closing the engine hood, check to see that you have not forgotten any tools, rags, etc.*

Parts and tools

Here is a list of parts and tools you will need to perform do-it-yourself maintenance. Remember all Toyota parts are designed in metric sizes, so your tools must be metric.

CHECKING THE ENGINE OIL LEVEL

Parts (if level is low):

- ◀ "Toyota Genuine Motor Oil" or equivalent

See Section 7-2 for details about engine oil selection.

Tools:

- ◀ Rag or paper towel
- ◀ Funnel (only for adding oil)

CHECKING THE ENGINE COOLANT LEVEL

Parts (if level is low):

- ◀ "Toyota Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, and non-borate coolant with long-life hybrid organic acid technology.

"Toyota Super Long Life Coolant" is a mixture of 50% coolant and 50% deionized water (for the U.S.A.) or 55% coolant and 45% deionized water (for Canada).

Tools:

- ◀ Funnel (only for adding coolant)

CHECKING BRAKE FLUID

Parts (if level is low):

- ◀ SAE J1703 or FMVSS No.116 DOT 3 brake fluid

Tools:

- ◀ Rag or paper towel
- ◀ Funnel (only for adding fluid)

CHECKING POWER STEERING FLUID

Parts (if level is low):

- ◀ Automatic transmission fluid DEXRON[®]VI or III

Tools:

- ◀ Rag or paper towel
- ◀ Funnel (only for adding fluid)

CHECKING BATTERY CONDITION

Tools:

- ◀ Warm water
- ◀ Baking soda
- ◀ Grease
- ◀ Conventional wrench (for terminal clamp bolts)

'05 TUNDRA_U (L/O 0409)

CHECKING AND REPLACING FUSES

Parts (if replacement is necessary):

- ◀ Fuse with same amperage rating as original

ADDING WASHER FLUID

Parts:

- ◀ Water
- ◀ Washer fluid containing antifreeze (for winter use)

Tools:

- ◀ Funnel

REPLACING LIGHT BULBS

Parts:

- ◀ Bulb with same number and wattage rating as original (See charts in "Replacing light bulbs" in Section 7-3.)

Tools:

- ◀ Screwdriver
- ◀ Wrench

SECTION 7-2

DO- IT- YOURSELF MAINTENANCE

Engine and Chassis

Checking the engine oil level	438

Checking the engine oil level

1GR-FE engine

2UZ-FE engine

With the engine at operating temperature and turned off, check the oil level on the dipstick.

1. To get a correct reading, the vehicle should be on level ground. After turning off the engine, wait a few minutes for the oil to drain back into the bottom of the engine.
2. Pull the dipstick out, hold a rag under the end and wipe it clean.
3. Reinsert the dipstick—push it in as far as it will go, or the reading will not be correct.
4. Pull the dipstick out and look at the oil level while holding a rag under the end.

CAUTION
Be careful not to touch the hot exhaust manifold.

NOTICE
Be careful not to drop engine oil on the vehicle components.

If the oil level is below or only slightly above the low level, add engine oil of the same type as already in the engine.

Remove the oil filler cap and add engine oil in small quantities at a time, checking the dipstick. We recommend that you use a funnel when adding oil.

The approximate quantity of oil needed to raise the level between low and full on the dipstick is indicated below for reference.

When the level reaches within the correct range, install the filler cap hand-tight.

Oil quantity, L (qt., Imp. qt.):

1.5 (1.6, 1.3)

NOTICE

- ◆ Be careful not to spill engine oil on the vehicle components.
- ◆ Avoid overfilling, or the engine could be damaged.
- ◆ Check the oil level on the dipstick once again after adding the oil.

'05 TUNDRA_U (L/O 0409)

Engine oil selection

"Toyota Genuine Motor Oil" is used in your Toyota vehicle. Use Toyota approved "Toyota Genuine Motor Oil" or equivalent to satisfy the following grade and viscosity.

Oil grade:

API grade SL "Energy-Conserving" or ILSAC multigrade engine oil

Recommended viscosity:

SAE 5W-30

SAE 5W-30 is the best choice for good fuel economy and good starting in cold weather.

If SAE 5W-30 is not available, SAE 10W-30 may be used. However, it should be replaced with SAE 5W-30 at the next oil change.

EC-07

API service symbol

API-02

ILSAC certification mark

Oil identification marks

Either or both API registered marks are added to some oil containers to help you select the oil you should use.

The API Service Symbol is located anywhere on the outside of the container.

The top portion of the label shows the oil quality by API (American Petroleum Institute) designations such as SL. The center portion of the label shows the SAE viscosity grade such as SAE 5W-30. "Energy-Conserving" shown in the lower portion, indicates that the oil has fuel-saving capabilities.

The ILSAC (International Lubricant Standardization and Approval Committee) Certification Mark is displayed on the front of the container.

To ensure excellent lubrication performance for your engine, "Toyota Genuine Motor Oil" is available, which has been specifically tested and approved for all Toyota engines.

Please contact your Toyota dealer for further details about "Toyota Genuine Motor Oil".

Checking the engine coolant level

Look at the see-through coolant reservoir when the engine is cold. The coolant level is satisfactory if it is between the "F" and "L" lines on the reservoir. If the level is low, add the coolant. (For the coolant type, see "Coolant type selection" described below.)

The coolant level in the reservoir will vary with engine temperature. However, if the level is on or below the "L" line, add coolant. Bring the level up to the "F" line.

If the coolant level drops within a short time after replenishing, there may be a leak in the system. Visually check the radiator, hoses, radiator cap and drain cock and water pump.

If you can find no leak, have your Toyota dealer test the cap pressure and check for leaks in the cooling system.

CAUTION

To prevent burning yourself, do not remove the radiator cap when the engine is hot.

Coolant type selection

Use of improper coolants may damage your engine cooling system.

Only use "Toyota Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, and non-borate coolant with long-life hybrid organic acid technology. (Coolant with long-life hybrid organic acid technology is a combination of low phosphates and organic acids.)

For the U.S.A.—"Toyota Super Long Life Coolant" is a mixture of 50% coolant and 50% deionized water. This coolant provides protection down to about -35°F (-31°C).

For the Canada—"Toyota Super Long Life Coolant" is a mixture of 55% coolant and 45% deionized water. This coolant provides protection down to about -42°F (-44°C).

NOTICE

Do not use plain water alone.

Toyota recommends "Toyota Super Long Life Coolant", which has been tested to ensure that it will not cause corrosion nor result in malfunction of your engine coolant system with proper usage. "Toyota Super Long Life Coolant" is formulated with long-life hybrid organic acid technology and has been specifically designed to avoid engine cooling system malfunction on Toyota vehicles.

Please contact your Toyota dealer for further details.

Checking the radiator and condenser

If any of the above parts are extremely dirty or you are not sure of their condition, take your vehicle to a Toyota dealer.

CAUTION

To prevent burning yourself, be careful not to touch the radiator or condenser when the engine is hot.

NOTICE

To prevent damage to the radiator and condenser, do not perform the work by yourself.

**Checking brake fluid
(without vehicles stability
control system)**

To check the fluid level, simply look at the see-through reservoir. The level should be between the “MAX” and “MIN” lines on the reservoir.

It is normal for the brake fluid level to go down slightly as the brake pads wear. So be sure to keep the reservoir filled.

If the reservoir needs frequent refilling, it may indicate a serious mechanical problem.

If the level is low, add SAE J1703 or FMVSS No.116 DOT 3 brake fluid to the brake reservoir.

Remove and replace the reservoir cap by hand. Fill the brake fluid to the dotted line. This brings the fluid to the correct level when you put the cap back on.

Use only newly opened brake fluid. Once opened, brake fluid absorbs moisture from the air, and excess moisture can cause a dangerous loss of braking.

When the brake fluid must be replaced, contact your Toyota dealer.

NOTICE

If you spill the fluid, be sure to wash it off with water to prevent it from damaging the parts or paint.

CAUTION

Take care when filling the reservoir because brake fluid can harm your hands or eyes. If fluid gets on your hands or in your eyes, flush the affected area with clean water immediately. If you still feel uncomfortable with your hands or eyes, go to the doctor.

**Checking brake fluid
(with vehicle stability control
system)**

To check the fluid level, simply look at the see-through reservoir. The level should be between the "MAX" and "MIN" lines on the reservoir.

It is normal for the brake fluid level to go down slightly as the brake pads wear or when the fluid level in the accumulator is high.

If the reservoir needs frequent refilling, it may indicate a serious mechanical problem.

If the level is low, add SAE J1703 or FMVSS No.116 DOT 3 brake fluid to the brake reservoir.

Refilling brake fluid:

1. Turn the ignition switch off.
2. Depress the brake pedal more than 20 times (until the brake pedal resistance decreases and pedal travel increases).
3. Remove the reservoir cover by hand. Add brake fluid up to the "MAX" line.

If you do not follow the procedure above, the reservoir may overflow.

Use only newly opened brake fluid. Once opened, brake fluid absorbs moisture from the air, and excess moisture can cause a dangerous loss of braking.

NOTICE

If you spill the fluid, be sure to wash it off with water to prevent it from damaging the parts or paint.

CAUTION

Take care when filling the reservoir because brake fluid can harm your hands or eyes. If fluid gets on your hands or in your eyes, flush the affected area with clean water immediately. If you still feel uncomfortable with your hands or eyes, go to the doctor.

Access cab models

Keep your tire inflation pressures at the proper level.

The recommended cold tire inflation pressures, tire sizes and the combined weight of occupants and cargo (payload) are described in Section 8. The recommended tire inflation pressures and tire sizes are also on the tire and loading information label.

You should check the tire inflation pressure every two weeks, or at least once a month. And do not forget the spare!

The following instructions for checking tire inflation pressure should be observed:

- ▶ **The pressure should be checked only when the tires are cold.** If your vehicle has been parked for at least 3 hours and has not been driven for more than 1.5 km or 1 mile since, you will get an accurate cold tire inflation pressure reading.

- ▶ **If you cannot adjust the tire pressure when the tires are cold,** add 20 to 30 kPa more to the front tires and rear tires than the cold tire pressure, but never exceed the maximum cold tire pressure molded on the tire sidewall.
- ▶ **Always use a tire pressure gauge.** The appearance of a tire can be misleading. Besides, tire inflation pressures that are even just a few pounds off can degrade ride and handling.
- ▶ **Do not bleed or reduce tire inflation pressure after driving.** It is normal for the tire inflation pressure to be higher after driving.
- ▶ **Never exceed the vehicle capacity weight.** Passenger and luggage weight should be located so that the vehicle is balanced.

INSPECTION AND ADJUSTMENT PROCEDURE

1. Remove the tire valve cap.
2. Press the tip of the tire pressure gauge to the tire valve.
3. Read the pressure using the graduations of the gauge.
4. In case the tire inflation pressure is not within the prescribed range, insert the compressed air from the valve. In case of applying too much air, press the center of the valve and release the air to adjust.

5. After completing the tire inflation pressure measurement and adjustment, apply soapy water to the valve and check for leakage.

6. Install the tire valve cap.

If a gauge and air pump are not available, have your vehicle checked by your Toyota dealer.

CAUTION

Be sure to reinstall the tire valve caps. Without the valve caps, dirt or moisture could get into the valve core and cause air leakage. If the caps have been lost, have new ones put on as soon as possible.

Incorrect tire inflation pressure may waste fuel, reduce the comfort of driving, reduce tire life and make your vehicle less safe to drive.

If a tire frequently needs refilling, have it checked by your Toyota dealer.

CAUTION

Keep your tires properly inflated. Otherwise, the following conditions may occur and cause an accident resulting in death or serious injuries.

Low tire pressure (underinflation)—

- ▶ Excessive wear
- ▶ Uneven wear
- ▶ Poor handling
- ▶ Possibility of blowouts from an overheated tire
- ▶ Poor sealing of the tire bead
- ▶ Wheel deformation and/or tire separation
- ▶ A greater possibility of tire damage from road hazards

High tire pressure (overinflation)—

- ▶ **Poor handling**
- ▶ **Excessive wear**
- ▶ **Uneven wear**
- ▶ **A greater possibility of tire damage from road hazards**

Checking and replacing tires

CHECKING YOUR TIRES

Check the tire's tread for tread wear indicators. If the indicators show, replace the tires. The location of tread wear indicators is shown by the "TWI" or "△" marks, etc., molded on the sidewall of each tire.

The tires on your Toyota have built-in tread wear indicators to help you know when the tires need replacement. When the tread depth wears to 1.6 mm (0.06 in.) or less, the indicators will appear. If you can see the indicators in two or more adjacent grooves, the tire should be replaced. The lower the tread, the higher the risk of skidding.

The effectiveness of snow tires is lost if the tread wears down below 4 mm (0.16 in.).

If you have tire damage such as cuts, splits, cracks deep enough to expose the fabric, or bulges indicating internal damage, the tire should be replaced.

If a tire often goes flat or cannot be properly repaired due to the size or location of a cut or other damage, it should be replaced. If you are not sure, consult with your Toyota dealer.

If air loss occurs while driving, do not continue driving. Driving even a short distance can damage a tire beyond repair.

Any tires which are over 6 years old must be checked by a qualified technician even if damage is not obvious.

Tires deteriorate with age even if they have never or seldom been used.

This applies also to the spare tire and tires stored for future use.

REPLACING YOUR TIRES

When replacing a tire, use a tire of the same size and construction, and the same or greater maximum load as the originally installed tires. Also, on four-wheel drive models, all the tires must be the same brand and have the same tread patterns.

Using any other size or type of tire may seriously affect handling, ride, speedometer/odometer calibration, ground clearance, and clearance between the body and tires or snow chains.

Check that the maximum load of the replaced tire is greater than 1/2 of the Gross Axle Weight Ratings (GAWR) of either the front axle or the rear axle, whichever is greater. As for the maximum load of the tire, see the load limit at maximum cold tire inflation pressure mentioned on the sidewall of the tire, and as for the Gross Axle Weight Ratings (GAWR), see the Certification Label.

For details about the side wall of the tire and the Certification Label.

CAUTION

Observe the following instructions. Otherwise, an accident may occur resulting in death or serious injuries.

- ▶ **Do not mix radial, bias belted, or bias-ply tires on your vehicle, as this may cause dangerous handling characteristics resulting in loss of control.**
- ▶ **Do not use tires other than the manufacturer's recommended size, as this may cause dangerous handling characteristics resulting in loss of control.**
- ▶ **Four-wheel drive models: Do not use tires of different brands, sizes, construction or tread patterns, as this may cause dangerous handling characteristics resulting in loss of control.**

For vehicles with vehicle stability control system—

▶ **Do not use tires of different brands, sizes and constructions. This may damage the drive system and prevent the vehicle stability control system from functioning correctly.**

Toyota recommends all four tires, or at least both of the front or rear tires be replaced at a time as a set.

See “If you have a flat tire” in Section 4 for tire change procedure.

When a tire is replaced, the wheel should always be balanced.

An unbalanced wheel may affect vehicle handling and tire life. Wheels can get out of balance with regular use and should therefore be balanced occasionally.

When replacing a tubeless tire, the air valve should also be replaced with a new one.

Initial adjustment of the tire pressure warning system is necessary after you have rotated your tires. See “Tire pressure warning system” in Section 1-7.

Rotating tires

With a spare tire of the same wheel type as the installed tires

With a spare tire of different wheel type from the installed tires

To equalize the wear and help extend tire life, Toyota recommends that you rotate your tires according to the maintenance schedule. (For scheduled maintenance information, please refer to the “Scheduled Maintenance Guide” or “Owner’s Manual Supplement”.) However, the most appropriate timing for tire rotation may vary according to your driving habits and road surface conditions.

See “If you have a flat tire” in Section 4 for tire change procedure.

When rotating tires, check for uneven wear and damage. Abnormal wear is usually caused by incorrect tire pressure, improper wheel alignment, out-of-balance wheels, or severe braking.

Initial adjustment of the tire pressure warning system is necessary after you have rotated your tires. See “Tire pressure warning system” in Section 1-7.

Installing snow tires and chains

WHEN TO USE SNOW TIRES OR CHAINS

Snow tires or chains are recommended when driving on snow or ice.

On wet or dry roads, conventional tires provide better traction than snow tires.

SNOW TIRE SELECTION

If you need snow tires, select tires of the same size, construction and load capacity as the originally installed tires. Also, on four-wheel drive models, all the tires must be the same brand and have the same tread patterns.

Do not use tires other than those mentioned above. Do not install studded tires without first checking local regulations for possible restrictions.

 **CAUTION**

Observe the following instructions. Otherwise, an accident may occur resulting in death or serious injuries.

- ▶ Do not use snow tires other than the manufacturer's recommended size, as this may cause dangerous handling characteristics resulting in loss of control.
- ▶ Four-wheel drive models:
Do not use snow tires of different brands, sizes, construction or tread patterns, as this may cause dangerous handling characteristics resulting in loss of control.

SNOW TIRE INSTALLATION

Snow tires should be installed on all wheels.

Installing snow tires on the rear wheels only can lead to an excessive difference in road grip capability between the front and rear tires which could cause loss of vehicle control.

When storing removed tires, you should store them in a cool dry place.

Mark the direction of rotation and be sure to install them in the same direction when replacing.

 **CAUTION**

- ▶ Do not drive with the snow tires incorrectly inflated.
- ▶ Never drive over 120 km/h (75 mph) with any type of snow tires.

TIRE CHAIN SELECTION

Use the tire chains of correct size.

Regulations regarding the use of tire chains vary according to location or type of road, so always check local regulations before installing chains.

CHAIN INSTALLATION

Install the chains on the rear tires as tightly as possible. Do not use tire chains on the front tires. Retighten chains after driving 0.5—1.0 km (1/4—1/2 mile).

When installing chains on your tires, carefully follow the instructions of the chain manufacturer.

If wheel covers are used, they will be scratched by the chain band, so remove the covers before putting on the chains.

 **CAUTION**

- ▶ Do not exceed 50 km/h (30 mph) or the chain manufacturer's recommended speed limit, whichever is lower.
- ▶ Drive carefully avoiding bumps, holes, and sharp turns, which may cause the vehicle to bounce.
- ▶ Avoid sharp turns or locked-wheel braking, as use of chains may adversely affect vehicle handling.
- ▶ When driving with chains installed, be sure to drive carefully. Slow down before entering curves to avoid losing control of the vehicle. Otherwise an accident may occur.

Replacing wheels

WHEN TO REPLACE YOUR WHEELS

If you have wheel damage such as bending, cracks or heavy corrosion, the wheel should be replaced.

If you fail to replace a damaged wheel, the tire may slip off the wheel or cause loss of handling control.

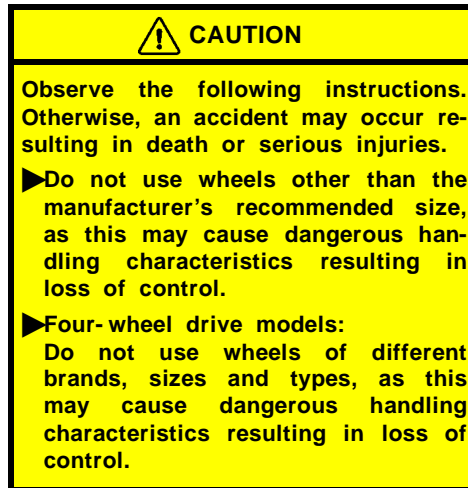

WHEEL SELECTION

When replacing wheels, care should be taken to ensure that the wheels are replaced by ones with the same load capacity, diameter, rim width, and offset.

Correct replacement wheels are available at your Toyota dealer.

A wheel of a different size or type may adversely affect handling, wheel and bearing life, brake cooling, speedometer/odometer calibration, stopping ability, headlight aim, bumper height, vehicle ground clearance, and tire or snow chain clearance to the body and chassis.

Replacement with used wheels is not recommended as they may have been subjected to rough treatment or high mileage and could fail without warning. Also, bent wheels which have been straightened may have structural damage and therefore should not be used. Never use an inner tube in a leaking wheel which is designed for a tubeless tire.

Aluminum wheel precautions

- ▶ When installing aluminum wheels, check that the wheel nuts are tight after driving your vehicle the first 1600 km (1000 miles).
- ▶ If you have rotated, repaired, or changed your tires, check that the wheel nuts are still tight after driving 1600 km (1000 miles).
- ▶ When using tire chains, be careful not to damage the aluminum wheels.
- ▶ Use only Toyota wheel nuts and wrench designed for your aluminum wheels.
- ▶ When balancing your wheels, use only Toyota balance weights or equivalent and a plastic or rubber hammer.
- ▶ As with any wheel, periodically check your aluminum wheels for damage. If damaged, replace immediately.

SECTION 7-3

DO- IT- YOURSELF MAINTENANCE

Electrical components

Checking battery condition	454
Battery recharging precautions	455
Checking and replacing fuses	456
Adding washer fluid	457
Replacing light bulbs	458

**Checking battery condition—
—Precautions**

⚠ CAUTION

BATTERY PRECAUTIONS

The battery produces flammable and explosive hydrogen gas.

- ▶ Do not cause a spark from the battery with tools.
- ▶ Do not smoke or light a match near the battery.

The electrolyte contains poisonous and corrosive sulfuric acid.

- ▶ Avoid contact with eyes, skin or clothes.
- ▶ Never ingest electrolyte.
- ▶ Wear protective safety glasses when working near the battery.
- ▶ Keep children away from the battery.

EMERGENCY MEASURES

- ▶ If electrolyte gets in your eyes, flush your eyes with clean water immediately and get immediate medical attention. If possible, continue to apply water with a sponge or cloth while en route to the medical office.

- ▶ If electrolyte gets on your skin, thoroughly wash the contact area. If you feel pain or burning, get medical attention immediately.
- ▶ If electrolyte gets on your clothes, there is a possibility of its soaking through to your skin, so immediately take off the exposed clothing and follow the procedure above, if necessary.
- ▶ If you accidentally swallow electrolyte, drink a large quantity of water or milk. Follow with milk of magnesia, beaten raw egg or vegetable oil. Then go immediately for emergency help.

—Checking battery exterior

Check the battery for corroded or loose terminal connections, cracks, or loose hold-down clamp.

- If the battery is corroded, wash it off with a solution of warm water and baking soda. Coat the outside of the terminals with grease to prevent further corrosion.
- If the terminal connections are loose, tighten their clamp nuts—but do not overtighten.
- Tighten the hold-down clamp only enough to keep the battery firmly in place. Overtightening may damage the battery case.

NOTICE

- ◆ *Be sure the engine and all accessories are off before performing maintenance.*
- ◆ *When checking the battery, remove the ground cable from the negative terminal (“-” mark) first and reinstall it last.*
- ◆ *Be careful not to cause a short circuit with tools.*
- ◆ *Take care no solution gets into the battery when washing it.*

—Checking battery condition

CHECKING BY INDICATOR

Check the battery condition by the indicator color.

Indicator color		Condition
Type A	Type B	
Green	Blue	Good
Dark	White	Charging necessary. Have battery checked by your Toyota dealer.
Clear or Light Yellow	Red	Have battery checked by your Toyota dealer.

Battery recharging precautions

During recharging, the battery is producing hydrogen gas.

Therefore, before recharging:

1. If recharging with the battery installed on the vehicle, be sure to disconnect the ground cable.
2. Be sure the power switch on the recharger is off when connecting the charger cables to the battery and when disconnecting them.

CAUTION

- ▶ **Always charge the battery in an unconfined area. Do not charge the battery in a garage or closed room where there is not sufficient ventilation.**
- ▶ **Only do a slow charge (5 A or less). Charging at a quicker rate is dangerous. The battery may explode, causing personal injuries.**

NOTICE

Never recharge the battery while the engine is running. Also, be sure all accessories are turned off.

Checking and replacing fuses

Type A

Type C

Standard and access cab models

Type B

Type D

Double cab models

If the headlights or other electrical components do not work, check the fuses. If any of the fuses are blown, they must be replaced.

See "Fuse locations" in Section 7-1 for locations of the fuses.

Turn the ignition switch and inoperative component off. Pull the suspected fuse straight out and check it.

Determine which fuse may be causing the problem. The lid of the fuse box shows the name of the circuit for each fuse. See Section 8 for the functions controlled by each circuit.

Type D—When any of the fuses are blown, contact your Toyota dealer.

Type A fuses can be pulled out by the pull-out tool. The location of the pull-out tool is shown in the illustration.

If you are not sure whether the fuse has blown, try replacing the suspected fuse with one that you know is good.

If the fuse has blown, push a new fuse into the clip.

Only install a fuse with the amperage rating designated on the fuse box lid.

If you do not have a spare fuse, in an emergency you can pull out the "DOME" or "A/C" fuse, which may be dispensable for normal driving, and use it if its amperage rating is the same.

If you cannot use one of the same amperage, use one that is lower, but as close to the rating as possible. If the amperage is lower than that specified, the fuse might blow out again but this does not indicate anything wrong. Be sure to get the correct fuse as soon as possible and return the substitute to its original clip.

It is a good idea to purchase a set of spare fuses and keep them in your vehicle for emergencies.

If the new fuse immediately blows out, there is a problem with the electrical system. Have your Toyota dealer correct it as soon as possible.

 **CAUTION**

Never use a fuse with a higher amperage rating, or any other object, in place of a fuse. This may cause extensive damage and possibly a fire.

Adding washer fluid

If any washer does not work or the low windshield washer fluid level warning light comes on, the washer tank may be empty. Add washer fluid.

You may use plain water as washer fluid. However, in cold areas where temperatures range below the freezing point, use washer fluid containing antifreeze. This product is available at your Toyota dealer and most auto parts stores. Follow the manufacturer's directions for how much to mix with water.

NOTICE

Do not use engine antifreeze or any other substitute because it may damage your vehicle's paint.

'05 TUNDRA_U (L/O 0409)

Replacing light bulbs—

The following illustrations show how to gain access to the bulbs. When replacing a bulb, make sure the ignition switch and light switch are off. Use bulbs with the wattage ratings given in the table.

 CAUTION
<p>▶ To prevent burning yourself, do not replace the light bulbs while they are hot.</p> <p>▶ Halogen bulbs have pressurized gas inside and require special handling. They can burst or shatter if scratched or dropped. Hold a bulb only by its plastic or metal case. Do not touch the glass part of a bulb with bare hands.</p>

NOTICE
<i>Only use a bulb of the listed type.</i>

The inside of the lens of exterior lights such as headlights may temporarily fog up when the lens becomes wet in the rain or in a car wash. This is not a problem because the fogging is caused by the temperature difference between the outside and inside of the lens, just like the windshield fogs up in the rain. However, if there is a large drop of water on the inside of the lens, or if there is water pooled inside the light, contact your Toyota dealer.

Light bulbs	Bulb No.	W	Type
Headlights	—	60/55	A
Front fog lights	9006	51	B
Parking lights	168	5	D
Front turn signal/front side marker lights	3157A	27/8	C
Rear turn signal lights	—	21	C
Stop/tail/rear side marker lights	—	21/5	D
Back-up lights	921	18	D
License plate lights	168	5	D
High mounted stoplight and cargo lamps	921	18	D
Interior light	—	8	E
Front personal lights			
Type A and C	—	10	E
Type B	—	3.8	D
Center personal lights	—	3.8	D

Light bulbs	Bulb No.	W	Type
Vanity light	—	1.5	E
Door courtesy lights	194	3.4	D
Glove box light	—	1.2	D
Step light	—	1.4	D

A: HB2 halogen bulbs
B: HB4 halogen bulbs
C: Wedge base bulbs (amber)
D: Wedge base bulbs (clear)
E: Double end bulbs

—Headlights

1. Open the hood. Unplug the connector. Remove the rubber cover.

If the connector is tight, wiggle it.

2. Release the bulb retaining spring and remove the bulb. Install a new bulb and the bulb retaining spring.

To install a bulb, align the tabs of the bulb with the cutouts of the mounting hole.

—Front fog lights

If either the left or right front fog lights burns out, contact your Toyota dealer.

NOTICE

Do not try to replace the front fog light bulbs by yourself. You may damage the vehicle.

3. Install the rubber cover as shown, and fit it securely on the boss. Then plug in the connector.

Make sure the rubber cover fits securely on the bulb base and the mounting body.

Aiming is not necessary after replacing the bulb. When aiming adjustment is necessary, contact your Toyota dealer.

—Parking lights

LEFT SIDE PARKING LIGHT—Loosen the bolt and remove the engine coolant reservoir.

'05 TUNDRA_U (L/O 0409)

—Front turn signal/front side marker lights (standard and access cab models)

Use a Phillips-head screwdriver. Remove and install the clip as shown in the following illustrations.

Removing clip

ENGINE LUBRICATION

Oil capacity (drain and refill), L (qt., Imp. qt.):

1GR- FE engine	
With filter	4.5 (4.8, 4.0)
Without filter	4.2 (4.4, 3.7)
2UZ- FE engine	
With filter	6.2 (6.5, 5.5)
Without filter	5.7 (6.0, 5.0)

"Toyota Genuine Motor Oil" is used in your Toyota vehicle. Use Toyota approved "Toyota Genuine Motor Oil" or equivalent to satisfy the following grade and viscosity.

Oil grade:

API grade SL "Energy-Conserving" or ILSAC multigrade engine oil

Recommended oil viscosity:

SAE 5W-30

Please contact your Toyota dealer for further details.

COOLING SYSTEM

Total capacity, L (qt., Imp. qt.):

With manual transmission	
	10.4 (11.0, 9.2)
With automatic transmission	
1GR- FE engine	10.3 (10.9, 9.1)
2UZ- FE engine	
Standard and access cab models	12.6 (13.0, 11.1)
Double cab models	12.8 (13.5, 11.3)

Coolant type:

"Toyota Super Long Life Coolant" is used in your Toyota vehicle at factory fill. In order to avoid technical problems, only use "Toyota Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, and non-borate coolant with long-life hybrid organic acid technology. (Coolant with long-life hybrid organic acid technology is a combination of low phosphates and organic acids.)

Do not use plain water alone.

Please contact your Toyota dealer for further details.

BATTERY

Open voltage* at 20°C (68°F):

12.6—12.8 V	Fully charged
12.2—12.4 V	Half charged
11.8—12.0 V	Discharged

*: Voltage that is checked 20 minutes after the key is removed with all the lights turned off

Charging rates:

5 A max.

'05 TUNDRA_U (L/O 0409)

Pedal free play, mm (in.):
5—15 (0.2—0.6)

Fluid type:
SAE J1703 or FMVSS No.116 DOT 3

MANUAL TRANSMISSION

Oil capacity, L (qt., Imp. qt.):
1.8 (1.9, 1.6)

Oil type:
Gear oil API GL-4 or GL-5

Recommended oil viscosity:
SAE 75W-90

AUTOMATIC TRANSMISSION

Fluid capacity (drain and refill),
L (qt., Imp. qt.):
Up to 3.0 (3.2, 2.6)

Fluid type:
Toyota Genuine ATF WS

Change automatic transmission fluid only
as necessary.

Generally, it is necessary to change automatic transmission fluid only if your vehicle is driven under one of the Special Operating Conditions listed in your "Scheduled Maintenance Guide" or "Owner's Manual Supplement". When changing the automatic transmission fluid, use only "Toyota Genuine ATF WS" (ATF JWS3324 or NWS9638) to aid in assuring optimum transmission performance.

Notice: Using automatic transmission fluid other than "Toyota Genuine ATF WS" may cause deterioration in shift quality, locking up of your transmission accompanied by vibration, and ultimately damage the automatic transmission of your vehicle.

Please contact your Toyota dealer for further details.

TRANSFER

Oil capacity, L (qt., Imp. qt.):
1.0 (1.1, 0.9)

Oil type:
Gear oil API GL-4 or GL-5

REPORTING SAFETY DEFECTS FOR U.S. OWNERS AND CAMPER INFORMATION

Reporting safety defects for U.S. owners and camper information

Reporting safety defects for U.S. owners	486
Camper information	486

'05 TUNDRA_U (L/O 0409)

Reporting safety defects for U.S. owners

If you believe that your vehicle has a defect which could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying Toyota Motor Sales, U.S.A., Inc. (Toll-free: 1-800-331-4331).

If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your dealer, or Toyota Motor Sales, U.S.A., Inc.

To contact NHTSA, you may either call the Auto Safety Hotline toll-free at 1-800-424-9393 (or 366-0123 in Washington, D.C. area) or write to: NHTSA, U.S. Department of Transportation, Washington, D.C. 20590. You can also obtain other information about motor vehicle safety from the Hotline.

Camper information—

This information has been prepared in accordance with regulation issued by the National Highway Traffic Safety Administration of the U.S. Department of Transportation. It provides the purchasers and/or prospective purchasers of Toyota vehicles with information on truck-camper loading. Your Toyota dealer will help answer any questions you may have as you read this information.

—Center of gravity location

Standard cab models

Access cab models (StepSide bed)

Access cab models (standard bed)

Double cab models

The figures given in the illustration indicate the recommended center of gravity zone.

Standard cab models

- A: 1186 mm (46.7 in.)
- B: 1058 mm (41.7 in.)

Access cab models

Standard bed

- A: 1186 mm (46.7 in.)
- B: 1058 mm (41.7 in.)

StepSide bed

- A: 1158 mm (45.6 in.)
- B: 1030 mm (40.6 in.)

Double cab models

- A: 1189 mm (46.8 in.)
- B: 1062 mm (41.8 in.)

⚠ CAUTION

If a load is too far back, it can cause dangerous handling. If it is too far forward, the front axle may be overloaded.

—Cargo weight rating and proper matching

CARGO WEIGHT RATING

Standard cab models

3 people, V6,	453 kg (1000 lb.)
3 people, V8,	476 kg (1050 lb.)

Access cab models

5 people, V6,	295 kg (650 lb.)
6 people, V6,	204 kg (450 lb.)
6 people, V8, 2WD, Standard bed	295 kg (650 lb.)
6 people, V8, 2WD, StepSide bed	204 kg (450 lb.)
6 people, V8, 4WD, Standard bed	159 kg (350 lb.)
6 people, V8, 4WD, StepSide bed	91 kg (200 lb.)

Double cab models

5 people, V8, 2WD,	385 kg (850 lb.)
5 people, V8, 4WD,	272 kg (600 lb.)

When the truck is used to carry a slide-in camper, the total cargo load of the truck consists of the manufacturer's camper weight figure, the weight of installed additional camper equipment not included in the manufacturer's camper weight figure, the weight of camper cargo, and the weight of passengers in the camper.

The total cargo load should not exceed the truck's cargo weight rating and the camper's center of gravity should fall within the truck's recommended center of gravity zone when installed.

⚠ CAUTION

Be careful—overloading can cause dangerous braking and handling problems, and can damage your vehicle and its tires.

—Gross axle and vehicle weight ratings

Secure loose items to prevent weight shifts that could affect the balance of your vehicle. When the truck camper is loaded, drive to a scale and weigh on the front and on the rear wheels separately to determine axle loads. Individual axle loads should not exceed either of the Gross Axle Weight Ratings (GAWR). The total of the axle loads should not exceed the Gross Vehicle Weight Rating (GVWR). These ratings are given on the vehicle Certification Label which is located on the door latch post on the left side of the vehicle. See "Your Toyota's identification" in Section 2 for the Certification Label location. If weight ratings are exceeded, move or remove items to bring all weights below the ratings.

GAWR

Front	1588 kg (3500 lb.)
Rear	
Standard and access cab models	
V6	1615 kg (3560 lb.)
V8	
Standard bed	1656 kg (3650 lb.)
StepSide bed	1615 kg (3560 lb.)
Double cab models	1706 kg (3760 lb.)

GVWR

Two-wheel drive models

Standard cab models

V6	2494 kg (5500 lb.)
V8	2858 kg (6300 lb.)

Access cab models

V6	2585 kg (5700 lb.)
V8	

Standard bed

2858 kg (6300 lb.)

StepSide bed

2726 kg (6010 lb.)

Double cab models

2993 kg (6600 lb.)

Four-wheel drive models

Standard cab models

2858 kg (6300 lb.)

Access cab models

Standard bed

2858 kg (6300 lb.)

StepSide bed

2726 kg (6010 lb.)

Double cab models

2993 kg (6600 lb.)

If weight ratings are exceeded, move or remove items to bring all weights below the ratings.

Gas station information

Fuel type:

1GR-FE engine: UNLEADED gasoline, Octane Rating 87 (Research Octane Number 91) or higher

For improved vehicle performance, the use of premium unleaded gasoline with an Octane Rating of 91 (Research Octane Number 96) or higher is recommended.

2UZ-FE engine: UNLEADED gasoline, Octane Rating 87 (Research Octane Number 91) or higher

See page 341 for detailed information.

Fuel tank capacity:

100 L (26.4 gal., 22.0 Imp. gal.)

Engine oil:

API grade SL "Energy-Conserving" or ILSAC multigrade engine oil is recommended.

See page 439 for detailed information.

Tire information: See pages 444 through 452.

Tire inflation pressure: See page 478.

Important information about this manual

Safety and vehicle damage warnings

Throughout this manual, you will see safety and vehicle damage warnings. You must follow these warnings carefully to avoid possible injury or damage.

The types of warnings, what they look like, and how they are used in this manual are explained as follows:

 CAUTION
<p>This is a warning against anything which may cause injury to people if the warning is ignored. You are informed about what you must or must not do in order to reduce the risk of injury to yourself and others.</p>

NOTICE
<p><i>This is a warning against anything which may cause damage to the vehicle or its equipment if the warning is ignored. You are informed about what you must or must not do in order to avoid or reduce the risk of damage to your vehicle and its equipment.</i></p>

Safety symbol

When you see the safety symbol shown above, it means: “Do not...”; “Do not do this”; or “Do not let this happen”.

Important information about your Toyota

Occupant restraint systems

Toyota encourages you and your family to take the time to read Section 1-3 of this Owner's Manual carefully. In terms of helping you understand how you can receive the maximum benefit of the occupant restraint systems this vehicle provides, Section 1-3 of this Owner's Manual is the most important Section for you and your family to read.

Section 1-3 describes the function and operation concerning seats, seat belts, SRS airbags and child restraint systems of this vehicle and some potential hazards you should be aware of. These systems work together along with the overall structure of this vehicle in order to provide occupant restraint in the event of a crash. The effect of each system is enhanced when it is used properly and together with other systems. No single occupant restraint system can, by itself, provide you or your family with the equal level of restraint which these systems can provide when used together. That is why it is important for you and your family to understand the purpose and proper use of each of these systems and how they relate to each other.

The purpose of all occupant restraint systems is to help reduce the possibility of death or serious injury in the event of a collision. None of these systems, either individually or together, can ensure that there is no injury in the event of collision. However, the more you know about these systems and how to use them properly, the greater your chances become of surviving an accident without death or serious injury.

Seat belts provide the primary restraint to all occupants of the vehicle, and every occupant of the vehicle should wear seat belts properly at all times. Children should always be secured in child restraint systems that are appropriate for their age and size. SRS (Supplemental Restraint System) airbags are, as their names imply, designed to work with, and be supplemental to, seat belts and are not substitutes for them. SRS airbags can be very effective in reducing the risk of head and chest injuries by preventing contact of the head and chest with interior portions of the vehicle.

In order to be effective, the SRS airbags must deploy with tremendous speed. The rapid deployment of the SRS airbags makes the SRS airbags themselves potential sources of serious injury if an occupant is too close to an airbag, or if an object or some part of his or her body has been placed between the occupant and the airbag at the time of deployment. This is just one example of how the instructions in Section 1-3 of this Owner's Manual will help ensure proper use of the occupant restraint systems, and increase the safety they can provide to you and your family in the event of an accident.

Toyota recommends you to read the provisions in Section 1-3 carefully and refer to them as needed during your time of ownership of this vehicle.

Event data recorder

Your vehicle has computers that monitor and control certain aspects of your vehicle. These computers assist in driving and maintaining optimal vehicle performance. Besides storing data useful for troubleshooting, there is a system to record data in a crash or a near car crash event. This is called an Event Data Recorder (EDR).

The SRS airbag sensor assembly contains the EDR. In a crash or a near car crash event, this device records some or all of the following information:

- ▶ Engine speed
- ▶ Whether the brake pedal was applied or not
- ▶ Vehicle speed
- ▶ To what extent the accelerator pedal was depressed
- ▶ Position of the transmission selector lever
- ▶ Whether the driver and front passenger wore the seat belts or not
- ▶ Driver's seat position
- ▶ Front passenger's occupant classification

'05 TUNDRA_U (L/O 0409)

- ▶ SRS airbag deployment data
- ▶ SRS airbag system diagnostic data

The information above is intended to be used for the purpose of improving vehicle safety performance. Unlike general data recorders, the EDR does not record sound data such as conversation between passengers.

Toyota will not disclose the data recorded in an EDR to a third party except when:

- ▶ An agreement from the vehicle's owner (or the leasing company for a leased vehicle) is obtained
- ▶ Officially requested by the police or other authorities
- ▶ Used as a defense for Toyota in a law suit
- ▶ Ordered by the court

However, if necessary Toyota will:

- ▶ Use the data for research on Toyota vehicle safety performance
- ▶ Disclose the data to a third party for research purposes without disclosing details of the vehicle owner, and only when it is deemed necessary
- ▶ Disclose summarized data cleared of vehicle identification information to a non-Toyota organization for research purposes

New vehicle warranty

Your new vehicle is covered by the following Toyota limited warranties:

- ▶ New vehicle warranty
- ▶ Emission control systems warranty
- ▶ Others

For further information, please refer to the "Owner's Warranty Information Booklet" or "Owner's Manual Supplement".

v

Your responsibility for maintenance

It is the owner's responsibility to make sure that the specified maintenance is performed. Section 6 gives details of these maintenance requirements. Also included in Section 6 is general maintenance. For scheduled maintenance information, please refer to the "Scheduled Maintenance Guide" or "Owner's Manual Supplement".

Important health and safety information about your Toyota

- ▶ **WARNING:** Engine exhaust, some of its constituents, and a wide variety of automobile components contain or emit chemicals known to the State of California to cause cancer and birth defects and other reproductive harm. In addition, oils, fuels and fluids contained in vehicles as well as waste produced by component wear contain or emit chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.
- ▶ **Battery posts, terminals and related accessories** contain lead and lead compounds. Wash your hands after handling. Used engine oil contains chemicals that have caused cancer in laboratory animals. Always protect your skin by washing thoroughly with soap and water.

Accessories, spare parts and modification of your Toyota

A wide variety of non-genuine spare parts and accessories for Toyota vehicles are currently available in the market. You should know that Toyota does not warrant these products and is not responsible for their performance, repair, or replacement, or for any damage they may cause to, or adverse effect they may have on, your Toyota vehicle.

This vehicle should not be modified with non-genuine Toyota products. Modification with non-genuine Toyota products could affect its performance, safety or durability, and may even violate governmental regulations. In addition, damage or performance problems resulting from the modification may not be covered under warranty.

Spark ignition system of your Toyota

The spark ignition system in your Toyota meets all requirements of the Canadian Interference-Causing Equipment Standard.

Installation of a mobile two-way radio system

As the installation of a mobile two-way radio system in your vehicle could affect electronic systems such as follows, be sure to check with your Toyota dealer for precautionary measures or special instructions regarding installation.

- ▶ Multiport fuel injection system/sequential multiport fuel injection system
- ▶ Electronic throttle control system
- ▶ SRS airbag system
- ▶ Seat belt pretensioner system
- ▶ Anti-lock brake system
- ▶ Traction control system
- ▶ "AUTO LSD" system
- ▶ Vehicle stability control system
- ▶ Cruise control system
- ▶ Tire pressure warning system

Tires and loading on your Toyota

Underinflated or overinflated tire pressure and the excess load may result in the deterioration of steering ability and braking ability, leading to an accident. Check the tire inflation pressure periodically and be sure to keep the load limits given in this Owner's Manual. For details about tire inflation pressure and load limits, see "Checking tire inflation pressure" in Section 7-2 and "Vehicle load limits" in Section 2.

Scrapping of your Toyota

The SRS airbag and seat belt pretensioner devices in your Toyota contain explosive chemicals. If the vehicle is scrapped with the airbags and pretensioners left as they are, this may cause an accident such as fire. Be sure to have the systems of the SRS airbag and seat belt pretensioner removed and disposed of by a qualified service shop or by your Toyota dealer before you dispose of your vehicle.

On- pavement and off- road driving tips

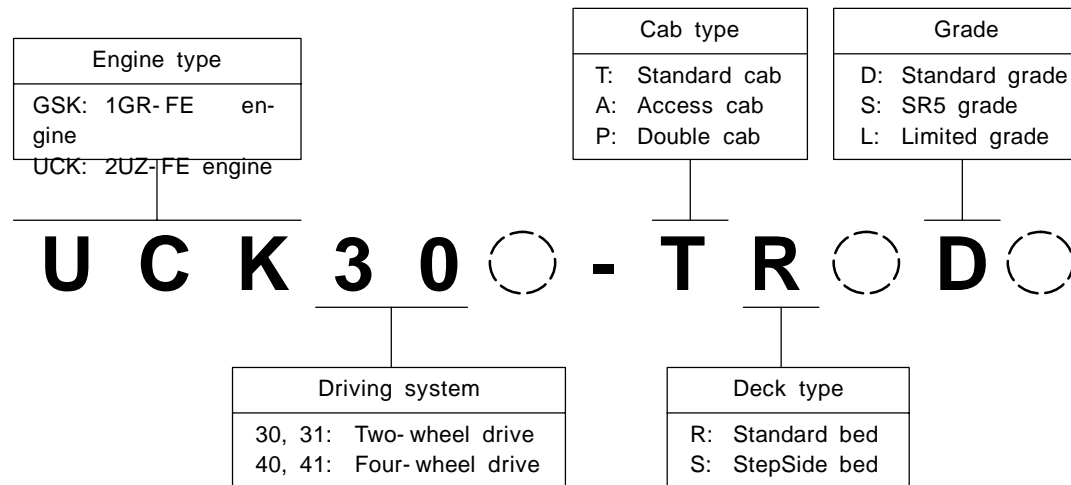

This vehicle will handle and maneuver differently from an ordinary passenger car because it is designed for off-road use also. It has a significantly higher rollover rate than other types of vehicles. In addition, this vehicle has a higher ground clearance and center of gravity than that of an ordinary passenger car. This vehicle design feature causes this type of vehicle to be more likely to rollover. Failure to operate this vehicle correctly may result in loss of control, accidents or vehicle rollover causing death or serious injury. Be sure to read "Off-road vehicle precautions" in Section 2 and "Off-road driving precautions" in Section 3.

Leak detection pump

This pump performs fuel evaporation leakage check. This check is done approximately five hours after the engine is turned off. So you may hear sound coming from underneath the rear deck for several minutes. It does not indicate a malfunction.

Model code

Check the model code to see what type of model your vehicle is.

The model code appears on the Certification Label with the heading "MODEL".
See "Your Toyota's identification" in Section 2 for the Certification Label location.

You should know as much about the quality and importance of proper maintenance of your new vehicle as the people who built it.

The Toyota authorized Repair Manual tells you how to maintain your vehicle and enables you to correctly perform your own maintenance.

The best way to keep your new vehicle in top running order is to maintain it properly from the moment you drive it off the showroom floor.

The Toyota authorized Repair Manual is packed with literally everything you need to know to perform your own maintenance in virtually every area of your new vehicle.

Maintenance procedures for the engine, chassis, body, electrical system, and more, are clearly explained and illustrated.

Periodic maintenance and tune-up

Periodic maintenance and tune-up helps to prevent small problems from growing into larger ones later on. The repair manual outlines exactly what maintenance is required and clearly explains how to do the work yourself step-by-step.

Areas covered include such things as spark plug replacement, valve clearance adjustment and engine oil and filter replacement.

**Where to obtain the
Repair Manual**

The repair manual for TOYOTA TUNDRA may be purchased from any Toyota dealer or the Material Distribution Center. To purchase the repair manual, please contact your Toyota dealer or call the Material Distribution Center toll-free at 1-800-622-2033.

WE REALLY CARE ABOUT YOU — PLEASE BUCKLE UP

Toyota has made a special effort to encourage use of seat belts.

Toyota belts are:

- ▶ **Comfortable**
- ▶ **Easy to use**
- ▶ **Convenient**

We encourage you to use your belts every time you drive.

SECTION I

BASIC FUNCTIONS

Basic information before operation

Display operation 2
Touch switch operation 2
Inputting letters and numbers 3
Current position display 5
Screen scroll operation (one-touch scroll) 5
Map scale 9
Orientation of the map 9
Limitations of the navigation system 10
Map database information and updates 12

BASIC FUNCTIONS

Display operation

You can adjust the angle of the display by pushing the “TILT” button. Each push of the “TILT” button will tilt the display to positions 1, 2, 3 and then back to 0 in the reverse order.

If you turn the ignition switch off, the display will automatically move back to position 0. The display will automatically resume the previous position when the ignition switch is turned to the “ACC” or “ON” position.

CAUTION

Take care not to jam your hand while the display is moving. Otherwise, you could be injured.

NOTICE

Do not obstruct the display while it is moving. It could damage your navigation system.

INFORMATION

Under extremely cold conditions, the display may react slowly or operation sound may become louder.

Touch switch operation

This system is operated mainly by the switches on the screen. To prevent damage to the screen, lightly touch switches on the screen with your finger. When you touch a switch on the screen, a beep sounds.

Do not use objects other than your finger to touch the screen.

INFORMATION

- ▶ *If the system does not respond to a touch of a switch, move your finger away from the screen and then touch it again.*
- ▶ *You cannot operate dimmed switches.*
- ▶ *Wipe off fingerprints on the surface of the display using a glass cleaning cloth.*
- ▶ *The displayed image may become darker and moving images may be slightly distorted when the display is cold.*
- ▶ *Under extremely cold conditions, the map may not be displayed and the data input by a user may be deleted. Also, the switches may be harder than usual to depress.*

Inputting letters and numbers

When searching for an address or a name, or entering a memo, you can input letters and numbers via the touch screen.

► To input letters

To display the alphabet keys, touch the “A-Z” switch or the “A-Y” switch.

Enter letters by touching the alphabet keys directly.

 : Touching this switch erases one letter. Holding this switch will continue to erase letters.

► To input numerals and symbols

To display the number keys and symbol keys, touch the “0-9” switch.

Enter numerals and symbols by touching the number keys and symbol keys directly.

 : Touching this switch erases one letter. Holding this switch will continue to erase letters.

 : Touching this switch displays other symbols.

► To display the list

To search for an address or a name, touch the “List” switch. Matching items from the database are listed even if the entered address or name is incomplete.

If the number of matches is four or less, the list is displayed without touching the “List” switch.

BASIC FUNCTIONS

INFORMATION

*The number of matching items is shown to the right side of the screen. If the number of matching items is more than 9,999, the system displays “****” on the screen.*

► List screen operation

When a list is displayed, you can scroll or page through the list by using the appropriate switch.

 To shift to the next or previous page.

 To scroll up or down one item at a time.

This expresses a displayed screen position.

 If  appears to the right of the item name, the complete name is too long for the display. Touch  to scroll to the end of the name.

Touch  to scroll to the beginning of the name.

Current position display

When starting the navigation system, the current position is displayed first.

This screen displays the current vehicle position and a map of the surrounding local area.

The current vehicle position mark appears in the center or bottom center of the map screen. You can return to this map screen showing your current position at any time from any screen by touching the “**MAP/VOICE**” button.

During driving, the current vehicle position mark is fixed in the screen and the map moves.

The current position is automatically set as your vehicle receives signals from the GPS (Global Positioning System). If your current position is not correct, it is automatically corrected after your vehicle receives signals from the GPS.

INFORMATION

- ▶ *After the battery disconnection, or on a new vehicle, the current position may not be correct. As soon as the system receives signals from the GPS, the correct current position is displayed.*
- ▶ *To correct the current position manually, see page 77.*

Screen scroll operation (one-touch scroll)

Touch any point on the map and that point moves to the center of the screen and is shown by the cursor mark.

If you wish to look at a point on the map which is different to your current vehicle position, you can bring the desired point to the center of the screen by using the scroll feature.

If you continue to hold your finger on the screen, the map will continue scrolling in that direction until you lift your finger.

BASIC FUNCTIONS

After you scroll the screen, the map remains centered at the selected location until you activate another function. The current vehicle position mark will continue to move along your actual route and may move off the screen. When you touch the **“MAP/VOICE”** button, the current vehicle position mark returns to the center of the screen and the map moves as you proceed along the designated route.

INFORMATION

*When you use the one-touch scroll feature, the current vehicle position mark may disappear from the screen. Move the map with a one-touch scroll again or push the **“MAP/VOICE”** button to return to the current vehicle position map location display.*

► To set the cursor position as a destination

You can set a specific point on the map as a destination using the one-touch scroll function.

Touch the **“Enter”** switch.

The screen changes and displays the map location of the selected destination and the route preference. (See **“ — Entering destination”** on page 38.)

If there is already a preset destination, touch the **“Add to”** switch or the **“Replace”** switch.

When there is already a preset destination, using the **“Add to”** switch to set an additional destination, will set the new one as the first point of arrival.

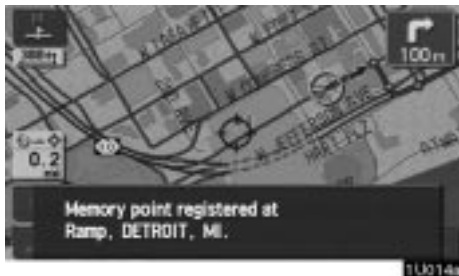

► To register the cursor position as a memory point

Memory point registration enables easy access to a specific point.

Touch the **“Mark”** switch.

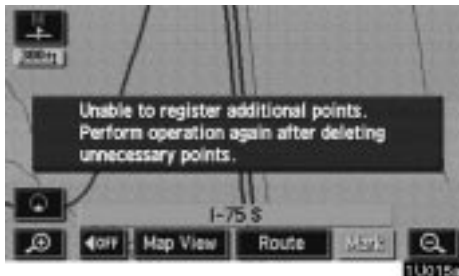

When you touch the **“Mark”** switch, the following screen appears for a few seconds, and then the map screen returns.

The registered point is shown by  on the map.

To change the icon or name, etc., see page 68.

You can register up to 106 memory points. If you attempt to register more than 106, a message appears for confirmation.

► To see information about the icon where the cursor is set

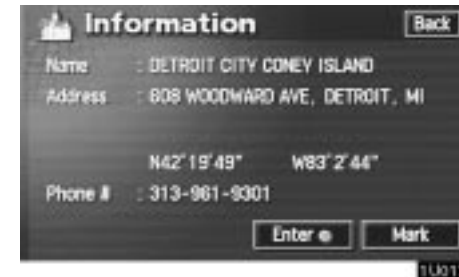

To display information about an icon, set the cursor on it.

POI INFORMATION

When the cursor is set on a POI icon, the name and “Info.” switch are displayed on the top of the screen.

Touch the “Info.” switch.

Information such as the name, address, and phone number are displayed.

If you touch the “Enter” switch, the position of cursor is set as a destination.

If there is already a preset destination, the “Add to” switch and the “Replace” switch are displayed.

When there is already a preset destination, using the “Add to” switch to set an additional destination, will set the new one as the first point of arrival.

To register this POI as a memory point, touch the “Mark” switch. (For details, see page 66.)

BASIC FUNCTIONS

INFORMATION

The desired Point of Interest can be displayed on the map screen. (For details, see page 49.)

MEMORY POINT INFORMATION

When the cursor is set on a memory point icon, the name and “Info.” switch are displayed on the top of screen.

Touch the “Info.” switch.

Information such as the name, location, and phone number are displayed.

If you touch the “Enter” switch, the position of cursor is set as a destination.

If there is already a set destination, the “Add to” switch and the “Replace” switch are displayed.

When there is already a preset destination, using the “Add to” switch to set an additional destination, will set the new one as the first point of arrival.

To edit a memory point, touch the “Edit” switch. (For details, see page 68.)

Map scale

Touch the or switch to change the scale of the map display. The scale bar and indicator at the bottom of the screen indicates the map scale menu. The scale ranges 150 feet (50 m) to 250 miles (400 km).

Touch the or switch until the scale bar changes normally. If you continue to touch on the switch, the scale bar changes smoothly.

You can change the scale of the map display by touching the scale bar directly. It is not available during driving.

The map scale is displayed under the north-up symbol or heading-up symbol at the top left of the screen.

INFORMATION

When the map scale is at the maximum range of 250 miles (400 km), is not shown. When the map scale is at the minimum range of 150 feet (50 m), is not shown. However, in the area where the foot print map is contained, when the map scale is changed to 150 feet (50 m), the switch changes to the switch.

Orientation of the map

North-up screen

Heading-up screen

BASIC FUNCTIONS

You can change the orientation of the map from north-up to heading-up by touching the orientation symbol at the top left of the screen.

North-up symbol

Regardless of the direction of vehicle travel, North is always up.

Heading-up symbol

The direction of vehicle travel is always up. A red arrow indicates North.

Limitations of the navigation system

This navigation system calculates the current vehicle position using satellite signals, various vehicle signals, map data, etc. However, the accurate position may not be shown depending on the satellite condition, road configuration, vehicle condition or other circumstances.

The Global Positioning System (GPS) developed and operated by the U.S. Department of Defense provides an accurate current vehicle position using 3 to 4 satellites. The GPS system has a certain level of inaccuracy. While the navigation system will compensate for this most of the time, occasional positioning errors up to 300 feet (100 m) can and should be expected. Generally, position errors will be corrected within a few seconds.

When your vehicle is receiving signals from the satellites, the "GPS" mark appears at the top left of the screen.

The GPS signal may be physically obstructed, leading to inaccurate vehicle position on the map display. Tunnels, tall buildings, trucks, or even the placement of objects on the instrument panel may obstruct the GPS signals.

The installation of window tinting may also obstruct the GPS signals. Most window tinting contains some metallic content that will interfere with the GPS signal reception. We advise against the use of window tinting on vehicles equipped with navigation systems.

The GPS satellites may not send signals due to repairs or improvements being made to them.

Even when the navigation system is receiving clear GPS signals, the vehicle position may not be shown accurately or inappropriate route guidance may occur in some cases.

(a) Accurate current vehicle position may not be shown in the following cases:

- ▶ When driving on a small angled Y-shaped road.
- ▶ When driving on a winding road.
- ▶ When driving on a slippery road such as in sand, gravel, snow, etc.
- ▶ When driving on a long straight road.
- ▶ When freeway and surface streets run in parallel.
- ▶ After moving by ferry or vehicle carrier.
- ▶ When a long route is searched during high speed driving.
- ▶ When driving without setting the current position calibration correctly.
- ▶ After repeating a change of direction by going forward and backward, or turning on a turntable in the parking lot.
- ▶ When leaving a covered parking lot or parking garage.
- ▶ When a roof carrier is installed.
- ▶ When driving with tire chains installed.
- ▶ When the tires are worn.
- ▶ After replacing a tire or tires.
- ▶ When using tires that are smaller or larger than the factory specifications.

- ▶ When the tire pressure in any of the four tires is not correct.

INFORMATION

If your vehicle cannot receive GPS signals, you can correct the current position manually. For information on setting the current position calibration, see page 77.

BASIC FUNCTIONS

(b) Inappropriate route guidance may occur in the following cases:

- ▶ When turning at an intersection off the designated route guidance.
- ▶ If you set more than one destination but skip any of them, auto reroute will display a route returning to the destination on the previous route.
- ▶ When turning at an intersection, there is no route guidance.
- ▶ When passing through the intersection, there is no route guidance.
- ▶ During auto reroute, the route guidance may not be available for the next turn to the right or left.
- ▶ It may take a long time to operate auto reroute during high speed driving. In auto reroute, a detour route may be shown.
- ▶ After auto reroute, the route may not be changed.
- ▶ An unnecessary U-turn may be shown or announced.
- ▶ A location may have multiple names and the system will announce one or more.
- ▶ Some routes may not be searched.
- ▶ If the route to your destination includes gravel, unpaved roads or alleys, the route guidance may not be shown.

- ▶ Your destination point might be shown on the opposite side of the street.
- ▶ When a portion of the route has regulations prohibiting the entry of the vehicle that vary by time or season or other reason.
- ▶ The road and map data stored in your navigation system may not be complete or may not be the latest version.

After replacing the tire, implement the operation described in the “▶Tire change calibration”. (For details, see page 78.)

This navigation system uses the tire turning data and is designed to work with factory-specified tires for your vehicle. Installing tires that are larger or smaller than the originally equipped diameter may cause inaccurate display of the vehicle's position. The tire pressure also affects the diameter of the tires so please make sure the tire pressure of all four tires is correct.

Map database information and updates

This system uses the maps of DENSO.

END USER LICENSE AGREEMENT

PLEASE READ THIS AGREEMENT CAREFULLY BEFORE USING THE NAVIGATION SYSTEM

THIS IS A LICENSE AGREEMENT FOR YOUR COPY OF THE MAP DATABASE (“The DATABASE”), ORIGINALLY MADE BY Geographic Data Technology, Inc. (“GDT”), USED IN THE NAVIGATION SYSTEM. BY USING THE DATABASE, YOU ACCEPT AND AGREE TO ALL TERMS AND CONDITIONS SET FORTH BELOW.

OWNERSHIP

The DATABASE and the copyrights and intellectual property or neighboring rights therein are owned by GDT or its licensors.

LICENSE GRANT

GDT grants you a non-exclusive license to use your copy of the DATABASE for your personal use or for use in your business' internal operations. This license does not include the right to grant sub-licenses.

LIMITATIONS ON USE

The DATABASE is restricted for use in the specific system for which it was created. Except to the extent explicitly permitted by mandatory laws, you may not extract or re-utilize any portion of the contents of the DATABASE, nor reproduce, copy, modify, adapt, translate, disassemble, decompile, or reverse engineer any portion of the DATABASE.

TRANSFER

You may not transfer the DATABASE to third parties, except together with the system for which it was created, provided that you do not retain any copy of the DATABASE, and provided that the transferee agrees to all terms and conditions of this AGREEMENT.

DISCLAIMER OF WARRANTY

GDT does not warrant or make any representations regarding, either express or implied, regarding the use or results of the use of the DATABASE in terms of its correctness, accuracy, reliability, or otherwise, and expressly disclaims any implied warranties of quality, performance, merchantability, fitness for a particular purpose or non-infringement. GDT does not warrant that the DATABASE is or will be error free. No oral or written information or advice provided by GDT, your supplier or any other person shall create a warranty.

LIMITATION OF LIABILITY

The price of the DATABASE does not include any consideration for assumption of risk of consequential, indirect or unlimited direct damages which may arise in connection with your use of the DATABASE. Accordingly, in no event shall GDT or supplier of the navigation system using the DATABASE ("Supplier") be liable for any consequential, special, incidental or indirect damages, including without limitation, loss of revenue, data, or use, incurred by you or any third party arising out of your use of the DATABASE, whether in an action in contract or tort or based on a warranty, even if GDT or the Supplier has been advised of the possibility of such damages. In any event GDT's liability for direct damages is limited to the price of your copy of the DATABASE.

THE DISCLAIMER OF WARRANTY AND LIMITATION OF LIABILITY, SET FORTH IN THIS AGREEMENT, DO NOT AFFECT OR PREJUDICE YOUR STATUTORY RIGHTS WHERE YOU HAVE ACQUIRED THE DATABASE OTHERWISE THAN IN THE COURSE OF A BUSINESS. Some states and laws do not allow the exclusion of implied warranties, so the above disclaimer may not apply to you.

BASIC FUNCTIONS

WARNINGS

The DATABASE reflects reality as existing before you received the DATABASE and it comprises data and information from government and other sources, which may contain errors and omissions. Accordingly, the DATABASE may contain inaccurate or incomplete information due to the passage of time, changing circumstances, and due to the nature of the sources used. The DATABASE does not include or reflect information on - inter alia - neighborhood safety; law enforcement; emergency assistance; construction work; road or lane closures; vehicle or speed restrictions; road slope or grade; bridge height, weight or other limits; road or traffic conditions; special events; traffic congestion; or travel time.

GOVERNMENT END USERS

If the DATABASE is for a region of North America and is being acquired by or on behalf of the United States government or any other entity seeking or applying rights similar to those customarily claimed by the United States government, the DATABASE is licensed with "limited rights." Utilization of the DATABASE is subject to the restrictions specified in the "Rights in Technical Data and Computer Database" clause at DFARS 252.227-7013, or the equivalent clause for non-defense agencies. Manufacturer of the DATABASE for North America is Geographic Data Technology, Inc., at 11 Lafayette Street, Lebanon, New Hampshire 03766, USA.

END USER NOTICE

PLEASE READ THIS NOTICE CAREFULLY BEFORE USING THIS NAVIGATION SYSTEM

The Point Of Interest Data ("POI" Data) in the navigation system is in part provided by infoUSA Inc. ("infoUSA"). By using the POI Data, you accept and agree to all terms and conditions set forth below.

1. Ownership

All rights, title and interest to the infoUSA POI Data shall be retained by infoUSA.

2. Limitations on use

Except to the extent explicitly permitted by mandatory laws, you may not extract or re-utilize any portion of the contents of the POI Data, nor reproduce, copy, modify, adapt, translate, disassemble, decompile, or reverse engineer any portion of the POI Data.

3. Transfer

You may not transfer the POI Data to third parties, except together with the system for which it was created, provided that you do not retain any copy of the POI Data.

4. Disclaimer of warranty
EXCEPT AS STATED HEREIN, INFOUSA MAKES NO EXPRESS OR IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, ANY EXPRESS OR IMPLIED WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE OR WARRANTY OF MERCHANTABILITY.

5. Limitation of Liability
EITHER INFOUSA OR SUPPLIER OF POI DATA SHALL NOT BE LIABLE FOR ANY INDIRECT, CONSEQUENTIAL OR INCIDENTAL DAMAGES MADE OR ALLEGED IN CONNECTION WITH YOUR USE OF THE POI DATA.

END USER LICENSE AGREEMENT

Personal Use Only. You agree to use this information for solely personal, non-commercial purposes, and not for service bureau, time-sharing or other similar purposes. You may not modify the information or remove any copyright notices that appear on the information in any way. You may not decompile, disassemble or reverse engineer any portion of this information, and may not transfer or distribute it in any form, for any purpose. Without limiting the foregoing, you may not use this information with any products, systems, or applications installed or otherwise connected to or in communication with vehicles, capable of vehicle navigation, positioning, dispatch, real time route guidance, fleet management or similar applications.

No Warranty. This information is provided to you "as is," and you agree to use it at your own risk. DENSO and its licensors (and their licensors and suppliers, collectively "DENSO") make no guarantees, representations or warranties of any kind, express or implied, arising by law or otherwise, including but not limited to, and DENSO expressly disclaims any warranties regarding content, quality, accuracy, completeness, effectiveness, reliability, fitness for a particular purpose, non-infringement, usefulness, use or results to be obtained from this information, or that the information or server will be uninterrupted or error-free. Some states, territories and countries do not allow certain warranty exclusions, so to that extent, the above exclusion may not apply to you.

BASIC FUNCTIONS

Disclaimer of Liability: DENSO SHALL NOT BE LIABLE TO YOU FOR ANY CLAIM, DEMAND OR ACTION, IRRESPECTIVE OF ITS NATURE, ALLEGING ANY LOSS, INJURY OR DAMAGES, WHETHER DIRECT, INDIRECT, INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES, INCLUDING ANY LOSS OF PROFIT, REVENUE OR CONTRACTS ARISING OUT OF YOUR POSSESSION, USE OF OR INABILITY TO USE THIS INFORMATION, ANY DEFECT IN THE INFORMATION, OR THE BREACH OF THESE TERMS OR CONDITIONS, WHETHER IN AN ACTION IN CONTRACT OR TORT OR BASED ON A WARRANTY, EVEN IF DENSO OR ITS LICENSORS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. Some states, territories and countries do not allow certain liability exclusions or damages limitations, so to that extent the above may not apply to you.

Indemnity. You agree to indemnify, defend and hold DENSO and its licensors (including their respective licensors, suppliers, assignees, subsidiaries, affiliated companies, and the respective officers, directors, employees, shareholders, agents and representatives of each of them) free and harmless from and against any liability, loss, injury (including injuries resulting in death), demand, action, cost, expense, or claim of any kind or character, including but not limited to attorney's fees, arising out of or in connection with any use or possession by you of this information.

END USER NOTICE

The marks of companies displayed by this product to indicate business locations are the marks of their respective owners. The use of such marks in this product does not imply any sponsorship, approval, or endorsement by such companies of this product.

There are two types of areas available for route guidance. In one type of area, primarily around metropolitan centers, detailed route guidance is available for the entire area. In the other type of area, all roads are displayed on the map but route guidance is limited. The navigation route might lack precision because the data (no right turns, one-way traffic, etc.) is not complete. It is still possible to reach the destination by following the arrow direction and distance as shown on the bottom left of the screen. The arrow points in the direction of the destination. The distance shown is as measured in a straight line from the current vehicle position to the destination area.

In order to provide you with as accurate map information as possible, we are always gathering information such as road repairs and doing site investigation. However, the names of roads, streets, facilities, and their locations are often changed. In some places, construction on roads may be in progress. For that reason, information on some areas in this system might be different from the actual location.

The map database is normally updated once a year. Contact your dealer for information about the availability and pricing of an update.

► **To confirm the database version and disc coverage area**

1. Push the **“MENU”** button.

2. Touch the **“Map DVD”** switch.

Make sure the version of the database on this screen. (The database version on the screen above may be different from the actual screen.)

To display the disc coverage area, touch the **“Covered Area”** switch. Confirm the covered area on the screen.

Contact your dealer to find out if there is a more recent update released.

BASIC FUNCTIONS

► To replace map disc

The slot for the map disc is behind the display.

To lower the display, push the “OPEN” button. After replacing map disc, push the button again to close the display.

CAUTION

- Do not place anything on the opened display, as such items may be thrown about in the compartment and possibly injure people in the vehicle during sudden braking or in an accident.
- To reduce the chance of injury in the case of an accident or sudden stopping while driving, keep the display closed.
- Take care not to jam your hand while the display is moving. Otherwise, you could be injured.

NOTICE

Do not obstruct the display while it is moving. It could damage your navigation system.

INFORMATION

Under extremely cold conditions, the display may react slowly or operation sound may become louder.

SECTION II

DESTINATION INPUT AND ROUTE GUIDANCE

Basic functions in frequent use

Destination input	20
Selecting the search area	20
Destination input by Home	22
Destination input by Quick access	22
Destination input by "Address"	22
Destination input by "POI Name"	26
Destination input by "POI Category"	29
Destination input by "Emergency"	32
Destination input by "Memory"	33
Destination input by "Previous"	34
Destination input by "Map"	34
Destination input by "Intersection"	35
Destination input by "Freeway Ent./Exit"	36
Destination input by "Coordinates"	37
Destination input by "Phone #"	37
Starting route guidance	38
Entering destination	38
Route guidance screen	40
Typical voice guidance prompts	40
Setting and deleting destination	42
Setting and deleting route	44
Show POI icons	49

Route preview	52
Screen configuration	53
Distance and time to destination	57
Foot print map	58

DESTINATION INPUT AND ROUTE GUIDANCE

Destination input —

Push the “DEST” button and the “Destination” screen appears.

You can use one of 13 different methods to enter your destination. (See pages 22 through 37.)

INFORMATION

- ◀ *When inputting the destination, the response to the switch may be slow.*
- ◀ *The route for returning may not be the same as that for going.*
- ◀ *The route guidance to the destination may not be the shortest route nor a route without traffic congestion.*

◀ *Route guidance may not be available if there is no road data for the specified location.*

◀ *When setting the destination on a map with a scale larger than 0.5 mile (800 m), the map scale changes to 0.5 mile (800 m) automatically. Set the destination again.*

◀ *To select an “Address”, “POI Name”, “Freeway Ent./Exit”, “Intersection” or “Phone #” in a different area, it is necessary to change the search area.*

◀ *If you enter a destination, the road nearest to the point you selected is set as the destination.*

CAUTION

While you are driving, be sure to obey traffic regulations and keep the road conditions in mind. If a traffic sign on the road has been changed, the route guidance may provide wrong information.

— Selecting the search area

The “Destination” screen allows you to select the area to search for your destination.

Touch the “Change” switch on the “Destination” screen to display a map of the United States and Canada divided into 11 areas. See page 12 for map database information and updates.

Touch one of the “US1” through “CAN” switches to select a search area. Touch the “OK” switch and the “Destination” screen returns.

DESTINATION INPUT AND ROUTE GUIDANCE

U.S.A.	
Switch	States included in the search area
"US1"	Idaho Oregon Washington
"US2"	California Nevada
"US3"	Arizona Colorado Montana New Mexico Utah Wyoming
"US4"	Iowa Kansas Minnesota Missouri North Dakota Nebraska South Dakota
"US5"	Oklahoma Texas
"US6"	Illinois Indiana Kentucky Michigan Ohio Wisconsin

"US7"	Arkansas Alabama Louisiana Mississippi Tennessee
"US8"	Connecticut Massachusetts Maine New Hampshire New Jersey New York Rhode Island Vermont
"US9"	Washington, D.C. Delaware Maryland New Jersey Pennsylvania Virginia West Virginia
"US10"	Florida Georgia North Carolina South Carolina

Canada	
Switch	Provinces and regions included in the search area
"CAN"	All provinces and regions in Canada included in this switch.

DESTINATION INPUT AND ROUTE GUIDANCE

— Destination input by Home

Touch the home switch on the “Destination” screen.

The screen changes and displays the map location of your home and the route preference. (See “ — Entering destination” on page 38.)

To use this function, it is necessary to set the “Attribute” for the memory point. (To register the “Home”, see page 70.)

INFORMATION

Guidance starts from your current position to your home if you touch the “Enter” switch even while driving.

— Destination input by Quick access

Touch any of the quick access switches on the “Destination” screen.

The screen changes and displays the map location of the quick access point and the route preference. (See “ — Entering destination” on page 38.)

To use this function, it is necessary to set the “Attribute” for each memory point. (To register the “Quick Access”, see page 70.)

INFORMATION

Guidance starts from your current position to the quick access point if you touch the “Enter” switch even while driving.

— Destination input by “Address”

There are 2 ways to input a destination by address.

Touch the “Address” switch on the “Destination” screen.

(a) Inputting a house number and a street name

Touch numerals directly on the screen to input a house number.

After inputting a house number, touch the “OK” switch to display the screen for inputting a street name.

It is possible to input a street name first. Touch the “Street” switch to display the screen for inputting a street name.

Input the street name.

When you find your desired street name, touch the corresponding switch.

The screen changes and displays the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

If the same address exists in more than one city, the current screen changes to the city list screen.

DESTINATION INPUT AND ROUTE GUIDANCE

Select or enter your desired city.

“Input Name”: To narrow down the listed items by inputting the city name.

If you input a street name first, the screen changes. You can then input the house number.

If the above screen appears, you can select an address range on the screen.

(b) Selecting a city to search

Touch the “City” switch.

To search by city, the following three methods are possible.

1. Selecting from the last 5 cities
2. Selecting from the nearest 5 cities
3. Inputting the city name

INFORMATION

To cancel the city setting, touch the “Any City” switch.

SELECTING FROM THE LAST 5 CITIES

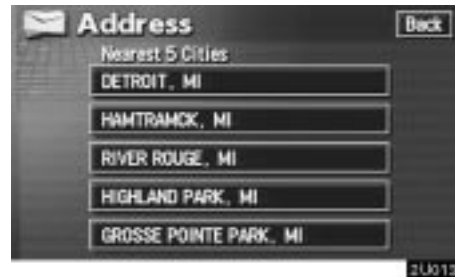

Touch the switch of the desired city name.

If you have not used the navigation yet, no cities will be displayed on the screen.

The current screen changes to the screen for inputting a house number or a street name. (See page 23.)

SELECTING FROM THE NEAREST 5 CITIES

Touch the “Nearest 5 Cities” switch.

Touch the switch of the desired city name from the displayed list.

The current screen changes to the screen for inputting a house number or a street name. (See page 23.)

INPUTTING THE CITY NAME

Touch the “Input City Name” switch.

Input a city name.

DESTINATION INPUT AND ROUTE GUIDANCE

Touch the switch of the desired city name from the displayed list.

“Map”: To display the selected destination and the route preference. (See “ — Entering destination” on page 38.)

The current screen changes to the screen for inputting a house number or a street name. (See page 23.)

— Destination input by “POI Name”

Touch the “POI Name” switch on the “Destination” screen.

Input the name of Point of Interest.

Touch the switch of the desired destination. The screen changes and displays the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

If you input the name of a specific Point of Interest and there are more than two sites with the same name, the list screen appears.

Touch the switch of the desired destination.

“Dist. Sort”: In the order of distance from your current position. The distance from your current position up to the destination is displayed on the right of the name.

“Name Sort”: In alphabetical order by name. If the same name exists in more than one city, you can search for it more easily with the **“City”** and **“Category”** switches. (See “(a) Selecting a city to search” and “(b) Selecting from the categories”.)

INFORMATION

The desired Point of Interest can be displayed on the map screen. (For details, see page 49.)

(a) Selecting a city to search

Touch the **“City”** switch.

To search by city, the following three methods are possible.

1. Selecting from the last 5 cities
2. Selecting from the nearest 5 cities
3. Inputting the city name

INFORMATION

*To cancel the city setting, touch the **“Any City”** switch.*

SELECTING FROM THE LAST 5 CITIES

Touch the switch of the desired city name.

If you have not used the navigation yet, no cities will be displayed on the screen.

DESTINATION INPUT AND ROUTE GUIDANCE

SELECTING FROM THE NEAREST 5 CITIES

Touch the “Nearest 5 Cities” switch.

Touch the switch of the desired city name.

INPUTTING THE CITY NAME

Touch the “Input City Name” switch.

Input the city name.

Touch the switch of the desired city name from the displayed list.

(b) Selecting from the categories

Touch the “Category” switch.

If the desired POI category is on the screen, touch the name to display a detailed list of the POI category.

If the desired POI category is not on the screen, touch the “List All Categories” switch to list all POI categories.

When you touch the desired category, the POI name list screen appears.

— Destination input by “POI Category”

The destination can be set by selecting the POI category and the search point.

Touch the “POI Category” switch on the “Destination” screen.

(a) Selecting the POI category

If the desired POI category is on the screen, touch the name to display a detailed list of the POI category.

If the desired POI category is not on the screen, touch the “List All Categories” switch to list all POI categories.

Touch the desired POI category from the list.

The selected category icon appears on the top left of the screen.

If you wish to delete the selected category, touch the “Delete” switch.

If you wish to select another category, touch the “OK” switch to return the previous screen.

If you wish to select a destination from the category displayed by the icon, touch the “List” switch.

(b) Setting a search point

It is possible to display the names of POIs located within approximately 20 miles (30 km) from the selected search point.

Touch the “Search Point” switch.

To set search points, the following four methods are possible.

1. Inputting city center
2. Setting the current position as the search point
3. Setting the search point via the map screen
4. Setting the search point from the destinations

INPUTTING CITY CENTER

Touch the “Input City Center” switch.

Input the city center name.

Touch the switch of the desired city center name.

DESTINATION INPUT AND ROUTE GUIDANCE

When you touch an arrow facing the desired point, the map scrolls in that direction. When you release your finger, scrolling stops.

To set the position of the cursor, touch the **“Enter”** switch.

SETTING THE CURRENT POSITION AS THE SEARCH POINT

Touch the **“Current Position”** switch.

When you touch an arrow facing the desired point, the map scrolls in that direction. When you release your finger, scrolling stops.

To set the position of the cursor, touch the **“Enter”** switch.

SETTING THE SEARCH POINT VIA THE MAP SCREEN

Touch the **“Map”** switch.

When you touch an arrow facing the desired point, the map scrolls in that direction. When you release your finger, scrolling stops.

To set the position of the cursor, touch the **“Enter”** switch.

DESTINATION INPUT AND ROUTE GUIDANCE

SETTING THE SEARCH POINT FROM THE DESTINATIONS

Touch the destination switches at the bottom of the screen.

When you touch an arrow facing the desired point, the map scrolls in that direction. When you release your finger, scrolling stops.

To set the position of the cursor, touch the “Enter” switch.

(c) Selecting from a list

You can select the desired destination from the listed POI names.

When you touch the switch of the desired item, the screen changes and displays the map location of the selected destination and the route preference. (See “— Entering destination” on page 38.)

“Dist.”: To sort in the order of distance from your current location.

“Icon”: To sort in the order of the POI icons.

“Name”: To sort in alphabetical order by name.

“On Route”: When the indicator is illuminated by touching this switch, the list of the items searched along the route is displayed.

— Destination input by “Emergency”

By touching the “Emergency” switch on the “Destination” screen, the display changes to a screen to select dealers, hospitals or police stations. During driving, only nearby police stations, hospitals or dealers are shown. The current position is shown with an address, the latitude and the longitude at the top of the screen.

When you touch the desired emergency category, the selected emergency category list is displayed.

Touch the switch of the desired destination. The screen changes and displays the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

“**Dist. Sort**”: To sort in the order of distance from your current position. The distance from your current position up to the destination is displayed on the right of the name.

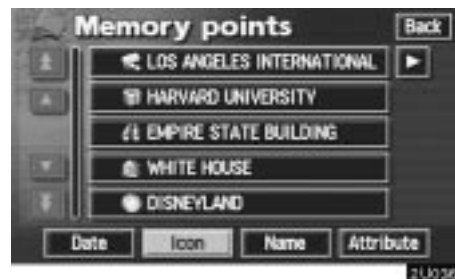

“**Name Sort**”: To sort in alphabetical order by name.

INFORMATION

The navigation system does not guide in areas where route guidance is unavailable. (See page 12.)

— Destination input by “Memory”

Touching the “**Memory**” switch on the “**Destination**” screen displays your list of registered memory points. See page 66 for registering and editing memory points.

When you touch the switch of your desired memory point, the screen changes and displays the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

There are 4 ways to list the memory point by touching switches on the bottom of the screen.

“**Date**”: To list the memory points in order of registered date.

“**Icon**”: To list the memory points by the registered icon.

“**Name**”: To list the memory points in alphabetical order.

“**Attribute**”: To list the memory points by the registered attribute.

— Destination input by “Previous”

Touch the “Previous” switch on the “Destination” screen.

The previous starting point and up to 99 previously set destinations are displayed on the screen.

Touch the switch of the desired destination. The screen changes and displays the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

“Date”: To list the previous destinations in order of registered date.

“Name”: To list the previous destinations in alphabetical order.

INFORMATION

You can delete the list of previous destinations while your vehicle is stopped, if you no longer need them. (See page 91.)

— Destination input by “Map”

Touch the “Map” switch on the “Destination” screen.

The screen changes and displays the map location that was previously displayed just before the destination input operation and the route preference. (See “ — Entering destination” on page 38.)

INFORMATION

Guidance starts if you touch the “Enter” switch even while driving. However, the cursor cannot be moved.

— Destination input by “Intersection”

Touch the “Intersection” switch on the “Destination” screen.

Input the name of the two intersecting streets which are located near the destination to be set.

Touch the switch of the desired item. After inputting the two intersecting streets, the screen changes and displays the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

If the same two streets cross at more than one intersection, the screen changes and displays the menu to select the city name where the streets intersect. Select the city, and the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

DESTINATION INPUT AND ROUTE GUIDANCE

— Destination input by “Freeway Ent./Exit”

To input a freeway entrance or exit, touch the “Freeway Ent./Exit” switch on the “Destination” screen.

Be sure to use the complete name of the freeway or highway, including the hyphen, when entering the destination. Freeways and interstates use an “I” (I-405). US highways use the state designation before the number (CA-118).

Select the desired freeway by touching the switch.

You can then select either a freeway “Entrance” or “Exit”.

Touch the switch of the desired entrance or exit name. The screen changes and displays the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

“Dist. Sort”: In the order of distance from your current position. The distance from your current position up to the destination is displayed on the right of the name.

“Name Sort”: In alphabetical order by name.

“Input Name”: An applicable list is displayed by touching this switch and inputting name.

— Destination input by “Coordinates”

Touch the “Coordinates” switch on the “Destination” screen.

Input the latitude and the longitude.

When the input is finished, touch the “OK” switch.

When you touch the switch of the desired point, the screen changes and displays the map location of the selected destination and the route preference. (See “ — Entering destination” on page 38.)

— Destination input by “Phone #”

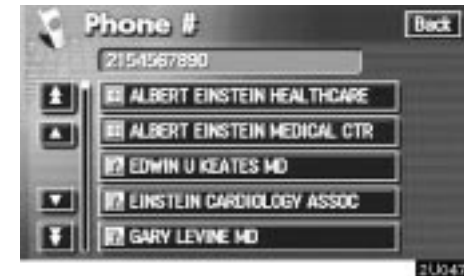

Touch the “Phone #” switch on the “Destination” screen.

Input a telephone number.

After inputting a telephone number, touch the “OK” switch, and the screen changes and displays the map location of the selected destination and the road preference. (See “ — Entering destination” on page 38.)

If there is more than one site having the same number, the following screen appears.

INFORMATION

- ◀ If there is no match for the telephone number inputted, a list of identical numbers but with different area codes will be displayed.
- ◀ To set a memory point as a destination using the phone number, the number must be registered previously. (See page 72.)

DESTINATION INPUT AND ROUTE GUIDANCE

Starting route guidance — — Entering destination

After you input the destination, the screen changes and displays the map location of the selected destination and the route preference.

SCREEN A

1. When you touch an arrow facing the desired point, the map scrolls in that direction. When you release your finger, scrolling stops.

2. To set the destination and display SCREEN B, touch the “Enter” switch.

When the destination is already set, the “Add to ” switch and the “Replace ” switch are displayed.

“Add to ”: To add a destination.

“Replace ”: To delete the existing destinations and set a new one.

“Change”: To change the route preference. (See page 39.)

“Info.”: If this switch is displayed on the top of the screen, touch the switch to see name, address, and phone number, etc.

SCREEN B

3. To start guidance, touch the “Guide” switch.

“3 Routes”: To select the desired route from three possible routes. (See page 39.)

“Route”: To change the route. (See pages 42 and 44.)

INFORMATION

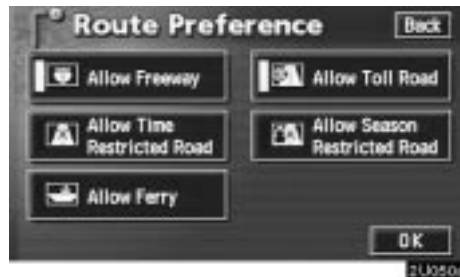

◀ *Guidance can be suspended or resumed. (See page 62.)*

◀ *If you keep touching the “Guide” switch until a beep sounds, Demo mode will start.*

◀ To change the route before starting guidance

ROUTE PREFERENCE

You can change route preference by touching the **“Change”** switch on SCREEN A.

You can turn the indicator on or off by touching the switch.

When searching for a route, the system avoids routes where the indicator is dimmed as much as possible.

After choosing conditions, touch the **“OK”** switch.

INFORMATION

◀ Even if the **“Allow Freeway”** indicator is dimmed, the route cannot avoid including a freeway in some cases.

◀ If the calculated route includes a trip by ferry, the route guidance shows a sea route. After you travel by ferry, the current vehicle position may be incorrect. Upon reception of GPS signals, it is automatically corrected.

3 ROUTES SELECTION

To select the desired route from three routes, touch the **“3 Routes”** switch on SCREEN B.

Touch the **“Quick1”**, **“Quick2”** or **“Short”** switch to select the desired route.

“Quick1”: Recommended route.

This route is indicated by an orange line.

“Quick2”: Other route.

This route is indicated by a purple line.

“Short”: A route by which you can reach the destination in the shortest distance.

This route is indicated by a green line.

DESTINATION INPUT AND ROUTE GUIDANCE

“Info.”: To display the following information about each of the 3 routes.

- 1 Time necessary for entire trip
- 2 Distance of entire trip
- 3 Toll road
- 4 Freeway
- 5 Ferry

— Route guidance screen

When starting route guidance, the following screen is displayed.

This screen displays the route that guides the driver to the destination.

The route to the destination is indicated by a highlighted line. Drive along the guided route.

When the vehicle approaches a guidance point such as an intersection or a freeway, the screen automatically divides in two to display the guidance screen. (For details, see page 53.)

The current street name will be displayed at the bottom of the screen.

In some areas, the roads have not been completely digitized in our database yet. For this reason, the route guidance may guide the road that is not allowed to pass.

— Typical voice guidance prompts

The voice guidance provides various messages as you approach an intersection, or other point where you need to maneuver the vehicle.

- 1 “Proceed about 5 miles.”
- 2 “In a quarter of a mile, right turn.”
- 3 “Right turn.”
- 4 (Beep sound only)

INFORMATION

On freeways, interstates or other highways with higher speed limits, the voice guidance will be made at earlier points than on city streets in order to allow time to maneuver.

- 1 "Proceed about 4 miles to the traffic circle."
- 2 "In a quarter of a mile, traffic circle ahead, and then 3rd exit ahead."
- 3 "The 3rd exit ahead."
- 4 "The exit ahead."
- 5 (Beep sound only)

*: The system indicates a U-turn if the distance between two one-way roads (of opposite directions) is less than 50 feet (15 m) in residential areas or 164 feet (50 m) in non-residential areas.

- 1 "In half of a mile, make a legal U-turn."
- 2 "Make a legal U-turn ahead."
- 3 (Beep sound only)

DESTINATION INPUT AND ROUTE GUIDANCE

The system announces your approach to the final destination.

- 1  "Your destination is ahead."
- 2  "You have arrived at your destination. The route guidance is now finished."

INFORMATION

- ◀ If the system cannot determine the current vehicle position correctly (in cases of poor GPS signal reception), the voice guidance may be made early or delayed.
- ◀ If you did not hear the voice guidance command, touch the "MAP/VOICE" button to hear it again.
- ◀ To adjust the voice guidance volume, see page 63.

Setting and deleting destination

(a) Adding destinations

You can add destinations and search again for the routes.

1. Touch the "Route" switch.

2. Touch the "Add" switch of "Destination".

3. Input an additional destination in the same way as the destination input. (See page 20.)

4. Touch the desired “Add” switch to determine the arrival order of the additional destination.

(b) Reordering destinations

When more than one destination is set, you can change the arrival order of the destinations.

1. Touch the “Route” switch.

2. Touch the “Reorder” switch of “Destination”.

3. Select the destination in the order of arrival by touching the switch of destinations.

Reordered number of arrival is displayed on the right side of the screen.

When you finish selecting the destinations, touch the “OK” switch. The system searches for the guidance route again, and displays the entire route. Even if you do not touch the “OK” switch, the entire route is displayed automatically within a few seconds when order is fixed.

DESTINATION INPUT AND ROUTE GUIDANCE

(c) Deleting destination

You can delete a set destination.

1. Touch the “Route” switch.

2. Touch the “Delete” switch of “Destination”.

3. When more than one destination is set, a list will appear on the screen. Touch the destination on the screen you wish to delete.

“Delete All”: To delete all destinations on the list.

4. A message appears to confirm your request to delete. To delete the destination(s), touch the “Yes” switch.

If you touch the “Yes” switch, the data cannot be recovered.

If you touch the “No” switch, the previous screen will return.

5. If more than one destination is set, touch the “OK” switch after deleting the destinations. The system searches for the guidance route again, and displays the entire route.

Setting and deleting route

(a) Adding preferred road

You can add points you wish to pass through.

1. Touch the “Route” switch.

2. Touch the “Add” switch of “Preferred road”.

3. Select the preferred road which you wish to modify and touch the “Enter ▼” switch.

4. A message appears to confirm your request. To add the preferred road, touch the “OK” switch.

Touch the “Next” switch to use another road.

5. If more than one destination is set, the “Add Preferred Road” screen appears. Touch the “Add” switch where you wish to add a preferred road.

(b) Deleting preferred road

You can delete a set preferred road.

1. Touch the “Route” switch.

2. Touch the “Delete” switch of “Preferred road”.

3. When more than one preferred road is set, a list will appear on the screen. Touch the switch of the preferred road to be deleted.

DESTINATION INPUT AND ROUTE GUIDANCE

“Delete All”: To delete all the listed preferred road.

4. A message appears to confirm your request to delete. To delete the preferred road, touch the **“Yes”** switch.

If you touch the **“Yes”** switch, the data cannot be recovered.

If you want to try again or cancel deletion, touch the **“No”** switch. The previous screen will return.

5. If more than one preferred road is set, touch the **“OK”** switch after deleting the preferred road. The system searches for the guidance route again, and displays entire route.

(c) Search condition

You can designate the route conditions of the route to the destination.

1. Touch the **“Route”** switch.

2. Touch the **“Search Condition”** switch. The **“Search Condition”** screen appears.

3. Touch the **“Quick”**, **“Quick1”**, **“Quick2”** or **“Short”** switch and touch the **“OK”** switch.

The entire route from the starting point to the destination is displayed.

“Guide”: To start guidance.

“Route”: To add or change a route. (For details, see pages 42 and 44.)

(d) Detour setting

While the route guidance is operating, you can change the route to detour around a section of the route where a delay is caused by road repairs, an accident, etc.

1. Touch the “Route” switch.

2. Touch the “Detour” switch.

3. Select the switch below to select the desired detour distance.

“1 mile (km)”, “3 miles (km)” or “5 miles (km)”: Touch one of these switches to start the detour process. After detouring, the system returns to the original guidance route.

“Whole Route”: If you touch this switch, the system will calculate an entire new route to the destination.

This picture shows an example of how the system would guide you around a delay caused by a traffic jam.

- 1 This position indicates the location of a traffic jam caused by road repairs or an accident.
- 2 This route indicates the detour suggested by the system.

INFORMATION

- ◀ When your vehicle is on a freeway, the detour distance selections are 5, 15, and 25 miles (km).
- ◀ The system may not be able to calculate a detour route depending on the selected distance and surrounding road conditions.

(e) Route preference

You are given a number of choices on the conditions which the system uses to determine the route to your destination.

1. Touch the “Route” switch.

2. Touch the “Route Preference” switch to change the conditions which are to determine the route to your destination.

3. You can turn the indicator on or off by touching the switch.

When searching for a route, the system avoids routes where the indicator is dimmed as much as possible.

After choosing the conditions, touch the “OK” switch.

(f) Starting route from adjacent road

You can start the route guidance from the adjacent road.

(ex. When the route guidance guides the route on the freeway, but you drive on the parallel way along a freeway.)

1. Touch the “Route” switch.

2. Touch the “Start from Adjacent Road” switch.

When there is no adjacent road, this switch will not appear.

Show POI icons

Points of Interest such as gas stations and restaurants can be displayed on the map screen. You can also set their location as a destination and use them for route guidance.

1. Touch the “Map View” switch.

2. Touch the “Show POI Icon” switch to display a particular type of Point of Interest on the screen.

A screen with a limited choice of Points of Interest will be displayed. (To change the displayed POI, see page 90.) When you touch the desired Point of Interest category, symbols will appear on the map screen indicating where the POI addresses are located.

To turn off the symbols of the Points of Interest on the map screen, touch the “POI Off” switch.

“More”: If you cannot find your desired Point of Interest on the limited choice screen, touch this switch. The screen then displays the complete POI listing screen.

You can display up to 5 categories of icons on the screen.

DESTINATION INPUT AND ROUTE GUIDANCE

When you select a Point of Interest type from either the limited list or the complete list, the screen will display symbols at those locations on the map screen.

Touching the **“Delete”** switch will delete the last selected icon.

“Local POI List”: If you want to search for the nearest Point of Interest, touch this switch. Then choose one of the categories. The system will list the points within 20 miles (30 km).

Touch the switch of your desired Point of Interest. Selected Points of Interest are displayed on the map screen.

“Dist.”: To sort in the order of distance from your current location.

“Icon”: To sort in the order of the POI icons.

“Name”: To sort in alphabetical order by name.

“On Route”: When the indicator is illuminated by touching this switch, the list of the items searched along the route is displayed.

◀ To set a POI as a destination

You can select one of the Points of Interest icons on the map screen as a destination and use it as route guidance.

Directly touch the Point of Interest icon that you wish to set as a destination.

The map will shift so that the icon is centered on the screen and overlaps with the cursor . At this time, the distance from your current position can be displayed on the screen. The distance shown is measured as a straight line from the current vehicle position to the POI.

When your desired Point of Interest overlaps with the cursor, touch the “Enter”  switch. The screen changes and displays the map location of the selected destination and route preference. (See “ — Entering destination” on page 38.)

Route overview

1. Touch the “Map View” switch.

2. Touch the “Route Overview” switch.

The entire route from the current position to the destination is displayed.

“Guide”: To start guidance.

“Route”: To change the route. (For details, see pages 42 and 44.)

“Turn List”: The following screen displays the list of the roads up to your destination.

You can scroll through the list of roads by touching ▲ or ▼. However, not all road names in the route may appear on the list. If a road changes its name without requiring a turn (such as on a street that runs through two or more cities), the name change will not appear on the list. The street name closest to the starting point will be displayed with a mileage to the next turn.

These marks indicate the direction in which you should turn at an intersection.

DESTINATION INPUT AND ROUTE GUIDANCE

Touch the “Map” switch of your desired point. The point which you choose is displayed on the map screen.

Route preview

1. Touch the “Map View” switch.

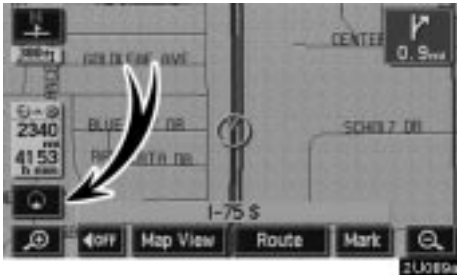

2. Touch the “Route Preview” switch.

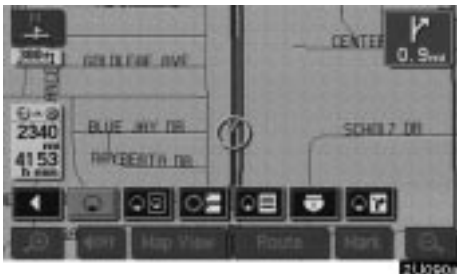

-  : To indicate the next destination.
-  : To preview the route to the next destination.
-  : To preview the route to the next destination in fast-forward mode.
-  : To stop the preview.
-  : To review the route to the previous destination or starting point.
-  : To review the route to the previous destination or starting point in fast-forward mode.
-  : To indicate the previous destination or starting point.

Screen configuration

You can choose any one of the screen configurations.

1. Touch this switch to display the following screen.

2. To select the desired screen configuration, touch one of the following switches.

Depending on the conditions, it may not be possible to select certain screen configuration switches.

-  : To display single map screen. (See page 53.)
-  : To display dual map screen. (See page 54.)
-  : To display compass mode screen. (See page 54.)
-  : To display turn list screen. (See page 55.)
-  : To display arrow screen. (See page 55.)
-  : To display freeway information screen. (See page 55.)
-  : To display intersection guidance screen or guidance screen on freeway. (See page 56.)

(a) Single map

The screen shows the single map.

(b) Dual map

The screen shows the dual map. The map on the left is the main map.

You can edit the right side map by touching any specific point on the right side map.

This screen can perform the following procedures.

- ◀ Changing the map scale
- ◀ Displaying the POI icon
- ◀ Changing the orientation of the map

Touch the “OK” switch when you complete editing. The screen returns to the dual map screen.

(c) Compass mode

Information about the destination and current position, as well as a compass, is displayed on the screen.

The destination mark is displayed in the direction of the destination. When driving, refer to the longitude and latitude coordinates and the compass, to make sure that your vehicle is headed in the direction of the destination.

INFORMATION

When the vehicle goes out of the disc area, the guidance screen changes into compass mode.

(d) Turn list screen

The screen shows the turn list. You cannot scroll through the list of roads.

(e) Arrow screen

The screen shows the current road name and the distance to the next corner.

(f) Freeway information screen

This screen displays the distance to the next junction and exit, or POIs in the vicinity of the freeway exit.

“**Map**”: To display the selected map of the exit vicinity.

On the left side of the “**Map**” switch, up to five POIs around the selected exit are displayed.

- ▲ : To scroll for farther junctions or exits.
- ▼ : To scroll for closer junctions or exits.
- ▼ : To scroll for the closest three junctions or exits.

DESTINATION INPUT AND ROUTE GUIDANCE

INFORMATION

When you drive on a freeway, the screen is automatically divided into two parts, with freeway information screen on the right side.

(g) Intersection guidance screen/guidance screen on freeway

◀ Intersection guidance screen

This screen automatically appears when the vehicle approaches an intersection on the road.

The distance to the intersection is shown at the bottom of the screen.

“▶OFF”: The intersection guidance screen disappears and the map screen appears.

When touching the  switch or pushing the “MAP/VOICE” button, the intersection guidance screen reappears.

INFORMATION

Intersection guidance can be turned on or off. (See page 85.)

◀ Guidance screen on freeway

This screen automatically appears when the vehicle approaches a junction or exit on a freeway.

The distance to the junction or exit is shown at the bottom of the screen.

“▶OFF”: The guidance screen on freeway disappears and the map screen appears.

When touching the  switch or pushing the “MAP/VOICE” button, the guidance screen on freeway reappears.

INFORMATION

Guidance screen on freeway can be turned on or off. (See page 86.)

Distance and time to destination

When the vehicle is on the guidance route, the distance and the estimated travel time to the destination are displayed. When the vehicle is not on the guidance route, the distance to and the direction of the destination are displayed.

When driving on the guidance route and more than one destination is set, the distance and the estimated travel time from current position to each destination are displayed.

1. Touch this switch to display the following screen.

2. Touch the number switch of the destination you wish to display.

The distance and the estimated travel time from the current position to the selected destination are displayed.

Displayed while driving along the guidance route.

Displayed while driving off the guidance route. The destination direction is indicated by an arrow.

INFORMATION

When the vehicle is on the guidance route, the distance measured along the route is displayed. Travel time is calculated based on the set vehicle speed information. (For details, see page 79.) However, when the vehicle is not on the guidance route, the distance is the linear distance between the current position and the destination.

DESTINATION INPUT AND ROUTE GUIDANCE

Foot print map

For the area which is covered by the foot print map (Some areas in the following cities; Detroit, Chicago, N.Y., L.A), you can switch to the foot print map on a scale of 75 feet (25 m).

◀ To switch to the foot print map

The  switch changes into the  switch when the map is scaled down to 150 feet (50 m).

To display the foot print map, touch the  switch.

◀ To delete the foot print map display

Touch the  switch.

INFORMATION

◀ *If the map or the current position is moved to the area which is not covered by the foot print map, the screen scale automatically changes to 150 feet (50 m).*

◀ *On the foot print map, a one way street is displayed by .*

◀ *It is not possible to perform scrolling on the foot print map (one-touch scroll) while driving.*

◀ To display building information

Information is available only for buildings for which information is recorded on the map disc.

1. Touch the “Info.” switch while the foot print map is displayed.

If the map is displayed in split screen, it turned into a single map display.

2. Using an eight-direction arrow, move the cursor to the position of the building you wish to display information.
3. Touch the “Building Info.” switch.

4. Details of POIs in some buildings may be displayed. If you wish to see detailed POI information, touch the building name. You can see the detail of the selected POIs.

ADVANCED FUNCTIONS

Suspending and resuming guidance

► To suspend guidance

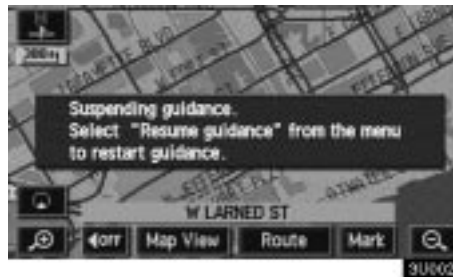

You can suspend route guidance.

Push the “MENU” button to display the “Menu” screen and touch the “Suspend Guidance” switch.

INFORMATION

When you do not have route guidance, the “Suspend Guidance” switch cannot be used.

The screen will return to the current position map without route guidance.

► To resume guidance

You can resume the suspended route guidance.

Push the “MENU” button to display the “Menu” screen and touch the “Resume Guidance” switch.

The screen will change to the current position map with route guidance.

Volume

You can use voice guidance when approaching a destination.

You can adjust the volume of the voice or turn off voice guidance.

Push the “MENU” button to display the “Menu” screen, and touch the “Volume” switch.

To adjust the volume, select the desired level by touching the appropriate number.

If you do not need voice guidance, touch the “Off” switch.

The selected item is highlighted in green.

INFORMATION

During route guidance, the voice guidance continues even if the navigation screen is changed to other screens.

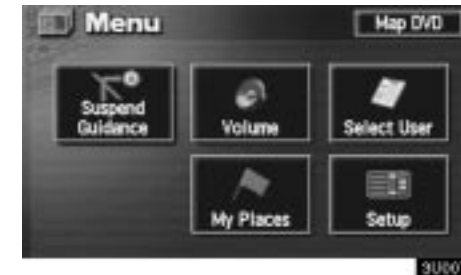

“Adaptive Volume Control”: If you turn the “Adaptive Volume Control” on, the volume is turned up automatically when the vehicle speed exceeds 50 mph (80 km/h).

To turn the “Adaptive Volume Control” system on, touch the switch. The indicator will be highlighted.

User selection

The system can memorize the following settings for up to three users.

- ▶ Map direction
- ▶ Map scale
- ▶ Guidance mode
- ▶ Setup
- ▶ Volume
- ▶ Language

Push the “MENU” button to display the “Menu” screen. Then touch the “Select User” switch.

ADVANCED FUNCTIONS

► To register

Touch the “**Memorize**” switch of your desired “User number”.

The confirmation screen will appear. To register, touch the “**Yes**” switch. To return to the previous screen, touch the “**No**” or “**Back**” switch.

When you touch the switch already registered, this screen appears. To replace, touch the “**Yes**” switch. To cancel the replacement, touch the “**No**” or “**Back**” switch.

► To change user

Push the “MENU” button to display the “Menu” screen. Then touch the “Select User” switch.

Touch the “User number” switch you wish to change.

The above message appears, then the map screen will be displayed.

► To delete user

Touch the “Delete” switch of “User number” you wish to delete.

ADVANCED FUNCTIONS

The confirmation screen appears. To delete, touch the “Yes” switch. To return to the previous screen, touch the “No” or “Back” switch.

My places

You can register and keep your own memory points (like restaurants, sports facilities, etc.) and use the memory points to input a destination.

(a) Registering memory points

1. Push the “MENU” button to display the “Menu” screen and touch the “My Places” switch.

2. Touch the “Register” switch of the “Memory Points”.

A screen similar to the destination input screen appears. Input the desired point in the same way as inputting a destination. (See page 20.)

When you finish memory point registration, the memory point data screen will appear.

You can set the icon, attribute, name, location and phone number.

Touch your desired switch you want to set. (For details, see “(b) Editing memory points”.)

INFORMATION

Up to 106 memory points can be registered.

ADVANCED FUNCTIONS

(b) Editing memory points

The icon, attribute, name, location and/or telephone number of a registered memory point can be edited.

1. Push the “MENU” button to display the “Menu” screen and touch the “My Places” switch.

2. Touch the “Edit” switch of the “Memory Points”.

The screen lists the memory points.

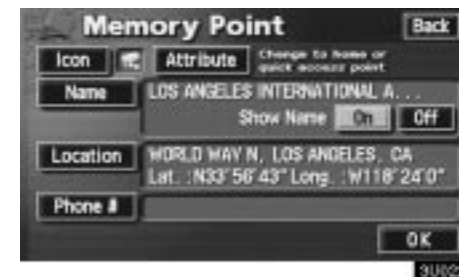

“Date”: Touch this switch to list the memory points in order of the registered date.

“Icon”: Touch this switch to list the memory points in order of the icon type.

“Name”: Touch this switch to list the memory points in alphabetical order.

“Attribute”: Touch this switch to list the memory points in order of the home and quick access number.

Touch the desired memory point switch to display the memory point data screen.

3. Touch the switch which you wish to edit.

► To change “Icon”

Touch the desired icon.

You can turn the page by touching “**Page 1**”, “**Page 2**” or “**With Sound**” switch.

“**With Sound**”: To display sound icons. When your vehicle approaches the memory point, the sound which you chose will sound.

Touch the desired sound icon.

The next screen appears when you touch the “**Bell (with direction)**” switch.

Touch the direction switches and adjust the direction. Touch the “**Enter**” switch. The bell sounds only when your vehicle approaches this point in the direction that you set.

ADVANCED FUNCTIONS

► To change “Attribute”

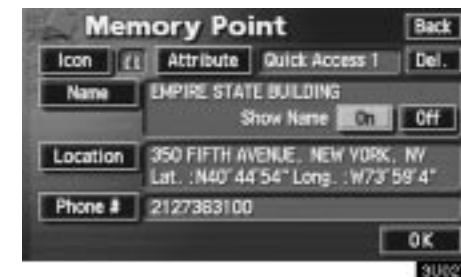

For easy destination input, set the attribute of the memory points as Home or Quick access 1 to 5.

Touch the desired attribute. It is possible to replace a registered attribute.

To replace the attribute, touch the “Yes” switch. To return to the previous screen, touch the “No” or “Back” switch.

To delete the attribute, touch the “Del.” switch.

To delete an attribute, touch the “Yes” switch. To return to the previous screen, touch the “No” or “Back” switch.

► To change “Name”

Touch the alphabet and/or numeral keys. When the entry has been completed, touch the “OK” switch on the screen. The previous screen will be displayed.

► “Show Name”

You can set the name of a memory point to be displayed or not on the map.

To show the name, touch the “On” switch. Not to show it, touch the “Off” switch.

► To change “Location”

Touch the eight direction switch to move the cursor to the desired point on the map.

Touch the “Enter” switch and the previous screen will be displayed.

ADVANCED FUNCTIONS

- To change “Phone #” (telephone number)

Touch numeral keys.

When the entry has been completed, touch the “OK” switch on the screen.

The previous screen will be displayed.

(c) Deleting memory points

1. Push the “MENU” button to display the “Menu” screen and touch the “My Places” switch.

2. Touch the “Delete” switch of the “Memory Points”.

3. Touch the corresponding switch. To delete all memory points, touch the “Delete All” switch.

For efficient memory point search, memory points can be sorted by the “Date”, “Icon”, “Name” or “Attribute” switch.

To delete, touch the “Yes” switch. To cancel the deletion, touch the “No” switch.

Area to avoid

Areas you wish to avoid because of traffic jams, construction work or other reasons can be registered as areas to avoid.

Push the “MENU” button to display the “Menu” screen and then touch the “My Places” switch to display the following screen.

INFORMATION

If a destination is inputted in the area to avoid or the route calculation cannot be made without running through the area to avoid, a route passing through the area to avoid may be shown.

(a) Registering area to avoid

1. Touch the “Register” switch of the “Areas to avoid”.

2. Enter the location in the same way as inputting a destination, or display the map of the area you wish to avoid. (See page 20.)

INFORMATION

Up to 10 locations can be registered as point/area to avoid. If there are 10 locations already registered, the message “Unable to register additional points. Perform operation again after deleting unnecessary points.” appears on the screen.

3. Set the cursor in the center of the area to avoid, and touch the “Enter” switch.

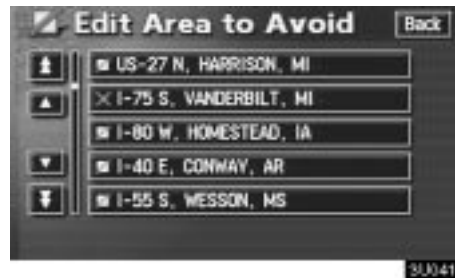

ADVANCED FUNCTIONS

4. Touch either  or  switch to change the size of the area to avoid.

(b) Editing area to avoid

1. Touch the “Edit” switch of the “Areas to Avoid” to display the “Edit Area to Avoid” screen.

2. To edit an area to avoid, touch the corresponding switch.

3. Touch the “Name”, “Location” or “Area Size” switch on this screen.

► To change “Name”

Touch alphabet or numeral keys.

When the entry has been completed, touch the “OK” switch on the screen.

The previous screen will be displayed.

► “Show Name”

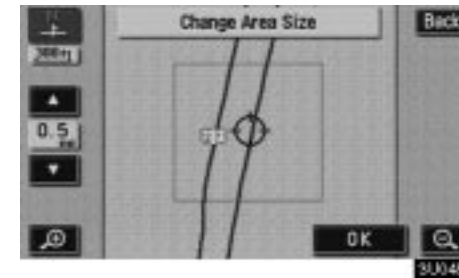

The avoid area name can be set to be displayed or not on the map. To show the name, touch the “On” switch. Not to show it, touch the “Off” switch.

► To change “Location”

Set the cursor  to the desired location, then touch the “Enter” switch. The previous screen will be displayed.

► To change “Area size”

Touch either  or  switch to change the size of area you want to avoid, and touch the “OK” switch. The previous screen will be displayed.

ADVANCED FUNCTIONS

(c) Deleting area to avoid

1. Touch the “Delete” switch of the “Areas to Avoid” to display the “Delete Area to Avoid” screen.

2. Touch the area you wish to delete from the list.

“Delete all”: To delete all registered areas to avoid in the system.

3. To delete, touch the “Yes” switch. To cancel the deletion, touch the “No” switch.

Setup

You can set the items shown on the “Set-up” screen.

1. Push the “MENU” button.

2. To display the “Set up” menu screen, touch the “Setup” switch. Touch the items you wish to set.

3. Touch the “OK” switch on the screen and then the previous screen will be displayed.

“Default”: This switch initializes all of the settings.

“Calibration”: You can adjust the current vehicle position mark manually.

“Distance”: You can select “km” or “miles” as the distance unit.

“Estimated Travel Time”: You can set the system to display the travel time to the destination on the route guidance screen.

“Auto Reroute”: You can set the system to automatically search for a new route to the destination.

“Adjust Time Zone”: You can select your desired time zone.

“Auto Voice Guidance”: You can set the automatic voice guidance.

“Voice Guidance in All Modes”: You can set the voice guidance in all modes.

“Notify Traffic Restriction”: You can select notification of seasonal restrictions.

“Intersection Guidance”: You can select ON or OFF to display of intersection guidance.

“Guidance Screen on Freeway”: You can select ON or OFF to display the guidance screen on the freeway.

“Street Name on Scroll Map”: You can select ON or OFF to display the street name on the scroll map.

“Display Building Shape”: You can select ON or OFF to display the building shape on the map screen.

“Map Function”: You can set to display or not to display each switches and current street name on the map screen.

“Show POI Icons”: You can choose 6 icons displayed on “Show POI Icons” top screen.

“Previous Point”: You can delete the previous destination.

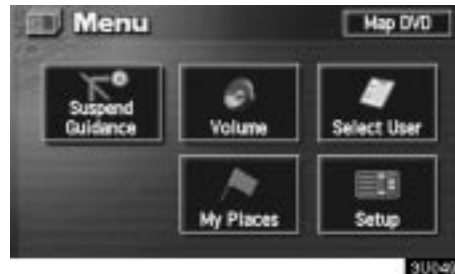

“Map Color (Day)”: You can select the desired map color.

“Map Color (Night)”: You can select the desired map color.

“Screen Animation”: You can set some screen displays to be animated.

Current position calibration

When driving, the current vehicle position mark will be automatically corrected by GPS signals. If GPS reception is poor due to location, you can manually adjust the current vehicle position mark.

1. Push the **“MENU”** button to display the **“Menu”** screen, and then touch the **“Setup”** switch.

2. Touch the **“Adjust”** switch of **“Calibration”**.

3. Touch the **“Position/Direction”** switch.

INFORMATION

For additional information on the accuracy of a current vehicle position, see “Limitations of the navigation system” on page 10.

ADVANCED FUNCTIONS

► Position/direction calibration

1. Touch the scroll arrows to move the cursor  to your desired location.

Touch the “Enter” switch.

2. Touch either the  or  switch to adjust the direction of the current vehicle position mark.

Touch the “Enter” switch and the map screen will be displayed.

► Tire change calibration

The tire change calibration function will be used when replacing the tires. This function will adjust the mis-calculation caused by the circumference difference between the old tires and new ones. If this procedure is not performed when tires are replaced, the current vehicle position mark may be incorrectly displayed.

To perform a distance calibration procedure, touch the “**Tire Change**” switch on the “Calibration” screen.

The message appears and the quick distance calibration is automatically started. A few seconds later, a map screen will be displayed.

Distance unit

1. Push the “MENU” button.

2. Touch the “Setup” switch.

3. Touch the “km” or “miles” switch of “Distance” to choose the distance unit. The selected switch is highlighted in green.

4. Touch the “OK” switch.

Estimated travel time

You can set the speed that is used for the calculation of the estimated travel time.

1. Push the “MENU” button.

ADVANCED FUNCTIONS

2. Touch the “Setup” switch.

3. Touch the “Set Speed” switch of the “Estimated Travel Time”.

4. Touch ◀ or ▶ to set the average vehicle speeds for driving on a Freeway, Main street, and Residential.

To set the default speeds, touch the “Default” switch.

5. When you finish setting the desired speeds, touch the “OK” switch.

INFORMATION

- ▶ The displayed time to the destination is the approximate driving time that is calculated based on the speeds you selected and your actual position along the guidance route.
- ▶ The time shown on the screen may vary greatly depending on your progress along the route, which may be affected by road conditions such as traffic jams, construction work.
- ▶ It is possible to display up to 99 hours 59 minutes.

Auto reroute

When the “Auto Reroute” feature is turned on, the system will automatically search for a new route to the destination if you stray from the guidance route. This feature does not operate while you are driving on roads where guidance is not available.

To turn the “Auto Reroute” mode on:

1. Push the “MENU” button.

2. Touch the “Setup” switch.

3. Touch the “On” switch of “Auto Reroute”.

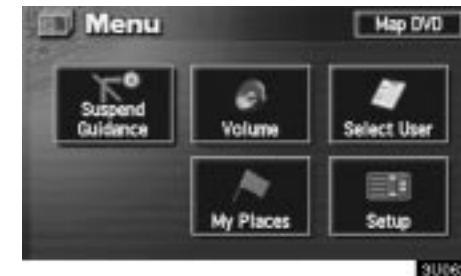

The selected switch is highlighted in green.

INFORMATION

If your vehicle strays from the guidance route, the system searches for a new route to the destination. The new route may or may not take you back to the previous route depending on how far you are off the original guidance route.

Adjusting time zone

1. Push the “MENU” button.

2. Touch the “Setup” switch.

ADVANCED FUNCTIONS

3. Touch the “Change” switch. The “Adjust Time Zone” screen appears on the display.

4. Touch the desired time zone.

The selected switch is highlighted in green.

5. Touch the “OK” switch on the screen and the “Setup” screen will be displayed.

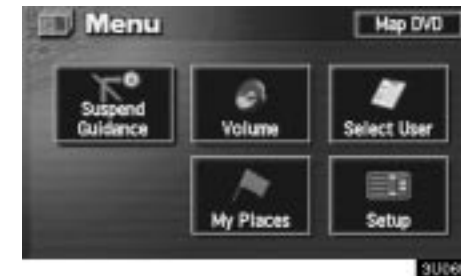

Auto voice guidance

When the “Auto Voice Guidance” feature is turned on, the voice guidance can be heard automatically.

When the “Auto Voice Guidance” feature is turned off, the voice guidance can be heard only if you push the “MAP/VOICE” button.

To turn the “Auto Voice Guidance” mode on:

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch to display page 2 of the “Setup” screen.

3. Touch the “On” switch of “Auto Voice Guidance”.
The selected switch is highlighted in green.

Voice guidance in all modes

When the “Voice Guidance in All Modes” feature is turned on, you can hear the voice guidance in all modes.

When the “Voice Guidance in All Modes” feature is turned off, voice guidance cannot be heard when you using the audio system.

To turn the “Voice Guidance in All Modes” on:

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch to display page 2 of the “Setup” screen.

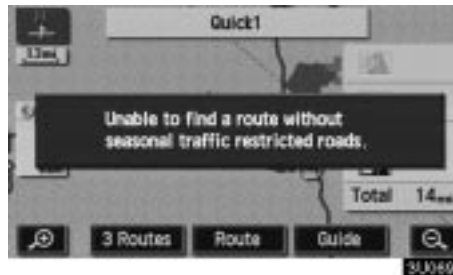

ADVANCED FUNCTIONS

3. Touch the “On” switch of “Voice Guidance in All Modes” and touch the “OK” switch.

Notifying traffic restriction

When the “Notify Traffic Restriction” feature is turned on, the system notifies you of traffic or seasonal restriction.

To turn the “Notify Traffic Restriction” mode on:

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch to display page 2 of the “Setup” screen.

3. Touch the “On” switch of “Notify Traffic Restriction” and touch the “OK” switch.

Intersection guidance

When the “Intersection Guidance” feature is turned on, the system will display the intersection guidance screen if you drive with route guidance.

To turn the “Intersection Guidance” mode on:

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch to display page 2 of the “Setup” screen.

ADVANCED FUNCTIONS

3. Touch the “On” switch of “Intersection Guidance” and touch the “OK” switch.

Guidance screen on freeway

When the “Guidance Screen on Freeway” feature is turned on, the system will display the lane guidance screen if you drive on a freeway with route guidance.

To turn the “Guidance Screen on Freeway” mode on:

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch to display page 2 of the “Setup” screen.

3. Touch the “On” switch of “Guidance Screen on Freeway” and touch the “OK” switch.

Street name on scroll map

When the “Street Name on Scroll Map” feature is turned on, the system will display the name of a street where the cursor  is positioned on the scroll map.

To turn the “Street Name on Scroll Map” mode on:

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch twice to display page 3 of the “Setup” screen.

ADVANCED FUNCTIONS

3. Touch the “On” switch of “Street Name on Scroll Map” and touch the “OK” switch.

Display of building shape

When the “Display Building Shape” feature is turned on, the system will display the building shape on the map screen using a scale of 150 feet (50 m) to 300 feet (100 m).

To turn the “Display Building Shape” mode on:

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch twice to display page 3 of the “Setup” screen.

3. Touch the “On” switch of “Display Building Shape” and touch the “OK” switch.

Screen layout function (**4OFF** Function)

You can set display or hide each switch and current street name on the map screen.

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch **4OFF** switch twice to display page 3 of the “Setup” screen.

3. Touch the “Change” switch of the “**4OFF** Function”.

4. Touch the switch corresponding to the desired setting. Then touch the “OK” switch.

ADVANCED FUNCTIONS

POI category change (Show POI Icons)

You can choose 6 icons displayed on the “Show POI Icons” top screen, so that you can easily set which icons to display on the map screen.

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch twice to display page 3 of the “Setup” screen.

3. Touch the “Change” switch of “Show POI Icons”.

4. Touch the category switch you wish to change.

5. Touch the switch corresponding to the desired category. Then touch the “OK” switch.

Delete previous point

You can delete your previous destination.

1. Push the “MENU” button.

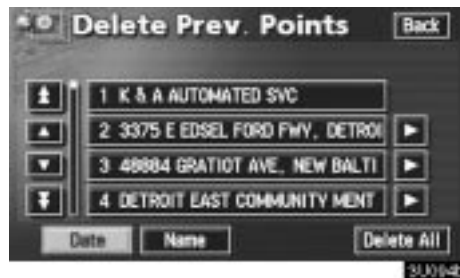

2. Touch the “Setup” switch. Then touch  switch twice to display page 3 of the “Setup” screen.

3. Touch the “Delete” switch of “Previous Point”.

ADVANCED FUNCTIONS

4. Touch the switch you want to delete.
For efficient previous point search, previous points can be sorted by the “Date” or “Name” switch.

5. To delete the point, touch the “Yes” switch.
To cancel the deletion, touch the “No” switch.

Map color

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch three times to display page 4 of the “Setup” screen.

3. Touch the desired color for day and/or night map color and then touch the “OK” switch to return the map screen.

Touch the “Normal” switch to return to the default map color.

Screen animation

When the “Screen Animation” feature is turned on, some switches and screens become animated. (e.g.: change map guidance on the map screen)

To turn the “Screen Animation” mode on:

1. Push the “MENU” button.

2. Touch the “Setup” switch. Then touch  switch three times to display page 4 of the “Setup” screen.

3. Touch the “On” switch of “Screen Animation” and touch the “OK” switch.

SECTION IV

OTHER FUNCTIONS

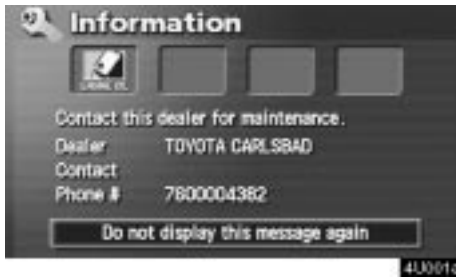

Other functions

Maintenance information	96
Calendar with memo	101
Screen adjustment	108
Screen setting	110

OTHER FUNCTIONS

Maintenance information

This system informs you when to replace certain parts or components and shows dealer information (if registered) on the screen. (See “Information items” on page 97.) When the navigation system begins operating after either the information item’s date comes or the driving distance reaches the “Information” screen will be displayed. This screen will appear every time the system is turned on until you touch the “Do not display this message again” switch.

To prevent this information screen from being displayed again, touch the “Do not display this message again” switch.

1. Push the “INFO” button to display the “Information Menu” screen. Touch the “Maintenance” switch to display the “Maintenance” screen.

2. Touch the desired icon and input the conditions.

Notice of “Date”: You can input the next maintenance date.

Notice of “Distance”: You can input the driving distance until the next maintenance check.

When you touch the  switch on the “Maintenance” screen, the screen changes to the “Personal Event” screen. Touch the keys to input the desired name and then input conditions.

After you input the date and/or distance, touch the **“OK”** switch. The screen then returns to the “Maintenance” screen.

The following switches appear.

“Delete All”: To cancel all conditions which have been inputted.

“Reset All”: To reset the item which has satisfied a condition.

Touch the **“Off”** switch at the top of the “Maintenance” screen to turn off the information screen.

When your vehicle needs to be serviced, the icon color will change to orange.

INFORMATION

- ▶ *For scheduled maintenance information, please refer to the “Scheduled Maintenance Guide” or “Owner’s Manual Supplement”.*
- ▶ *Depending on the driving or the road conditions, the actual date and distance may differ from the stored date and distance in the system.*

Information items

-  Oil change
-  Replace oil filter
-  Rotate tires
-  Replace tires
-  Replace battery
-  Replace brake linings
-  Replace wiper blades

OTHER FUNCTIONS

Replace engine coolant

Replace brake fluid

Replace ATF

Scheduled maintenance

Replace air filter

Personal event

(a) Register dealer

You can register the dealer name, staff, location and phone number.

1. Touch the “Set Dealer” switch on the “Maintenance” screen.

2. Enter the location of the dealer in the same way as for destination input. (See page 20.)

OTHER FUNCTIONS

► To edit “Dealer” or “Contact”

To input the name, touch the alphabet, numeral and/or umlaut keys. You can input up to 24 letters.

After inputting, touch the “OK” switch at the bottom right of the screen. The previous screen will be displayed.

► To edit “Location”

Set the cursor  to the desired point, and touch the “Enter” switch on the screen.

► To edit “Phone #” (telephone number)

Touch numeral keys.

After inputting, touch the “OK” switch. The previous screen will be displayed.

(c) Delete dealer

1. Touch the “Delete Dealer” switch on the screen.
2. A message will appear on the screen. To delete, touch the “Yes” switch. To cancel the deletion, touch the “No” or “Back” switch.

(d) Set as destination

Touch the “Enter ” switch on “Set Dealer” screen. The screen changes and displays the map location of the registered dealer and the “Route Preference”. (See “— Entering destination” on page 38.)

Calendar with memo

This system informs you of the memo entry. At the specified date, the memo information will be displayed, when the navigation system is in operation. The memo information screen will appear every time the system is turned on. To disable this screen, touch the “Do not display this message again” switch.

OTHER FUNCTIONS

To display the "Information Menu" screen, push the "INFO" button. Then touch the "Calendar" switch.

The current date is circled in yellow. If the current date is not displayed on the screen, touch the "Today" switch to display the current month calendar.

(a) Inputting a memo

1. Touch the day you want to add a memo.

2. To display the "Memo" screen, touch the "Add Memo" switch.

▶ Memo

Touch the “Memo” switch to enter text.

Enter text using the keys. You can enter text up to 24 letters.

After entering the text, touch the “OK” switch at the bottom right of the screen.

▶ Location

Touch the “Location” switch to set location.

A screen similar to the destination input screen appears. Input the same way as inputting a destination. (See page 20.)

You can add the memos up to 100 until December 31, 2022.

OTHER FUNCTIONS

The date inputted is marked as shown above.

You can choose the desired mark and/or date color.

▶ Mark color

Touch the “Mark” switch.

Touch your desired color for the mark.

▶ Date color

Touch the “Date” switch.

Touch your desired color for the date.

You can set a color of the mark and/or date for the date you added the memo and/or location.

To default the date color, touch the “Delete” switch on the screen. After you choose the date and/or mark color, touch the “OK” switch to display the previous screen.

(b) Adding a memo

To add a memo, touch the corresponding date.

The “Memo” screen appears on the display. Touch the “Add Memo” switch. (See page 102 for inputting a memo.)

You can add the memo up to 100.

(c) Deleting a memo

Touch the corresponding date. Touch the corresponding memo switch, and then touch the “Delete” switch on the screen. A message appears on the display. To delete, touch the “Yes” switch. To cancel the deletion, touch the “No” switch.

OTHER FUNCTIONS

(d) Editing a memo

To edit the memo, touch the corresponding date, and then touch the memo you wish to edit.

Touch the "Memo" or "Location" switch.

(e) Memo list

1. To list the memos you added, touch the "List" switch.

2. Touch the desired search condition to list the memos. The “Memo list” is displayed on the screen.

To display the memos listed in a desired period, touch the “Period” switch.

Touch the number keys.

After setting the period, touch the “OK” switch. The “Memo list” screen will be displayed.

You can set a period from January 1, 2003, through December 31, 2022, for searching.

To delete and/or edit the memo, touch the desired memo switch.

To delete all memos, touch the “Delete All” switch. A message appears on the display. To delete, touch the “Yes” switch. To cancel the deletion, touch the “No” switch.

OTHER FUNCTIONS

To edit: Touch the corresponding “Memo” or “Location” switch. (See page 106 for details.)

To delete: Touch the “Delete” switch. (See page 105 for details.)

Screen adjustment

The brightness or contrast of the screen can be adjusted depending on the brightness of your surroundings. You can also turn the display off.

To display the “Display” screen push the “DISPLAY” button.

Contrast and brightness adjustment

“CONTRAST” “+”:

Strengthens the contrast of the screen.

“CONTRAST” “-”:

Weakens the contrast of the screen.

“BRIGHTNESS” “+”:

Brightens the screen.

“BRIGHTNESS” “-”:

Darkens the screen.

After adjusting the screen, touch the “OK” switch.

The screen goes off when you touch the “SCREEN OFF” switch. To turn the display screen back on, push any button such as “INFO”, etc. The selected screen appears.

INFORMATION

When you do not touch any switch on the screen for 20 seconds the “Display” screen goes off.

Color and tone adjustment (with rear seat entertainment system)

You can adjust the color and the tone while the DVD video, DVD audio and video CD are being played.

“COLOR” “RED”:

Strengthens the red color of the screen.

“COLOR” “GREEN”:

Strengthens the green color of the screen.

“TONE” “+”: Strengthens the tone of the screen.

“TONE” “-”: Weakens the tone of the screen.

After adjusting the screen, touch the “OK” switch.

The rear screen turns off when you touch “Rear OFF”.

The screen turns off when you touch “SCREEN OFF”. To turn the screen back on, push any button such as “INFO”, etc. The selected screen appears.

INFORMATION

When you do not touch any switch on the screen for 20 seconds the “Display” screen goes off.

Depending on the position of the headlight switch, the screen changes to the day mode or night mode.

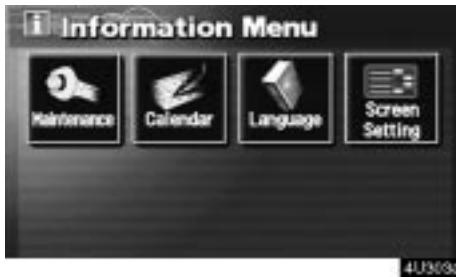

To display the screen in the day mode even with the headlight switch on, touch the “DAY MODE” switch on the adjustment screen for brightness and contrast control.

If the screen is set in the day mode with the headlight switch turned to on, this condition is memorized in the system even with the engine turned off.

OTHER FUNCTIONS

Screen setting

1. Push the "INFO" button to display the "Information Menu" screen.

2. Touch the "Screen Setting" switch.

(a) Automatic transition

You can select a function that enables automatic return to the navigation screen from the audio screen.

Select "ON" or "OFF" and then touch the "OK" switch.

"ON": The navigation screen automatically returns from the audio screen 20 seconds after the end of audio operation.

"OFF": The audio screen remains on.

(b) Background color

You can select a background color.

Select the desired background color and then touch the "OK" switch.

SECTION V

AUDIO SYSTEM

Audio system

Quick reference	112
Using your audio system	113
Audio system operating hints	140

Quick reference

- 1 Function switch display screen**
Touch the switches displayed on the screen to control the radio and disc players. For details, see page 114.
- 2 “TUNE” knob**
Turn this knob to move the station band up or down. For details, see page 116.
- 3 “AM-SAT” button**
Push this button to choose an AM station. For details, see pages 114 and 116.
- 4 “FM” button**
Push this button to choose a FM station. For details, see pages 114 and 116.
- 5 “DISC” button**
Push this button to turn the compact disc player and DVD player on. For details, see pages 114, 121 and 125.
- 6 “SCAN” button**
Push this button to scan radio stations or the tracks on discs. For details, see pages 117, 122 and 126.
- 7 “OPEN” button**
Push this button to open the display to access the slot for the compact disc player. For details, see page 119.

- 8** “**AUDIO**” button
Push this button to display the audio control screen. For details, see page 113.
- 9** “**SEEK/TRACK**” button
Push either side of this button to seek up or down for a station, or to access a desired program or track. For details, see pages 117, 121 and 126.
- 10** “**PWR-VOL**” knob
Push this knob to turn the audio system on and off, and turn it to adjust the volume. For details, see page 113.

Using your audio system — — Some basics

This section describes some of the basic features of your audio system. Some information may not pertain to your system.

Your audio system works when the ignition switch is in the “ACC” or “ON” position.

NOTICE

To prevent the battery from being discharged, do not leave the audio system on longer than necessary when the engine is not running.

(a) Turning the system on and off

“**PWR-VOL**”: Push this knob to turn the audio system on and off. Turn this knob to adjust the volume. The system turns on in the last mode used.

“**AUDIO**”: Push this button to display switches for audio system (audio control mode).

You can select the function that enables automatic return to the previous screen from the audio screen. See page 110 for details.

AUDIO SYSTEM

Push “AM-SAT”, “FM” or “DISC” button to turn on the desired mode. The selected mode turns on immediately.

Push these buttons if you want to switch from one mode to another.

If the disc is not set, the compact disc player does not turn on.

You can turn off the compact disc player by ejecting the compact disc. If the audio system was previously off, then the entire audio system will be turned off when you eject the compact disc. If the another function was previously playing, it will come on again.

The switches for radio, compact disc player and DVD player (with rear seat entertainment system) operation are displayed on the function switch display screen when the audio control mode is selected. Touch them lightly and directly on the screen.

The selected switch is highlighted in green or yellow.

INFORMATION

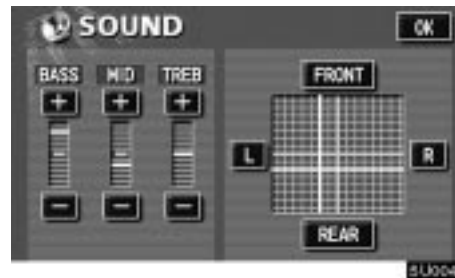

- *If the system does not respond to a touch of a switch, move your finger away from the screen and then touch it again.*
- *You cannot operate dimmed switches.*
- *Wipe off fingerprints on the surface of the display using a glass cleaning cloth.*

(b) Tone and balance

How good an audio program sounds to you is largely determined by the mix of the treble, midrange, and bass levels. In fact, different kinds of music and vocal programs usually sound better with different mixes of treble, mid-range, and bass.

A good balance of the left and right stereo channels and of the front and rear sound levels is also important.

Keep in mind that if you are listening to a stereo recording or broadcast, changing the right/left balance will increase the volume of one group of sounds while decreasing the volume of another.

Touching the “SOUND” switch displayed on the screen at the audio control mode will display the sound control mode. Adjust the tone and balance as follows.

To adjust the tone, touch the “+” or “-” switch on the screen. To adjust the balance between the front and rear speakers, touch the “FRONT” or “REAR” switch on the screen, and to adjust the balance between the left and right, touch the “L” or “R” switch on the screen.

“BASS”: Adjusts low-pitched tones.

“MID”: Adjusts mid-pitched tones.

“TREB”: Adjusts high-pitched tones.

As the yellow display goes up, each tone is more emphasized.

(c) Your compact disc player

When you insert a compact disc, insert it with the label side up. The compact disc player will play from track 1 through the end of the disc. Then it will play from track 1 again.

NOTICE

Never try to disassemble or oil any part of the compact disc player. Do not insert anything other than compact discs into the slot.

The player is intended for use with 12 cm (4.7 in.) discs only.

AUDIO SYSTEM

(d) Your DVD player (with rear seat entertainment system)

You can enjoy the sound of the rear seat entertainment system by pushing the "DISC" button.

— Radio operation

(a) Listening to the radio

Push these buttons to choose either an AM or FM station.

"AM", "FM1" or "FM2" appears on the screen.

Turn the knob clockwise to step up the station band or counterclockwise to step down.

Your radio automatically changes to stereo reception when a stereo broadcast is received. "ST" appears on the screen. If the signal becomes weak, the radio reduces the amount of channel separation to prevent the weak signal from creating noise. If the signal becomes extremely weak, the radio switches from stereo to mono reception. In this case, "ST" disappears from the screen.

(b) Presetting a station

1. Tune in the desired station.
2. Touch one of the switches (1 — 6) you want and hold it until a beep is heard. This sets the station to the switch and the frequency appears on the switch.

Each radio mode (AM, FM1 or FM2) can store up to 6 stations. To change the preset station to a different one, follow the same procedure.

The preset station memory is cancelled when the power source is interrupted by battery disconnection or a blown fuse.

(c) Selecting a station

Tune in the desired station using one of the following methods.

Preset tuning: Touch the switch (1 — 6) for the station you want. The switch is highlighted in green and the station frequency appears on the screen.

Seek tuning: Push the “SEEK/TRACK” button on either side. The radio will begin seeking up or down for a station of the nearest frequency and will stop on reception. Each time you push the button, the stations will be searched automatically one after another.

To scan all the frequencies: Touch the “SCAN” switch on the screen or push the “SCAN” button briefly. “SCAN” appears on the screen. The radio will find the next station and stay there for a few seconds, and then scan again. To select a station, touch the “SCAN” switch or push the “SCAN” button again.

To scan the preset stations: Touch the “SCAN” switch on the screen or push the “SCAN” button for longer than approximately a second. “P. SCAN” appears on the screen. The radio will tune in the next preset station, stay there for a few seconds, and then move to the next preset station. To select a station, touch the “SCAN” switch or push the “SCAN” button again.

(d) Radio Data System

Your audio system is equipped with Radio Data Systems (RDS). RDS mode provides you to receive text messages from radio stations that utilize RDS transmitters.

When RDS is on, the radio can

- only select stations of a particular program type,
- display messages from radio stations,
- search for a stronger signal station.

RDS features are available for the use only on FM stations which broadcast RDS information.

AUDIO SYSTEM

“TYPE ◀▶” switch

If the system receives no RDS stations, “NO PTY” appears on the display.

Each time you touch the “TYPE ◀” or “TYPE ▶” switch, the program type changes as in the following:

- ROCK
- MISC (Miscellaneous)
- Inform (Information)
- Easy Lis (Easy listening)
- Cls/Jazz (Classical music and Jazz)
- R & B (Rhythm and Blues)
- Religion
- Alert (Emergency message)

“TYPE SEEK” switch

When a program is set, “TYPE SEEK” switch appears. Touch the switch and the system starts to seek the station in the relevant program type.

If any type program station is not found, “NOTHING” appears on the display.

“MSG” (MESSAGE) switch

If the system receives a radio text from RDS station, “MSG” appears on the display. Touch the “MSG” switch, and a text message is displayed on the screen.

In case a text message is not accepted in a screen, you can touch the “MSG” switch and hold it to display the rest of the message.

When the system can show the station name, “RDS” appears on the display. Each time you touch the “MSG” switch, indication on the display changes from the band to the station name, a radio text in this order. After six seconds passes, indication returns to the band.

(e) Traffic announcement

“TRAF” switch

A station that regularly broadcasts traffic information is automatically located.

When you push the “TRAF” switch, “TRAF SEEK” appears on the display and the radio will start seeking any traffic program station.

If no traffic program station is found, “NOTHING” appears on the display.

If a traffic program station is found, the name for traffic program station is displayed and “TRAF” is lit for a while until a traffic announcement is received.

— Compact disc player operation

(a) Playing a compact disc

The slot for the compact disc player is behind the display.

To insert a compact disc, push the “OPEN” button to lower the display. Put the compact disc in the slot with the label side up.

The player will automatically start when you insert the compact disc. At this time, “CD” appears on the screen.

If the label faces down, the disc cannot be played. In this case, “CD CHECK” appears on the screen.

CAUTION

- Do not place anything on the opened display, as such items may be thrown about in the compartment and possibly injure people in the vehicle during sudden braking or in an accident.
- To reduce the chance of injury in case of an accident or sudden stop while driving, keep the display closed.
- Take care not to jam your hand while the display is moving. Otherwise, you could be injured.

AUDIO SYSTEM

NOTICE

Do not obstruct the display while it is moving. It could damage your audio system.

INFORMATION

Under extremely cold conditions, the display may react slowly or operation sound may become louder.

To stop and eject the compact disc, push the “OPEN” button to lower the display. Push the “DISC ▲” button.

Push the “DISC” button if a compact disc is already loaded in the slot.

“CD” appears on the screen.

Vehicles with rear entertainment system —

If the DVD player is turned on, push the “DISC” button again to switch to the compact disc player.

If the rear seat entertainment system is on, pushing the “DISC” button switches the sound of the front audio system and that of the rear seat entertainment system.

(b) Selecting a desired track

“SEEK/TRACK” button: Use for a direct access to a desired track.

Push either side of the “SEEK/TRACK” button and hold it until the desired track number appears on the screen. As you release the button, the player will start playing the selected track from the beginning.

Vehicles with rear entertainment system —

While the DVD player is in operation, the chapter or track can be changed by pushing either side of the “SEEK/TRACK” button.

Fast forward: Touch the  switch and hold it to fast forward the disc. When you release the switch, the compact disc player will resume playing from that position.

Reverse: Touch the  switch and hold it to reverse the disc. When you release the switch, the compact disc player will resume playing.

AUDIO SYSTEM

(c) Searching for a desired track

Touch the “SCAN” switch on the screen or push the “SCAN” button.

The compact disc player will play the next track for 10 seconds, then scan again. To select a track, touch the “SCAN” switch on the screen or push the “SCAN” button a second time. If the player reaches the end of the disc, it will continue scanning at track 1.

After all the tracks are scanned in one pass, normal play resumes.

(d) Other compact disc player functions

“RPT” switch: Use it for automatic repeat of the track you are currently listening to.

Touch the switch while the track is playing. When the track is finished, the player will automatically go back to the beginning of the track and play the track again. To cancel it, touch the switch once again.

“RAND” switch: Use it for automatic and random selection.

When the switch is touched, the system selects a track in the disc. To cancel it, touch the switch once again.

If a CD-TEXT disc is inserted, the title of the disc and track will be displayed. Up to 29 letters can be displayed.

(e) If the player malfunctions

If “CD ERROR” appears on the screen, audio signals of the disc cannot be read or the system has trouble. Push the “DISC” button once again.

If the player does not operate, check that the disc surface is not soiled or damaged. If the disc is O.K., the temperature of the player’s internal mechanism may be raised because of high external temperature. Remove the disc from the player to cool it.

If the player still does not operate, have it checked by your dealer.

**—DVD player operation
(with rear seat entertainment system)**

The DVD player can play DVD video, audio CD, video CD, CD text, dts-CD or DVD audio only when a disc is loaded in the DVD player.

Refer to “Rear seat entertainment system” for details.

For appropriate discs for this player, see “Audio system operating hints” on page 140.

(a) Inserting the disc

1. Pull up the console box lid while pushing the lock release button.

2. Slide the lid backward.

AUDIO SYSTEM

3. Insert a disc.

When you insert a disc, push it in gently with the label side up.

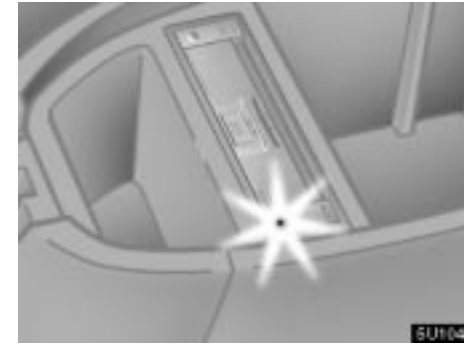

If the label faces down, the disc cannot be played. In this case, "DISC CHECK" appears on the screen.

If a disc which is not playable is inserted, "DISC CHECK" will also appear on the screen. For appropriate discs for this player, see "Audio system operating hints" on page 140.

An adapter must be used for 8 cm (3 in.) discs which are loaded in the same manner as for 12 cm (4.7 in.) discs.

4. Slide the lid forward to close the DVD player.

The indicator light turns on while the disc is loaded.

NOTICE

Never try to disassemble or oil any part of the DVD player. Do not insert anything other than a disc into the slot.

5. Close the console box.

(b) Ejecting a disc

Slide the lid backward to open the DVD player. Push the disc eject button to eject a disc.

 CAUTION
<p>To reduce the chance of injury in case of an accident or a sudden stop, always keep the console box closed while driving.</p>

(c) Playing a disc

Push the “DISC” button if a disc is already loaded in the player.

“DVD” appears on the screen. (If the CD player is turned on, push the “DISC” button again to switch to the DVD player.)

(d) Operating an audio CD

PLAYING AN AUDIO CD

CD text only — The disc title and track title will appear on the screen when pushing the “DISC” button.

Push the “AUDIO” button to display this screen.

AUDIO SYSTEM

SELECTING A DESIRED TRACK

“SEEK/TRACK” button: Use for direct access to a desired track.

Push either side of the “SEEK/TRACK” button and hold it until the desired track number appears on the display. As you release the button, the player will start playing the selected track from the beginning.

Fast forward: Touch the  switch and hold it to fast forward the disc. When you release the switch, the player will resume playing from that position.

Reverse: Touch the  switch and hold it to reverse the disc. When you release the switch, the player will resume playing.

SEARCHING FOR A DESIRED TRACK

Touch the “SCAN” switch on the screen or push the “SCAN” button.

“SCAN” will be highlighted in yellow on the screen. The player will play the next track for 10 seconds, then scan again. To select a track, touch the “SCAN” switch on the screen or push the “SCAN” button a second time. If the player reaches the end of the disc, it will continue scanning at track 1.

After all the tracks are scanned in one pass, normal play resumes.

OTHER FUNCTIONS

“RPT” switch: Use it for automatic repeat of the track you are currently listening to.

Touch the switch while the track is playing. When the track is finished, the player will automatically go back to the beginning of the track and play the track again. To cancel it, touch the switch once again.

“RAND” switch: Use it for automatic and random selection of the disc which you are currently listening to.

When the switch is touched, the system selects a track in the disc you are currently listening to. To cancel it, touch the switch once again.

If a CD-TEXT disc is inserted, the title of the disc and track will be displayed. Up to 29 letters can be displayed.

(e) Operating a DVD video disc

NOTE: The playback condition of some DVD video discs may be determined by a DVD video software producer. This DVD player plays a disc as the software producer intended. So some functions may not work properly. Be sure to read the instruction manual for the DVD video disc separately provided. For the detailed information about DVD video discs, see “(h) DVD player and DVD video disc information”.

Precautions on DVD video disc

When recording with a DVD video or video CD, audio tracks may not record in some cases while the menu is displayed. As audio will not play in this case, verify that the video tracks are playing and then activate playback.

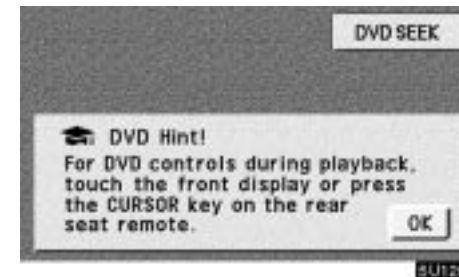

When playback of a disc is completed:

- If an audio CD is playing, the first track starts.
- If a DVD video or video CD is playing, playback will stop or the menu screen will be displayed.

The title/chapter number and playback time display may not appear while playing back certain DVD video discs.

 **CAUTION**

Conversational speech on some DVDs is recorded at a low volume to emphasize the impact of sound effects. If you adjust the volume assuming that the conversations represent the maximum volume level that the DVD will play, you may be startled by louder sound effects or when you change to a different audio source. The louder sounds may have a significant impact on the human body or pose a driving hazard. Keep this in mind when you adjust the volume.

This “DVD Hint!” screen appears when the video screen is first displayed after you turn the ignition key to “ACC” or “ON”.

Touch “OK” when you read the message.

AUDIO SYSTEM

DVD video

DVD audio

PLAYING A DVD DISC

Push the “AUDIO” button to display this screen.

If you touch the “PICTURE” switch when the vehicle is completely stopped and the parking brake is applied, the video screen returns.

DVD video

DVD audio

DISPLAYING DVD CONTROLS

If you touch a part of the screen, where controls are not located while you are watching video, DVD controls will appear.

“**Second Page**”: Touching this will display on the second page of DVD controls.

“**Top Page**”: Touching this will display the top page of DVD controls.

“Hide Keys” switch: Touching this will turn off the controls from the screen.

If “” appears on the screen when you touch a control, the operation relevant to the control is not permitted.

DESCRIPTION OF DVD CONTROLS

◦ Top page of DVD video controls

“Menu” and “Top Menu”: If you touch any of the above controls, the menu screen for DVD video appears. (For the operation, see the manual that come with the DVD video disc provided separately.)

“”: The menu control key appears on the screen. (See page 130.)

“”: Touching this will pause the video screen. When you touch this again, the video screen advances frame by frame.

“”: Touching this will fast reverse during playback and reverse slowly during pause.

“”: Touching this switch will resume normal play after stop or pause.

“”: Touching this will fast forward during playback and forward slowly during pause.

◦ Second page of DVD video controls

“Set Up”: The initial set up screen appears. (See page 133.)

“Search”: The title search screen appears. (See page 130.)

“Return”: Touching this will display the pre-determined scene and start playing from there.

“Audio”: The audio changing screen appears. (See page 132.)

“Sub Title”: The subtitle changing screen appears. (See page 131.)

“Angle”: The angle selection screen appears. (See page 132.)

◦ Top page of DVD audio controls

“Top Menu”: If you touch this switch, the menu screen for DVD audio appears. (For operation, refer to the DVD audio disc manual that is provided separately.)

“Audio”: The audio changing screen appears. (See page 132.)

“”: The menu control key appears on the screen. (See page 130.)

“”: Touch this switch to pause the disc.

“”: Touching this will fast reverse.

“”: Touching this will resume normal play after stop or pause.

“”: Touching this will fast forward.

◦ Second page of DVD audio controls

“Set Up”: The initial set up screen appears. (See page 133.)

“Search”: The group search screen appears. (See page 130.)

“Return”: Touching this will display the pre-determined scene and start playing from there.

“Still Prev.”: Touch this switch to reverse the still pictures. (See page 131.)

“Still Next”: Touch this switch to forward the still pictures. (See page 131.)

“Sub Title”: The subtitle changing screen appears. (See page 131.)

“Angle”: The angle selection screen appears. (See page 132.)

SELECTING A MENU ITEM

Enter the menu item using “▲”, “▶”, “▼” and “◀” switches and touch “Enter”. The player starts playing video for that menu item. (For details, see the manual that comes with the DVD video disc provided separately.)

Each time you touch “Shift Keys”, the controls on the screen move upward and downward.

When you touch “<<OFF”, the controls will disappear. To display them again, touch “ON” switch.

When you touch “Back”, the previous screen returns.

DVD video

SEARCHING BY TITLE

Enter the title number using “-”, “+” and “+10” and touch “Enter”. The player starts playing video for that title number.

When you push either side of the “SEEK/TRACK × V” button, you can select a chapter.

When you touch “Back”, the previous screen returns.

DVD audio

SEARCHING BY GROUP

Enter the group number by using the “-” and “+” switches. The selected group number will appear on the screen. Touch the “Enter” switch. The player starts playing the disc from the entered group number.

When you push either side of the “SEEK/TRACK × V” button, you can select a track.

When you touch “Back”, the previous screen returns.

SELECTING THE BONUS GROUP

DVD audio only —

Enter the bonus group number on the searching group screen and touch the “Enter” switch. The “Enter Key Code” screen will appear. To enter the number of the group you want to play, touch the group number. If you enter the wrong number, touch the “Clear” switch to delete the number.

Touch the “Enter” switch on the screen. The player starts playing the disc from the selected bonus group number.

CHANGING THE STILL PICTURE

DVD audio only —

Touch the “Still Prev.” or “Still Next” switch on the screen to forward or reverse the still pictures.

CHANGING THE SUBTITLE LANGUAGE

Each time you touch “Sub Title”, the language is selected from the ones stored in the discs and changed.

To turn off the subtitle, touch “Hide”.

When you touch “Back”, the previous screen returns.

AUDIO SYSTEM

CHANGING THE AUDIO LANGUAGE

DVD video only —

Each time you touch “Audio”, the language is selected from the ones stored in the discs and changed.

When you touch “Back”, the previous screen returns.

CHANGING THE AUDIO FORMAT

DVD audio only -

Each time you touch “Audio”, another audio format stored on the disc is selected.

When you touch “Back”, the previous screen returns.

CHANGING THE ANGLE

The angle can be selected for discs that are multi-angle compatible when the angle mark appears on the screen.

Each time you touch “Angle”, the angle changes.

When you touch “Back”, and the previous screen returns.

Setup Menu 1 screen

Setup Menu 2 screen

SETUP MENU

There are initial setting switches on the “Setup Menu 1” screen and “Setup Menu 2” screen.

To change the screen, touch the “Top Page” or “Second Page” switch on the screen.

After you change the initial setting, touch the “Enter” switch. The initial setting switch will be turned off and return to the picture previously.

When the “Initial Setting” switch on “Setup Menu 2” is touched, all menus are initialized.

The initial setting can be changed.

- **Audio language**

You can change the audio language.

1. Touch “Audio Lang.”.
2. Touch the language you want to hear on the “Select Audio Lang.” screen.

If you cannot find the language you want to hear on this screen, touch “Others” and enter a language code. For the entry of language code, see the following “ENTER LANGUAGE CODE”.

- **Subtitle language**

You can change the subtitle language.

1. Touch “Subtitle Lang.”.
2. Touch a language you want to read on the “Select Subtitle Lang.” screen.

If you cannot find the language you want to read on this screen, touch “Others” and enter a language code. For the entry of language code, see the following “ENTER LANGUAGE CODE”.

To return to the “Setup Menu 1” screen, touch the “Back” switch.

- **DVD language**

You can change the language on the DVD video menu.

1. Touch “DVD Language”.
2. Touch the language you want to read on the “Select DVD Language” screen.

If you cannot find the language you want to read on this screen, touch “Others” and enter a language code. For the entry of language code, see the following “ENTER LANGUAGE CODE”.

To return to the “Setup Menu 1” screen, touch the “Back” switch.

- **Angle mark**

The multi-angle mark can be turned on or off on the screen while the disc which is multi-angle compatible is being played.

Each time you touch “Angle Mark”, the angle mark on the screen turns on or off alternately.

- **Parental lock**

The level of viewer restrictions can be changed.

AUDIO SYSTEM

1. Touch “Parental”.
2. Enter the 4-digit personal code on the “Enter personal code” screen.

If you enter the wrong numbers, touch “Clear” to delete the numbers.

10 touches of “Clear” will initialize the personal code.

To return to the “Setup Menu 1” screen, touch the “Back” switch.

3. Touch a parental level (1 — 8) on the “Select Restriction Level”. Touch the “Back” switch to return to the “Setup Menu 1” screen.

Each time you touch the “Display Mode” on the “Setup Menu 2” screen, the display mode is changed from wide mode to auto mode.

ENTER LANGUAGE CODE

If you touch “Others” on the “Select Audio Lang.” screen, “Select Subtitle Lang.” screen or “Select DVD language” screen, you can select the language you want to hear or read by entering a language code.

1. Enter the 4-digit language code.

If you enter the wrong numbers, touch “Clear” to delete the numbers.

2. Touch “Enter”.

(f) Operating a video CD
PLAYING A VIDEO CD
 Push the “AUDIO” button to display this screen.

If you touch the “PICTURE” switch when the vehicle is completely stopped and the parking brake is applied, the video screen returns.

DISPLAYING OPERATION SWITCHES

If you touch the part where switches are not located while you are watching video on the video CD, video CD operation switches will appear.

“**Second Page**” switch: Use this switch to display the operation switches on the second page.

“**Top Page**” switch: Use this switch to display the operation switches on the top page.

“**Hide Keys**” switch: Use this switch to turn off the operation switches from the display.

If “” appears on the display when you touch the switch, the operation is not permitted.

DESCRIPTION OF EACH SWITCH

◦ **Switches on top page**

“**Sel. Number**” switch: The track or number search screen appears. (See “SEARCHING BY TRACK” on page 138.)

“**D. Menu Prev.**” switch: When you touch this switch while the disc menu is displayed, the previous page appears on the screen. If you touch this switch while the player is playing video, the previous track is searched and played.

“**D. Menu Next**” switch: When you touch this switch while the disc menu is displayed, the next page appears on the display. If you touch this switch while the player is playing video, the next track is searched and played.

“**Main/Sub**” switch: A multiplex transmission changing switch. The mode changes from Main/Sub to Main, to Sub and back to Main/Sub by touching this switch.

AUDIO SYSTEM

◦ Switches on second page

“**II**” **switch**: Use this switch to pause the video screen. When you touch this switch again, the video screen advance frame by frame.

“**◀◀**” **switch**: Touch this switch to fast reverse during playback.

“**▶**” **switch**: Touch this switch during pause to resume playing.

“**▶▶**” **switch**: Touch this switch to fast forward during the playback and start playing slowly during pause.

SEARCHING BY TRACK

Enter the track numbers using “-”, “+” and “+10” switches and touch “Enter”. The player starts playing video for that title number.

You can select a track number by pushing “x” or “v” on the “SEEK/TRACK” button.

Touch “Back”, and the previous screen returns.

(g) If the player malfunctions

If the player or another unit equipped with the player malfunction, your audio system will display one of the three following messages.

If “DISC CHECK” appears on the display: It indicates that the disc dirty, damaged, or it was inserted upside down. Clean the disc or insert it correctly. If a disc which is not playable is inserted, “DISC CHECK” will also appear on the screen. For appropriate discs for this player, see “Audio system operating hints” on page 140.

If “REGION CODE ERROR” appears on the display: It indicates that the DVD region code is not set properly.

If “DVD ERROR” appears on the display: It indicates that the inside of the player unit may be too hot due to the very high ambient temperature. Remove the magazine from the player and allow the player to cool down.

If the malfunction is not rectified: Take your vehicle to your dealer.

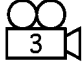

(h) DVD player and DVD video disc information

DVD VIDEO DISCS

This DVD player conforms to NTSC color TV formats. The DVD video disc conforming to another formats such as PAL or SE-CAM cannot be used.

Region codes: Some DVD video discs have a region code indicating a country where you can use the DVD video disc on this DVD player. If the DVD video disc is not labeled as “ALL” or “1”, you cannot use it on this DVD player. If you attempt to play an inappropriate DVD video disc on this player, “REGION CODE ERROR” appears on the screen. Even if the DVD video disc does not have a region code, there is a case that you cannot use it.

Marks shown on DVD video discs:

	Indicates NTSC format of color TV.
	Indicates the number of audio tracks.
	Indicates the number of language subtitles.
	Indicates the number of angles.
	Indicates the screen to be selected. Wide screen: 16:9 Standard: 4:3
	Indicates a region code by which this video disc can be played. ALL: in all countries Number: region code

DVD VIDEO DISC GLOSSARY

DVD video discs: Digital versatile Disc that holds video. DVD video discs have adopted "MPEG2", one of the world standards of digital compression technologies. The picture data is compressed by 1/40 on average and stored. Variable rate encoded technology in which the volume of data assigned to the picture is changed depending on the picture format has also been adopted. Audio data is stored using PCM and Dolby digital, which enables higher quality of sound. Furthermore, multi-angle and multi-language features will also help you enjoy the more advanced technology of DVD video.

Viewer restrictions: This feature limits what can be viewed in conformity with a level of restrictions of the country. The level of restrictions varies depending on the DVD video disc. Some DVD video discs cannot be played at all, or violent scenes are skipped or replaced with other scenes.

Level 1: DVD video discs for children can be played.

Level 2 - 7: DVD video discs for children and G-rated movie can be played.

Level 8: All types of the DVD video discs can be played.

Multi-angle feature: You can enjoy the same scene at different angles.

Multi-language feature: You can select a language of the subtitle and audio.

Region codes: The region codes are provided on DVD players and DVD discs. If the DVD video disc does not have the same region code as the DVD player, you cannot play the disc on the DVD player. For region codes, see page 139.

Audio: This DVD player can play liner PCM, Dolby digital and MPEG audio format DVD. Other decoded type cannot be played.

Title and chapter: Video and audio programs stored in DVD video disc are divided in parts by title and chapter.

Title: The largest unit of the video and audio programs stored on DVD video discs. Usually, one piece of movie, one album, or one audio program is assigned as a title.

Chapter: The unit smaller than that of title. A title comprises plural chapters.

Audio system operating hints

NOTICE

To ensure correct audio system operations:

- *Be careful not to spill beverages over the audio system.*
- *Do not put anything other than a Compact Disc into the slot.*
- *Do not put anything other than an appropriate disc into the DVD player.*
- *The use of a cellular phone inside or near the vehicle may cause a noise from the speakers of the audio system which you are listening to. However, this does not indicate a malfunction.*

RADIO RECEPTION

Usually, a problem with radio reception does not mean there is a problem with your radio — it is just the normal result of conditions outside the vehicle.

For example, nearby buildings and terrain can interfere with FM reception. Power lines or telephone wires can interfere with AM signals. And of course, radio signals have a limited range. The farther you are from a station, the weaker its signal will be. In addition, reception conditions change constantly as your vehicle moves.

Here are some common reception problems that probably do not indicate a problem with your radio:

FM

Fading and drifting stations — Generally, the effective range of FM is about 40 km (25 miles). Once outside this range, you may notice fading and drifting, which increase with the distance from the radio transmitter. They are often accompanied by distortion.

Multi-path — FM signals are reflective, making it possible for two signals to reach your antenna at the same time. If this happens, the signals will cancel each other out, causing a momentary flutter or loss of reception.

Static and fluttering — These occur when signals are blocked by buildings, trees, or other large objects. Increasing the bass level may reduce static and fluttering.

Station swapping — If the FM signal you are listening to is interrupted or weakened, and there is another strong station nearby on the FM band, your radio may tune in the second station until the original signal can be picked up again.

AM

Fading — AM broadcasts are reflected by the upper atmosphere — especially at night. These reflected signals can interfere with those received directly from the radio station, causing the radio station to sound alternately strong and weak.

Station interference — When a reflected signal and a signal received directly from a radio station are very nearly the same frequency, they can interfere with each other, making it difficult to hear the broadcast.

Static — AM is easily affected by external sources of electrical noise, such as high tension power lines, lightening, or electrical motors. This results in static.

CARING FOR YOUR COMPACT DISC PLAYER, DVD PLAYER AND DISCS

- Your compact disc player is intended for use with 12 cm (4.7 in.) discs only.
- Extremely high temperatures can keep your compact disc player and DVD player from working. On hot days, use the air conditioning to cool the vehicle interior before you use the players.
- Bumpy roads or other vibrations may make your compact disc player and DVD player skip.
- If moisture gets into your compact disc player and DVD player, you may not play even though they appear to be working. Remove the disc from the player and wait until it dries.

 **CAUTION**

Compact disc players and DVD players use an invisible laser beam which could cause hazardous radiation exposure if directed outside the unit. Be sure to operate the players correctly.

Compact disc player

- Use only compact discs marked as shown above. The following products may not be playable on your compact disc player.

Copy-protected CD
 CD-R (CD-Recordable)
 CD-R W (CD-Re-writable)
 CD-ROM

AUDIO SYSTEM

► Low quality discs

DVD player

- Use only discs marked as shown above. The following products may not be playable on your DVD player.

SACD
 Copy-protected CD
 CD-R (CD-Recordable)
 CD-R W (CD-Re-writable)
 CD-ROM
 DVD-R
 DVD+R
 DVD-R W
 DVD+RW
 DVD-ROM
 DVD-RAM

► Transparent/translucent discs

► Labeled discs

NOTICE

Do not use special shaped, transparent/translucent, low quality or labeled discs such as those shown in the illustrations. The use of such discs may damage the player or changer, or it may be impossible to eject the disc.

▶ Correct

▶ Wrong

- Handle discs carefully, especially when you are inserting them. Hold them on the edge and do not bend them. Avoid getting fingerprints on them, particularly on the shiny side.
- Dirt, scratches, warping, pin holes, or other disc damage could cause the player to skip or to repeat a section of a track. (To see a pin hole, hold the disc up to the light.)
- Remove discs from the players when you are not using them. Store them in their plastic cases away from moisture, heat, and direct sunlight.

To clean a compact disc: Wipe it with a soft, lint-free cloth that has been dampened with water. Wipe in a straight line from the center to the edge of the disc (not in circles). Dry it with another soft, lint-free cloth. Do not use a conventional record cleaner or anti-static device.

AUDIO SYSTEM

Introduction

Thank you for your purchase of the Navigation System. Please read this manual carefully to ensure proper use. Keep this manual in your vehicle at all times.

The Navigation System is one of the most technologically advanced vehicle accessories ever developed. The system receives satellite signals from the Global Positioning System (GPS) operated by the U.S. Department of Defense. Using these signals and other vehicle sensors, the system indicates your present position and assists in locating a desired destination.

The navigation system is designed to select efficient routes from your present starting location to your destination. The system is designed to direct you to a destination that is unfamiliar to you in an efficient manner. The system uses the maps of DENSO. The calculated routes may not be the shortest nor the least traffic congested. Your own personal local knowledge or "short cut" may at times be faster than the calculated routes.

The navigation system's database includes about 75 Point of Interest categories to allow you to easily select destinations such as restaurants and banks. If a destination is not in the database, you can enter the street address or a major intersection close to it and the system will guide you there. The system will provide both a visual map and audio instructions. The audio instructions will announce the distance remaining and the direction to turn in approaching a fork or intersection. These voice instructions will help you keep your eyes on the road and are timed to provide enough time to allow you to maneuver, change lanes or slow down.

Please be aware that all current vehicle navigation systems have certain limitations that may affect their ability to perform properly. The accuracy of the vehicle's position depends on the satellite condition, road configuration, vehicle condition or other circumstances. For more information on the limitations of the system, refer to pages 10 through 12.

TOYOTA MOTOR CORPORATION

Important information about this manual

For safety reasons, this manual indicates items requiring particular attention with the following marks.

 CAUTION
This is a warning against anything which may cause injury to people if the warning is ignored. You are informed about what you must or must not do in order to reduce the risk of injury to yourself and others.

NOTICE
<i>This is a warning against anything which may cause damage to the vehicle or its equipment if the warning is ignored. You are informed about what you must or must not do in order to avoid or reduce the risk of damage to your vehicle and its equipment.</i>

INFORMATION
<i>This provides additional information.</i>

Initial screen

When you start the engine or turn the ignition switch to the “ACC” position, the initial screen appears and the system begins operating.

 CAUTION
When the vehicle is stopped with the engine running, always apply the parking brake for safety.

After a few seconds, the “CAUTION” screen appears.

Touch either “English” or “Français” to select a language. Read and follow the instructions.

When you touch the “I Agree” switch on the screen, the map screen appears.

You can access this screen when you push the “INFO” button and touch the “Language” switch. Then you can select a language.

Safety Instruction

To use your system in the safest possible manner, follow all the safety tips shown below.

This system is intended to assist you in reaching your destination and, if used properly, can do so. You, as the driver, are solely responsible for the safe operation of your vehicle and the safety of your passengers.

Do not use any feature of this system to the extent it distracts you from safe driving. Your first priority while driving should always be the safe operation of your vehicle. While you are driving, be sure to observe all traffic regulations.

Prior to the actual use of this system, learn how to use it and become thoroughly familiar with it. Read the entire Navigation System Owner's Manual to make sure you understand the system. Do not allow others to use this system until they have read and understood the instructions in this manual.

For your safety, some functions may become inoperable when you start driving. Unavailable switches are dimmed. You can input your destination and select your route only when the vehicle is not moving.

 CAUTION	
▶	For safety, the driver should not operate the navigation system while he/she is driving. Inattention to the road and traffic may cause an accident.
▶	While you are driving, be sure to obey the traffic regulations and maintain awareness of the road conditions. If a traffic sign on the road has been changed, route guidance may provide wrong information such as the direction of a one way street.

While you are driving, listen to the voice instructions as much as possible and glance at the screen briefly and only when it is safe. However, do not totally rely on voice guidance. Use it just for your information. If the system cannot determine your current position correctly, there is a possibility of incorrect, late or non-voice guidance.

The data in the system may occasionally be incomplete. Road conditions, including driving restrictions (no left turns, street closures, etc.) frequently change. Therefore, before you follow any instruction from the system, look to see whether you can comply with the instruction safely and legally.

This system cannot warn you about such things as the safety of an area, condition of streets, and availability of emergency services. If you are unsure about the safety of an area, do not drive into it. **Under no circumstances is this system a substitute for the driver's personal judgement.**

Use this system only in locations where it is legal to do so. Some states/provinces may have laws prohibiting video screens within sight of the driver.

**Your navigation system —
— Quick reference**

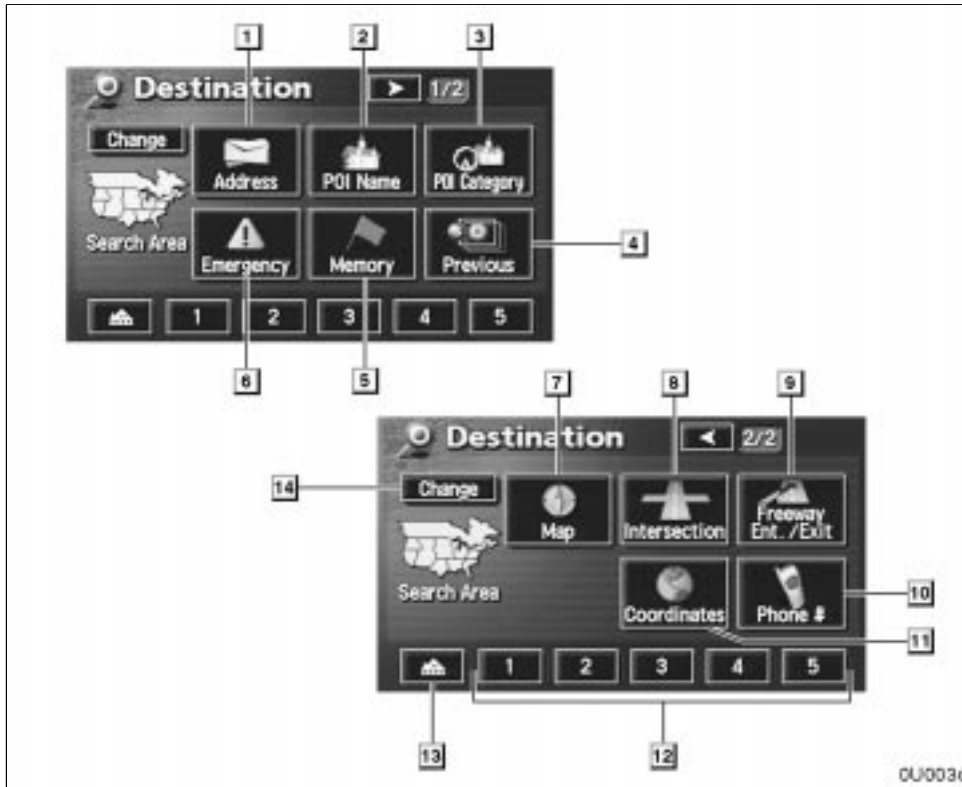

- 1 North-up or heading-up symbol**
This symbol indicates a map view with north-up or heading-up. Touching this symbol changes the map orientation. 9
- 2 Scale indicator**
This figure indicates the map scale. 9
- 3 “INFO” button**
Push this button to display the “Information Menu” screen. ii, 96, 101, 110
- 4 Zoom out switch**
Touch this switch to reduce the map scale. 9
- 5 “Mark” switch**
Touch this switch to register the cursor position as a memory point. 6
- 6 “Route” switch**
Touch this switch to change the route. 42, 44
- 7 “DISPLAY” button**
Push this button to display the “Display” screen. 108

- 8 “Map View” switch**
Touch this switch to obtain information regarding the route to the destination and information about the POI (Points of Interest) on map screen. 49, 51, 52
- 9 “◀OFF” switch**
Touch this switch to obtain a broader view, some of the switches on the screen are not displayed. They reappear by touching the “ON ▶” switch. 89
- 10 Zoom in switch**
Touch this switch to magnify the map scale. 9
- 11 Foot print map switch**
Touch this switch to display the foot print map and the building information. 58
- 12 “MAP/VOICE” button**
Push this button to repeat a voice guidance, cancel one touch scroll, start guidance and display the current position. 5, 6, 42
- 13 “DEST” button**
Push this button to display the “Destination” screen. x, 20
- 14 Screen configuration switch**
Touch this switch to change the screen mode. 53

- 15 “MENU” button**
Push this button to display the “Menu” screen. xii, 17, 61
- 16 Distance and time to destination**
Displays the distance and the estimated travel time to the destination. 57
- 17 “GPS” mark (Global Positioning System)**
Whenever your vehicle is receiving signals from the GPS, this mark is displayed. 10

— “Destination” screen

To search for a destination, the switches below perform the following operations.

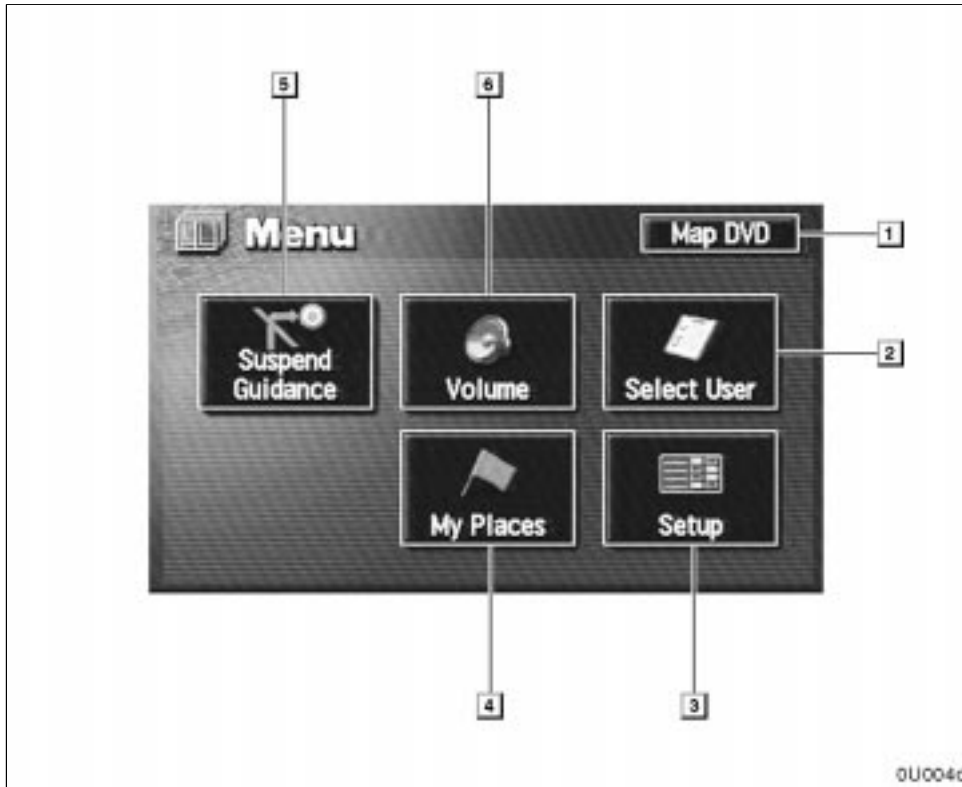

- 1 “Address” switch**
You can input the house number and the street address by using the input keys. 22
- 2 “POI Name” switch**
You can select one of the many POIs (Points of Interest) that have been already stored in the system’s database. 26
- 3 “POI Category” switch**
You can select a destination from the POI category. 29
- 4 “Previous” switch**
You can select a destination from any of the last 99 previously set destinations and from the previous starting point. 34
- 5 “Memory” switch**
You can select the location from those registered as the “Memory points”. (To register memory points, see page 66.) 33
- 6 “Emergency” switch**
You can select one of the three categories of emergency service points that have been already stored in the system’s database. 32

- 7 “Map” switch**
You can select a destination simply by touching the location on the displayed map. 34
- 8 “Intersection” switch**
You can enter the names of two intersecting streets. This is helpful if you do not know the specific street address of your destination but know the general vicinity. 35
- 9 “Freeway Ent./Exit” switch**
You can enter the name of a freeway (interstate) entrance or exit. 36
- 10 “Phone #” switch**
You can enter a destination by the telephone number. 37
- 11 “Coordinates” switch**
You can set a destination using latitude and longitude coordinates. 37
- 12 Quick access switch**
You can select one of 5 preset destinations directly. To use this function, it is necessary to set the “Attribute” for each memory point. (To register the “Quick Access”, see page 70.) 22

- 13 Home switch**
You can select your own home without entering the address each time. To use this function, it is necessary to set the “Attribute” for the memory point. (To register the “Home”, see page 70.) 22
- 14 “Change” switch**
To change the search area, touch this switch. 20

— “Menu” screen

The switches below perform the following operations.

- 1 “Map DVD” switch**
Displays information regarding the disc version or covered area. 12
- 2 “Select User” switch**
Enables recall of up to three memorized user setting patterns. 63
- 3 “Setup” switch**
Enables various settings for the navigation system. 76
- 4 “My Places” switch**
Enables changes to “Memory points” and “Areas to avoid”. 66
- 5 “Suspend Guidance” and “Resume Guidance” switch**
Suspends or resumes the guidance. 62
- 6 “Volume” switch**
Sets the volume of the voice guidance. 63

Regular maintenance is essential to obtaining the highest level of performance from your Toyota. It can also increase your vehicle's resale value. This booklet presents Toyota's maintenance recommendations in convenient checklists, so you can easily see what type of maintenance your vehicle needs and document that the work was performed.

To ensure that your vehicle receives first-quality service and parts, Toyota recommends having maintenance performed by an authorized Toyota dealership. Toyota dealership technicians are experts on Toyota vehicles, and they use Genuine Toyota Parts designed to your vehicle's exact specifications. When you go to a Toyota dealership, you can be confident of the quality that is going on your vehicle as well as the qualifications of the person under the hood.

Documenting Your Investment

To help you verify that you've invested in proper maintenance, each maintenance checklist includes space for your Toyota dealership to certify that you obtained Genuine Toyota Service for your vehicle. The dealership will mark the dealer service verification area with the following stamp (which may be customized with the dealership's name):

Additional Maintenance

In addition to scheduled maintenance, your Toyota requires ongoing general maintenance such as fluid checks and visual inspections. These procedures are explained in the "Vehicle Maintenance and Care" section of the *Owner's Manual*. Be sure to perform these procedures regularly to ensure the most trouble-free operation of your vehicle.

Maintenance Records

Maintaining your vehicle according to the recommendations in this booklet is required to ensure that your warranty coverage remains intact. You should keep detailed records of vehicle maintenance, including date of service, mileage at time of service and a description of service and/or parts installation performed. The scheduled maintenance log in this booklet can help you document this information. If you sell your vehicle, be sure to give your maintenance records to the new owner.

Toyota will not deny a warranty claim solely because you do not have records to show that you maintained your vehicle. However, damage or failures caused by lack of proper maintenance are not covered under warranty.

Maintenance Providers

Maintenance and repair services may be performed by you or by any automotive service provider you choose. Toyota will not deny a warranty claim solely because you used a service provider other than a Toyota dealership for maintenance and repairs. However, damage or failures caused by improper maintenance or repairs are not covered under warranty.

Dealer-Recommended Maintenance

Your dealer may recommend more frequent maintenance intervals or more maintenance services than those listed in the scheduled maintenance log. These additional services are not required to maintain your warranty coverage. Ask your dealer for an explanation of any recommended maintenance not included in the scheduled maintenance log.

For a complete description of Toyota warranty coverages, see the booklet entitled *2005 Owner's Warranty Information* located in your vehicle's glove box.

ONLINE INFORMATION

For your convenience, scheduled maintenance information for your vehicle is also available at www.toyota.com.

From the site's home page, select the "Owners" link, then select "Service & Maintenance." This will bring you to the screen shown below, where you will select your vehicle's model name, year and current mileage/time interval. After you click "Submit," you'll be able to view your vehicle's recommended maintenance for that interval.

Vehicle Service Maintenance

Your vehicle represents a significant investment, and taking an active role in maintaining your vehicle will help you protect this investment. Proper maintenance will help extend the life of your Toyota and preserve its value. In addition to helping you avoid costly repairs down the road, regular maintenance will optimize your Toyota's performance, safety and fuel efficiency.

To help you determine when your Toyota requires servicing, we've provided a factory-recommended maintenance schedule (see pull-down menu below) that includes mileage as well as time intervals since your last service. Both intervals are equally important for properly maintaining your vehicle. Remember, all Toyota dealerships offer a broad range of parts and service support including trained Toyota technicians who have the technology at hand to provide expert care for your vehicle.

VEHICLE: **VEHICLE YEAR:** **MILEAGE / TIME INTERVAL:**

If you have any questions about service intervals or don't see your vehicle's maintenance schedule, please refer to your Owner's Manual, Owner's Manual Supplement or the Scheduled Maintenance Guide that came with your vehicle. You can also contact our Toyota dealer or the Toyota Customer Assistance Center at 1-888-431-4331 or by email to toyota@toyota.com. [Click here.](#)

Vehicle Identification Number _____

Miles or Months?

Toyota recommends obtaining scheduled maintenance for your vehicle every 5,000 miles or six months, whichever comes first.

For example:

- If you drive 5,000 miles in less than six months, you should obtain maintenance at **5,000 miles** – don't wait until six months.
- If at six months you have driven less than 5,000 miles, you should obtain maintenance at **six months** – don't wait until 5,000 miles.

Be sure to keep an eye on your mileage so that you obtain maintenance when recommended. If you are a low-mileage driver, mark your calendar to remind yourself to obtain maintenance every six months.

Special Operating Conditions

In addition to standard maintenance items, the maintenance log indicates services that should be performed on vehicles that are driven under especially demanding conditions. These “special operating conditions” and their required maintenance items are clearly indicated in each chart.

Note: You should perform these additional maintenance services if you drive *primarily* under any of the special operating conditions indicated. If you drive only occasionally under these conditions, it is not necessary to perform the additional services.

5,000 Miles or 6 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

10,000 Miles or 12 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

15,000 Miles or 18 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Clean cabin air filter (Camry)
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Visually inspect brake linings/drums and brake pads/discs
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Rear differential oil ⁴
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive shaft boots	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Engine coolant ³	<input type="checkbox"/> Transfer case oil ⁴
<input type="checkbox"/> Exhaust pipes and mountings	

Note: Driving in heavy traffic, on dirt roads or in urban, dusty or desert areas may shorten the life of the cabin air filter. Replacement may be needed if you notice reduced air flow from the air conditioner and heater or if the windows fog easily when you use the "Fresh" mode. Consult your dealer if any of these conditions occur.

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect engine air filter
- Tighten nuts and bolts on chassis

Driving while towing:

- Replace rear differential oil⁴
- Replace transfer case oil⁴
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ See page 37 for details.

⁴ Applies to Corolla Matrix 4WD and Sienna 4WD.

20,000 Miles or 24 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Replace cabin air filter (Corolla and Corolla Matrix, if equipped)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

25,000 Miles or 30 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

30,000 Miles or 36 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Replace cabin air filter (Camry and Camry Solara)
- Replace engine air filter
- Replace spark plugs (ECHO)³
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Fuel tank cap gasket
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Radiator core and condenser
<input type="checkbox"/> Brake linings/drums and brake pads/discs ⁴	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Differential oil ⁵	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Drive shaft boots	<input type="checkbox"/> Transfer case oil ⁷
<input type="checkbox"/> Engine coolant ⁶	<input type="checkbox"/> Transmission fluid or oil
<input type="checkbox"/> Exhaust pipes and mountings	
<input type="checkbox"/> Fuel lines and connections, fuel tank band and fuel tank vapor vent system hoses	

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Tighten nuts and bolts on chassis

Driving while towing:

- Replace front differential oil (all models with manual transmission except Corolla Matrix 4WD)
- Replace manual transmission oil
- Replace rear differential oil⁸
- Replace transfer case oil⁷
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Required under the terms of the Emission Control Warranty.

⁴ Inspect thickness measurement and disc runout.

⁵ Except front differential of Corolla Matrix 4WD with manual transmission.

⁶ See page 37 for details.

⁷ Applies to Corolla Matrix 4WD and Sienna 4WD.

⁸ Applies to Corolla Matrix 4WD, MR2 Spyder and Sienna 4WD.

35,000 Miles or 42 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

40,000 Miles or 48 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Replace cabin air filter (Corolla and Corolla Matrix, if equipped)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

45,000 Miles or 54 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Clean cabin air filter (Camry)
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Visually inspect brake linings/drums and brake pads/discs
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Rear differential oil ⁴
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive shaft boots	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Engine coolant ³	<input type="checkbox"/> Transfer case oil ⁴
<input type="checkbox"/> Exhaust pipes and mountings	

Note: Driving in heavy traffic, on dirt roads or in urban, dusty or desert areas may shorten the life of the cabin air filter. Replacement may be needed if you notice reduced air flow from the air conditioner and heater or if the windows fog easily when you use the "Fresh" mode. Consult your dealer if any of these conditions occur.

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect engine air filter
- Tighten nuts and bolts on chassis

Driving while towing:

- Replace rear differential oil⁴
- Replace transfer case oil⁴
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ See page 37 for details.

⁴ Applies to Corolla Matrix 4WD and Sienna 4WD.

50,000 Miles or 60 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

55,000 Miles or 66 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

60,000 Miles or 72 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Replace cabin air filter (if equipped)
- Replace engine air filter
- Replace spark plugs (ECHO)³
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Fuel lines and connections, fuel tank band and fuel tank vapor vent system hoses
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Fuel tank cap gasket
<input type="checkbox"/> Brake linings/drums and brake pads/discs ⁴	<input type="checkbox"/> Radiator core and condenser
<input type="checkbox"/> Differential oil ⁵	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive belts ⁶	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Drive shaft boots	<input type="checkbox"/> Transfer case oil ⁸
<input type="checkbox"/> Engine coolant ⁷	<input type="checkbox"/> Transmission fluid or oil
<input type="checkbox"/> Engine valve clearance	
<input type="checkbox"/> Exhaust pipes and mountings	

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Tighten nuts and bolts on chassis

Driving while towing:

- Replace front differential oil
- Replace rear differential oil⁹
- Replace transfer case oil⁸
- Replace transmission fluid or oil
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Required under the terms of the Emission Control Warranty.

⁴ Inspect thickness measurement and disc runout.

⁵ Except front differential of Corolla Matrix 4WD with manual transmission.

⁶ Initial inspection at 60,000 miles/72 months. Inspect every 15,000 miles/18 months thereafter.

⁷ See page 37 for details.

⁸ Applies to Corolla Matrix 4WD and Sienna 4WD.

⁹ Applies to Corolla Matrix 4WD, MR2 Spyder and Sienna 4WD.

65,000 Miles or 78 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

70,000 Miles or 84 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

75,000 Miles or 90 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Clean cabin air filter (Camry)
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Visually inspect brake linings/drums and brake pads/discs
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Exhaust pipes and mountings
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Rear differential oil ⁴
<input type="checkbox"/> Drive belts	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive shaft boots	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Engine coolant ³	<input type="checkbox"/> Transfer case oil ⁴

Note: Driving in heavy traffic, on dirt roads or in urban, dusty or desert areas may shorten the life of the cabin air filter. Replacement may be needed if you notice reduced air flow from the air conditioner and heater or if the windows fog easily when you use the "Fresh" mode. Consult your dealer if any of these conditions occur.

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect engine air filter
- Tighten nuts and bolts on chassis

Driving while towing:

- Replace rear differential oil⁴
- Replace transfer case oil⁴
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ See page 37 for details.

⁴ Applies to Corolla Matrix 4WD and Sienna 4WD.

80,000 Miles or 96 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Replace cabin air filter (Corolla and Corolla Matrix, if equipped)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

85,000 Miles or 102 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

90,000 Miles or 108 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Replace cabin air filter (Camry and Camry Solara)
- Replace engine air filter
- Replace spark plugs (ECHO)³
- Replace timing belt (Camry with 1MZ-FE or 3MZ-FE, Camry Solara with 3MZ-FE, Sienna)
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Fuel lines and connections, fuel tank band and fuel tank vapor vent system hoses
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Fuel tank cap gasket
<input type="checkbox"/> Brake linings/drums and brake pads/discs ⁴	<input type="checkbox"/> Radiator core and condenser
<input type="checkbox"/> Differential oil ⁵	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive belts	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Drive shaft boots	<input type="checkbox"/> Transfer case oil ⁷
<input type="checkbox"/> Engine coolant ⁶	<input type="checkbox"/> Transmission fluid or oil
<input type="checkbox"/> Exhaust pipes and mountings	

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Tighten nuts and bolts on chassis

Driving while towing:

- Replace front differential oil (all models with manual transmission except Corolla Matrix 4WD)
- Replace manual transmission oil
- Replace rear differential oil⁸
- Replace transfer case oil⁷
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Required under the terms of the Emission Control Warranty.

⁴ Inspect thickness measurement and disc runout.

⁵ Except front differential of Corolla Matrix 4WD with manual transmission.

⁶ See page 37 for details.

⁷ Applies to Corolla Matrix 4WD and Sienna 4WD.

⁸ Applies to Corolla Matrix 4WD, MR2 Spyder and Sienna 4WD.

95,000 Miles or 114 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

100,000 Miles or 120 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Replace cabin air filter (Corolla and Corolla Matrix, if equipped)
- Replace engine coolant³
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

105,000 Miles or 126 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Clean cabin air filter (Camry)
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Visually inspect brake linings/drums and brake pads/discs
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Exhaust pipes and mountings
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Rear differential oil ⁵
<input type="checkbox"/> Drive belts	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive shaft boots	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Engine coolant ⁴	<input type="checkbox"/> Transfer case oil ⁵

Note: Driving in heavy traffic, on dirt roads or in urban, dusty or desert areas may shorten the life of the cabin air filter. Replacement may be needed if you notice reduced air flow from the air conditioner and heater or if the windows fog easily when you use the "Fresh" mode. Consult your dealer if any of these conditions occur.

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect engine air filter
- Tighten nuts and bolts on chassis

Driving while towing:

- Replace rear differential oil⁵
- Replace transfer case oil⁵
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Initial replacement at 100,000 miles/120 months. Replace every 50,000 miles/60 months thereafter. See page 37 for additional information.

⁴ See page 37 for details.

⁵ Applies to Corolla Matrix 4WD and Sienna 4WD.

110,000 Miles or 132 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

115,000 Miles or 138 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots
- Inspect engine air filter
- Inspect steering linkage and boots
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Tighten nuts and bolts on chassis

Driving while towing:

- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

120,000 Miles or 144 Months

- Replace engine oil and oil filter¹
- Rotate tires (except MR2 Spyder)
- Replace cabin air filter (if equipped)
- Replace engine air filter
- Replace spark plugs³
- Tighten drive shaft bolt (Corolla and Corolla Matrix)
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Fuel lines and connections, fuel tank band and fuel tank vapor vent system hoses
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Fuel tank cap gasket
<input type="checkbox"/> Brake linings/drums and brake pads/discs ⁴	<input type="checkbox"/> Radiator core and condenser
<input type="checkbox"/> Differential oil ⁵	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive belts	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Drive shaft boots	<input type="checkbox"/> Transfer case oil ⁷
<input type="checkbox"/> Engine coolant ⁶	<input type="checkbox"/> Transmission fluid or oil
<input type="checkbox"/> Engine valve clearance	
<input type="checkbox"/> Exhaust pipes and mountings	

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Tighten nuts and bolts on chassis

Driving while towing:

- Replace front differential oil
- Replace rear differential oil⁸
- Replace transfer case oil⁷
- Replace transmission fluid or oil
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Required under the terms of the Emission Control Warranty. Does not apply to Camry PZEV with 2AZ-FE in California, New York, Massachusetts, Maine and Vermont. For this model, replacement interval is 150,000 miles.

⁴ Inspect thickness measurement and disc runout.

⁵ Except front differential of Corolla Matrix 4WD with manual transmission.

⁶ See page 37 for details.

⁷ Applies to Corolla Matrix 4WD and Sienna 4WD.

⁸ Applies to Corolla Matrix 4WD, MR2 Spyder and Sienna 4WD.

5,000 Miles or 6 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

10,000 Miles or 12 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Applies to Highlander, Land Cruiser, RAV4, 4WD Sequoia, 4WD Tacoma, 4WD Tundra and 4WD 4Runner.

15,000 Miles or 18 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Visually inspect brake linings/drums and brake pads/discs
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Radiator core and condenser
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Rear differential oil (all models except 2WD Highlander and 2WD RAV4)
<input type="checkbox"/> Drive shaft boots ³	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Engine coolant ⁵	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Exhaust pipes and mountings	<input type="checkbox"/> Transfer case oil (4WD Highlander, 4WD RAV4)
<input type="checkbox"/> Front differential oil (all 4WD except Highlander and RAV4)	

Note: Driving in heavy traffic, on dirt roads or in urban, dusty or desert areas may shorten the life of the cabin air filter. Replacement may be needed if you notice reduced air flow from the air conditioner and heater or if the windows fog easily when you use the "Fresh" mode. Consult your dealer if any of these conditions occur.

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect engine air filter
- Tighten nuts and bolts on chassis

Driving while towing:

- Replace front differential oil (all 4WD except Highlander and RAV4)
- Replace rear differential oil, including limited-slip (all models except 2WD Highlander, 2WD RAV4, Sequoia and non-limited-slip Tundra)
- Replace transfer case oil (4WD Highlander, 4WD RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

⁴ Applies to Land Cruiser, 4WD Sequoia, 4WD Tundra and 4WD 4Runner.

⁵ See page 37 for details.

20,000 Miles or 24 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

25,000 Miles or 30 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Applies to Highlander, Land Cruiser, RAV4, 4WD Sequoia, 4WD Tacoma, 4WD Tundra and 4WD 4Runner.

⁴ Applies to Land Cruiser, 4WD Sequoia, 4WD Tundra and 4WD 4Runner.

⁵ Applies to Land Cruiser, 4WD Tacoma, Tacoma PreRunner and Tundra.

30,000 Miles or 36 Months

- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Applies to Highlander, Land Cruiser, RAV4, 4WD Sequoia, 4WD Tacoma, 4WD Tundra and 4WD 4Runner.

⁴ Applies to Land Cruiser, 4WD Sequoia, 4WD Tundra and 4WD 4Runner.

⁵ Applies to Land Cruiser, 4WD Tacoma, Tacoma PreRunner and Tundra.

⁶ Applies to Tacoma with 1GR-FE, Tundra with 1GR-FE and 4Runner with 1GR-FE. Required under the terms of the Emission Control Warranty.

60,000 Miles or 72 Months

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Tighten nuts and bolts on chassis

Driving while towing:

- Replace automatic transmission fluid
- Replace front differential oil (Highlander, RAV4 and all 4WD models)
- Replace manual transmission oil (RAV4, Tundra)
- Replace rear differential oil, including limited slip (all models except 2WD Highlander and 2WD RAV4)
- Replace transfer case oil (4WD models)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

⁷ Inspect thickness measurement and disc runout.

⁸ Applies to Land Cruiser, Sequoia, Tundra and 4Runner with 2UZ-FE. Required only for vehicles in California, Massachusetts and New York.

⁹ Initial inspection at 60,000 miles/72 months. Inspect every 15,000 miles/18 months thereafter.

¹⁰ See page 37 for details.

65,000 Miles or 78 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

70,000 Miles or 84 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Applies to Highlander, Land Cruiser, RAV4, 4WD Sequoia, 4WD Tacoma, 4WD Tundra and 4WD 4Runner.

75,000 Miles or 90 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Visually inspect brake linings/drums and brake pads/discs
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Radiator core and condenser
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Rear differential oil (all models except 2WD Highlander and 2WD RAV4)
<input type="checkbox"/> Drive belts	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive shaft boots ³	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Engine coolant ⁵	<input type="checkbox"/> Transfer case oil (4WD Highlander, 4WD RAV4)
<input type="checkbox"/> Exhaust pipes and mountings	
<input type="checkbox"/> Front differential oil (all 4WD except Highlander and RAV4)	

Note: Driving in heavy traffic, on dirt roads or in urban, dusty or desert areas may shorten the life of the cabin air filter. Replacement may be needed if you notice reduced air flow from the air conditioner and heater or if the windows fog easily when you use the "Fresh" mode. Consult your dealer if any of these conditions occur.

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect engine air filter
- Tighten nuts and bolts on chassis

Driving while towing:

- Replace front differential oil (all 4WD except Highlander and RAV4)
- Replace rear differential oil, including limited-slip (all models except 2WD Highlander, 2WD RAV4, Sequoia and non-limited-slip Tundra)
- Replace transfer case oil (4WD Highlander, 4WD RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

⁴ Applies to Land Cruiser, 4WD Sequoia, 4WD Tundra and 4WD 4Runner.

⁵ See page 37 for details.

80,000 Miles or 96 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

85,000 Miles or 102 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Applies to Highlander, Land Cruiser, RAV4, 4WD Sequoia, 4WD Tacoma, 4WD Tundra and 4WD 4Runner.

⁴ Applies to Land Cruiser, 4WD Sequoia, 4WD Tundra and 4WD 4Runner.

⁵ Applies to Land Cruiser, 4WD Tacoma, Tacoma PreRunner and Tundra.

90,000 Miles or 108 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Lubricate drive shaft bushing (Land Cruiser)
- Lubricate propeller shaft⁴
- Lubricate wheel bearings (Land Cruiser)
- Replace limited-slip differential oil, if equipped⁵
- Replace spark plugs⁶
- Replace timing belt⁷
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Inspect the following:
 - Automatic transmission fluid
 - Ball joints and dust covers
 - Brake lines and hoses
 - Brake linings/drums and brake pads/discs⁸
 - Drive belts
 - Drive shaft boots³
 - Engine coolant⁹
 - Exhaust pipes and mountings
 - Front differential oil (4WD models, Highlander and RAV4)
 - Fuel lines and connections, fuel tank band and fuel tank vapor vent system hoses
 - Fuel tank cap gasket
 - Manual transmission oil (RAV4, Tundra)
 - Radiator core and condenser
 - Rear differential oil (all models except 2WD Highlander and 2WD RAV4)
 - Steering gear box
 - Steering linkage and boots
 - Transfer case oil (all 4WD models)

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Tighten nuts and bolts on chassis

Driving while towing:

- Replace front differential oil (2WD RAV4 with manual transmission, all 4WD models except RAV4 with automatic transmission and Highlander)
- Replace manual transmission oil (RAV4, Tundra)
- Replace rear differential oil, including limited slip (all models except 2WD Highlander and 2WD RAV4)
- Replace transfer case oil (4WD models)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

⁶ Applies to Tacoma with 1GR-FE, Tundra with 1GR-FE and 4Runner with 1GR-FE. Required under the terms of the Emission Control Warranty.

⁷ Applies to Highlander with 3MZ-FE, Land Cruiser, Sequoia, Tundra with 2UZ-FE and 4Runner with 2UZ-FE.

⁸ Inspect thickness measurement and disc runout.

⁹ See page 37 for details.

95,000 Miles or 114 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

100,000 Miles or 120 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Replace engine coolant⁵
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

¹ Reset the oil replacement reminder ("MAINT REQD") light after replacing engine oil, if vehicle is equipped with this light.

² Perform these service items only if you drive primarily under the conditions indicated.

³ Applies to Highlander, Land Cruiser, RAV4, 4WD Sequoia, 4WD Tacoma, 4WD Tundra and 4WD 4Runner.

⁴ Applies to Land Cruiser, 4WD Sequoia, 4WD Tundra and 4WD 4Runner.

105,000 Miles or 126 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Visually inspect brake linings/drums and brake pads/discs
- Inspect the following:

<input type="checkbox"/> Ball joints and dust covers	<input type="checkbox"/> Radiator core and condenser
<input type="checkbox"/> Brake lines and hoses	<input type="checkbox"/> Rear differential oil (all models except 2WD Highlander and 2WD RAV4)
<input type="checkbox"/> Drive belts	<input type="checkbox"/> Steering gear box
<input type="checkbox"/> Drive shaft boots ³	<input type="checkbox"/> Steering linkage and boots
<input type="checkbox"/> Engine coolant ⁶	<input type="checkbox"/> Transfer case oil (4WD Highlander, 4WD RAV4)
<input type="checkbox"/> Exhaust pipes and mountings	
<input type="checkbox"/> Front differential oil (all 4WD except Highlander and RAV4)	

Note: Driving in heavy traffic, on dirt roads or in urban, dusty or desert areas may shorten the life of the cabin air filter. Replacement may be needed if you notice reduced air flow from the air conditioner and heater or if the windows fog easily when you use the "Fresh" mode. Consult your dealer if any of these conditions occur.

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect engine air filter
- Tighten nuts and bolts on chassis

Driving while towing:

- Replace front differential oil (all 4WD except Highlander and RAV4)
- Replace rear differential oil, including limited-slip (all models except 2WD Highlander, 2WD RAV4, Sequoia and non-limited-slip Tundra)
- Replace transfer case oil (4WD Highlander, 4WD RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

⁵ Initial replacement at 100,000 miles/120 months. Replace every 50,000 miles/60 months thereafter. See page 37 for additional information.

⁶ See page 37 for details.

110,000 Miles or 132 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

115,000 Miles or 138 Months

- Replace engine oil and oil filter¹
- Rotate tires
- Visually inspect brake linings/drums and brake pads/discs

Additional Maintenance Items for Special Operating Conditions²

Driving in desert or on dirt roads:

- Inspect ball joints and dust covers
- Inspect drive shaft boots³
- Inspect engine air filter
- Inspect steering linkage and boots
- Lubricate propeller shaft⁴
- Re-torque drive shaft bolt (4WD RAV4)
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

Driving on salted roads:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)

Driving while towing:

- Lubricate propeller shaft⁴
- Re-torque propeller shaft bolt (all models except Highlander and RAV4)
- Tighten nuts and bolts on chassis

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

DEALER SERVICE VERIFICATION:

DATE:

MILEAGE:

⁶ Required under the terms of the Emission Control Warranty.

⁷ Inspect thickness measurement and disc runout.

⁸ Applies to Land Cruiser, Sequoia, Tundra and 4Runner with 2UZ-FE. Required only for vehicles in California, Massachusetts and New York.

⁹ See page 37 for details.

The following descriptions are provided to give you a better understanding of the maintenance items that should be performed on your vehicle. The scheduled maintenance log indicates at which mileage/time intervals each item should be performed. Please note that many maintenance items should be performed only by a qualified technician.

For further information on maintenance items you can perform yourself, see the "Vehicle Maintenance and Care" and "Do-It-Yourself Maintenance" sections of your *Owner's Manual*.

Automatic Transmission Fluid or Manual Transmission Oil

Inspect or replace at specified intervals. When performing inspections, check each component for signs of leakage. If you discover any leakage, have it repaired by a qualified technician immediately.

Ball Joints and Dust Covers

Check the suspension and steering linkage ball joints for looseness and damage. Check all dust covers for deterioration and damage. Replace any deteriorated or damaged parts. A qualified technician should perform these operations.

Brake Lines and Hoses

Visually inspect for proper installation. Check for chafing, cracks, deterioration and signs of leakage. Replace any deteriorated or damaged parts. A qualified technician should perform these operations.

Brake Linings/Drums and Brake Pads/Disks

Check the brake linings (shoes) and drums for scoring, burning, fluid leakage, broken parts and excessive wear. Check the pads for excessive wear and the discs for runout, excessive wear and fluid leakage. Replace any deteriorated or damaged parts. A qualified technician should perform these operations.

Cabin Air Filter

Replace at specified intervals. Driving in heavy traffic, on dirt roads or in urban, desert or dusty areas may shorten filter's life. More frequent replacement may be necessary.

Charcoal Canister (CA, MA and NY vehicles)

Check for internal damage and clogging. If necessary, clean with compressed air or replace. A qualified technician should perform these operations.

Differential Oil

Replace at specified intervals. When performing inspections, check each component for signs of leakage. If you discover any leakage, have it repaired by a qualified technician immediately.

Drive Belts

Inspect for cracks, excessive wear and oiliness. Check the belt tension and adjust if necessary. Replace the belts if they are damaged.

Drive Shaft Boots

Check the drive shaft boots and clamps for cracks, deterioration and damage. Replace any deteriorated or damaged parts and, if necessary, repack the grease. Selected models also require periodic inspection of the drive shaft bolt for proper torque. A qualified technician should perform these operations.

Engine Air Filter

Replace at specified intervals. When performing inspections, check for damage, excessive wear and oiliness, and replace if necessary.

Engine Coolant

Drain and flush the cooling system and refill with an ethylene-glycol type coolant. Inspect the radiator, condenser and/or intercooler for leaves, dirt and insects and clean if necessary. Inspect hoses and connections for corrosion and leaks. Tighten connections and replace parts as necessary. A qualified technician should perform these operations. (For further details, refer to "Radiator, Condenser and Hoses" in the "Vehicle Maintenance and Care" section of the *Owner's Manual*.)

Note: Your Toyota is equipped with Genuine Toyota Super Long-Life Coolant. The replacement intervals for engine coolant recommended in this booklet are based on replacement with Genuine Toyota Super Long-Life Coolant or similar high-quality non-silicate, non-amine, non-borate ethylene-glycol coolant with long-life hybrid organic acid technology (i.e., a combination of low phosphates and organic acids). If another type of ethylene-glycol coolant is used, replacement intervals may be different.

Engine Oil and Oil Filter

Replace the oil filter and drain and refill the engine oil at specified intervals. For recommended oil grade and viscosity, refer to the *Owner's Manual*.

Engine Valve Clearance

Inspect for excessive lifter noise and engine vibration and adjust if necessary. A qualified technician should perform this operation.

Exhaust Pipes and Mountings

Visually inspect the exhaust pipes, muffler and hangers for cracks, deterioration and damage. Start the engine and listen carefully for any exhaust gas leakage. Tighten connections or replace parts as necessary.

Fuel Lines and Connections, Fuel Tank Band and Fuel Tank Vapor Vent System Hoses

Visually inspect for corrosion, damage, cracks and loose or leaking connections. Tighten connections or replace parts as necessary.

Fuel Tank Cap Gasket

Visually inspect for cracks, deterioration and damage and replace if necessary.

Nuts and Bolts on Chassis and Body

Re-tighten the seat-mounting bolts and front/rear suspension member retaining bolts to specified torque.

Propeller Shaft

Lubricate the propeller shaft spiders and slide yokes with lithium-base chassis grease and the double cardan joint with molybdenum-disulfide lithium-base chassis grease, and re-torque the bolt. Only a qualified technician should re-torque the bolt.

Radiator Core and Condenser

Inspect for debris and signs of damage. Have any problem repaired immediately by a qualified technician.

Spark Plugs

Replace at specified intervals. Install new plugs of the same type as originally equipped. A qualified technician should perform this operation.

Steering Gear Box

Inspect for signs of leakage. If you discover any leakage, have it repaired immediately by a qualified technician.

Steering Linkage and Boots

With the vehicle stopped, check for excessive freeplay in the steering wheel. Inspect the linkage for bending and damage and the dust boots for deterioration, cracks and damage. Replace any damaged parts. A qualified technician should perform these operations.

Timing Belt

Replace every 90,000 miles. A qualified technician should perform this operation.

Tire Rotation

Tires should be rotated at specified intervals according to the instructions in the *Owner's Manual*. When rotating tires, check for damage and uneven wear. Replace if necessary.

Transfer Case Oil

Inspect or replace at specified intervals. When performing inspections, check for signs of leakage. If you discover any leakage, have it repaired by a qualified technician immediately.

Wheel Bearing and Drive Shaft Bushing Grease

Repack the wheel bearings with wheel bearing grease and the drive shaft bushing with molybdenum-disulfide lithium-base chassis grease. A qualified technician should perform these operations.
