HOW TO USE THIS MANUAL

INOKN-01

GENERAL INFORMATION

1. INDEX

An INDEX is provided on the first page of each section to guide you to the item to be repaired. To assist you in finding your way through the manual, the section title and major heading are given at the top of every page.

2. PRECAUTION

At the beginning of each section, a PRECAUTION that pertains to all repair operations contained in that section is given.

Read these precautions before starting any repair task.

3. TROUBLESHOOTING

TROUBLESHOOTING tables are included for each system to help you diagnose the problem and find the cause. The fundamentals of how to proceed with troubleshooting are described on page IN-19.

Be sure to read this before performing troubleshooting.

4. PREPARATION

Preparation lists the SST (Special Service Tools), recommended tools, equipment, lubricant and SSM (Special Service Materials) which should be prepared before beginning the operation and explains the purpose of each one.

5. REPAIR PROCEDURES

Most repair operations begin with an overview illustration. It identifies the components and shows how the parts fit together.

Example:

The procedures are presented in a step-by-step format:

- The illustration shows what to do and where to do.
- The task heading tells what to do.
- The detailed text tells how to perform the task and gives other information such as specifications and warnings.

Example:

*Illustration:
what to do and where to do*

Task heading : what to do

21. CHECK PISTON STROKE OF OVERDRIVE BRAKE

(a) Place SST and a dial indicator onto the overdrive brake piston as shown in the illustration.

SST 09350-30020 (09350-06120)

Set part No. *Component part No.*

Detailed text : how to do task

(b) Measure the stroke applying and releasing the compressed air (392 — 785 kPa, 4 — 8 kgf/cm² or 57 — 114 psi) as shown in the illustration.

Piston stroke: 1.40 — 1.70 mm (0.0551 — 0.0669 in.)

Specification

This format provides the experienced technician with a FAST TRACK to the information needed. The upper case task heading can be read at a glance when necessary, and the text below it provides detailed information. Important specifications and warnings always stand out in bold type.

6. REFERENCES

References have been kept to a minimum. However, when they are required, you are given the page to refer to.

7. SPECIFICATIONS

Specifications are presented in bold type throughout the text where needed. You never have to leave the procedure to look up your specifications. They are also found in Service Specifications section for quick reference.

8. CAUTIONS, NOTICES, HINTS:

- CAUTIONS are presented in bold type, and indicate there is a possibility of injury to you or other people.
- NOTICES are also presented in bold type, and indicate the possibility of damage to the components being repaired.
- HINTS are separated from the text but do not appear in bold. They provide additional information to help you perform the repair efficiently.

9. SI UNIT

The UNITS given in this manual are primarily expressed according to the SI UNIT (International System of Unit), and alternately expressed in the metric system and in the English System.

Example:

Torque: 30 N·m (310 kgf·cm, 22 ft·lbf)

IDENTIFICATION INFORMATION

VEHICLE IDENTIFICATION AND ENGINE SERIAL NUMBER

IN01P-08

1. VEHICLE IDENTIFICATION NUMBER

The vehicle identification number is stamped on the vehicle identification number plate and certification label.

A: Vehicle Identification Number Plate

B: Certification Label

2. ENGINE SERIAL NUMBER

The engine serial number is stamped on the engine block, as shown in the illustration.

A: Engine Serial Number

REPAIR INSTRUCTIONS

GENERAL INFORMATION

INOCO-32

BASIC REPAIR HINT

- (a) Prevent damage and maintain vehicle cleanliness by protective covering on the fender, seat and floor.
- (b) During disassembly, line up parts in the order they were removed to facilitate reassembly.

- (c) Installation and removal of battery terminal:

NOTICE:

When connecting the negative (-) terminal make sure that the steering wheel is centered.

- (1) Before performing electrical work, disconnect the negative (-) terminal cable from the battery.
 - (2) If it is necessary to disconnect the battery for inspection or repair, first disconnect the negative (-) terminal cable.
 - (3) To prevent damage to the battery terminal when disconnecting the terminal cable, loosen the cable nut and raise the cable straight up. Do not twist or pry the cable off.
 - (4) Clean the battery terminals and cable ends with a clean shop rag. Do not scrape them with a file or other abrasive objects.
 - (5) Install the cable ends to the battery terminals after loosening the nut, and tighten the nut after installation. Do not use a hammer to tap the cable ends onto the terminals.
 - (6) Be sure the cover for the positive (+) terminal is properly in place.
- (d) Check hose and wiring connectors to make sure that they are connected securely and correctly.
 - (e) Non-reusable parts:
 - (1) Always replace cotter pins, gaskets, O-rings, oil seals, etc. with new ones.
 - (2) Non-reusable parts are indicated in component illustrations by the "◆" symbols.

- (f) Precoated parts
Precoated parts are bolts, nuts, etc. that are coated with a seal lock adhesive at the factory.
 - (1) If a precoated part is retightened, loosened or caused to move in any way, it must be recoated with the specified adhesive.
 - (2) When reusing precoated parts, clean off the old adhesive and dry with compressed air. Then apply new seal lock adhesive to the bolt, nut or threads.

- (3) Precoated parts are indicated in component illustrations by the "★" symbols.
- (g) When necessary, use a sealer on gaskets to prevent leaks.
- (h) Carefully observe all specifications for bolt tightening torques. Always use a torque wrench.
- (i) Use of special service tools (SST) and special service materials (SSM) may be required, depending on the nature of the repair. Be sure to use SST and SSM where specified and follow the proper work procedure. A list of SST and SSM can be found in the Preparation section in this manual.

- (j) When replacing fuses, be sure the new fuse has the correct amperage rating. DO NOT exceed the rating or use one with a lower rating.

Illustration	Symbol	Part Name	Abbreviation
<p>BE5594</p>	<p>IN0365</p>	FUSE	FUSE
<p>BE5595</p>	<p>IN0366</p>	MEDIUM CURRENT FUSE	M-FUSE
<p>BE5596</p>	<p>IN0367</p>	HIGH CURRENT FUSE	H-FUSE
<p>BE5597</p>	<p>IN0367</p>	FUSIBLE LINK	FL
<p>BE5598</p>	<p>IN0368</p>	CIRCUIT BREAKER	CB

- (k) Care must be taken when jacking up and supporting the vehicle. Be sure to lift and support the vehicle at the proper locations (see page [IN-8](#)).
- Release the parking brake on a level surface and shift to the N position.
 - When jacking up the front wheels of the vehicle, first place chocks behind the rear wheels.
 - When jacking up the rear wheels of the vehicle, place chocks in front of the front wheels.
 - When jacking up only the front or rear wheels, set rigid racks and place chocks on front and behind the wheels in contact with the ground.
 - After the vehicle is jacked up, be sure to support it on rigid racks. It is extremely dangerous to do any work on a vehicle raised on a jack alone, even for a job that can be finished quickly.
- (l) Observe the following precautions to avoid damage to the following parts:
- (1) Do not open the cover or case of the ECU unless absolutely necessary. (Static electricity transmitted through human touch may destroy the IC.)

- (2) To disconnect vacuum hoses, pull off the end of the hose, not the middle.
- (3) To pull apart electrical connectors, pull on the connector itself, not the wires.
- (4) Be careful not to drop electrical components, such as sensors or relays. If they are dropped on a hard floor, they should be replaced and not reused.
- (5) When steam cleaning an engine, protect the electronic components, air filter and emission-related components from water.
- (6) Never use an impact wrench to remove or install temperature switches or temperature sensors.
- (7) When checking continuity at the wire connector, insert the tester probe carefully to prevent terminals from bending.
- (8) When using a vacuum gauge, never force the hose onto a connector that is too large. Use a step-down adapter for adjustment. Once the hose has been stretched, it may leak air.

- (m) Installation and removal of vacuum hose:
- (1) When disconnecting vacuum hoses, use tags to identify where they should be reconnected to.
 - (2) After completing a job, double check that the vacuum hoses are properly connected. A label under the hood shows the proper layout.
- (n) Unless otherwise stated, all resistance should be measured at an ambient temperature of 20°C (68°F). Measurement should be made after the engine has cooled down. If measured at high temperatures immediately after the vehicle has been running, resistance may be outside specifications.

FOR ALL OF VEHICLES PRECAUTION

INOKM-01

1. FOR VEHICLES EQUIPPED WITH SRS AIRBAG AND SEAT BELT PRETENSIONER

- (a) The TOYOTA TUNDRA is equipped with an SRS (Supplemental Restraint System), such as the driver airbag, front passenger airbag assembly and seat belt pretensioner.

Failure to carry out service operations in the correct sequence could cause the supplemental restraint system to unexpectedly deploy during servicing, possibly leading to a serious accident.

Further, if a mistake is made in servicing the supplemental restraint system, it is possible the SRS may fail to operate when required. Before servicing (including removal or installation of parts, inspection or replacement), be sure to read the following items carefully, then follow the correct procedure described in this manual.

(b) GENERAL NOTICE

- (1) Malfunction symptoms of the supplemental restraint system are difficult to confirm, so the diagnostic trouble codes become the most important source of information when troubleshooting. When troubleshooting the SRS, always check the diagnostic trouble codes before disconnecting the battery (see page [DI-1810](#)).

- (2) Work must be started after 90 seconds from the time the ignition switch is turned to the LOCK position and the negative (-) terminal cable is disconnected from the battery.

(The supplemental restraint system is equipped with a back-up power source because if work is started within 90 seconds of disconnecting the negative (-) terminal cable from the battery, the SRS may deploy.)

When the negative (-) terminal cable is disconnected from the battery, memory of the clock and audio systems will be cancelled. So before starting work, make a record of the contents memorized in each memory system. When work is finished, reset the clock and audio systems as before.

To avoid erasing the memory of each memory system, never use a back-up power supply from another battery.

- (3) Even in case of a minor collision where the SRS does not deploy, the steering wheel pad (see page [RS-24](#)), front passenger airbag assembly (see page [RS-38](#)), side airbag assembly (see page [RS-77](#), [RS-52](#) or [RS-67](#)) curtain shield airbag assembly (see page [RS-85](#)) and seat belt pretensioner (see page [BO-241](#)) should be inspected.
- (4) Never use SRS parts from another vehicle. When replacing parts, replace them with new ones.
- (5) Before repairs, remove the airbag sensor if shocks are likely to be applied to the sensor during repairs.
- (6) Never disassemble or repair the airbag sensor assembly, steering wheel pad, front passenger airbag assembly or seat belt pretensioner.
- (7) If the airbag sensor assembly, steering wheel pad, front passenger airbag assembly or seat belt pretensioner has been dropped, or if there are cracks, dents or other defects in the case, bracket or connector, replace them with new ones.
- (8) Do not directly expose the airbag sensor assembly, steering wheel pad, front passenger airbag assembly or seat belt pretensioner to hot air or flames.
- (9) Use a voltmeter/ohmmeter with high impedance (10 k Ω /V minimum) for troubleshooting of the electrical circuit.
- (10) Information labels are attached to the periphery of the SRS components. Follow the instructions on the labels.
- (11) After work on the supplemental restraint system is completed, check the SRS warning light (see page [DI-1855](#)).

(c) SPIRAL CABLE (in Combination Switch)

The steering wheel must be fitted correctly to the steering column with the spiral cable at the neutral position, otherwise cable disconnection and other troubles may result. Refer to [SR-28](#) or [SR-42](#) concerning correct steering wheel installation.

- (d) STEERING WHEEL PAD (with Airbag)
 - (1) When removing the steering wheel pad or handling a new steering wheel pad, it should be placed with the pad top surface facing up.
Storing the pad with its metallic surface upward may lead to a serious accident if the airbag inflates for some reason. In addition, do not store a steering wheel pad on top of another one.
 - (2) Never measure the resistance of the airbag squib. This may cause the airbag to deploy, which could cause serious injury.
 - (3) Grease or detergents of any kind should not be applied to the steering wheel pad.
 - (4) Store the steering wheel pad where the ambient temperature remains below 93°C (200°F), with low humidity and away from electrical noise.
 - (5) Before using an electric welder, first disconnect the airbag connector (the connector is yellow and has 4 pins) under the steering column near the combination switch connector.
 - (6) As a safety measure, always deploy airbags using an SST before disposal (see page RS-25).
Deploy airbags in a safe place away from electrical noise.

(e) FRONT PASSENGER AIRBAG ASSEMBLY

- (1) Always store a removed or new front passenger airbag assembly with the airbag deployment side facing up.

Storing the airbag assembly with the airbag deployment side facing down could cause a serious accident if the airbag inflates.

- (2) Never measure the resistance of the airbag squib. This may cause the airbag to deploy, which could cause serious injury.
- (3) Grease or detergents of any kind should not be applied to the steering wheel pad.
- (4) Store the steering wheel pad where the ambient temperature remains below 93°C (200°F), with low humidity and away from electrical noise.
- (5) Before using an electric welder, first disconnect the airbag connector (the connector is yellow and has 4 pins) under the steering column near the combination switch connector.
- (6) As a safety measure, always deploy airbags using an SST before disposal (see page RS-39). Deploy airbags in a safe place away from electrical noise.

(f) SEAT BELT PRETENSIONER

- (1) Never measure the resistance of the seat belt pretensioner. This may cause the seat belt pretensioner to activate, which could cause serious injury.
- (2) Never disassemble the seat belt pretensioner.
- (3) Never install the seat belt pretensioner in another vehicle.
- (4) Store the seat belt pretensioner where the ambient temperature remains below 80°C (176°F), with low humidity and away from electrical noise.
- (5) Before using an electric welder, first disconnect the connector (the connector is yellow and has 2 pins).
- (6) As a safety measure, always activate the seat belt pretensioner before disposal (see page [BO-245](#)). Activate the pretensioner in a safe place away from electrical noise.
- (7) The seat belt pretensioner becomes hot after activation. Allow it to cool before disposing. Never use water to cool the seat belt pretensioner.

Example:

B02121

(g) SIDE AIRBAG ASSEMBLY

- (1) Always store a removed or new side airbag assembly with the airbag deployment side facing up. Storing the airbag assembly with the airbag deployment side facing down could cause a serious accident if the airbag inflates.
- (2) Never measure the resistance of the airbag squib (This may cause the airbag to deploy, which is very dangerous.).
- (3) Grease should not be attached to the side airbag assembly and the surface should not be cleaned with any kind of detergents.
- (4) Store the airbag assembly where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.
- (5) When using electric welding, first disconnect the airbag connector (yellow color and 2 pins) under the seat before starting work.
- (6) When disposing of a vehicle or the side airbag assembly alone, the airbag should be deployed using an SST before disposal (See page [RS-78](#), [RS-53](#) or [RS-68](#)).

Perform the operation in a safe place away from electrical noise.

(h) CURTAIN SHIELD AIRBAG ASSEMBLY

- (1) Always store a removed or new curtain shield airbag assembly in a clear plastic bag, and keep it in a safe place.

NOTICE:

Protection bag is not reused.

CAUTION:

Never disassemble the curtain shield airbag assembly

- (2) Never measure the resistance of the airbag squib (This may cause the airbag to deploy, which is very dangerous.).
- (3) Grease should not be attached to the curtain shield airbag assembly and the surface should not be cleaned with any kind of detergents.
- (4) Store the airbag assembly where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.
- (5) When using electric welding, first disconnect the airbag connector (yellow color and 2 pins) into the instrument panel before starting work.
- (6) When disposing of a vehicle or the curtain shield airbag assembly alone, the airbag should be deployed using an SST before disposal (See page RS-86). Perform the operation in a safe place away from electrical noise.

(i) AIRBAG SENSOR ASSEMBLY

- (1) If an airbag sensor assembly has been involved in a collision where its SRS has deployed, do not re-use it.
- (2) The connectors to the airbag sensor assembly should be connected or disconnected with the sensor mounted on the floor. Failure to do so could cause undesired deployment of the SRS.
- (3) To avoid serious injury, servicing the SRS must be started 90 seconds after:
 - The ignition switch is turned to the LOCK position.
 - The negative (-) terminal cable is disconnected from the battery.

Even if only loosening the set bolts of the airbag sensor assembly, you must follow the above guidelines.

(j) WIRE HARNESS AND CONNECTOR

The SRS wire harness is integrated with the instrument panel wire harness assembly. All the connectors in the system are a standard yellow color. If the SRS wire harness becomes disconnected or the connector becomes broken, etc., repair or replace it as shown on page [RS-139](#).

2. FOR VEHICLES EQUIPPED WITH A CATALYTIC CONVERTER

CAUTION:

If large amounts of unburned gasoline flow into the converter, it may overheat and create a fire hazard. To prevent this, observe the following precautions and explain them to your customer.

- (a) Use only unleaded gasoline.
- (b) Avoid prolonged idling.
Avoid idling the engine for more than 20 minutes.
- (c) Avoid spark jump test.
 - (1) Perform spark jump tests only when absolutely necessary. Perform this test as rapidly as possible.
 - (2) While testing, never race the engine.
- (d) Avoid prolonged engine compression measurement.
Engine compression tests must be done as rapidly as possible.
- (e) Do not run engine when the fuel tank is nearly empty.
This may cause the engine to misfire and create an extra load on the converter.
- (f) Avoid coasting with ignition turned off.
- (g) Do not dispose of used catalyst with gasoline or oil contaminated parts.

3. IF VEHICLE IS EQUIPPED WITH MOBILE COMMUNICATION SYSTEM

For vehicles with mobile communication systems such as two-way radios and cellular telephones, observe the following precautions.

- (1) Install the antenna as far away as possible from the ECU and sensors of the vehicle's electronic system.
- (2) Install the antenna feeder at least 20 cm (7.87 in.) away from the ECU and sensors of the vehicle's electronic systems. For details about ECU and sensor locations, refer to the applicable component's section.
- (3) Avoid winding the antenna feeder together with other wiring as much as possible, and also avoid running the antenna feeder parallel with other wire harnesses.
- (4) Check that the antenna and feeder are correctly adjusted.
- (5) Do not install powerful mobile communications system.

4. FOR USING OBD II SCAN TOOL OR HAND-HELD TESTER

CAUTION:

Observe the following items for safety reasons:

- Before using the hand-held tester or OBD II scan tool, the hand-held tester's operator manual or OBD II scan tool's instruction book should be read thoroughly.
- Be sure to route all cables securely when driving with the hand-held tester or OBD II scan tool connected to the vehicle. (I.e. keep cables away from feet, pedals, steering wheel and shift lever.)
- Two persons are required when test-driving with the hand-held tester or OBD II scan tool: one person to drive the vehicle and another to operate the hand-held tester or OBD II scan tool.

HOW TO TROUBLESHOOT ECU CONTROLLED SYSTEMS

GENERAL INFORMATION

IN01T-19

A large number of ECU controlled systems are used in the TOYOTA TUNDRA. In general, ECU controlled systems are considered to be a very intricate, requiring a high level of technical knowledge to troubleshoot. However, following the problem checking procedures of the ECU controlled system's circuits carefully is not complex. If you have an adequate understanding of the system and a basic knowledge of electricity, accurate diagnosis and necessary repair can be performed.

This manual emphasizes the above standpoint to help service technicians perform accurate and effective troubleshooting. Detailed information on major ECU controlled systems in this vehicle are outlined below:

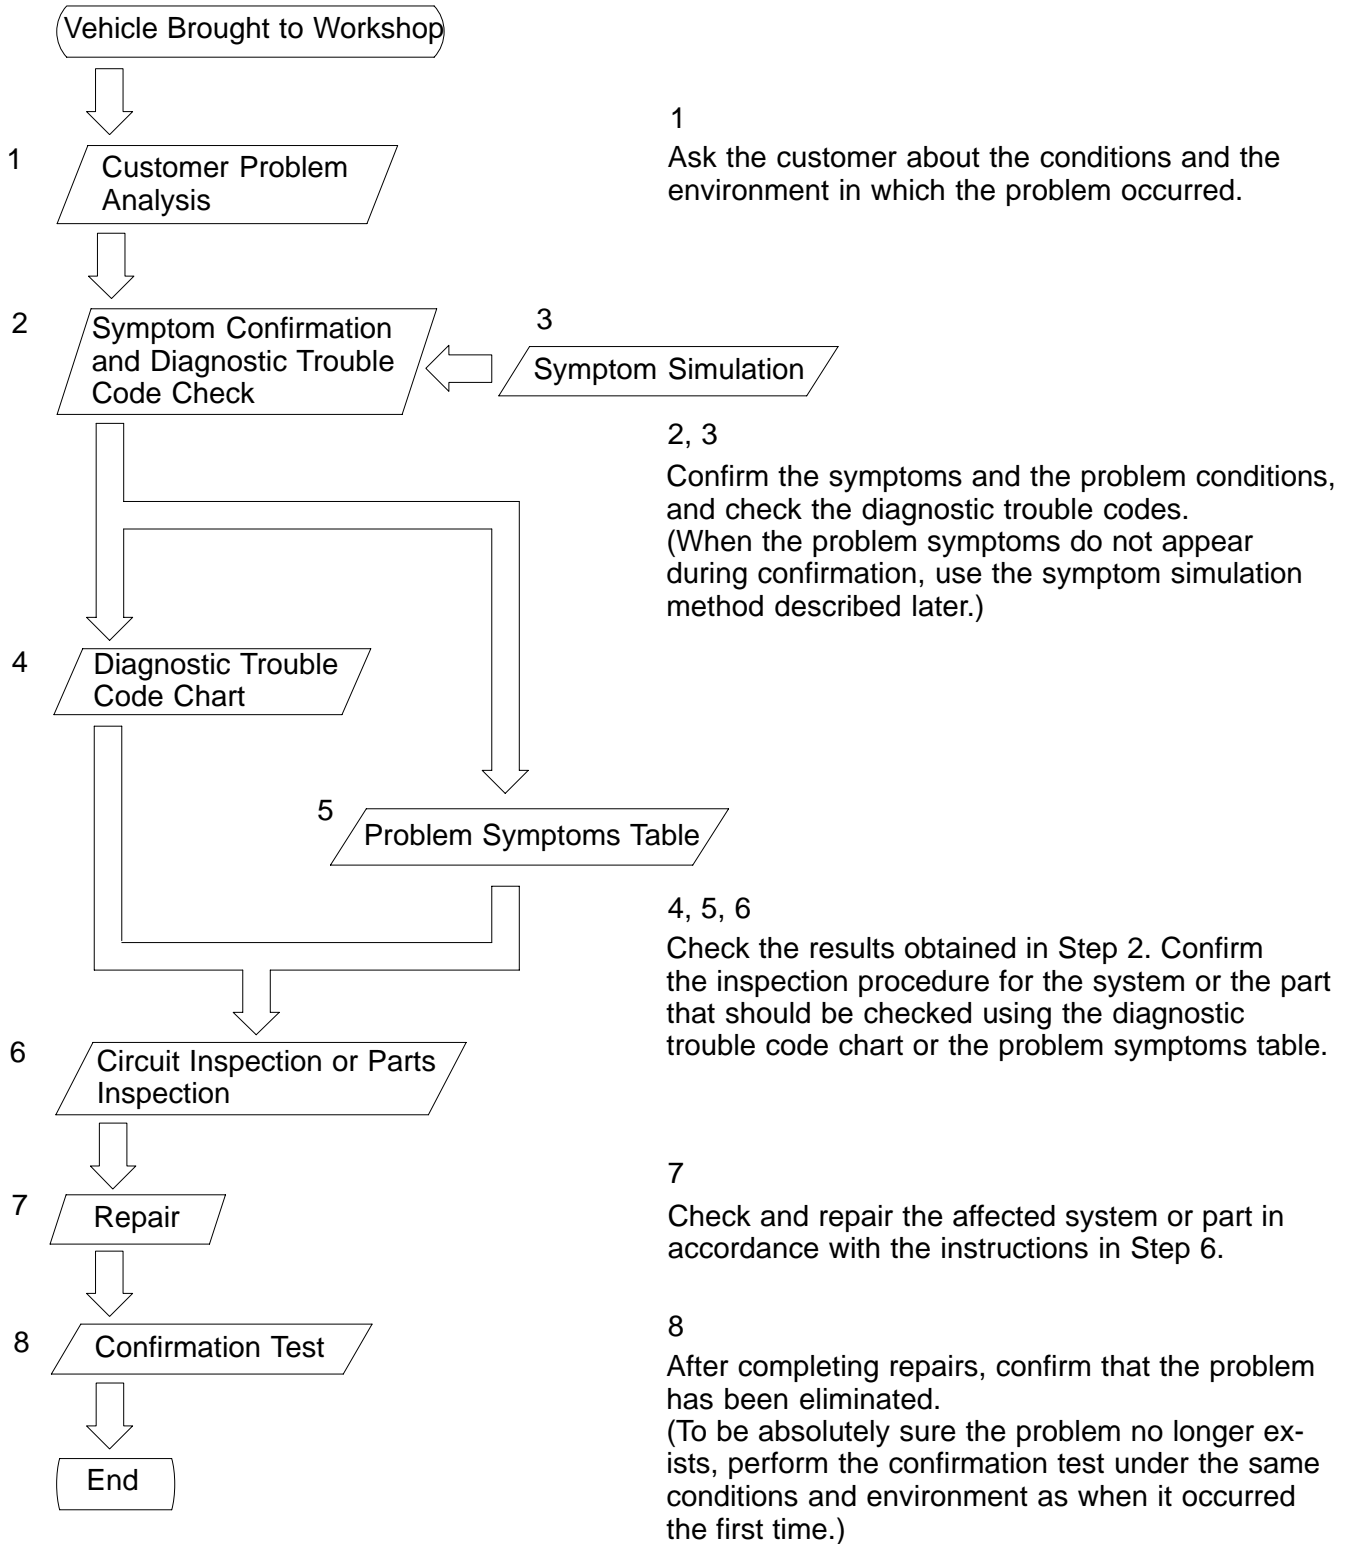

System	Page
1. Engine 1GR-FE	DI-1
2. Engine 2UZ-FE	DI-420
3. Automatic Transmission A750E for 1GR-FE	DI-943
4. Automatic Transmission A750E/A750F for 2UZ-FE	DI-1108
5. Tire Pressure Warning System	DI-1280
6. Anti-Lock Brake System	DI-1383
7. ABS with EBD & BA & TRAC & VSC System	DI-1456
8. Can Communication System	DI-1693
9. Supplemental Restraint System	DI-1810
10. TOYOTA Vehicle Intrusion Protection System	DI-2297
11. Cruise Control System	DI-2341
12. Sliding Roof System	DI-2376
13. Body Control System	DI-2391
14. Driver Door Control System	DI-2453
15. Passenger Door Control System	DI-2475
16. Multiplex Communication System	DI-2495
17. Audio System	DI-2519
18. Rear Seat Audio System	DI-2633
19. Rear Seat Entertainment System	DI-2669
20. Navigation System	DI-2753

FOR USING OBD II SCAN TOOL OR HAND-HELD TESTER

- Before using the tester, read its user manual thoroughly.
- Connect the cable of the tester to DLC3, turn the ignition switch ON and operate the tester. If the tester cannot communicate with the ECU controlled system, there is a problem on the vehicle side or tester side.
 - (1) If communication is normal when the tester is connected to another vehicle, inspect the diagnosis data link line (Bus \oplus line) or ECU power circuit of the vehicle.
 - (2) If communication is still not possible when the tester is connected to another vehicle, the problem lies in the tester. Perform the Self Test procedures outlined in the Tester Operator's Manual.

HOW TO PROCEED WITH TROUBLESHOOTING

Carry out troubleshooting in accordance with the procedure below. Only a basic procedure is shown. Details in the Diagnostics section show the most effective methods for each circuit. Confirm troubleshooting procedures first for the relevant circuit before beginning troubleshooting of that circuit.

2. SYMPTOM CONFIRMATION AND DIAGNOSTIC TROUBLE CODE CHECK

The diagnostic system in the TOYOTA TUNDRA fulfills various functions.

- The first function is the Diagnostic Trouble Code (DTC) Check. In a DTC Check, a previous malfunction's DTC can be checked by a technician during troubleshooting. (A DTC is a code stored in the ECU memory whenever a malfunction in the signal circuits to the ECU occurs.)
- Another function is the Input Signal Check, which checks if the signals from various switches are sent to the ECU correctly. By using these check functions, the problem areas can be narrowed down and troubleshooting is more effective. Diagnostic functions are incorporated in the following systems in the TOYOTA TUNDRA.

System	Diagnostic Trouble Code Check	Input Signal Check (Sensor Check)	Diagnostic Test Mode (Active Test)
1. Engine 1GR-FE	<input type="radio"/> (with Check Mode)	<input type="radio"/>	<input type="radio"/>
2. Engine 2UZ-FE	<input type="radio"/> (with Check Mode)	<input type="radio"/>	<input type="radio"/>
3. Automatic Transmission A750E for 1GR-FE	<input type="radio"/> (with Check Mode)	<input type="radio"/>	<input type="radio"/>
4. Automatic Transmission A750E/A750F for 2UZ-FE	<input type="radio"/> (with Check Mode)	<input type="radio"/>	<input type="radio"/>
5. Tire Pressure Warning System	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
6. Anti-Lock Brake System	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
7. ABS with EBD & BA & TRAC & VSC System	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
8. Can Communication System	<input type="radio"/>		
9. Supplemental Restraint System	<input type="radio"/> (with Check Mode)	<input type="radio"/>	
10. Cruise Control System	<input type="radio"/>	<input type="radio"/>	
11. Sliding Roof System		<input type="radio"/>	<input type="radio"/>
12. Body Control System		<input type="radio"/>	<input type="radio"/>
13. Driver Door Control System		<input type="radio"/>	<input type="radio"/>
14. Passenger Door Control System		<input type="radio"/>	<input type="radio"/>
15. Multiplex Communication System	<input type="radio"/>		

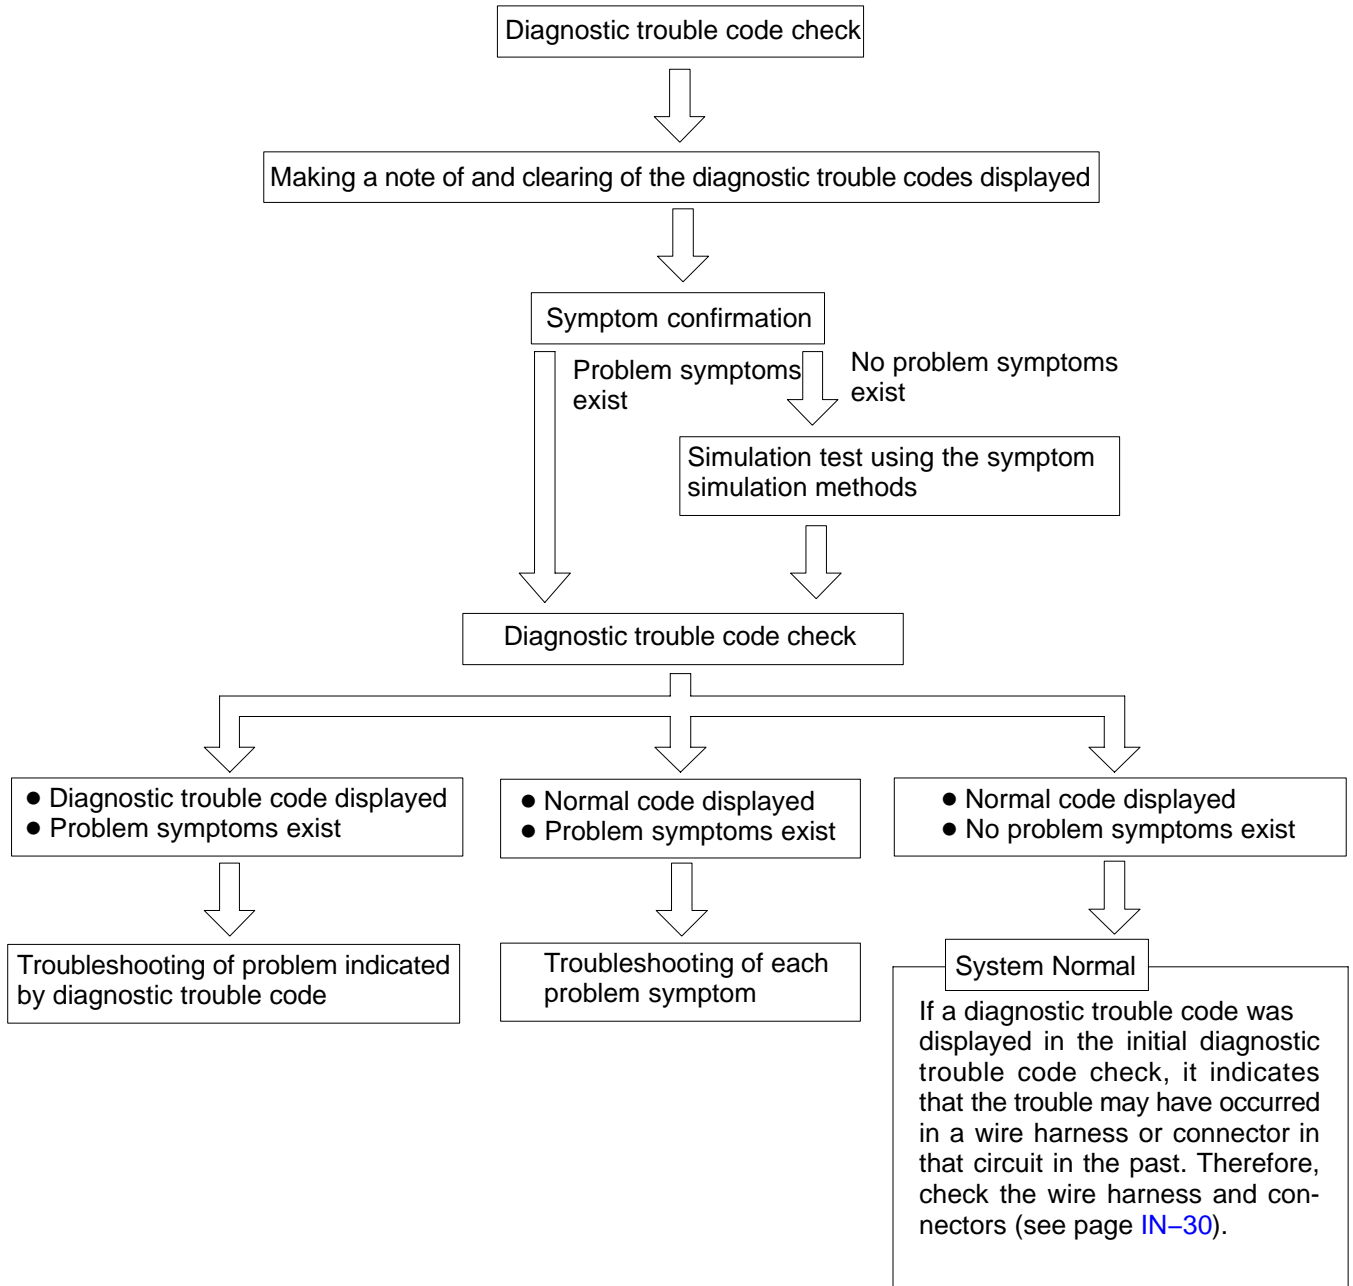

In the DTC Check, it is very important to determine whether the problem indicated by the DTC is: 1) still occurring, or 2) occurred in the past but has since returned to normal. In addition, the DTC should be compared to the problem symptom to see if they are related. For this reason, DTCs should be checked before and after confirmation of symptoms (i.e., whether or not problem symptoms exist) to determine current conditions, as shown in the table below.

Never skip the DTC Check. Failure to check DTCs may, depending on the case, result in unnecessary troubleshooting for systems operating normally or lead to repairs not pertinent to the problem. Follow the procedures listed above in the correct order.

DIAGNOSTIC TROUBLE CODE CHECK PROCEDURE

Diagnostic Trouble Code Check (Make a note of and then clear)	Confirmation of Symptoms	Diagnostic Trouble Code Check	Problem Condition
Diagnostic Trouble Code Display	Problem symptoms exist	Same diagnostic trouble code is displayed	Problem is still occurring in the diagnostic circuit
	 No problem symptoms exist	Normal code is displayed	The problem is still occurring in a place other than in the diagnostic circuit (The diagnostic trouble code displayed first is either for a past problem or it is a secondary problem)
	Normal Code Display  Problem symptoms exist  No problem symptoms exist		The problem occurred in the diagnostic circuit in the past
Normal Code Display		 Problem symptoms exist	Normal code is displayed
	 No problem symptoms exist	Normal code is displayed	The problem occurred in a place other than the diagnostic circuit in the past

Taking into account the points on the previous page, a flow chart showing how to proceed with troubleshooting using the diagnostic trouble code check is shown below. Directions from the flow chart will indicate how to proceed to DTC troubleshooting or to the troubleshooting of problem symptoms table.

3. SYMPTOM SIMULATION

The most difficult case in troubleshooting is when no problem symptoms occurring. In such cases, a thorough customer problem analysis must be carried out. Then simulate a simulation of the same or similar conditions and environment in which the problem occurred in the customer’s vehicle should be carried out. No matter how much skill or experience a technician has, troubleshooting without confirming the problem symptoms will lead to something important in the repair operation being overlooked and lead to mistakes or delays in repairs.

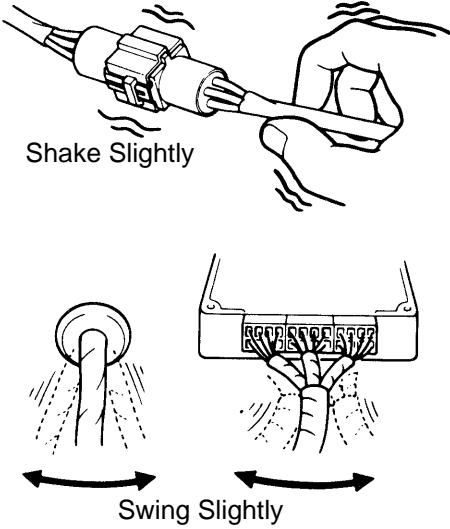

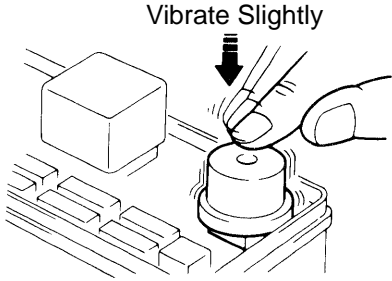

For example:

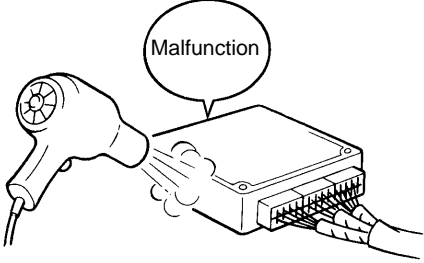

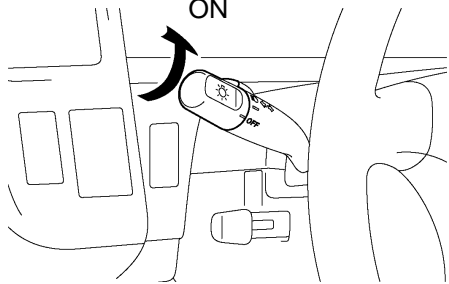

With a problem that only occurs when the engine is cold, or occurs as a result of vibration caused by road during driving, the problem can never be determined as long as the symptoms are being checked on stationary vehicle or a vehicle with a warmed-up engine.

Vibration, heat or water penetration (moisture) is difficult to reproduce. The symptom simulation tests below are effected substitutes for the conditions and can be applied on a stationary vehicle.

Important Points in the Symptom Simulation Test:

In the symptom simulation test, the problem symptoms as well as problem area or parts must be confirmed. First, narrow down the possible problem circuits according to the symptoms. Then, connect the tester and carry out the symptom simulation test, judging whether the circuit being tested is defective or normal, and also confirming the problem symptoms at the same time. Refer to the problem symptoms table for each system to narrow down the possible causes of the symptom.

<p>1</p>	<p>VIBRATION METHOD: When vibration seems to be the major cause.</p>	
<p>CONNECTORS Slightly shake the connector vertically and horizontally.</p> <p>WIRE HARNESS Slightly shake the wire harness vertically and horizontally. The connector joint, fulcrum of the vibration, and body through portion are the major areas that should be checked thoroughly.</p>	 <p>The diagrams illustrate two vibration methods. The top diagram shows a hand holding a connector with the text 'Shake Slightly' and wavy lines indicating movement. The bottom diagram shows a hand holding a wire harness with the text 'Swing Slightly' and arrows indicating a swinging motion.</p> <p>F12331 F12332</p>	
<p>PARTS AND SENSOR Apply slight vibration with a finger to the part of the sensor considered to be the cause of the problem and check whether or not the malfunction occurs.</p> <p>HINT: Applying strong vibration to relays may result in open relays.</p>	 <p>The diagram shows a hand applying vibration to a sensor component on a circuit board. The text 'Vibrate Slightly' is above the hand, and a downward arrow indicates the direction of vibration.</p> <p>F12330</p>	

<p>2</p>	<p>HEAT METHOD: When the problem seems to occur when the suspect area is heated.</p>
<p>Heat the component that is the likely cause of the malfunction with a hair dryer or similar device. Check whether or not if the malfunction occurs.</p> <p>NOTICE:</p> <p>(1) Do not heat to more than 60°C (140°F). (Exceeding this temperature may damage components.)</p> <p>(2) Do not apply heat directly to parts in the ECU.</p>	 <p>F12334</p>
<p>3</p>	<p>WATER SPRINKLING METHOD: When the malfunction seems to occur on a rainy day or in a high-humidity condition.</p>
<p>Sprinkle water onto the vehicle and check whether or not if the malfunction occurs.</p> <p>NOTICE:</p> <p>(1) Never sprinkle water directly into the engine compartment. Indirectly change the temperature and humidity by applying water spray onto the front of the radiator.</p> <p>(2) Never apply water directly onto electronic components.</p> <p>HINT:</p> <p>If a vehicle is subject to water leakage, the leaked water may damage the ECU. When testing a vehicle with a water leakage problem, special caution must be taken.</p>	 <p>F16649</p>
<p>4</p>	<p>OTHER: When a malfunction seems to occur when electrical load is excessive.</p>
<p>Turn on all electrical loads including the heater blower, head lights, rear window defogger, etc. and check to see if the malfunction occurs.</p>	 <p>B02389</p>

4. DIAGNOSTIC TROUBLE CODE CHART

Use Diagnostic Trouble Codes (DTCs) (from the DTC checks) in the table below to determine the trouble area and proper inspection procedure. Engine diagnostic trouble code chart is shown below as an example.

● DTC No.
Indicates the diagnostic trouble code.

● Page or Instructions
Indicates the page where the inspection procedure for each circuit is to be found, or gives instructions for checking and repairs.

● Trouble Area
Indicates the suspect area of the problem.

● Detection Item
Indicates the system of the problem or contents of the problem.

DTC CHART (SAE Controlled)

HINT:
Parameters listed in the chart may not be exactly the same as your reading due to the type of instrument or other factors.

If a malfunction code is displayed during the DTC check mode, check the circuit for that code listed in the table below. For details of each code, refer to the "See page" under the "DTC No." in the DTC chart.

DTC No. (See page)	Detection Item	Trouble Area	MIL*	Memory
P0100 (DI-24)	Mass Air Flow Circuit Malfunction	<ul style="list-style-type: none"> ● Open or short in mass air flow meter circuit ● Mass air flow meter ● ECM 	○	○
P0101 (DI-28)	Mass Air Flow Circuit Range/ Performance Problem	<ul style="list-style-type: none"> ● Mass air flow meter 	○	○
P0110 (DI-29)	Intake Air Temp. Circuit Malfunction	<ul style="list-style-type: none"> ● Open or short in intake air temp. sensor circuit ● Intake air temp. sensor ● ECM 	○	○
P0115 (DI-33)	Engine Coolant Temp. Circuit Malfunction	<ul style="list-style-type: none"> ● Open or short in engine coolant temp. sensor circuit ● Engine coolant temp. sensor ● ECM 	○	○
P0116 (DI-37)	Engine Coolant Temp. Circuit Range/ Performance Problem	<ul style="list-style-type: none"> ● Engine coolant temp. sensor ● Cooling system 	○	○
	Throttle Position Sensor/Switch Malfunction	<ul style="list-style-type: none"> ● Open or short in throttle position sensor circuit ● Throttle position sensor ● ECM 		
	Throttle Position Sensor/ Switch Range/ Performance Problem	<ul style="list-style-type: none"> ● Throttle position sensor 		

5. PROBLEM SYMPTOMS TABLE

The suspected circuits or parts for each problem symptom are shown in the table below. Use this table to troubleshoot when, during a DTC check, a "Normal" code is displayed in the diagnostic trouble code check but the problem is still occurring. Numbers in the table show the inspection order in which the circuits or parts should be checked.

HINT:

In some cases, a problem is not detected by the diagnostic system even though a problem symptom is present. It is possible that the problem is occurring outside the detection range of the diagnostic system, or that the problem is occurring in a completely different system.

● Page
Indicates the page where the flow chart for each circuit is located.

● Circuit Inspection, Inspection Order
Indicates the circuit which needs to be checked for a problem symptom.

● Problem Symptom

● Circuit or Part Name
Indicates the circuit or part which needs to be checked.

PROBLEM SYMPTOMS TABLE

Symptom	Suspect Area	See page
Engine does not crank (Does not start)	1. Starter and starter relay	ST-2 ST-17
No initial combustion (Does not start)	1. ECM power source circuit 2. Fuel pump control circuit 3. Engine control module (ECM)	DI-147 DI-151 IN-29
No complete combustion (Does not start)	1. Fuel pump control circuit	DI-151
Engine cranks normally (Difficult to start)	1. Starter signal circuit 2. Fuel pump control circuit 3. Compression	DI-144 DI-151 EM-3
Cold engine (Difficult to start)	1. Starter signal circuit 2. Fuel pump control circuit	DI-144 DI-151
Hot engine	1. Starter signal circuit 2. Fuel pump control circuit	DI-144 DI-151
Engine idle speed (Poor idling)	1. A/C signal circuit (Compressor circuit) 2. ECM power source circuit	AC-88
Engine idle speed (Poor idling)	1. A/C signal circuit 2. Fuel pump control circuit	
Engine idle speed (Poor idling)	1. Compression 2. Fuel pump control circuit	

6. CIRCUIT INSPECTION

How to read and use each page is shown below.

• Diagnostic Trouble Code No. and Detection Item

• Circuit Description
The major role and operation of the circuit and its component parts are explained.

DTC	P0325	Knock Sensor 1 Circuit Malfunction
------------	--------------	---

CIRCUIT DESCRIPTION
Knock sensor is fitted to the cylinder block to detect engine knocking. This sensor contains a piezoelectric element which generates a voltage when it becomes deformed, which occurs when the cylinder block vibrates due to knocking. If engine knocking occurs, ignition timing is retarded to suppress it.

DTC No.	DTC Detecting Condition	Trouble Area
P0325	No knock sensor 1 signal to ECM with engine speed 1,200 rpm or more.	<ul style="list-style-type: none"> • Open or short in knock sensor1 circuit • Knock sensor 1 (looseness) • ECM

If the ECM detects the above diagnosis conditions, it operates the fail safe function in which the corrective retard angle value is set to the maximum value.

• Indicates the diagnostic trouble code (DTC), set parameter and suspect area of the problem.

WIRING DIAGRAM

• Wiring Diagram
This is a wiring diagram of the circuit. Use this diagram together with an ELECTRICAL WIRING DIAGRAM to thoroughly understand the circuit.
Wire colors are indicated by an alphabetical code: B = Black; L = Blue; R = Red; BR = Brown; LG = Light Green; V = Violet; G = Green; O = Orange; W = White; GR = Gray; P = Pink; Y = Yellow; SB = Sky Blue.
The first letter indicates the basic wire color and the second letter indicates the color of the stripe.

- Indicates the position of the ignition switch during the check.

- Inspection Procedure
Use the inspection procedure to determine if the circuit is normal or abnormal. If it is abnormal, use it to determine whether the problem is located in the sensors, actuators, wire harness or ECU.

INSPECTION PROCEDURE

1 Check continuity between terminal KNK of ECM connector and body ground.

PREPARATION:

- (a) Remove the glove compartment (See page SF-68).
- (b) Disconnect the E6 connector of ECM.

CHECK:

Measure resistance between terminal KNK of ECM connector and body ground.

OK:

Resistance: 1 MΩ or higher

OK

Go to step 3.

NG

2 Check knock sensor (See page SF-61).

OK

Replace knock sensor.

- Indicates the place to check the voltage or resistance.
- Indicates the connector position to checked (from the front or back side).

Check from the connector back side (with harness).

Check from the connector front side (without harness). In this case, care must be taken not to bend the terminals.

- Indicates the condition of the connector of ECU during the check.

Connector being checked is connected.

Connector being checked is disconnected.

FI0046

FI0047

FI0048

HOW TO USE THE DIAGNOSTIC CHART AND INSPECTION PROCEDURE

1. CONNECTOR CONNECTION AND TERMINAL INSPECTION

- For troubleshooting, diagnostic trouble code (DTC) charts or problem symptom table are provided for each circuit with detailed inspection procedures in this manual.
- When component parts, wire harnesses and connectors of each circuit are found to be normal in troubleshooting, the problem is most likely in the ECU. Accordingly, if diagnosis is performed without the problem symptoms occurring, refer to Step 8 to replace the ECU. Always confirm that the problem symptoms are occurring, or proceed with inspection while using the symptom simulation method.
- The instructions "Check wire harness and connector" and "Check and replace ECU" which appear in the inspection procedure are common and applicable to all DTCs. Follow the procedure outlined below whenever these instructions appear.

OPEN CIRCUIT:

An open circuit could result from a disconnected wire harness, a faulty contact in the connector, a connector terminal pulled out, etc.

HINT:

- A wire is rarely broken in its middle. Most problems occur at the wire ends. Carefully check the connectors of sensors and actuators.
- Faulty contacts could be due to rusting, contamination, and/or deformation of connector terminals. In some cases: 1) simply disconnecting and reconnecting the connectors will fix the problem, or 2) even though no abnormality is found in the wire harness or connector, the problem disappears after the check (meaning the cause was most likely in the wire harness or connectors).

SHORT CIRCUIT:

A short circuit could result from contact between the wire harness and the body ground or a short circuiting switch.

HINT:

When there is a short circuit between the wire harness and body ground, check thoroughly if wire harness is caught in the body or is clamped properly.

2. CONNECTOR HANDLING

When inserting tester probes into a connector, insert them from the rear of the connector. When necessary, use mini test leads. For water resistant connectors which cannot be accessed from behind, take good care not to deform the connector terminals.

3. CONTINUITY CHECK (OPEN CIRCUIT CHECK)

- (a) Disconnect the connectors at both ECU and sensor sides.
- (b) Measure the resistance between the applicable terminals of the connectors.

Resistance: Below 1 Ω

HINT:

Measure the resistance while lightly shaking the wire harness vertically and horizontally.

4. RESISTANCE CHECK (SHORT CIRCUIT CHECK)

- (a) Disconnect the connectors on both ends.
- (b) Measure the resistance between the applicable terminals of the connectors and body ground. Be sure to carry out this check on the connectors on both ends.

Resistance: 10 kΩ or higher

HINT:

Measure the resistance while lightly shaking the wire harness vertically and horizontally.

5. VISUAL CHECK AND CONTACT PRESSURE CHECK

- (a) Disconnect the connectors at both ends.
- (b) Check for rust or foreign material, etc. in the terminals of the connectors.
- (c) Check crimped portions for looseness or damage and check that the terminals are secured in the lock portion.

HINT:

The terminals should not come out when pulled lightly from the back.

- (d) Prepare a test male terminal and insert it in the female terminal, then pull it out.

NOTICE:

When testing a gold-plated female terminal, always use a gold-plated male terminal.

HINT:

If a test terminal is pulled out more easily than others, there may be poor contact in that section.

6. CHECK OPEN CIRCUIT

For an open circuit in the wire harness in Fig. 1, perform a continuity check (step (a) below) or a voltage check (step (b) below).

- (a) Check the continuity.
 - (1) Disconnect connectors A and C and measure the resistance between them.
 - In the case of Fig. 2:
 - Between terminal 1 of connector A and terminal 1 of connector C → 10 kΩ or higher (open)
 - Between terminal 2 of connector A and terminal 2 of connector C → Below 1 Ω
 - An open circuit exists in the wire harness between terminal 1 of A and terminal 1 of C.

- (2) Disconnect connector B and measure the resistance between the connectors.
 - In the case of Fig. 3:
 - Between terminal 1 of connector A and terminal 1 of connector B1 → Below 1 Ω
 - Between terminal 1 of connector B2 and terminal 1 of connector C → 10 kΩ or higher (open)
 - An open circuit exists in the wire harness between terminal 1 of B2 and terminal 1 of C.

- (b) Check the voltage.
In a circuit in which voltage is applied to the ECU connector terminal, an open circuit can be checked by conducting a voltage check.

As shown in Fig. 4, with each connector still connected, measure the voltage between body ground and terminal 1 of connector A at the ECU 5V output terminal, terminal 1 of connector B, and terminal 1 of connector C (in that order).

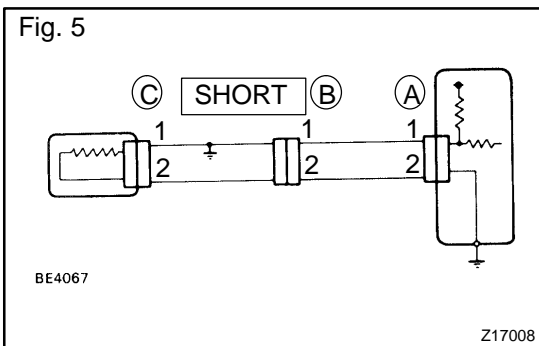

Example results:

5V: Between Terminal 1 of connector A and Body Ground

5V: Between Terminal 1 of connector B and Body Ground

0V: Between Terminal 1 of connector C and Body Ground

In the above example, an open circuit is in the wire harness between terminal 1 of B and terminal 1 of C.

7. CHECK SHORT CIRCUIT

If the wire harness is shorted (Fig. 5), locate the section by conducting a resistance check with ground below.

Check the resistance with ground.

- (1) Disconnect connectors A and C and measure the resistance between terminals 1 and 2 of connector A and body ground.

In the case of Fig. 6:

Between terminal 1 of connector A and body ground → Below 1 Ω (short)

Between terminal 2 of connector A and body ground → 10 kΩ or higher

A short circuit is between terminal 1 of connector A and terminal 1 of connector C.

- (2) Disconnect connector B and measure the resistance between terminal 1 of connector A and body ground, and terminal 1 of connector B2 and body ground.

In the case of Fig. 7:

Between terminal 1 of connector A and body ground → 10 kΩ or higher

Between terminal 1 of connector B2 and body ground → Below 1 Ω (short)

A short circuit is between terminal 1 of connector B2 and terminal 1 of connector C.

8. CHECK AND REPLACE ECU

First check the ECU ground circuit. If it is faulty, repair it. If it is normal, the ECU could be faulty. Replace the ECU with a functioning one and check if the symptoms occur.

If the trouble symptoms stop, replace the ECU.

- (1) Measure the resistance between the ECU ground terminal and the body ground.

Resistance: Below 1 Ω

- (2) Disconnect the ECU connector. Check for bent ground terminals (on the ECU side and the wire harness side). Lastly, check the contact pressure.

TERMS

ABBREVIATIONS USED IN THIS MANUAL

IN04Q-34

Abbreviations	Meaning
ABS	Anti-Lock Brake System
A/C	Air Conditioner
AC	Alternating Current
ACC	Accessory
ACIS	Acoustic Control Induction System
ACM	Active Control Engine Mount

GLOSSARY OF SAE AND TOYOTA TERMS

This glossary lists all SAE-J1930 terms and abbreviations used in this manual in compliance with SAE recommendations, as well as their TOYOTA equivalents.

SAE ABBREVIATIONS	SAE TERMS	TOYOTA TERMS ()--ABBREVIATIONS
A/C	Air Conditioning	Air Conditioner
ACL	Air Cleaner	Air Cleaner, A/CL
AIR	Secondary Air Injection	Air Injection (AI)
AP	Accelerator Pedal	--
B+	Battery Positive Voltage	+B, Battery Voltage
BARO	Barometric Pressure	HAC
CAC	Charge Air Cooler	Intercooler
CARB	Carburetor	Carburetor
CFI	Continuous Fuel Injection	--
CKP	Crankshaft Position	Crank Angle
CL	Closed Loop	Closed Loop
CMP	Camshaft Position	Cam Angle
CPP	Clutch Pedal Position	--
CTOX	Continuous Trap Oxidizer	--
CTP	Closed Throttle Position	LL ON, Idle ON
DFI	Direct Fuel Injection	Direct Injection (DI/INJ)
DI	Distributor Ignition	--
DLC3	Data Link Connector 3	OB2 II Diagnostic Connector
DTC	Diagnostic Trouble Code	Diagnostic Trouble Code
DTM	Diagnostic Test Mode	--
ECL	Engine Coolant Level	--
ECM	Engine Control Module	Engine ECU (Electronic Control Unit)
ECT	Engine Coolant Temperature	Coolant Temperature, Water Temperature (THW)
EEPROM	Electrically Erasable Programmable Read Only Memory	Electrically Erasable Programmable Read Only Memory (EEPROM), Erasable Programmable Read Only Memory (EPROM)
EFE	Early Fuel Evaporation	Cold Mixture Heater (CMH), Heat Control Valve (HCV)
EGR	Exhaust Gas Recirculation	Exhaust Gas Recirculation (EGR)
EI	Electronic Ignition	Distributorless Ignition (DLI)
EM	Engine Modification	Engine Modification (EM)
EPROM	Erasable Programmable Read Only Memory	Programmable Read Only Memory (PROM)
EVAP	Evaporative Emission	Evaporative Emission Control (EVAP)
FC	Fan Control	--
FEEPROM	Flash Electrically Erasable Programmable Read Only Memory	--
FEPROM	Flash Erasable Programmable Read Only Memory	--
FF	Flexible Fuel	--
FP	Fuel Pump	Fuel Pump
GEN	Generator	Alternator
GND	Ground	Ground (GND)
HO2S	Heated Oxygen Sensor	Heated Oxygen Sensor (HO ₂ S)

OUTSIDE VEHICLE

GENERAL MAINTENANCE

MA001-44

These maintenance checks on the vehicle are performed on the owner's responsibility. The owner may perform the maintenance or take the vehicle to a service center.

Check the parts of the vehicle described below on a daily basis. In most cases, special tool are not required. It is recommended that the owner perform these check.

The procedures for general maintenance are as follows.

1. GENERAL NOTES

- Maintenance requirements vary depending on the country.
- Check the maintenance schedule in the owner's manual supplement.
- Following the maintenance schedule is mandatory.
- Determine the appropriate time to service the vehicle using either miles driven or time (month) elapsed, whichever reaches the specification first.
- Maintain similar intervals between periodic maintenance unless noted.
- Failing to check each vehicle part could lead to poor engine performance and increase exhaust emissions.

2. TIRES

- (a) Check the tire pressure with a gauge. Make adjustment if necessary.
- (b) Check the surfaces of tires for cuts, damage or excessive wear.

3. WHEEL NUTS

Check for nuts that are loose or missing. Tighten them if necessary.

4. TIRE ROTATION (See page SA-3)

Check the maintenance schedule in the owner's manual supplement.

5. WINDSHIELD WIPER BLADES

Check the blades for wear or cracks whenever they are unable to wipe the windshield clean. Replace them if necessary.

6. FLUID LEAKS

- (a) Check under the vehicle for leaking fuel, oil, water and other fluid.
- (b) If you smell gasoline fumes or notice any leak, find the cause and correct it.

7. DOORS AND ENGINE HOOD

- (a) Check that all of the doors and the trunk lid operate smoothly, and that all the latches lock securely.
- (b) When the primary latch is released, check that the engine hood secondary latch prevents the hood from opening.

INSIDE VEHICLE

MA002-52

GENERAL MAINTENANCE

These maintenance checks on the vehicle are performed on the owner's responsibility. The owner may perform the maintenance or take the vehicle to a service center.

Check the parts of the vehicle described below on a daily basis. In most cases, special tool are not required. It is recommended that the owner perform these check.

The procedures for general maintenance are as follows.

1. GENERAL NOTES

- Maintenance requirements vary depending on the country.
- Check the maintenance schedule in the owner's manual supplement.
- Following the maintenance schedule is mandatory.
- Determine the appropriate time to service the vehicle using either miles driven or time (month) elapsed, whichever reaches the specification first.
- Maintain similar intervals between periodic maintenance unless noted.
- Failing to check each vehicle part could lead to poor engine performance and increase exhaust emissions.

2. LAMPS

- (a) Check that the headlamps, stop lamps, taillamps, turn signal lamps, and other lamps are all working.
- (b) Check that the headlamps are aimed properly.

3. WARNING LAMPS AND BUZZERS

Check that all the warning lamps and buzzers are working.

4. HORN

Check that the horn is working.

5. WINDSHIELD

Check for scratches, pits or abrasions.

6. WINDSHIELD WIPER AND WASHER

- (a) Check if the wind washers are aimed properly. Also, check if the washer fluid hits the center of the operating range of each wiper on the windshield.
- (b) Check that the wipers do not streak.

7. WINDSHIELD DEFROSTER

When the heater or air conditioner is on the defroster setting, check that air comes out of the defroster outlet.

8. REAR VIEW MIRROR

Check that the rear view mirror is securely mounted.

9. SUN VISORS

Check that the sun visors move freely and are securely mounted.

10. STEERING WHEEL

Check that the steering wheel has the proper freeplay. Also check for steering difficulty, freeplay in the steering wheel and unusual noises.

11. SEATS

- (a) Check that the seat adjusters operate smoothly.
- (b) Check that all the latches lock securely in all positions.
- (c) Check that the head restraints move up and down smoothly and that the locks hold securely in all latched positions.
- (d) When the rear seatbacks are folded down, check if the latches lock securely.

12. SEAT BELTS

- (a) Check that the seat belt system such as the buckles, retractors and anchors operate properly and smoothly.
- (b) Check that the belt webbing is not cut, frayed, worn or damaged.

13. ACCELERATOR PEDAL

Check the pedal for smooth operation and uneven pedal effort and catching.

14. CLUTCH PEDAL (See page CL-2)

- (a) Check the pedal for smooth operation.
- (b) Check that the pedal has the proper freeplay.

15. BRAKE PEDAL (See page BR-10)

- (a) Check the pedal for smooth operation.
- (b) Check that the pedal has the proper reserve distance and freeplay.
- (c) Check the brake booster function.

16. BRAKES

In a safe place, check that the vehicle remains straight when applying the brakes.

17. PARKING BRAKE (See page BR-18)

- (a) Check that the parking brake pedal has the proper range of motion.
- (b) On a low incline, check that the parking brake alone can stabilize the vehicle.

18. AUTOMATIC TRANSMISSION "PARK" MECHANISM

- (a) Check the lock release mechanism of the selector lever for proper and smooth operation.
- (b) When the selector lever is in the "P" position and all brakes are released on a low incline, check that the vehicle is stabilized.

UNDER HOOD

MA003-52

GENERAL MAINTENANCE

1. GENERAL NOTES

- Maintenance requirements vary depending on the country.
- Check the maintenance schedule in the owner's manual supplement.
- Following the maintenance schedule is mandatory.
- Determine the appropriate time to service the vehicle using either miles driven or time (month) elapsed, whichever reaches the specification first.
- Maintain similar intervals between periodic maintenance unless noted.
- Failing to check each vehicle part could lead to poor engine performance and increase exhaust emissions.

2. WINDSHIELD WASHER FLUID

Check that there is sufficient fluid in the tank.

3. ENGINE COOLANT LEVEL

Check that the coolant level is between the "FULL" and "LOW" lines on the see-through reservoir.

4. RADIATOR AND HOSES

- (a) Check that the front of the radiator is clean and free of leaves, dirt and bugs.
- (b) Check the hoses for cracks, kinks, rotting and loose connections.

5. BATTERY ELECTROLYTE LEVEL

Check that the electrolyte level of all the battery cells is between the upper and lower lines on the case.

6. BRAKE AND CLUTCH FLUID LEVELS

Check that the brake and clutch fluid levels are near the upper level line on the see-through reservoirs.

7. ENGINE DRIVE BELTS

Check the drive belt for fraying, cracks, wear or oiliness.

8. ENGINE OIL LEVEL

Check if the level of engine oil is between "F" and "L" on the dipstick with the engine turned off.

9. POWER STEERING FLUID LEVEL

- Check the level on the dipstick.
- The level should be in the "HOT" or "COLD" range depending on the fluid temperature.

10. AUTOMATIC TRANSMISSION FLUID

Visually check the overflow plug and oil pan for fluid leaks or traces of fluid.

11. EXHAUST SYSTEM

Check for unusual exhaust sounds or abnormal exhaust fumes. Find the cause and correct it.

ENGINE INSPECTION

MA004-20

HINT:

Perform the following procedures.

1. **REPLACE TIMING CHAIN OR BELT**
(1GR-FE: See pages [EM-32](#) and [EM-44](#))
(2UZ-FE: See pages [EM-16](#) and [EM-23](#))
2. **INSPECT VALVE CLEARANCE**
(1GR-FE: See page [EM-4](#))
(2UZ-FE: See page [EM-4](#))
3. **INSPECT DRIVE BELT(S)**
(1GR-FE: See pages [SR-3](#) and [AC-17](#))
(2UZ-FE: See page [SR-3](#) and [AC-17](#))
4. **REPLACE ENGINE OIL AND OIL FILTER**
(1GR-FE: See page [LU-3](#))
(2UZ-FE: See page [LU-2](#))
5. **REPLACE ENGINE COOLANT**
(1GR-FE: See page [CO-2](#))
(2UZ-FE: See page [CO-2](#))
6. **INSPECT EXHAUST PIPES AND MOUNTINGS**

Visually inspect the pipes, hangers and connections for severe corrosion, leaks or damage.

7. INSPECT AIR FILTER

- (a) Visually check that the air filter is not excessively dirty or oily.

HINT:

Oiliness may indicate a stuck PCV valve.

If necessary, replace the air filter.

- (b) Clean the air filter with compressed air.
First blow from the inside of the filter thoroughly then repeat from the outside.

8. REPLACE AIR FILTER

Replace the air filter with a new one.

9. INSPECT FUEL LINES AND CONNECTIONS, AND FUEL TANK VAPOR VENT SYSTEM HOSES AND FUEL TANK BAND

Visually inspect the fuel lines for cracks, leakage, loose connections, deformation or tank band looseness.

10. REPLACE GASKET IN FUEL TANK CAP

- (1GR-FE: See page [EC-6](#))
- (2UZ-FE: See page [EC-9](#))

11. **REPLACE SPARK PLUGS**
(1GR-FE: See page [IG-1](#))
(2UZ-FE: See page [IG-1](#))
12. **INSPECT CHARCOAL CANISTER**
(1GR-FE: See page [EC-6](#))
(2UZ-FE: See page [EC-9](#))

BRAKE INSPECTION

MA014-07

1. INSPECT BRAKE LINE PIPES AND HOSES

HINT:

Work in a well-lighted area. Check the entire circumference and length of the brake hoses using a mirror if necessary. Turn the front wheels fully to the right or left before beginning.

- (a) Check all the brake lines and hoses for:
 - Damage
 - Wear
 - Deformation
 - Cracks
 - Corrosion
 - Leaks
 - Bends
 - Twists
- (b) Check all the clamps for tightness and connections for leakage.
- (c) Check that the hoses and lines are not near sharp edges, moving parts and the exhaust system.
- (d) Check that the lines installed pass through the center of the grommets.

2. INSPECT FRONT BRAKE PADS AND DISCS

(See page [BR-44](#))

HINT:

If a squealing or scraping noise occurs from the brake during driving, check the pad wear indicator.

If there are traces of the indicator contacting the disc rotor, the disc pad should be replaced.

3. INSPECT REAR BRAKE LININGS AND DRUMS

(See page [BR-51](#))

CHASSIS

INSPECTION

1. INSPECT STEERING LINKAGE

- (a) Check the steering wheel freeplay (see page [SR-9](#)).
- (b) Check the steering linkage for looseness or damage.
 - Check that the tie rod ends do not have excessive play.
 - Check that the dust seals and boots are not damaged.
 - Check that the boot clamps are not loose.

2. INSPECT STEERING GEAR HOUSING OIL

Check the steering gear housing for oil leaks.

If leakage is found, check for cause and repair.

3. INSPECT BALL JOINTS AND DUST COVERS

- (a) Inspect the ball joints for excessive looseness.
- (b) Inspect the dust cover for damage.

4. 4WD:

INSPECT DRIVE SHAFT BOOTS

Inspect the drive shaft boots for loose clamps, grease leakage or damage.

5. CHECK OIL LEVEL IN MANUAL TRANSMISSION, TRANSFER AND DIFFERENTIAL

Remove the filler plug and feel inside the hole with your finger. Check that the oil comes to within 5 mm (0.20 in.) of the bottom edge of the hole.

If the level is low, add oil until it reaches the bottom of the fire hole.

Transmission oil: See page [MT-7](#).

Transfer oil: See page [TR-5](#).

Front differential oil (4WD): See page [SA-36](#).

Rear differential oil: See page [SA-101](#).

6. REPLACE MANUAL TRANSMISSION, TRANSFER AND DIFFERENTIAL OIL

- (a) Remove the drain plug and drain the oil.
- (b) Reinstall drain plug securely.
- (c) Add new oil until it reaches the bottom of the fire hole.

Transmission oil: See page [MT-7](#).

Transfer oil: See page [TR-5](#).

Front differential oil (4WD): See page [SA-36](#).

Rear differential oil: See page [SA-101](#).

7. CHECK FLUID LEVEL IN AUTOMATIC TRANSMISSION (See page [AT-4](#))

8. REPLACE AUTOMATIC TRANSMISSION FLUID

- (a) Remove the drain plug and drain the fluid.
- (b) Reinstall the drain plug securely.
- (c) Fill the transmission (See page [AT-4](#)).

9. LUBRICATE PROPELLER SHAFT AND TIGHTEN BOLTS

(a) 4WD:

Lubricate the propeller shaft, referring to the lubrication chart. Before pumping in grease, wipe off any mud and dust on the grease fitting.

Grease grade:

Propeller shaft (Except Double-cardan joint): Lithium base chassis grease NLGI No. 2

Double-cardan joint: Molybdenum disulphide lithium base chassis grease NLGI No. 2

(b) Tighten the bolts for propeller shaft (2WD: See page PR-8) (4WD: See page PR-15).

10. ROTATE TIRES (See page SA-3)

BODY

MA04E-02

INSPECTION

TIGHTEN BOLTS AND NUTS ON CHASSIS AND BODY

- (a) Where necessary, tighten all parts of the chassis.
- Front axle and suspension
 - Drive train
 - Rear axle and suspension
 - Brake system
 - Engine mounting, etc.
- (b) Where necessary, tighten all parts of the body.
- Seat belt system
 - Seats
 - Doors and hood
 - Body mountings
 - Fuel tank
 - Exhaust pipe system, etc.

HOW TO DETERMINE NUT STRENGTH

Present Standard Hexagon Nut	Nut Type		Class
	Old Standard Hexagon Nut		
	Cold Forging Nut	Cutting Processed Nut	
 No Mark			4N
 No Mark (w/ Washer)	 No Mark (w/ Washer)	 No Mark	5N (4T)
  			6N
	 	  *	7N (5T)
 			8N
 	 	 No Mark	10N (7T)
 			11N
 			12N

*: Nut with 1 or more marks on one side surface of the nut.

B06432

HINT:

Use the nut with the same number of the nut strength classification or the greater than the bolt strength classification number when tightening parts with a bolt and nut.

Example: Bolt = 4T

Nut = 4N or more

BRAKE

SERVICE DATA

SS084-04

Brake pedal height (from dash panel) (w/o VSC, standard, access cab)		163.6 to 173.6 mm (6.44 to 6.83 in.)
Brake pedal height (from dash panel) (w/ VSC, standard, access cab)		164.0 to 174.0 mm (6.46 to 6.85 in.)
Brake pedal height (from dash panel) (double cab)		151.1 to 165.1 mm (5.95 to 6.50 in.)
Stop light switch clearance		0.5 to 2.4 mm (0.020 to 0.094 in.)
Brake pedal free play		1 to 6 mm (0.04 to 0.24 in.)
Parking brake pedal travel at 294 N (30 kgf, 66 lbf)		8 to 10 clicks
Parking brake lever travel at 196 N (20 kgf, 44 lbf)		19 to 25 clicks
Brake booster push rod to piston clearance (w/ SST)		0 mm (0 in.)
Brake pedal reserve distance from asphalt sheet at 490 N (50 kgf, 110.2 lbf)		More than 95 mm (3.74 in.)
Front brake pad thickness	STD	11.5 mm (0.453 in.)
	Minimum	1.0 mm (0.039 in.)
Front brake disc thickness	STD	28.0 mm (1.102 in.)
	Minimum	26.0 mm (1.024 in.)
Front brake disc runout	Maximum	0.07 mm (0.0028 in.)
Rear brake drum inside diameter	STD	295.0 mm (11.614 in.)
	Maximum	297.0 mm (11.693 in.)
Rear brake shoe lining thickness	STD	6.0 mm (0.236 in.)
	Minimum	1.0 mm (0.039 in.)
Rear brake drum to shoe clearance		0.5 mm (0.020 in.)
Rear axle load (includes vehicle weight) (standard cab)		950 kg (2,094 lb)
Rear axle load (includes vehicle weight) (access cab) 1GR-FT		1,000 kg (2,205 lb)
Rear axle load (includes vehicle weight) (access cab) 2UZ-FT		1,050 kg (2,315 lb)
Rear brake pressure (front brake pressure at 7,845 kPa (80 kgf/cm ² , 1,138 psi)		5,110 ± 490 kPa (52.1 ± 5 kgf/cm ² , 741 ± 71 psi)
Fluid pressure (LSP & BV) initial set		120 mm (4.72 in.)
Fluid pressure (LSP & BV) adjustment range		112 to 128 mm (4.41 to 5.04 in.)
Valve piston pin and load sensing contact surface	Wear limit	0.7 mm (0.028 in.)

STEERING

SERVICE DATA

SS08W-05

POWER STEERING FLUID		
Oil level rise	Maximum	5 mm (0.20 in.)
Oil pressure at idle speed with valve closed	Minimum	8,336 kPa (85 kgf/cm ² , 1,209 psi)
STEERING WHEEL		
Steering wheel freeplay	Maximum	30 mm (1.18 in.)
Steering effort at idle speed	Reference:	4.9 N·m (50 kgf·cm, 43 in.·lbf)
PS VANE PUMP (1GR-FE)		
Pump shaft and front housing bushing oil clearance	Maximum	0.07 mm (0.0028 in.)
Vane plate thickness	STD	1.405-1.411 mm (0.05531-0.05555 in.)
Vane plate and pump rotor groove clearance	Maximum	0.03 mm (0.0012 in.)
Flow control valve spring length	Minimum	36.9 mm (1.453 in.)
Pump rotating torque	Maximum	0.27 N·m (2.8 kgf·cm, 2.4 in.·lbf) or less
PS VANE PUMP (2UZ-FE)		
Pump shaft and front housing bushing oil clearance	STD	0.03-0.05 mm (0.0012-0.0020 in.)
Pump shaft and front housing bushing oil clearance	Maximum	0.07 mm (0.0028 in.)
Vane plate height	Minimum	8.6 mm (0.339 in.)
Vane plate thickness	Minimum	1.397 mm (0.0550 in.)
Vane plate length	Minimum	14.991 mm (0.5902 in.)
Vane plate and pump rotor groove clearance	Maximum	0.033 mm (0.0013 in.)
Vane plate length	Pump rotor and cam ring mark	
	None	14.999-15.001 mm (0.59051-0.59059 in.)
	1	14.997-14.999 mm (0.59043-0.59051 in.)
	2	14.995-14.997 mm (0.59035-0.59043 in.)
	3	14.993-14.995 mm (0.59027-0.59035 in.)
	4	14.991-14.993 mm (0.59020-0.59027 in.)
Flow control valve spring length	Minimum	33.2 mm (1.307 in.)
Pump rotating torque	Maximum	0.28 N·m (2.8 kgf·cm, 2.4 in.·lbf) or less
PS GEAR		
Steering rack runout	Maximum	0.09 mm (0.0035 in.)
Total preload	Turning	1.0-1.45 N·m (10-10.45 kgf·cm, 8.7-12.6 in.·lbf)

ENGINE (1GR-FE)

DIDSK-01

PRECAUTION

NOTICE:

Perform the **RESET MEMORY (AT initialization)** when replacing the automatic transaxle assembly, engine assembly or ECM (see page [DI-961](#)).

HINT:

RESET MEMORY (AT initialization) can not be completed by only removing the battery.

DEFINITION OF TERMS

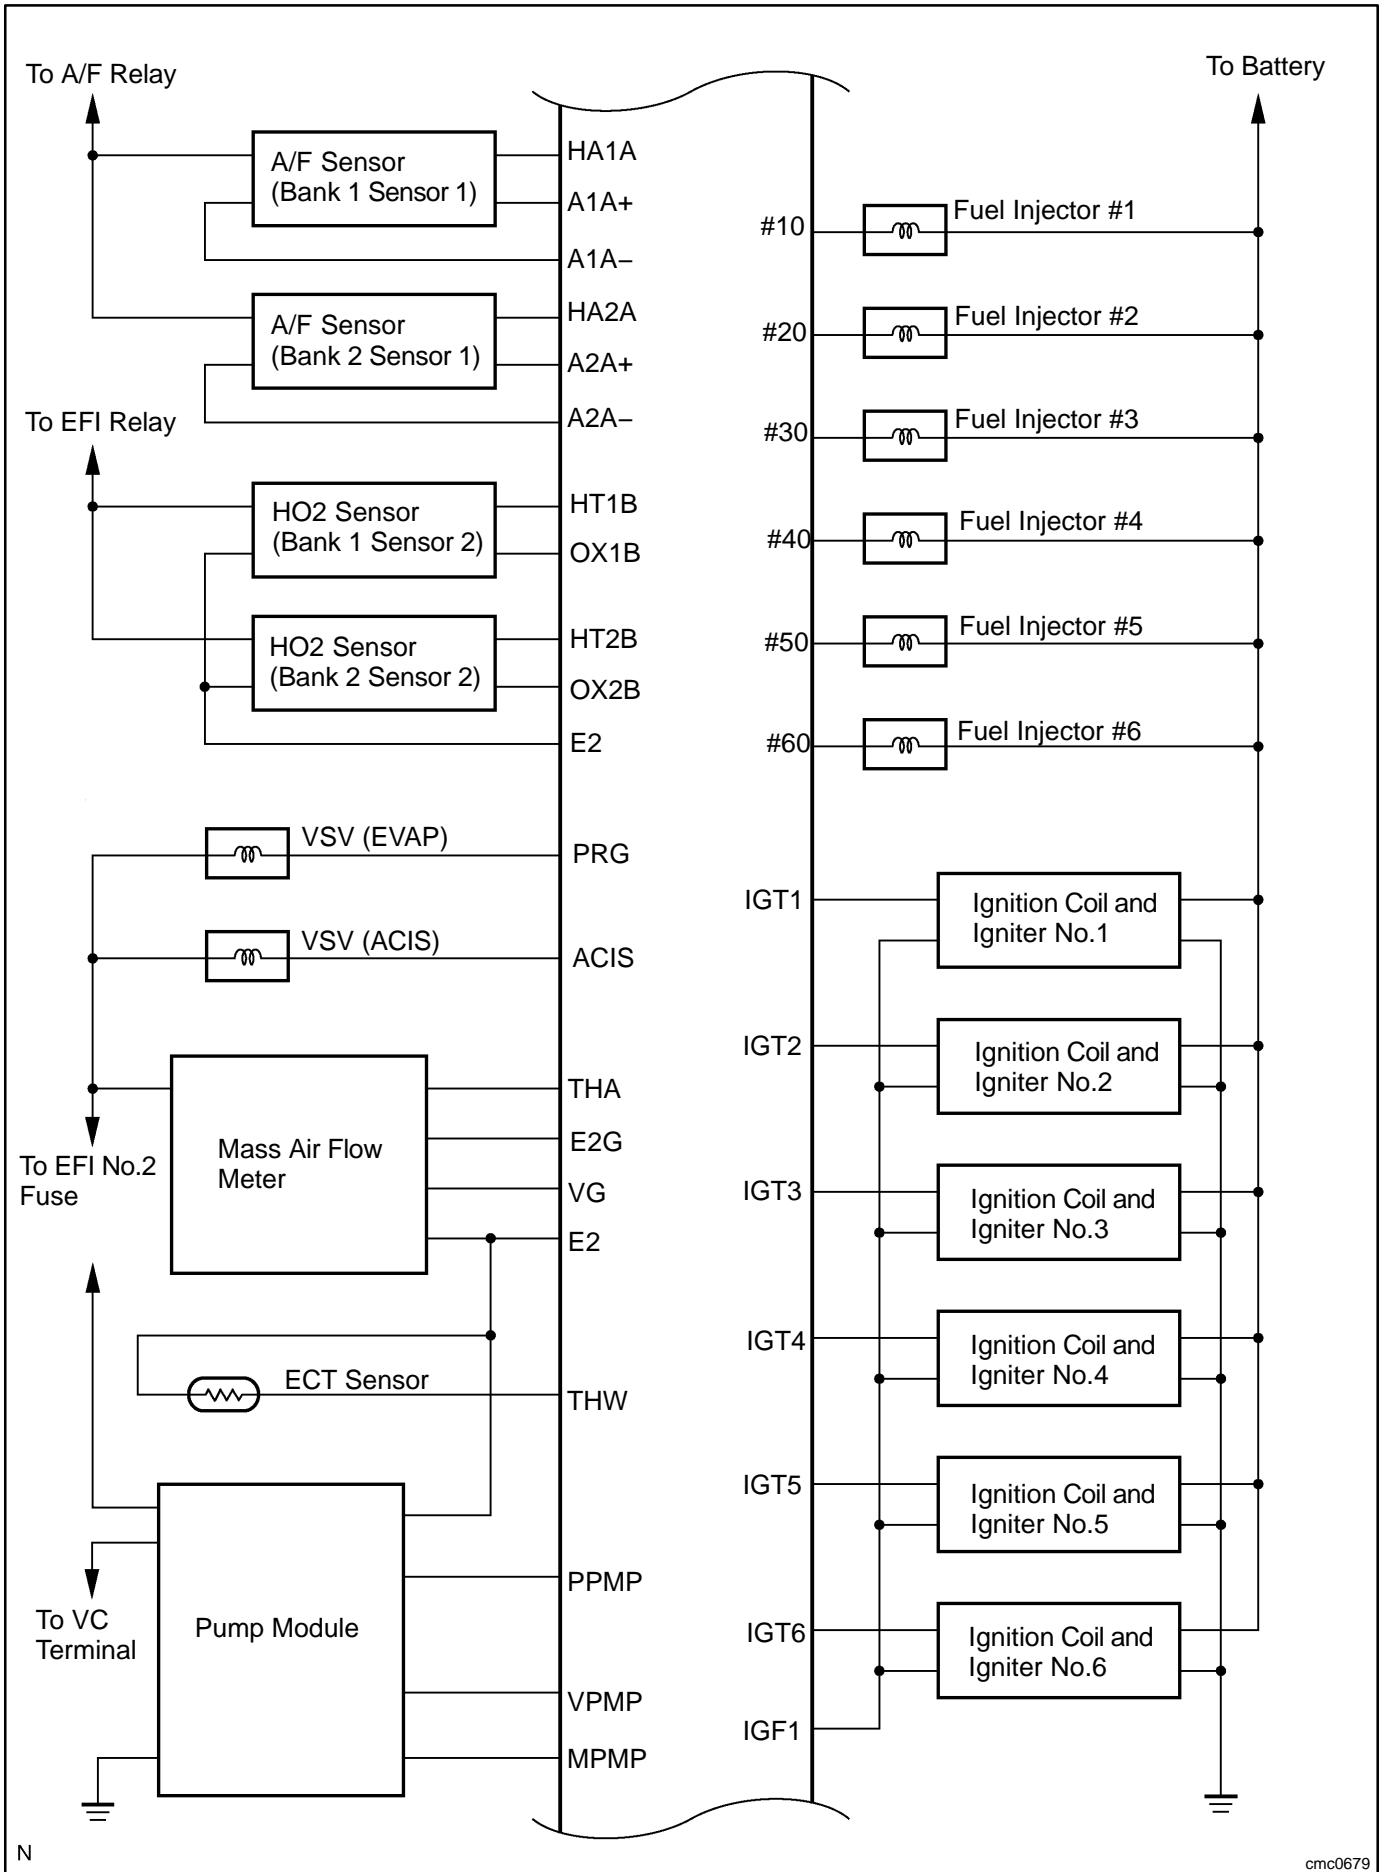

Term	Definition
Monitor description	Description of what the ECM monitors and how it detects malfunctions (monitoring purpose and its details).
Related DTCs	Diagnostic code
Typical enabling condition	Preconditions that allow the ECM to detect malfunctions. With all preconditions satisfied, the ECM sets the DTC when the monitored value(s) exceeds the malfunction threshold(s).
Sequence of operation	The priority order that is applied to monitoring, if multiple sensors and components are used to detect the malfunction. When a sensor is being monitored, the next sensor or component will not be monitored until the sensor monitoring is finished.
Required sensor/components	The sensors and components that are used by the ECM to detect malfunctions.
Frequency of operation	The number of times that the ECM checks for malfunctions per driving cycle. "Once per driving cycle" means that the ECM detects the malfunction only one time during a single driving cycle. "Continuous" means that the ECM detects malfunction every time an enabling condition is met.
Duration	The minimum time that the ECM must sense a continuous deviation in the monitored value(s) before setting a DTC. This timing begins after the "typical enabling conditions" are met.
Malfunction thresholds	Beyond this value, the ECM will conclude that there is a malfunction and set a DTC.
MIL operation	MIL illumination timing after a defect is detected. "Immediately" means that the ECM illuminates MIL the instant the ECM determines that there is a malfunction. "2 driving cycle" means that the ECM illuminates MIL if the same malfunction is detected again in the 2nd driving cycle.

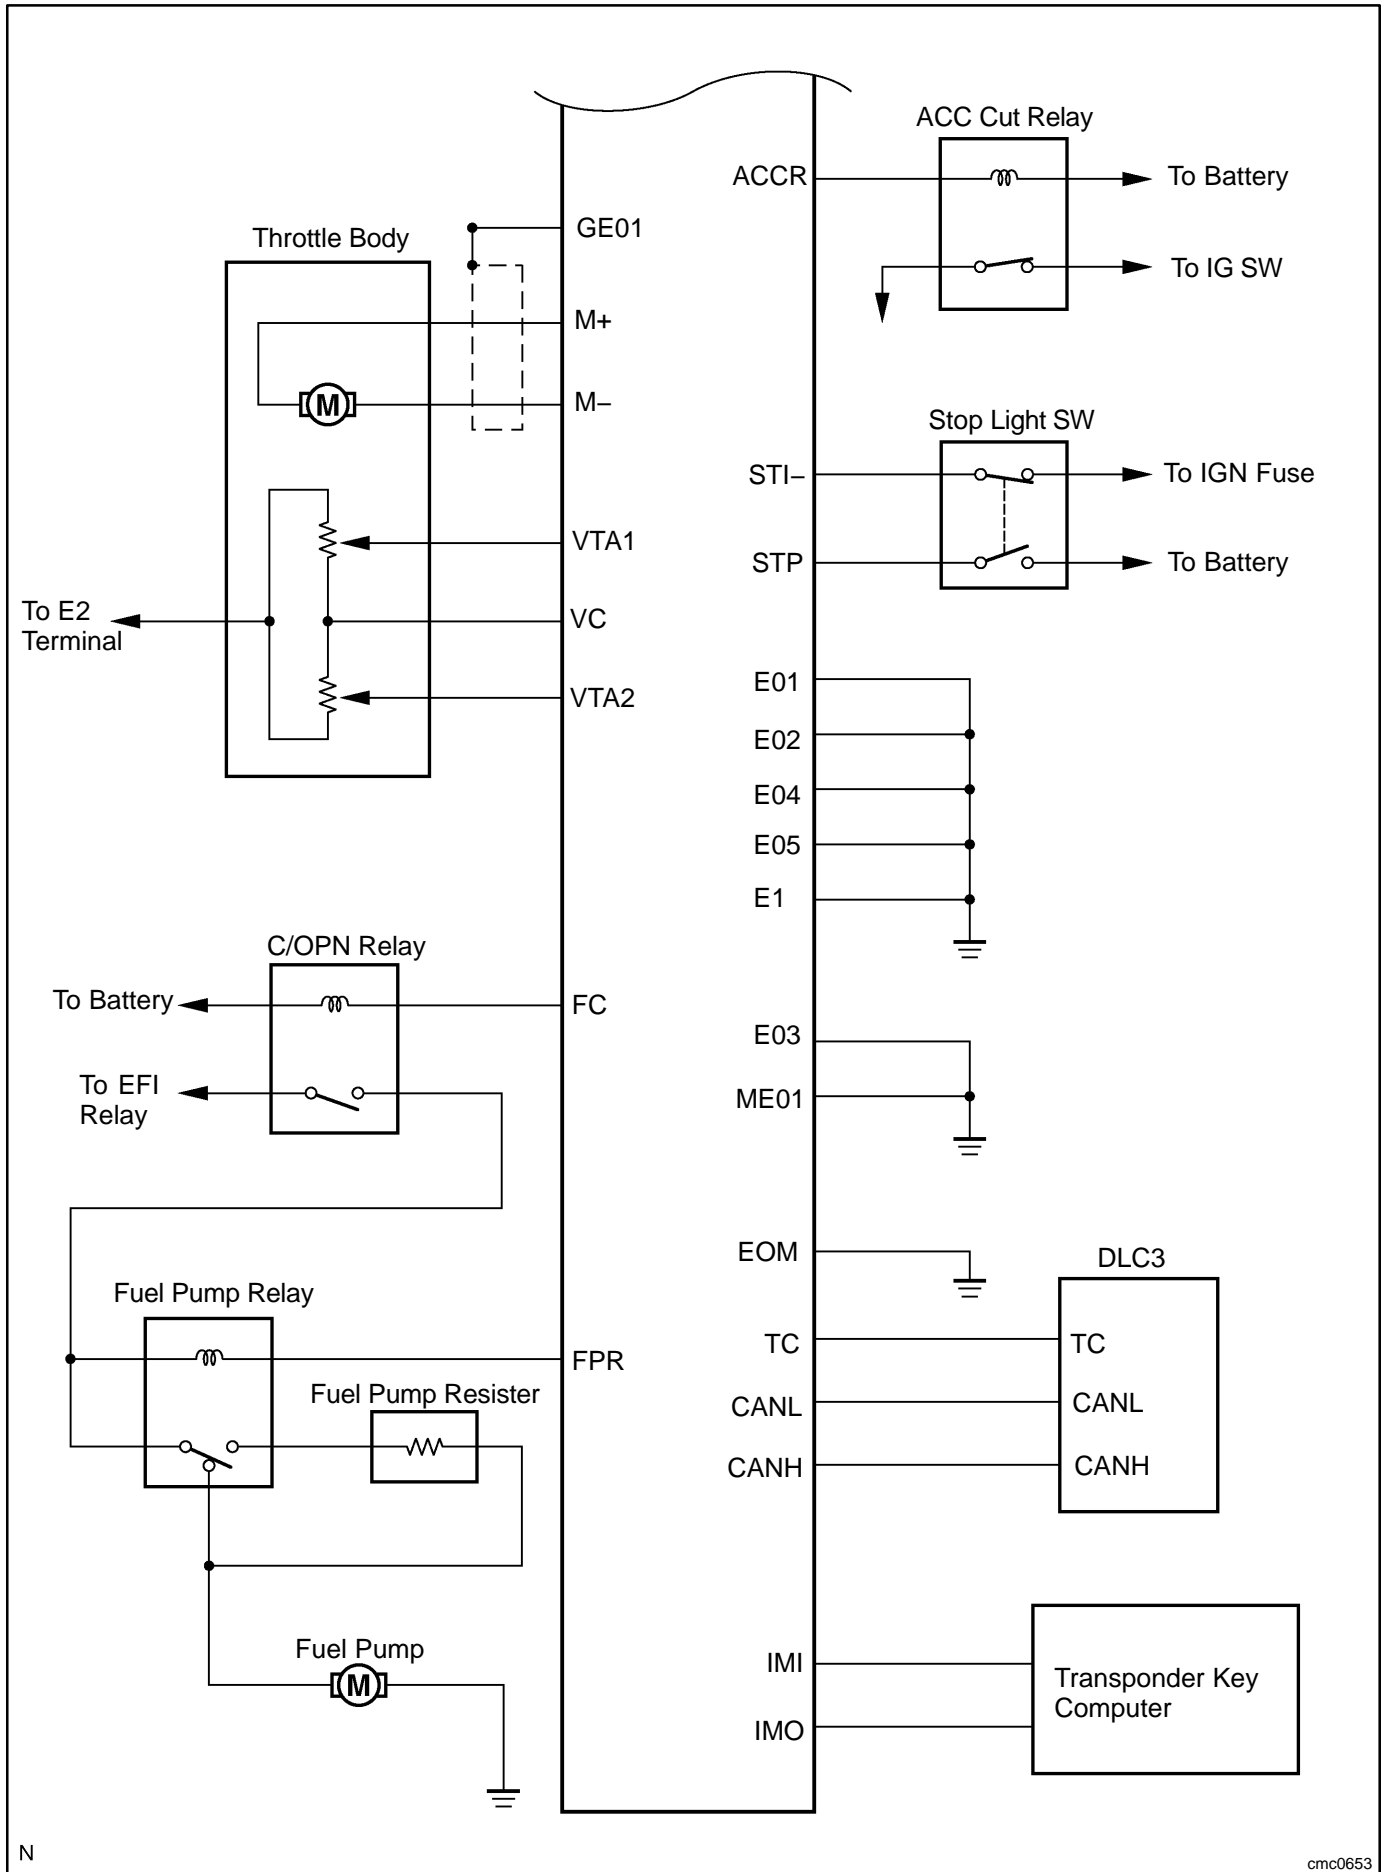

LOCATION

SYSTEM DIAGRAM

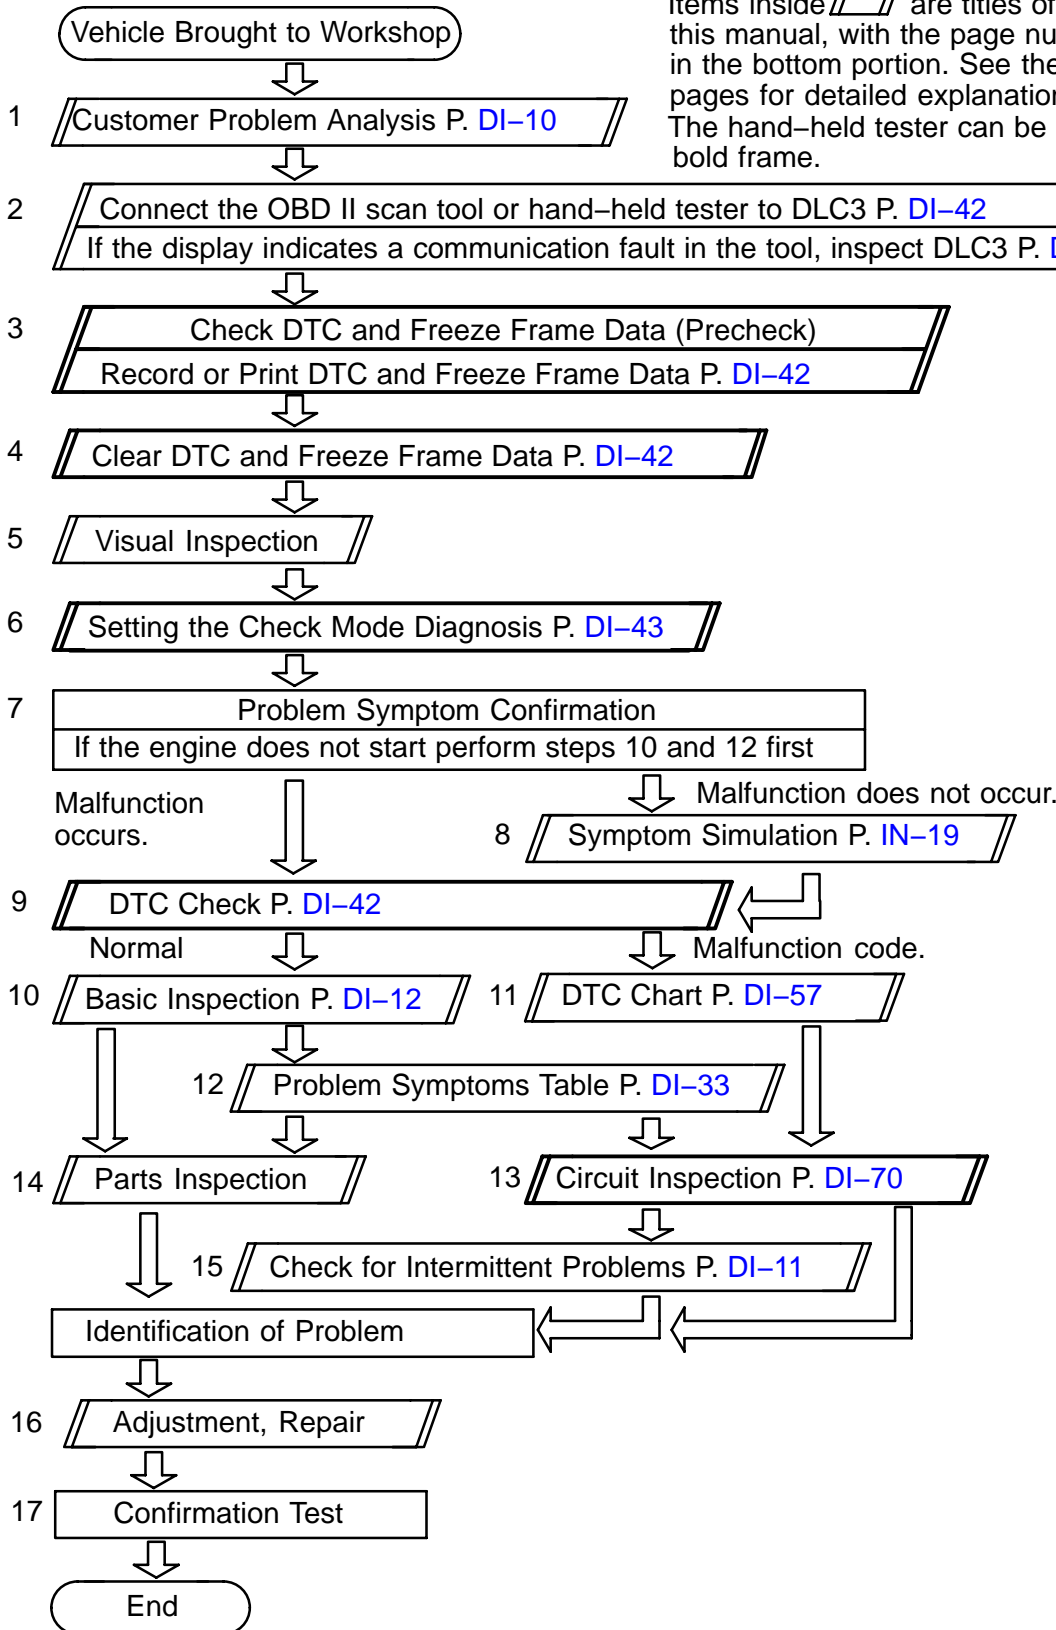

HOW TO PROCEED WITH TROUBLESHOOTING

Troubleshoot in accordance with the procedure on the following page.

Items inside **//** are titles of pages in this manual, with the page number in the bottom portion. See the indicated pages for detailed explanations.

The hand-held tester can be used at **//**.

CHECK FOR INTERMITTENT PROBLEMS

HINT:

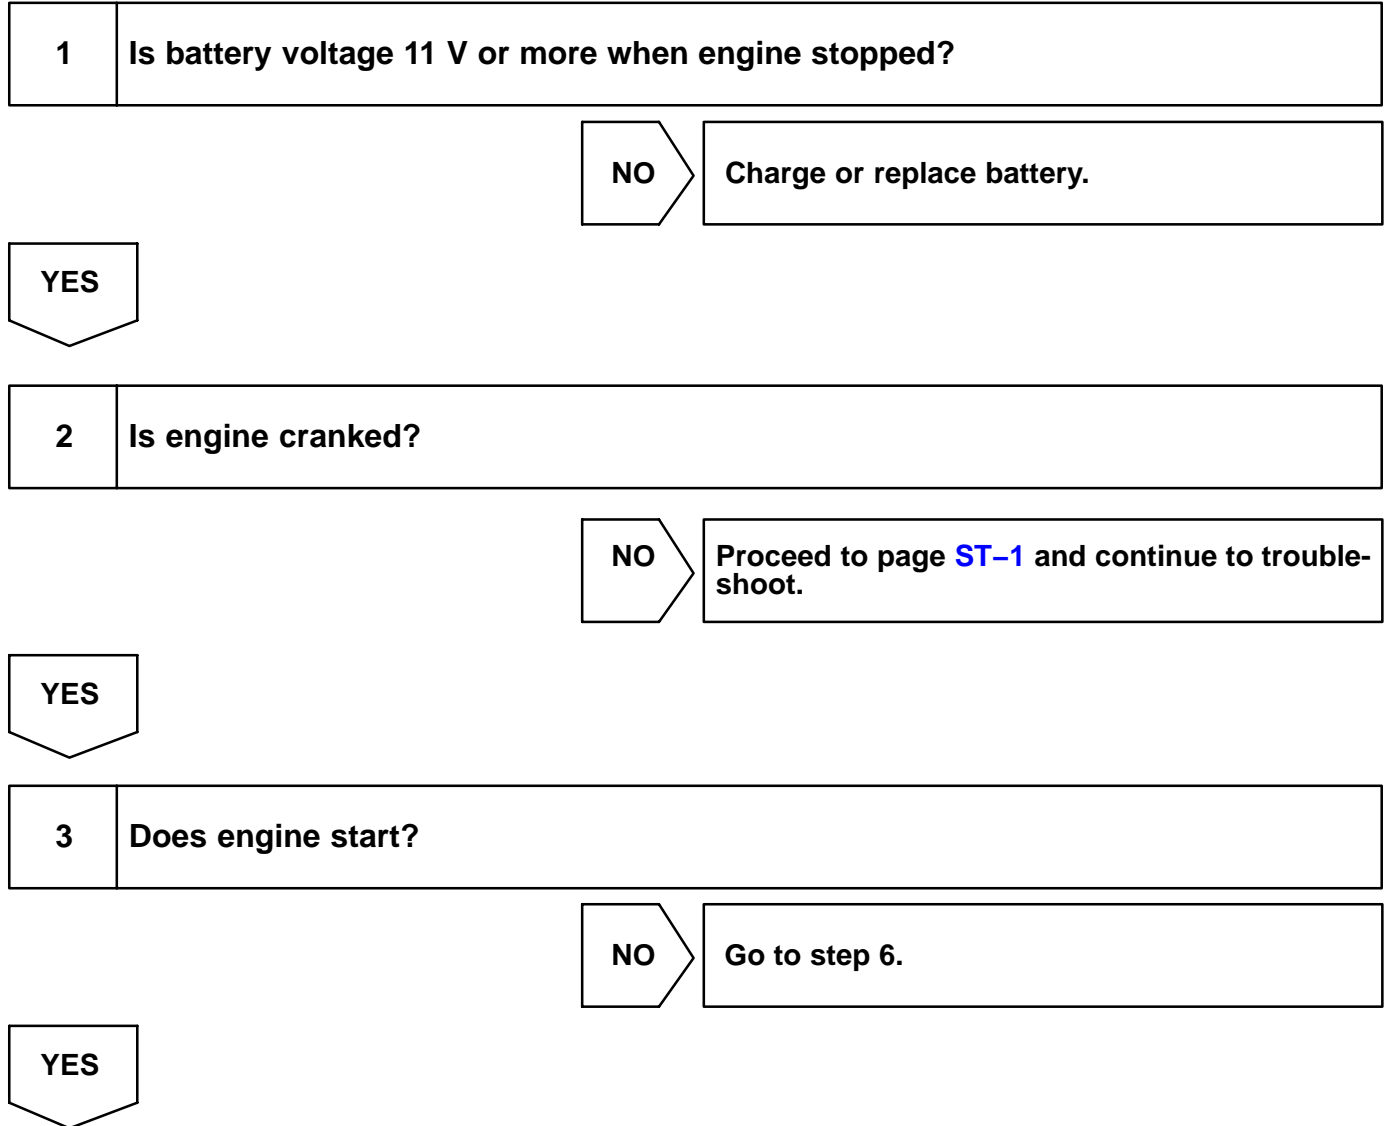

Hand-held tester only:

Inspect the vehicle's ECM using check mode. Intermittent problems are easier to detect with a hand-held tester when the ECM is in check mode. In check mode, the ECM uses 1trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2trip detection logic.

- (c) Clear DTCs (see page [DI-42](#)).
- (d) Switch the ECM from normal mode to check mode using a hand-held tester (see page [DI-43](#)).
- (e) Perform a simulation test (see page [IN-19](#)).
- (f) Check and wiggle the harness(es), connector(s) and terminal(s) (see page [IN-30](#)).

BASIC INSPECTION

When the malfunction is not confirmed in the DTC check, troubleshooting should be carried out in all the possible circuits considered as causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location causing the problem can be found quickly and efficiently. Therefore, using this check is essential in the engine troubleshooting.

4	Check air filter.
----------	--------------------------

PREPARATION:

Remove the air filter.

CHECK:

Visual check that the air filter is not excessively dirty or oily.

NG	Repair or replace air filter.
-----------	--------------------------------------

OK

5	Check idle speed (See page EM-25).
----------	---

NG	Proceed to problem symptoms table on page DI-33.
-----------	---

OK

6	Check fuel pressure (See page SF-5).
----------	---

NG	Proceed to page SF-5 and continue to trouble-shoot.
-----------	--

OK

7	Check for spark (See page IG-1).
----------	---

NG	Proceed to page IG-1 and continue to trouble-shoot.
-----------	--

OK

Proceed to problem symptoms table on page DI-33.

REGISTRATION

NOTICE:

The Vehicle Identification Number (VIN) must be input into the replacement ECM.

HINT:

The VIN is in the form of a 17–digit alphanumeric vehicle identification number. A hand–held tester is required to register the VIN.

1. DESCRIPTION

This registration section consists of three parts, Input Instructions, Read VIN and Write VIN.

- (a) Input Instructions: Explains the general VIN input instructions using a hand–held tester.
- (b) Read VIN: Explains the VIN reading process in a flowchart. This process allows the VIN stored in the ECM to be read, in order to confirm that the two VINs, provided with the vehicle and stored in the vehicle’s ECM, are the same.
- (c) Write VIN: Explains the VIN writing process in a flowchart. This process allows the VIN to be input into the ECM. If the ECM is changed, or the VIN and VIN do not match, the VIN can be registered, or overwritten in the ECM by following this procedure.

2. INPUT INSTRUCTIONS

- (a) Hand–held tester
The arrow buttons (UP, DOWN, RIGHT and LEFT) and numerical buttons (0 to 9) are used, in order to input the VIN.
- (b) Cursor Operation
To move the cursor around the tester screen, press the RIGHT and LEFT buttons.
- (c) Alphabetical Character Input
 - (1) Press the UP and DOWN buttons to select the desired alphabetical character.
 - (2) After selection, the cursor should move.
- (d) Numeric Character Input
 - (1) Press the numerical button corresponding to the number that you want to input.
 - (2) Select or input the correct character using the UP/DOWN buttons, or the numerical buttons.

HINT:

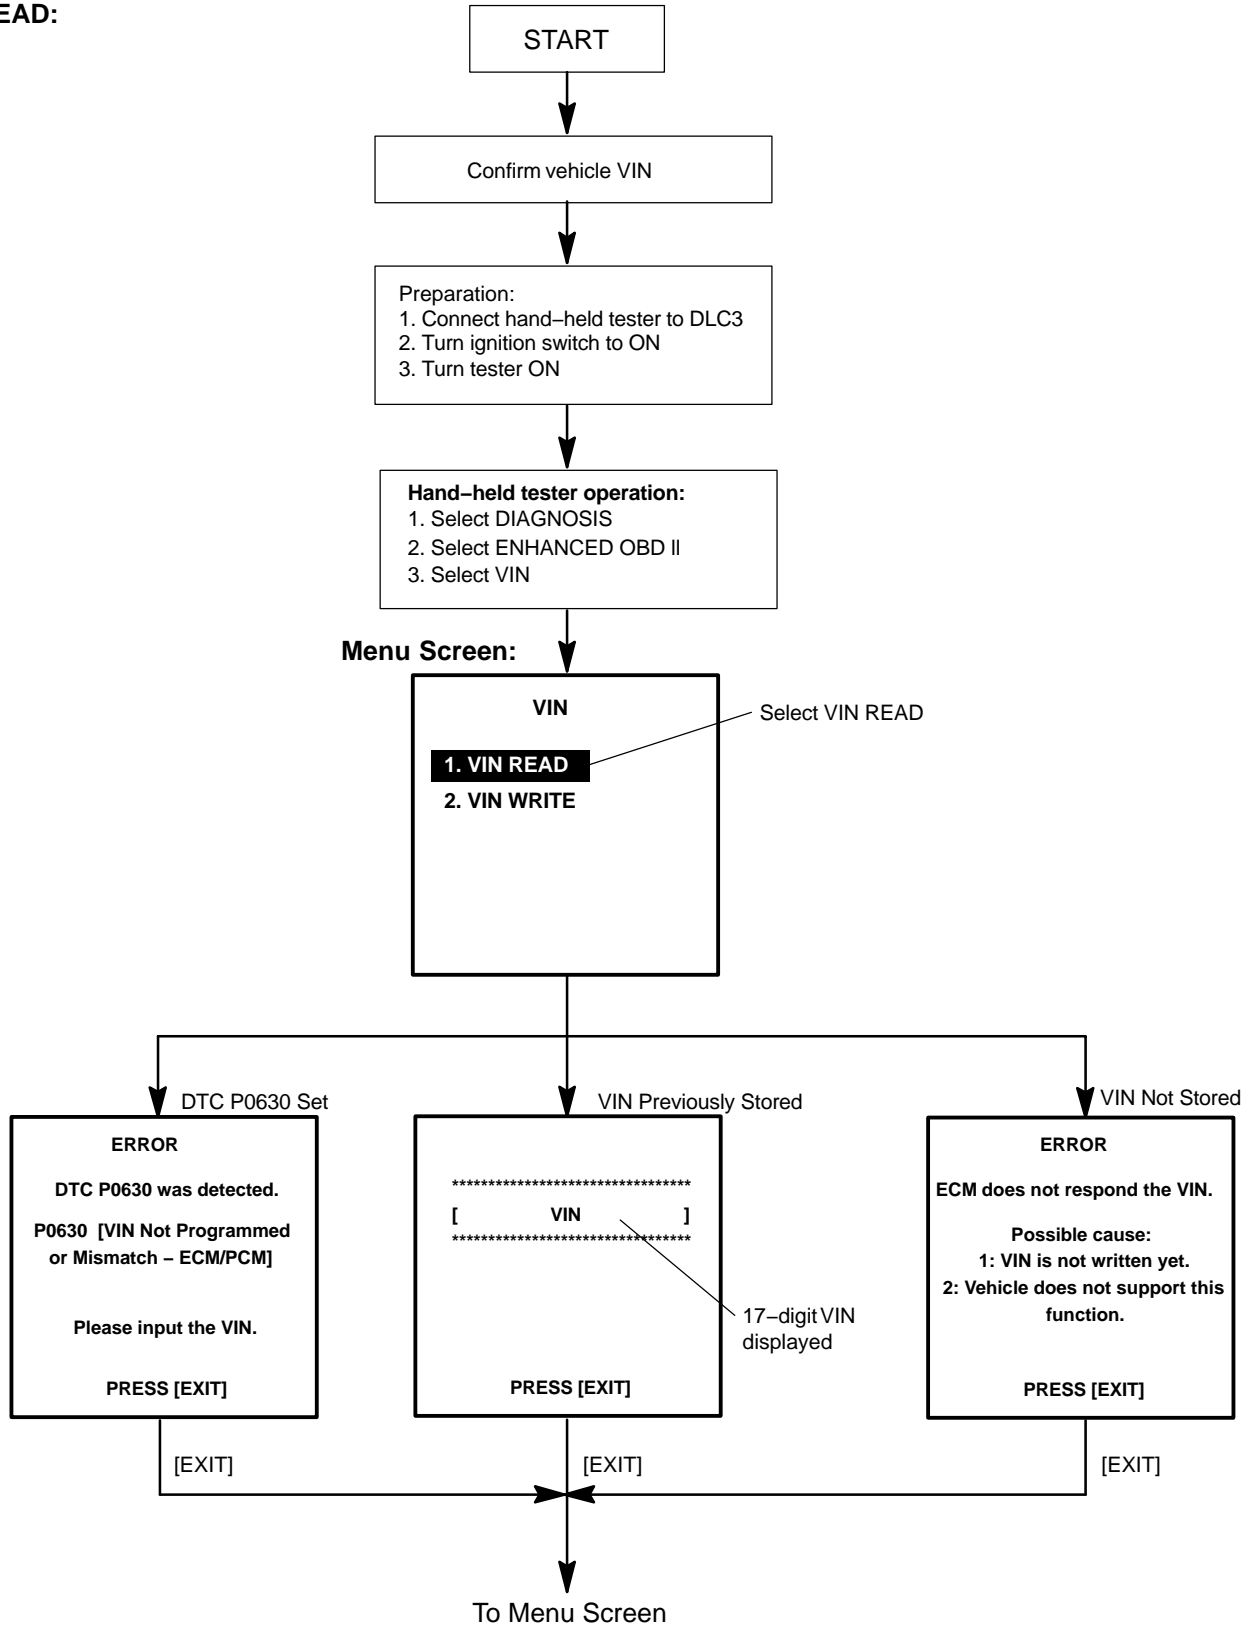

Numerical characters can be selected by using the UP and DOWN buttons.

- (e) Correction
 - (1) After input, the cursor should move.
 - (2) When correcting the input character(s), put the cursor onto the character using the RIGHT or LEFT buttons.
- (f) Finishing Input Operation
 - (1) Make sure that the input VIN matches the vehicle VIN after input.
 - (2) Press the ENTER button on the tester.

3. READ VIN (Vehicle Identification Number)

(a) Read VIN using a hand-held tester.

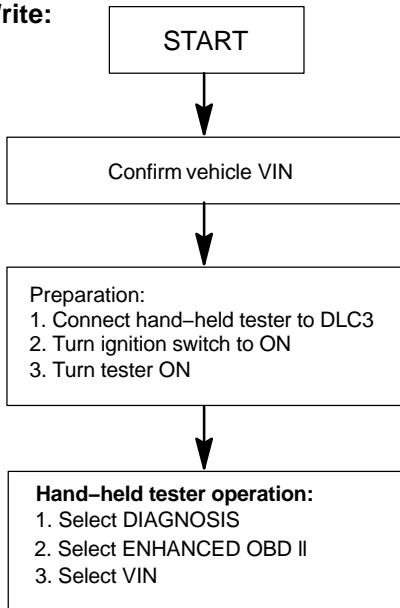

READ:

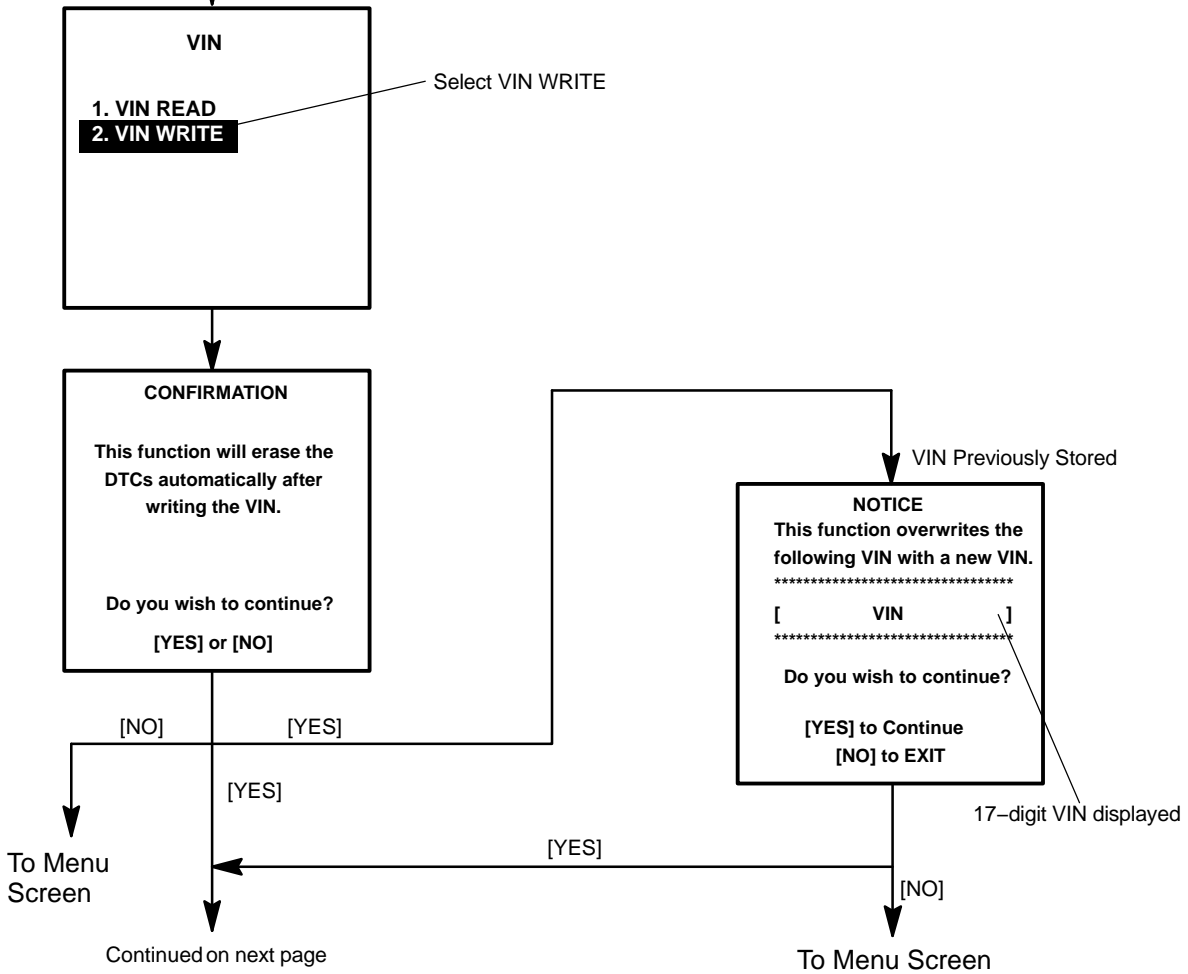

4. WRITE VIN

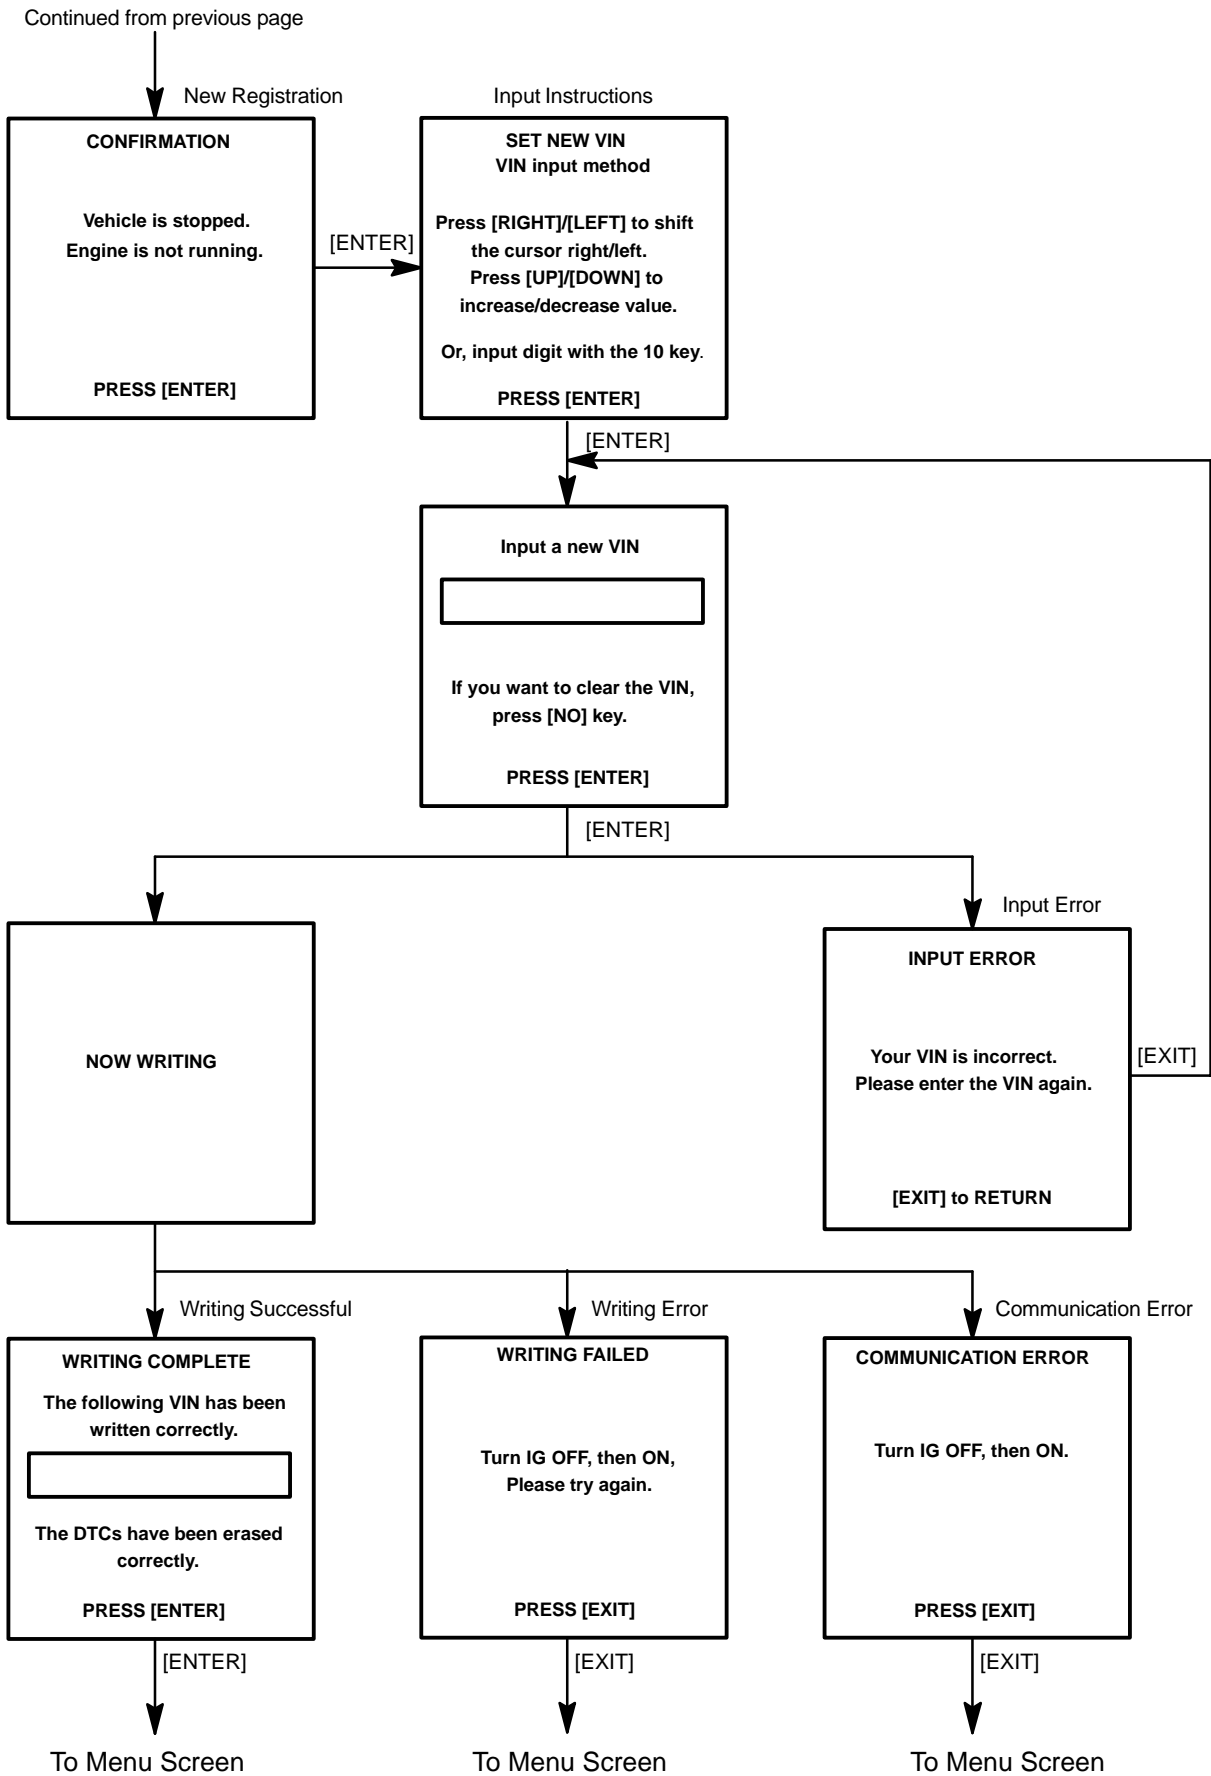

(a) Write VIN using the hand-held tester.

Write:

O2S TEST RESULT

INTRODUCTION

The O2S TEST RESULT refers to the results of the engine control module (ECM) when it monitors the oxygen sensor (O2S), and it can be read using the hand-held tester. Based on this, you can find the O2S's conditions.

The ECM monitors the O2S in the various items. You can read the monitor result (TEST DATA) of each monitor item using the O2S TEST RESULT. However, the output value of the TEST DATA is the latest "snapshot" value that is taken after monitoring and therefore it is not dynamic.

In this repair manual, the description of the O2S TEST RESULT (for O2S related DTCs) are written in a table.

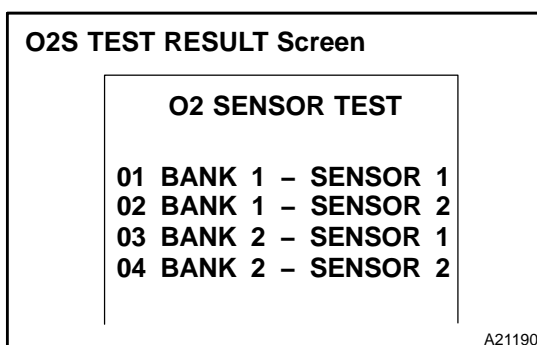

This table consists of 5 items:

- (1) TEST ID (a code applied to each TEST DATA)
- (2) Description of TEST DATA
- (3) Conversion Factor (When Conversion Factor has a value written in the table, multiply the TEST DATA value appearing on the scan tool by the Conversion Factor value. The result will be the required value.)
- (4) Unit
- (5) Standard Value

If the TEST DATA value appearing on the scan tool is out of the standard value, the O2S is malfunctioning. If it is within the standard value, the O2S is functioning normally. However, if the value is on the borderline of the standard value, the O2S may malfunction very soon.

HOW TO READ O2S TEST RESULT USING HAND-HELD TESTER

- (a) Connect the hand-held tester to the DLC3.

- (b) On the tester screen, select the following menus: DIAGNOSIS / CARB OBDII / O2S TEST RESULT. A list of the O2S equipped on the vehicle will be displayed.

- (c) Select the desired O2S and press ENTER. The following screen will appear.
- (d) Press HELP and * simultaneously. More information will appear.
- (e) Example:
 - (1) The hand-held tester displays "17" as a value of the "TIME \$81" (see the illustration on the left).
 - (2) Find the Conversion Factor value of "TIME \$81" in the O2S TEST RESULT chart below. 0.3906 is specified for \$81 in this chart.
 - (3) Multiply "17" in step (1) by 0.3906 (Conversion Factor) in the step (2).
 $17 \times 0.3906 = 6.6 \%$
 - (4) If the answer is within the standard value, the "TIME \$81" can be confirmed to be normal.

O2S TEST RESULT Chart

TEST ID	Description of TEST DATA	Conversion Factor	Unit	Standard Value
\$81	Percentage of monitoring time when the HO2S voltage is less than 0.05V	Multiply 0.3906	%	Within 60 %

CHECKING MONITOR STATUS

1. OUTLINE

The monitor results and the test values can be checked with the hand-held tester.

The engine control module (ECM) monitors the emissions-related components as the thermostat, catalyst converter and evaporative emissions (EVAP), and determines whether they are functioning normally or not. When finished and monitoring, the ECM stores the monitor results and the test values.

The monitor result indicates whether the component is functioning normally or not. The test value is the value that was used to determine the monitor result. If the test value is outside the test limit (malfunction criterion), the ECM determines the component is malfunctioning. Some emissions-related components have multiple test values to determine monitor result. If one of these test values is outside test limit, the ECM determines the component is determine monitor result. If one of these test values is outside test limit, the ECM determines the components is malfunctioning.

2. DESCRIPTION

The test value and test limit information are described as shown in the following table. This information is included under "MONITOR RESULT" in the emissions-related DTC sections.

Thermostat:

MID	TID	Scaling	Test Result	Minimum Test Limit	Maximum Test Limit
\$E1	\$E8	Multiply by 0.1 [°C]	ECT sensor output when estimated ECT reached to malfunction criteria	Malfunction criteria	Maximum test limit

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic hand-held tester.

3. PROCEDURE (USING HAND-HELD TESTER)

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch and hand-held tester ON.
- Clear DTCs.
- Allow the vehicle to drive, in accordance with the applicable drive pattern described in the READINESS MONITOR DRIVE PATTERN section (see page [DI-27](#)).
- Check the monitor result. Select the hand-held tester menus: DIAGNOSIS/ENHANCED OBDII/MONITOR INFO/MONITOR STATUS. The monitor result appears after the component name.
 - AVAIL indicates the component has not been monitored yet.
 - COMPL indicates the component is functioning normally.
 - INCMPL indicates the component is malfunctioning.
- Check the test value(s). Select the hand-held tester menus: DIAGNOSIS/ENHANCED OBDII/MONITOR INFO/TEST RESULT.
- Select the component and press ENTER. If the monitor result has been COMPL or INCMPL, the accuracy test value appears.
- Compare the test value with the test limits, MIN and MAX.
 - If the test value is outside of the test limit, the component is malfunctioning.
 - If the test value is on the borderline of the test limit, a malfunction is concealed in the component.

HINT:

The monitor result might on rare occasions be COMPL even if the malfunction indicator lamp (MIL) is illuminated. This indicates the system malfunctioned on a previous driving cycle. This might be caused by an intermittent problem.

READINESS MONITOR DRIVE PATTERN

1. PURPOSE OF THE READINESS TESTS

- The On-Board Diagnostic (OBD II) system is designed to monitor the performance of emission-related components and report any detected abnormalities in the form of Diagnostic Trouble Codes (DTCs). Since the various components need to be monitored during different driving conditions, the OBD II system is designed to run separate monitoring programs called Readiness Monitors. Many state Inspection and Maintenance (I/M) programs require that vehicles complete their Readiness Monitors prior to beginning an emission test.
- The current status of the Readiness Monitors can be seen by using the hand-held tester with version 9.0 software (or newer), or a generic OBD II Scan tool.
- To view the Readiness Monitor status using the hand-held tester, select "Monitor Status" from the Enhanced OBD II Menu.
- A status of "complete" indicates that the necessary conditions have been met to run the performance tests for the related Readiness Monitor.
- The Readiness Monitor will be reset to "incomplete" if:
 - ECM has lost power (battery or fuse).
 - DTCs have been cleared.
 - The conditions for running the Readiness Monitor have not been met.
- In the event that any Readiness Monitor shows "incomplete," follow the appropriate Readiness Monitor Drive Pattern to activate the monitor and change the readiness status to "complete."

CAUTION:

Strictly observe the posted speed limits, traffic laws, and road conditions when performing these drive patterns.

NOTICE:

These drive patterns represent the fastest method to satisfy all necessary conditions which allow the specific readiness monitor to complete.

In the event that the drive pattern must be interrupted (possibly due to traffic conditions or other factors) the drive pattern can be resumed, and in most cases, the readiness monitor will still set to "complete".

To ensure rapid completion of readiness monitors, avoid sudden changes in vehicle load and speed (driving up and down hills and/or sudden acceleration).

Contents:

TITLE	STEP(s)
CATALYST MONITOR	2
EVAP MONITOR	3, 4
AIR-FUEL RATIO (A/F) AND OXYGEN SENSOR (O ₂ S) MONITOR	5
OXYGEN SENSOR HEATER MONITOR	6

2. CATALYST MONITOR (ACTIVE AIR-FUEL RATIO CONTROL TYPE)

(a) Preconditions

The monitor will not run unless:

- The MIL is OFF

(b) Drive Pattern

- (1) Connect a hand-held tester or OBD II scan tool to the DLC3.
- (2) Turn the ignition switch to ON.
- (3) Turn the tester or scan tool ON.
- (4) Clear DTCs (where set) (see page [DI-42](#)).
- (5) Start the engine and warm it up.
- (6) Drive the vehicle at between 40 mph and 70 mph (64 km/h and 113 km/h) for at least 10 minutes.

(c) Monitor Status

- (1) Check the Readiness Monitor status displayed on the tester or scan tool.
- (2) If the status does not switch to COMPL (complete), extend the driving time.

3. EVAP MONITOR (VACUUM PRESSURE MONITOR)

NOTICE:

A cold soak must be performed prior to conducting the drive pattern to complete the Internal Pressure Readiness Monitor.

(a) Cold Soak Preconditions

The monitor will not run unless:

- MIL is OFF
- Fuel level is approximately 1/2 to 3/4
- Altitude is 7,800 feet (2,400 m) or less

(b) Cold Soak Procedure

Let the vehicle cold soak for 8 hours or until the difference between IAT and ECT becomes less than 7°C (13°F)

HINT:

Examples:

- Scenario 1

ECT = 24°C (75°F)

IAT = 16°C (60°F)

Difference between ECT and IAT is 8°C (15°F)

→ The monitor will not run because difference between ECT and IAT is greater than 7°C (13°F)

- Scenario 2

ECT = 21°C (70°F)

IAT = 20°C (68°F)

Difference between ECT and IAT is 1°C (2°F)

→ The monitor will run because difference between ECT and IAT is less than 7°C (13°F)

4. EVAP MONITOR (VACUUM PRESSURE MONITOR) (CONTINUED)

(a) Preconditions

The monitor will not run unless:

- MIL is OFF
- Fuel level is approximately 1/2 to 3/4
- Altitude is 7,800 feet (2,400 m) or less
- Engine Coolant Temperature (ECT) is between 4.4°C and 35°C (40°F and 95°F)
- Intake Air Temperature (IAT) is between 4.4°C and 35°C (40°F and 95°F)
- Cold Soak Procedure has been completed
- Before starting the engine, the difference between ECT and IAT must be less than 7°C (13°F)

HINT:

Examples:

- Scenario 1
ECT = 24°C (75°F)
IAT = 16°C (60°F)
Difference between ECT and IAT is 8°C (15°F)
→ The monitor will not run because difference between ECT and IAT is higher than 7°C (13°F)
- Scenario 2
ECT = 21°C (70°F)
IAT = 20°C (68°F)
Difference between ECT and IAT is 1°C (2°F)
→ The monitor will run because difference between ECT and IAT is less than 7°C (13°F)

The readiness test can be completed in cold ambient conditions (less than 40°F / 4.4°C) and/or at high altitudes (more than 7,800 feet / 2,400 m) if the drive pattern is repeated a second time after cycling the ignition off.

(b) Drive Pattern

- (1) Connect the OBD II scan tool to DLC3 to check monitor status and preconditions (refer to (a)).
- (2) Release pressure in fuel tank by removing the fuel tank cap and then reinstall it.
- (3) Start the engine and allow it to idle until ECT becomes 75°C (167°F) or higher.
- (4) Run the engine at 3,000 rpm for approximately 10 seconds.
- (5) Allow the engine to idle with the A/C ON (to create slight load) for 15 to 50 minutes.

NOTICE:

If the vehicle is not equipped with A/C, put a slight load on the engine by doing the following :

- **Securely set the parking brake.**
- **Block the drive wheels with wheel chocks.**
- **Allow the vehicle to idle in drive for 15 to 50 minutes.**

5. AIR-FUEL RATIO (A/F) AND OXYGEN SENSOR (HO2) MONITOR (ACTIVE AIR-FUEL RATIO CONTROL TYPE)

(a) Preconditions

The monitor will not run unless:

- 2 minutes or more have elapsed since the engine was started.
- The Engine Coolant Temperature (ECT) is 75°C (167°F) or higher.
- Air-fuel ratio feedback control is performed.
- Fuel-cut control is performed for 8 seconds or more.

(b) Drive Pattern

- (1) Connect the hand-held tester to DLC3.
- (2) Turn the ignition switch to ON.
- (3) Clear DTCs (see page DI-42).
- (4) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
- (5) Drive the vehicle at 40 mph (64 km/h) or more for at least 10 minutes.
- (6) Change the transmission to 2nd gear.
- (7) Accelerate the vehicle to 30 mph (48 km/h) or more by depressing the accelerator pedal for at least 10 seconds.
- (8) Soon after performing step (8) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
- (9) Stop the vehicle and allow the engine to idle for 10 seconds or more.
- (10) Allow the vehicle to decelerate until the vehicle speed declines to less than 6 mph (10 km/h).
- (11) Repeat steps from (8) through (10) above at least 3 times in one driving cycle.

(c) Monitor Status

- (1) Check the Readiness Monitor status displayed on the tester.
- (2) If the status does not switch to COMPL (complete), make sure that the preconditions have been met, and then perform steps from (5) through (11) in Drive Pattern above.

6. OXYGEN SENSOR HEATER MONITOR

A18915

(a) Preconditions

The monitor will not run unless:

- MIL is OFF

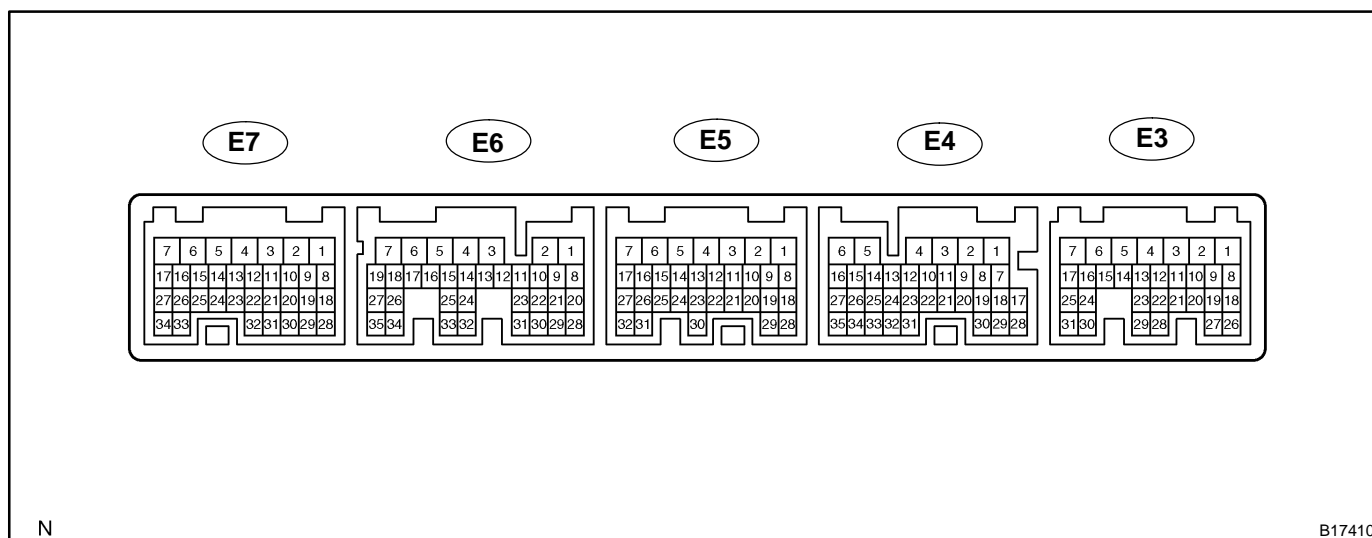

(b) Drive Pattern

- (1) Connect the OBD II scan tool to the DLC3 to check monitor status and preconditions (refer to (a)).
- (2) Start the engine and allow it to idle for 500 seconds or more.
- (3) Drive the vehicle at 25 mph (40 km/h) or more for at least 2 minutes.
- (4) Check the status of the readiness monitor on the scan tool display. If readiness status did not switch to complete, ensure the preconditions are met, turn the ignition off and then repeat steps (2) and (3).

TERMINALS OF ECM

Each ECM terminals' standard voltage is shown in the table below. In the table, first follow the information under "Condition".

Look under "Symbols (Terminals No.)" for the terminals to be inspected.

The standard voltage between the terminals is shown under "STD Voltage".

Use the illustration above as a reference for the ECM terminals.

Symbols (Terminals No.)	Wiring Color	Condition	STD Voltage
BATT (E3-3) - E1 (E5-1)	B-R - BR	Always	9 to 14 V
+BM (E3-7) - E1 (E5-1)	G-Y - BR		
IGSW (E3-9) - E1 (E5-1)	B-O - BR

WAVEFORM 1

Fuel injector

ECM Terminal Names	Between #10 (to 60) and E01
Tester Ranges	20 V/DIV, 20 msec./DIV
Conditions	Idling

HINT:

The wavelength becomes shorter as the engine rpm increases.

WAVEFORM 2

Knock sensor

ECM Terminal Name	Between KNK1 and EKNK Between KNK2 and EKN2
Tester Range	1 V/DIV, 1 msec./DIV
Condition	Maintain engine RPM at 2,000 rpm after engine warmed-up

HINT:

- The wavelength becomes shorter as engine rpm increases.
- The waveforms and amplitudes displayed differ slightly depending on the vehicle.

WAVEFORM 3

VVT OCV

ECM Terminal Name	Between OC1+ and OC1- Between OC2+ and OC2-
Tester Range	0.2 V/DIV, 200 msec./DIV
Condition	Accelerate slowly after engine warmed-up

HINT:

In the DATA LIST, the items VVT OCV DUTY B1 and B2 show the duty ratio of voltage flowing to the OCV (see illustration on left).

VVT OCV DUTY B1, B2 = $A/B \times 100$ (%)

WAVEFORM 4

- (a) VVT sensor bank 1
- (b) VVT sensor bank 2
- (c) Crankshaft position sensor

ECM Terminal Name	(a) Between VV1+ and VV1- (b) Between VV2+ and VV2- (c) Between NE+ and NE-
Tester Range	5 V/DIV, 20 msec./DIV
Condition	Idle after engine warmed-up

HINT:

The wavelength becomes shorter as the engine rpm increases.

WAVEFORM 5

Vehicle speed signal

ECM Terminal Name	Between SPD and E1
Tester Range	5 V/DIV, 10 msec./DIV
Condition	Driving by 40 km/h (25 mph)

HINT:

The wavelength becomes shorter as vehicle speed increases.

**WAVEFORM 6**

Throttle actuator positive terminal

ECM Terminal Name	Between M+ and ME01
Tester Range	5 V/DIV, 1 msec./DIV
Condition	Idle after engine warmed-up

HINT:

The duty ratio varies depending on the throttle opening operation.

**WAVEFORM 7**

Throttle actuator negative terminal

ECM Terminal Name	Between M- and ME01
Tester Range	5 V/DIV, 1 msec./DIV
Condition	Idle after engine warmed-up

HINT:

The duty ratio varies depending on the throttle opening operation.

**WAVEFORM 8**

- (a) Igniter IGT signal (from ECM to igniter)
 (b) Igniter IGF1 signal (from igniter to ECM)

ECM Terminal Name	(a) Between IGT1 (to IGT6) and E1 (b) Between IGF1 and E1
Tester Range	2 V/DIV, 20 msec./DIV
Condition	Idling

HINT:

The wavelength becomes shorter as vehicle speed increases.

**WAVEFORM 9**

Heated oxygen sensor

ECM Terminal Names	Between OX1B and E2
Tester Ranges	0.2 V/DIV, 200 msec./DIV
Conditions	Engine speed maintained 2,500 rpm for 2 minutes after warming up sensor

HINT:

In the DATA LIST, item O2S B1S2 shows the ECM input values from the heated oxygen sensor.

**WAVEFORM 10**

Engine speed signal

ECM Terminal Names	Between TACH and E1
Tester Ranges	5 V/DIV, 10 msec./DIV
Conditions	Idling

HINT:

The wavelength becomes shorter as vehicle speed increases.

DIAGNOSIS SYSTEM

1. Description

- When troubleshooting On-Board Diagnostic (OBD II) vehicles, the vehicle must be connected to the hand-held tester. Various data output from the vehicle's ECM can then be read.
- OBD II regulations require that the vehicle's on-board computer illuminates the Malfunction Indicator Light (MIL) on the instrument panel when the computer detects a malfunction in: 1) the emission control system/components, or 2) the powertrain control components (which affect vehicle emissions), or 3) the computer. In addition, the applicable Diagnostic Trouble Codes (DTCs) prescribed by SAE J2012 are recorded in the ECM memory (See page [DI-57](#)).

If the malfunction does not reoccur in 3 consecutive trips, the MIL goes off automatically but the DTCs remain recorded in the ECM memory.

To check the DTC, connect the hand-held tester or OBD II scan tool to the Data Link Connector 3 (DLC3) of the vehicle. The hand-held tester also enables you to erase the DTC and check the freeze frame data and various forms of engine data (See the instruction manual for the hand-held tester). The DTC includes SAE controlled codes and manufacturer controlled codes. SAE controlled codes must be set according to the SAE, while manufacturer controlled codes can be set by a manufacturer with certain restrictions (See the DTC chart on page [DI-57](#)).

2. NORMAL MODE AND CHECK MODE

The diagnosis system operates in "normal mode" during normal vehicle use. In "normal mode", 2 trip detection logic* is used to ensure accurate detection of malfunctions. A "check mode" is also available to technicians as an option. In "check mode", 1 trip detection logic is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent malfunctions (See page [DI-11](#)).

3. 2-TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory. This is known as 1st trip detection. If the ignition switch is turned OFF and then ON again, and the same malfunction is detected again, the MIL will illuminate. This is known as 2nd trip detection.

- Freeze frame data:
The freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

Priorities for troubleshooting:

When multiple DTCs occur, find out the order in which the DTCs should be inspected by checking the component's DTC chart. If no instructions are written in the DTC chart, check DTCs in the following order of priority:

- DTCs other than fuel trim malfunction DTCs (P0171, P0172, P0174 and P0175) and misfire DTCs (P0300 to P0306).
- Fuel trim malfunction DTCs (P0171, P0172, P0174 and P0175).
- Misfire DTCs (P0300 to P0306).

4. CHECK DLC3

The vehicle's ECM uses the ISO 9141–2 for communication protocol. The terminal arrangement of the DLC3 complies with SAE J1962 and matches the ISO 9141–2 format.

Symbol	Terminal Description	Condition	Specified Condition
SIL (7) – SG (5)	Bus "+" line	During transmission	Pulse generation
CG (4) – Body ground	Chassis ground	Always	Below 1 Ω
SG (5) – Body ground	Signal ground	Always	Below 1 Ω
BAT (16) – Body ground	Battery positive	Always	11 to 14 V
CANH (6) – CANL (14)	HIGH–level CAN bus line	Ignition switch OFF	54 to 69 Ω
CANH (6) – Battery positive	HIGH–level CAN bus line	Ignition switch OFF	1 M Ω or higher
CANH (6) – CG (4)	HIGH–level CAN bus line	Ignition switch OFF	1 k Ω or higher
CANL (14) – Battery positive	LOW–level CAN bus line	Ignition switch OFF	1 M Ω or higher
CANL (6) – CG (4)	LOW–level CAN bus line	Ignition switch OFF	1 k Ω or higher

HINT:

Connect the cable of the hand–held tester to the DLC3, turn the ignition switch ON and attempt to use the hand–held tester. If the screen displays UNABLE TO CONNECT TO VEHICLE, a problem exists in the vehicle side or the tester side.

- If the communication is normal when the tool is connected to another vehicle, inspect the DLC3 on the original vehicle.

- If the communication is still impossible when the tool is connected to another vehicle, the problem is probably in the tool itself, so consult the Service Department listed in the tool's instruction manual.

5. INSPECT BATTERY VOLTAGE

Battery Voltage: 11 to 14 V

If voltage is below 11 V, recharge the battery before proceeding.

6. CHECK MIL

- (a) The MIL comes on when the ignition switch is turned ON and the engine is not running.

HINT:

If the MIL is not illuminated, troubleshoot the MIL circuit (See page [DI-417](#)).

- (b) When the engine is started, the MIL should not illuminate. If the lamp remains on, the diagnosis system has detected a malfunction or abnormality in the system.

7. ALL READINESS

For this vehicle, using the hand-held tester allows readiness codes corresponding to all DTCs to be read. When diagnosis (normal or malfunctioning) has been complete, readiness codes are set. Enter the following menus: ENHANCED OBD II / MONITOR STATUS on the hand-held tester.

DTC CHECK / CLEAR

1. CHECK DTC

DTCs which are stored in the ECM can be displayed with the hand-held tester or generic OBD II scan tool.

These scan tools can display pending DTCs and current DTCs. Some DTCs are not stored if the ECM does not detect a malfunction during consecutive driving. However, the detected malfunction during once driving is stored as pending DTC.

- (a) Connect the hand-held tester to the CAN VIM. Then connect the CAN VIM to the Data Link Connector 3 (DLC3).
- (b) Turn the ignition switch to ON.
- (c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES (or PENDING CODE).
- (d) Confirm the DTCs and freeze frame data and then write them down.
- (e) See page [DI-57](#) to confirm the details of the DTCs.

NOTICE:

When simulating a symptom with the hand-held tester to check the DTCs, use the normal mode. For DTC chart subject to "2 trip detection logic", perform either of the following actions.

Turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again. When the problem has been simulated twice, the MIL illuminates and the DTCs are recorded in the ECM.

2. CLEAR DTC

- (a) Connect the hand-held tester to the CAN VIM. Then connect the CAN VIM to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CLEAR CODES and press YES.

CHECK MODE PROCEDURE

HINT:

Hand-held tester only:

Check mode has a higher sensitivity to detect malfunctions and can detect malfunctions that normal mode cannot detect. Check mode can also detect all the malfunctions that normal mode can detect.

1. CHECK MODE PROCEDURE

- (a) Make sure that the items below are true.
 - (1) Battery positive voltage 11 V or more
 - (2) Throttle valve fully closed
 - (3) Transmission in the P or N position
 - (4) A/C switched OFF
- (b) Turn the ignition switch OFF.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch ON.
- (e) Change the ECM to check mode with the hand-held tester. Enter the following menus: DIAGNOSIS / ENHANCED OBD II / CHECK MODE. Make sure the MIL flashes as shown in the illustration.

NOTICE:

All DTCs and freeze frame data recorded will be erased if:

- 1) the hand-held tester is used to change the ECM from normal mode to check mode or vice-versa; or
- 2) during check mode, the ignition switch is turned from ON to ACC or OFF.

- (f) Start the engine. The MIL should turn off after the engine starts.
- (g) Simulate the conditions of the malfunction described by the customer.
- (h) After simulating the malfunction conditions, use the hand-held tester diagnosis selector to check the DTC, freeze frame data and other data.
- (i) After checking the DTC, inspect the applicable circuit.

2. CLEAR DTC (Using the hand-held tester)

- (a) Connect the OBD II scan tool or the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Erase DTCs and freeze frame data with the OBD II scan tool (complying with SAE J1978) or the hand-held tester. For the hand-held tester: 1) enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CLEAR CODES; and 2) press YES. For the OBD II scan tool, see its instruction manual.

3. CLEAR DTC (Not using the hand-held tester)

- (a) Remove the EFI No. 1 and ETCS fuses from the engine room J/B for more than 60 seconds, or disconnect the battery terminal for more than 60 seconds.

After disconnecting the battery terminal, perform the "INITIALIZE" procedure.

FAIL-SAFE CHART

If any of the following code is recorded, the ECM enters fail-safe mode.

DTC No.	Fail-Safe Operation	Fail-Safe Deactivation Conditions
P0031 P0032 P0037 P0038 P0051 P0052 P0057 P0058	The heater circuit in which an abnormality is detected is turned off	Ignition switch OFF
P0100 P0102 P0103	Ignition timing is calculated from engine speed and throttle angle	"Pass" condition detected
P0110 P0112 P0113	Intake air temperature is fixed at 20°C (68°F)	"Pass" condition detected
P0115 P0117 P0118	Engine coolant temperature is fixed at 80°C (176°F)	"Pass" condition detected
P0120 P0121 P0122 P0123 P0220 P0222 P0223 P0606 P0607 P0657 P2102 P2103 P2111 P2112 P2118 P2119 P2135	<p>If the Electronic Throttle Control System (ETCS) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimal speed.</p> <p>If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly. If the accelerator pedal is depressed quickly, the vehicle may speed up and slow down erratically.</p>	"Pass" condition is detected and then the ignition switch is turned OFF.

P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	Fuel cut	"Pass" condition detected
P2120 P2121 P2122 P2123 P2125 P2127 P2128 P2138	The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the remaining circuit is used to calculate the accelerator pedal opening to allow the vehicle to continue driving. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal to be fully closed. In this case, the throttle valve will remain closed as if the engine is idling.	"Pass" condition is detected and the ignition switch is turned OFF.

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

By reading the DATA LIST displayed on a hand-held tester, you can check values, including those of the switches, sensors, and actuators, without removing any parts. Reading the DATA LIST as the first step of troubleshooting is one method of shortening diagnostic time.

NOTICE:

In the table below, the values listed under Normal Conditions are for reference only. Do not depend solely on these values when determining whether or not a part is faulty.

- (a) Warm up the engine.
- (b) Turn the ignition switch to OFF.
- (c) Connect a hand-held tester to the DLC3.
- (d) Turn the ignition switch to ON.
- (e) Turn the tester ON.
- (f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST.
- (g) Check the values by referring to the table below.

Hand-Held Tester Display	Measurement Item:Range (Display)	Normal Condition *	Diagnostic Note
INJECTOR	Injection period of the No. 1 cylinder: Min.: 0 ms, Max.: 32.64 ms	2.3 to 3.8 ms: Idling	—
IGN ADVANCE	Ignition timing advance for No. 1 cylinder/ Min.: -64 deg., Max.: 63.5 deg.	BTDC 4 to 17°: Idling	—
CALC LOAD	Calculated load by ECM: Min.: 0 %, Max.: 100 %	• 11 to 21 %: Idling • 12 to 22 %: Running without load (2,500 rpm)	—
VEHICLE LOAD	Vehicle load: Min.: 0 %, Max.: 25700 %	Actual vehicle load	—
MAF	Air flow rate from MAF meter: Min.: 0 g/s, Max.: 655 g/s	2.0 to 3.9 g/s: Idling	If the value approximately 0.0 g/s: • Mass air flow meter power source circuit open • VG circuit open or short If the value 160.0 g/s or more: • E2G circuit open
ENGINE SPD	Engine speed: Min.: 0 rpm, Max.: 16,383 rpm	600 ± 50 rpm: Idling	—
VEHICLE SPD	Vehicle speed: Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	Speed indicated on speedometer
COOLANT TEMP	Engine coolant temperature: Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F): After warming up	• If the value -40°C (-40°F): sensor circuit open • If the value 140°C (284°F): sensor circuit shorted
INTAKE AIR	Intake air temperature: Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	• If the value -40°C (-40°F): sensor circuit open • If the value 140°C (284°F): sensor circuit shorted
AIR-FUEL RATIO	Air-fuel ratio: Min.: 0, Max.: 1.999	0.8 to 1.2: During idling	—
EVAP VAPOR PRES	EVAP vapor pressure: Min.: -8192 Pa, Max.: 8191 Pa	0 Pa: Fuel tank cap removed	—
PURGE DENSITY	Learning value of purge density/ Min.: -50, Max.: 350	Idling: -40 to 0 %	Service data

PURGE FLOW	Purge flow: Min.: 0 %, Max.: 102.4 %	0 to 100 %: Idling	—
EVAP PURGE VSV	EVAP (Purge) VSV control duty: Min.: 0 %, Max.: 100 %	0 to 100 %: During idling	Order signal from ECM
VAPOR PRESS	Vapor pressure: Min.: -4.125 kPa, Max.: 2.125 kPa	0 kPa: Fuel tank cap removed	Pressure inside fuel tank monitored by the vapor pressure sensor
KNOCK CRRT VAL	Correction learning value of knocking: Min.: -64 CA, Max.: 1,984 CA	0 to 22 °CA: Driving, 44 mph (70 km/h)	Service data
KNOCK FB VAL	Feedback value of knocking: Min.: -64 CA, Max.: 1,984 CA	-22 to 0 °CA Driving, 44 mph (70 km/h)	Service data
ACCEL POS #1	Absolute Accelerator Pedal Position (APP) No. 1: Min.: 0 %, Max.: 100 %	10 to 22 %: accelerator pedal is released 54 to 86 %: accelerator pedal is fully depressed	—
ACCEL POS #2	Absolute APP No. 2: Min.: 0 %, Max.: 100 %	12 to 42 %: accelerator pedal is released 66 to 98 %: The accelerator pedal is fully depressed	—
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 4.98 V	—	ETCS freeze data
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 4.98 V	—	ETCS freeze data
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: accelerator pedal is released. 2.6 to 4.5 V: or pedal is fully depressed.	—
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: accelerator pedal is released. 3.4 to 5.3 V: accelerator pedal is fully depressed.	—
ACCEL IDL POS	Whether or not accelerator pedal position sensor detecting idle: ON or OFF	ON: Idling	—
THRTL LEARN VAL	Throttle valve fully closed (learned value):	0.4 to 0.8 V	—
ACCEL SSR #1 AD	Accelerator fully closed value No.1 (AD): Min.: 0, Max.: 4.98 V	—	ETCS service data
ACCEL LRN VAL#1	Accelerator fully closed learning value No.1: Min.: 0, Max.: 124.512	—	ETCS service data
ACCEL LRN VAL#2	Accelerator fully closed learning value No.2: Min.: 0, Max.: 124.512	—	ETCS service data
FAIL #1	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	—
FAIL #2	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	—
ST1	Starter signal: ON or OFF	ON: Cranking	—

DIAGNOSTICS – ENGINE (1GR-FE)

SYSGUARD JUDGE	System guard: ON or OFF	—	ETCS service data
OPN MALFUNCTION	Open side malfunction: ON or OFF	—	ETCS service data
THROTTLE POS	Absolute throttle position sensor: Min.: 0 %, Max.: 100 %	• 10 to 24 %: Throttle fully closed • 64 to 96 %: Throttle fully open	Read the value with intrusive operation (active test)
THROTTL IDL POS	Whether or not throttle position sensor detecting idle: ON or OFF	ON: Idling	—
THRTL REQ POS	Throttle requirement position: Min.: 0 V, Max.: 5 V	0.5 to 1.0 V: Idling	—
THROTTLE POS	Throttle sensor positioning: Min.: 0 %, Max.: 100 %	10 to 18 %: Idling	Calculated value based on VTA1
THROTTLE POS #2	Throttle sensor positioning #2: Min.: 0 %, Max.: 100 %	—	Calculated value based on VTA2
THROTTLE POS #1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 4.9 V	—	ETCS freeze data
THROTTLE POS #2	Throttle position sensor No.2 output voltage: Min.: 0 V, Max.: 4.9 V	—	ETCS freeze data
THROTTLE POS #1	Throttle position No. 1: Min.: 0 V, Max.: 5 V	• 0.5 to 1.2 V: Throttle fully closed • 3.2 to 4.8 V: Throttle fully opened	—
THROTTLE POS #2	Throttle position No. 2: Min.: 0 V, Max.: 5 V	• 2.0 to 2.9 V: Throttle fully closed • 4.6 to 5.5 V: Throttle fully open	Read the value with intrusive operation (active test)
THRTL COMND VAL	Throttle position command value: Min.: 0 V, Max.: 4.98 V	0.5 to 4.8 V	ETCS service data
THROTTLE SSR #1	Throttle sensor opener position No. 1: Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	ETCS service data
THROTTLE SSR #2	Throttle sensor opener position No. 2: Min.: 0 V, Max.: 4.98 V	2.2 to 2.6 V	ETCS service data
THRTL SSR #1 AD	Throttle sensor opener position No.1 (AD): Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	ETCS service data
THROTTLE MOT	Whether or not throttle motor control permitted: ON or OFF	ON: Idling	Read the value with the power switch ON (Do not start engine)
THROTTLE MOT	Throttle motor current: Min.: 0 A, Max.: 80 A	0 to 3.0 A: Idling	—
THROTTLE MOT	Throttle motor: Min.: 0 %, Max.: 100 %	0.5 to 40 %: Idling	—
THROTTLE MOT	Throttle motor current: Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	—
THROTL OPN DUTY	Throttle motor opening duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	When accelerator pedal depressed, duty ratio increased
THROTL CLS DUTY	Throttle motor closed duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	When accelerator pedal released quickly, duty ratio increased
THRTL MOT (OPN)	Throttle motor duty ratio (open): Min.: 0 %, Max.: 100 %	—	ETCS service data
THRTL MOT (CLS)	Throttle motor duty ratio (close): Min.: 0 %, Max.: 100 %	—	ETCS service data

O2S B1 S2	Heated oxygen sensor output voltage for bank 1 sensor 2: Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving 44 mph (70 km/h)	Performing the INJ VOL or A/F CONTROL function of the ACTIVE TEST enables the technician to check voltage output of the sensor
O2S B2 S2	Heated oxygen sensor output voltage for bank 1 sensor 2: Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving 44 mph (70 km/h)	Performing the INJ VOL or A/F CONTROL function of the ACTIVE TEST enables the technician to check voltage output of the sensor
AFS B1 S1	A/F sensor output voltage for bank 1 sensor 1: Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the INJ VOL or A/F CONTROL function of the ACTIVE TEST enables the technician to check voltage output of the sensor
AFS B2 S1	A/F sensor output voltage for bank 1 sensor 1: Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the INJ VOL or A/F CONTROL function of the ACTIVE TEST enables the technician to check voltage output of the sensor
TOTAL FT #1	Total fuel trim of bank 1 Average value for fuel trim system of bank 1: Min.: -0.5, Max.: 1,496	-0.2 to 0.2: Idling	—
TOTAL FT #2	Total fuel trim of bank 1 Average value for fuel trim system of bank 1: Min.: -0.5, Max.: 1,496	-0.2 to 0.2: Idling	—
SHORT FT #1	Short-term fuel trim of bank 1: Min.: -100 %, Max.: 99.2%	0 ± 20 %	This item the short-term fuel compensation used to maintain the air-fuel ratio at stoichiometric air-fuel ratio
SHORT FT #2	Short-term fuel trim of bank 1: Min.: -100 %, Max.: 99.2%	0 ± 20 %	This item the short-term fuel compensation used to maintain the air-fuel ratio at stoichiometric air-fuel ratio
LONG FT #1	Long-term fuel trim of bank 1: Min.: -100 %, Max.: 99.2 %	0 ± 20 %	This item the overall fuel compensation carried out in long-term to compensate a continual deviation of the short-term fuel trim from the central value
LONG FT #2	Long-term fuel trim of bank 1: Min.: -100 %, Max.: 99.2 %	0 ± 20 %	This item the overall fuel compensation carried out in long-term to compensate a continual deviation of the short-term fuel trim from the central value
FUEL SYS #1	Fuel system status (Bank1): OL or CL or OL DRIVE or OL FAULT or CL FAULT	CL: Idling after warming up	<ul style="list-style-type: none"> • OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using heated oxygen sensor as feedback for fuel control. • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but heated oxygen sensor, which used for fuel control malfunctioning

DIAGNOSTICS – ENGINE (1GR-FE)

FUEL SYS #2	Fuel system status (Bank1): OL or CL or OL DRIVE or OL FAULT or CL FAULT	CL: Idling after warming up	<ul style="list-style-type: none"> • OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using heated oxygen sensor as feedback for fuel control. • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but heated oxygen sensor, which used for fuel control malfunctioning
O2FT B1 S2	Short-term fuel trim associated with the bank 1 sensor 2: Min.: -100 %, Max.: 99.2 %	0 ± 20 %	Same as SHORT FT #1
O2FT B2 S2	Short-term fuel trim associated with the bank 1 sensor 2: Min.: -100 %, Max.: 99.2 %	0 ± 20 %	Same as SHORT FT #1
AF FT B1 S1	Short-term fuel trim associated with the bank 1 sensor 1: Min.: 0, Max.: 1.999	<ul style="list-style-type: none"> • Value less than 1 (0.000 to 0.999) = Lean • Stoichiometric air-fuel ratio=1 • Value greater than 1 (1.001 to 1.999) = RICH 	—
AF FT B2 S1	Short-term fuel trim associated with the bank 1 sensor 1: Min.: 0, Max.: 1.999	<ul style="list-style-type: none"> • Value less than 1 (0.000 to 0.999) = Lean • Stoichiometric air-fuel ratio=1 • Value greater than 1 (1.001 to 1.999) = RICH 	—
CAT TEMP B1S1	Catalyst temperature (Bank 1, Sensor 1): Min.: -40, Max.: 6,513.5 °C	—	—
CAT TEMP B2S1	Catalyst temperature (Bank 1, Sensor 1): Min.: -40, Max.: 6,513.5 °C	—	—
CAT TEMP B1S2	Catalyst temperature (Bank 1, Sensor 2): Min.: -40, Max.: 6,513.5 °C	—	—
CAT TEMP B2S2	Catalyst temperature (Bank 1, Sensor 2): Min.: -40, Max.: 6,513.5 °C	—	—
INI COOL TEMP	Initial engine coolant temperature: Min.: -40°C, Max.: 140°C	Close to ambient air temperature	Service data
INI INTAKE TEMP	Initial intake air temperature: Min.: -40°C, Max.: 140°C	Close to ambient air temperature	Service data
INJ VOL	Injection volume (cylinder 1): Min.: 0 ml, Max.: 2.048 ml	0 to 0.5 ml	Quantity of fuel injection volume for 10 times
ACC RELAY	ACC relay: ON or OFF	ON: Cranking	—
STARTER RELAY	Starter relay: ON or OFF	ON: Cranking	—
STARTER SIG	Starter signal: ON or OFF	ON: Cranking	—
STARTER CONTROL	Starter switch status: ON or OFF	ON: Cranking	—
PS SW	Power steering signal: ON or OFF	ON: Power steering operation	—

PS SIGNAL	Power steering signal: ON or OFF	ON: When steering wheel first turned after ignition switch turned to ON	This signal status usually ON until ignition switch turned to OFF
CTP SW	Closed throttle position switch: ON or OFF	• ON: Throttle fully closed • OFF: Throttle open	—
PNP SW (NSW)	PNP switch status: ON or OFF	ON: P or N position	—
A/C SIG	A/C signal: ON or OFF	ON: A/C ON	—
ELECT LOAD SIG	Electrical load signal: ON or OFF	ON: Headlights or defogger is turned ON	—
STOP LIGHT SW	Stop lamp switch: ON or OFF	ON: brake pedal is depressed.	—
+BM	Whether or not electric throttle control system power inputted: ON or OFF	ON: Idling	—
+BM VOLTAGE	+BM voltage: Min.: 0, Max.: 19.92	10 to 15 V: Idling	ETCS service data
BATTERY VOLTAGE	Battery voltage: Min.: 0 V, Max.: 65.535 V	9 to 14 V: Idling	—
ACTUATOR POWER	Actuator power supply: ON or OFF	ON: Idling	ETCS service data
ATM PRESSURE	Atmospheric pressure: Min.: 0 kPa, Max.: 150 kPa	Equivalent to atmospheric pres- sure (absolute pressure)	—
ACT VSV	A/C cut status for Active Test: ON or OFF	—	Active Test support data
ACIS VSV	VSV for ACIS control: ON or OFF	—	Active Test support data
EVAP (Purge) VSV	VSV status for EVAP control: ON or OFF	—	Active Test support data
FUEL PUMP / SPD	Fuel pump/speed status: ON or OFF	—	Active Test support data
FUEL SP CTL	Fuel pump speed control status: ON or OFF	—	Active Test support data
VVT CTRL B1	VVT control status: ON or OFF	—	Active Test support data
VVT CTRL B2	VVT control status: ON or OFF	—	Active Test support data
VACUUM PUMP	Key-off EVAP system pump sta- tus: ON or OFF	—	Active Test support data
EVAP VENT VAL	Key-off EVAP system vent valve status: ON or OFF	—	Active Test support data
TC/TE1	TC and TE1 terminal of DLC3: ON or OFF	—	—
VVTL AIM ANGL #1	VVT aim angle (bank 1): Min.: 0 %, Max.: 100 %	0 %: Idling	VVT duty signal value during intru- sive operation
VVTL AIM ANGL #2	VVT aim angle (bank 1): Min.: 0 %, Max.: 100 %	0 %: Idling	VVT duty signal value during intru- sive operation
VVT CHNG ANGL #1	VVT change angle: Min.: 0°FR, Max.: 60°FR	0 to 5 °FR: Idling	Displacement angle during intru- sive operation
VVT CHNG ANGL #2	VVT change angle: Min.: 0°FR, Max.: 60°FR	0 to 5 °FR: Idling	Displacement angle during intru- sive operation

DIAGNOSTICS – ENGINE (1GR-FE)

VVT OCV DUTY B1	VVT OCV operation duty: Min.: 0 %, Max.: 100 %	0 %: Idling	Requested duty value for intrusive operation
VVT OCV DUTY B2	VVT OCV operation duty: Min.: 0 %, Max.: 100 %	0 %: Idling	Requested duty value for intrusive operation
FC IDL	Fuel cut idle: ON or OFF	ON: Fuel cut operation	FC IDL = "ON" when throttle valve fully closed and engine speed over 2,800 rpm
FC TAU	Fuel cut TAU: Fuel cut during very light load: ON or OFF	ON: Fuel cut operating	The fuel cut being performed under very light load to prevent the engine combustion from becoming incomplete
IGNITION	Ignition counter: Min.: 0, Max.: 800	0 to 800	—
CYL #1, #2, #3, #4, #5, #6	Misfire ratio of the cylinder 1 to 4: Min.: 0, Max.: 255	0 %	This item displayed in only idling
CYL ALL	All cylinders misfire rate: Min.: 0, Max.: 255	0 to 35	—
MISFIRE RPM	Engine RPM for first misfire range: Min.: 0 rpm, Max.: 6,375 rpm	0 rpm: Misfire 0	—
MISFIRE LOAD	Engine load for first misfire range: Min.: 0 g/rev, Max.: 3.98 g/rev	0 g/rev: Misfire 0	—
MISFIRE MARGIN	Misfire monitoring: Min.: -100 %, Max.: 99.22 %	-100 to 99.2 %	Misfire detecting margin
#CODES	#Codes: Min.: 0, Max.: 255	—	Number of detected DTCs
CHECK MODE	Check mode: 0: ON, 1: OFF	ON: Check mode ON	See page DI-43
SPD TEST	Check mode result for vehicle speed sensor: 0: COMPL, 1: INCOMPL	—	See page DI-43
MISFIRE TEST	Check mode result for misfire monitor: 0: COMPL, 1: INCOMPL	—	See page DI-43
OXS1 TEST	Check mode result for HO2 sensor : 0: COMPL, 1: INCOMPL	—	See page DI-43
OXS2 TEST	Check mode result for HO2 sensor : 0: COMPL, 1: INCOMPL	—	See page DI-43
A/F SSR TEST B1	Check mode result for air-fuel ratio sensor : 0: COMPL, 1: INCOMPL	—	See page DI-43
A/F SSR TEST B2	Check mode result for air-fuel ratio sensor : 0: COMPL, 1: INCOMPL	—	See page DI-43
MIL	MIL status: ON or OFF	ON: MIL ON	—
MIL ON RUN DIST	MIL ON Run Distance: Min.: 0 second, Max.: 65,535 seconds	Distance after DTC detected	—
MIL ON RUN TIME	Running time from MIL ON: Min.: 0 minute, Max.: 65,535 minutes	Equivalent to running time after MIL was ON	—

ENG RUN TIME	Engine run time: Min.: 0 second, Max.: 65,535 seconds	Time after engine start	Service data
TIME DTC CLEAR	Time after DTC cleared: Min.: 0 minute, Max.: 65,535 minutes	Equivalent to time after DTCs were erased	—
DIST DTC CLEAR	Distance after DTC cleared: Min.: 0 km/h, Max.: 65535 km/h	Equivalent to drive distance after DTCs were erased	—
WU CYC DTC CLEAR	Warm-up cycle after DTC cleared: Min.: 0, Max.: 255	—	Number of warm-up cycles after DTC cleared
MODEL CODE	Model code:	—	Identifying the model code: GSK3#
ENGINE TYPE	Engine type:	—	Identifying the engine type: 1GRFE
CYLINDER NUMBER	Cylinder number: Min.: 0, Max.: 255	—	Identifying the cylinder number: 6
TRANSMISSION	Transmission type:	—	Identifying the transmission type: ECT(5AT), M/T
DESTINATION	Destination	—	Identifying the destination: A (America)
MODEL YEAR	Model year: Min.: 0, Max.: 255	—	Identifying the model year: 200#
SYSTEM	System identification	—	Identifying the engine system: GASLIN (gasoline engine)

*1: If no idling conditions are specified, the transmission gear selector lever should be in the N or P position, and the A/C switch and all accessory switches should be OFF.

2. ACTIVE TEST

HINT:

Performing an ACTIVE TEST enables components including the relays, VSV (Vacuum Switching Valve), and actuators, to be operated without removing any parts. The ACTIVE TEST can be performed with a hand-held tester. Performing an ACTIVE TEST as the first step of troubleshooting is one method of shortening diagnostic time.

DATA LIST can be displayed during ACTIVE TESTS.

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Turn the tester ON.
- (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST.
- (e) Perform the ACTIVE TEST by referring to the table below.

Hand-held Tester Displays	Test Details	Control Ranges	Diagnostic Notes
INJ VOL	Change injection volume	Between -12 % and 25 %	<ul style="list-style-type: none"> • All injectors tested at the same time • Perform test at less than 3,000 rpm • Injection volume can be changed in 1 % graduations within control range
A/F CONTROL	Change injection volume	Lower by 12.5 % or increase by 25 %	<ul style="list-style-type: none"> • Perform test at less than 3,000 rpm • A/F CONTROL enables checking and graphing of A/F (Air Fuel Ratio) sensor and Heated Oxygen (HO2) sensor voltage outputs • To conduct test, select following menu items: ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press YES and ENTER followed by F4
FUEL PMP SP CTL	Fuel pump speed control	ON (low speed)/OFF (high speed)	Test possible when following conditions met: <ul style="list-style-type: none"> • Engine switch on (IG) • Engine is stopped
INTAKE CTL VSV1	ACIS VSV	ON/OFF	–
EVAP VSV (ALONE)	Activate EVAP VSV control	ON/OFF	–
VVT CTRL B1	Turn on and off OCV (Oil Control Valve)	ON/OFF	<ul style="list-style-type: none"> • Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV off
VVT CTRL B2	Turn on and off OCV (Oil Control Valve)	ON/OFF	<ul style="list-style-type: none"> • Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV off
A/C CUT SIG	Control A/C cut signal	ON/OFF	–
FUEL PUMP/SPD	Activate fuel pump (C/OPN Relay)	ON/OFF	–
TC/TE1	Turn on and off TC and TE1 connection	ON/OFF	<ul style="list-style-type: none"> • ON: TC and TE1 connected • OFF: TC and TE1 disconnected
FC IDL PROHBT	Prohibit idling fuel cut control	ON/OFF	–
STARTER	Starter	ON/OFF	–
ACC CUT	Active ACC cut relay	ON/OFF	Test possible when following conditions met: <ul style="list-style-type: none"> • Engine switch on (IG) • Engine is stopped

ETCS OPEN SLOW	Throttle actuator	ON: throttle valve opens slowly	This test is possible when the following conditions are met: • Ignition switch ON • Engine does not start • Fully depressing accelerator pedal (APP: 58 degrees or more)
ETCS CLOSE SLOW	Throttle actuator	ON: throttle valve closes slowly	Same as above
ETCS OPEN FAST	Throttle actuator	ON: throttle valve opens fast	Same as above
ETCS CLOSE FAST	Throttle actuator	ON: throttle valve closes fast	Same as above
FUEL CUT #1	Cylinder #1 injector fuel cut	ON/OFF	This test is possible during vehicle stopping and engine idling.
FUEL CUT #2	Cylinder #2 injector fuel cut	ON/OFF	Same as above
FUEL CUT #3	Cylinder #3 injector fuel cut	ON/OFF	Same as above
FUEL CUT #4	Cylinder #4 injector fuel cut	ON/OFF	Same as above
FUEL CUT #5	Cylinder #5 injector fuel cut	ON/OFF	Same as above
FUEL CUT #6	Cylinder #6 injector fuel cut	ON/OFF	Same as above
VVT B1	Control the VVT (bank 1)	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	Engine stall or rough idle when the VVT actuator is operated by 100%. This test is possible during idle.
VVT B2	Control the VVT (bank 2)	Between -128% and 127%	Same as above
VENT VALVE (ALONE)	Activate vent valve (built into pump module)	ON/OFF	-
VCUUM PUMP	Activate vacuum pump (built into pump module)	ON/OFF	-

3. SYSTEM CHECK

HINT:

Performing a SYSTEM CHECK enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs are set, and can detect potential malfunctions in the system. The SYSTEM CHECK can be performed with a hand-held tester.

- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON.
- Turn the tester ON.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK.
- Perform the SYSTEM CHECK by referring to the table below.

Hand-held Tester Displays	Test Details	Recommended Fuel Temperatures	Diagnostic Notes
EVAP SYS CHECK (AUTO OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor automatically	35°C (95°F) or less	• If no DTCs in PENDING CODE after performing this test, system functioning normally • Refer to EVAP Inspection Procedure on page DI-368
EVAP SYS CHECK (MANUAL OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor manually	35°C (95°F) or less	• Used to detect malfunctioning parts • Refer to EVAP Inspection Procedure on page DI-368

DIAGNOSTIC TROUBLE CODE CHART

HINT:

Parameters listed in the chart may not be exactly the same as your reading due to the type of instrument or other factors.

If a malfunction code is displayed during the DTC check in check mode, check the circuit for the codes listed in the table below. For details of each code, refer to the "See page" under the respective "DTC No." in the DTC chart.

DTC No. (See page)	Detection Item	Trouble Area	MIL*1	Memory
P0010 (DI-70)	Camshaft Position "A" Actuator Circuit (Bank 1)	<ul style="list-style-type: none"> • Open or short in OCV circuit • OCV • ECM 	○	○

CIRCUIT INSPECTION

DTC	P0010	Camshaft Position "A" Actuator circuit (Bank 1)
------------	--------------	--

DTC	P0020	Camshaft Position "A" Actuator circuit (Bank 2)
------------	--------------	--

CIRCUIT DESCRIPTION

The Variable Valve Timing (VVT) system includes the ECM, the Oil Control Valve (OCV) and the VVT controller. The ECM sends a target "duty-cycle" control signal to the OCV. This control signal, applied to the OCV, regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed based on engine operation conditions such as intake air volume, throttle position and engine coolant temperature. The ECM controls the OCV, based on the signals output from the sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative position between the camshaft and the crankshaft is optimized, and the engine torque improves, fuel economy improves, and exhaust emissions decrease under overall driving conditions. Also, the ECM detects the actual valve timing using signals from the camshaft position sensor and the crankshaft position sensor, and performs feedback control. This is how target valve timing is verified by the ECM.

P

A20891

DTC No.	DTC Detecting Condition	Trouble Area
P0010 P0020	Open or short in OCV circuit	<ul style="list-style-type: none"> • Open or short in OCV circuit • OCV • ECM

MONITOR DESCRIPTION

After the ECM sends the "target" duty-cycle signal to the OCV (Oil Control Valve), the ECM monitors the OCV current to establish an "actual" duty-cycle. When the actual duty-cycle ratio varies from the target duty-cycle, the ECM sets a DTC.

MONITOR STRATEGY

Related DTCs	P0010	VVT oil control valve bank 1 range check
	P0020	VVT oil control valve bank 2 range check
Required sensors/components	OCV	
Frequency of operation	Continuous	
Duration	1 sec.	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-18	
Battery voltage	11 V	13 V
Target duty ratio	-	70%
Starter	OFF	
Current cut status	Not cut	

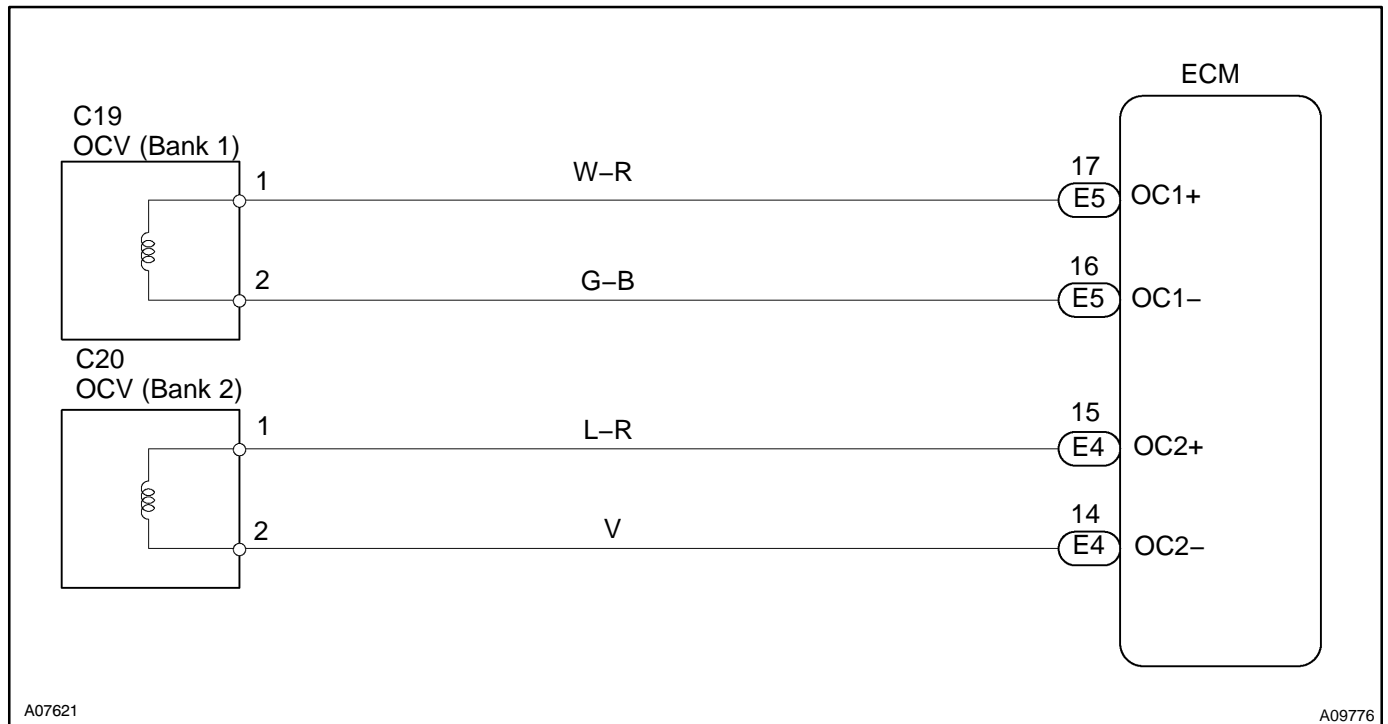

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Either of the following conditions is met:	Condition 1 or 2
1. Output signal duty for OCV	Output duty ratio is 100% (always ON) but target duty ratio is less than 70%
2. Output signal duty for OCV	Output duty is 3% or less despite the ECM supplying current to the OCV

COMPONENT OPERATING RANGE

Parameter	Standard Value
Output signal duty for OCV	"More than 3%" and "less than 100%"

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If DTC P0010 displayed, check left bank OCV circuit.
- If DTC P0020 displayed, check right bank OCV circuit.
- Read freeze frame data using hand-held tester. Because freeze frame records the engine conditions when the malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1	Check OCV circuit.
----------	---------------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and warm it up.
- (c) Turn the ignition switch to ON and turn the hand-held tester ON.

CHECK:

- (a) Select the item: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1 or VVT CTRL B2.
- (b) Using the hand-held tester, operate the OCV and check the engine speed.

OK:

Standard:

Tester Operation	Specified Condition
OCV is OFF	Normal engine speed
OCV is ON	Rough idle or engine stall

OK	Check for intermittent problems (See page DI-11).
-----------	--

NG

2	Check operation of OCV).
----------	---------------------------------

PREPARATION:

- (a) Start the engine and warmed it up.
- (b) Disconnect the OCV connector.
- (c) Apply battery positive voltage between the terminals of the OCV.

CHECK:

Check the engine speed.

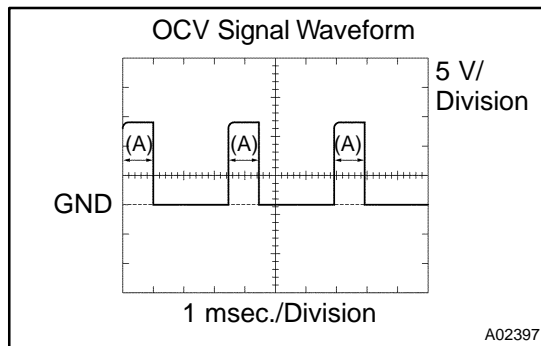

OK:

Rough idle or engine stalled.

NG	Replace OCV.
-----------	---------------------

OK

3 Check voltage between terminals OC1+ and OC1-, OC2+ and OC2- of ECM connector.

**CHECK:**

- Inspection using the oscilloscope.
- During idling, check the waveform between the specified terminals of the E5 ECM connector.

HINT:

The waveform frequency (A) is lengthened as the engine speed becomes higher.

OK:**Standard:**

The correct waveform is as shown.

**NG**

Replace ECM (See page SF-66).

OK

4 Check for open and short in harness and connector between OCV and ECM.

PREPARATION:

- (a) Disconnect the C19 or C20 OCV connector.
- (b) Disconnect the E5 ECM connector.

CHECK:

Check for resistance between the wire harness side connectors.

OK:

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
OCV (C20-1) – OC1+ (E5-17)	Below 1 Ω
OCV (C20-2) – OC1- (E5-16)	Below 1 Ω
OCV (C19-1) – OC2+ (E5-15)	Below 1 Ω
OCV (C19-2) – OC2- (E5-14)	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
OCV (C20-1) or OC1+ (E5-17) – E1 (E5-1)	10 kΩ or higher
OCV (C20-2) or OC1- (E5-16) – E1 (E5-1)	10 kΩ or higher
OCV (C19-1) or OC2+ (E5-15) – E1 (E5-1)	10 kΩ or higher
OCV (C19-2) or OC2- (E5-14) – E1 (E5-1)	10 kΩ or higher

NG → **Repair or replace harness or connector.**

OK

Check for intermittent problems (See page DI-11).

DTC	P0011	Camshaft Position "A" –Timing Over-Advanced or System Performance (Bank 1)
------------	--------------	---

DTC	P0012	Camshaft Position "A" –Timing Over-Retarded (Bank 1)
------------	--------------	---

DTC	P0021	Camshaft Position "A" –Timing Over-Advanced or System Performance (Bank 2)
------------	--------------	---

DTC	P0022	Camshaft Position "A" –Timing Over-Retarded (Bank 2)
------------	--------------	---

CIRCUIT DESCRIPTION

Refer to DTCs P0010 on page [DI-70](#).

DTC No.	DTC Detecting Condition	Trouble Area
P0011 P0021	Advanced cam timing: After engine is warmed up and engine speed is at 400 to 4,000 rpm, condition (a) continues. (1 trip detection logic) (a) Valve timing does not change from current valve timing	<ul style="list-style-type: none"> • Valve timing • OCV • VVT controller assembly • ECM
P0012 P0022	Retarded cam timing: After engine is warmed up and engine speed is at 400 to 4,000 rpm, condition (a) continues. (2 trip detection logic) (a) Valve timing does not change from current valve timing	

MONITOR DESCRIPTION

The ECM optimizes the valve timing using the VVT (Variable Valve Timing) system to control the intake valve camshaft. The VVT system includes the ECM, the OCV (Oil Control Valve) and the VVT controller. The ECM sends a target "duty-cycle" control signal to the OCV. This control signal, applied to the OCV, regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake valve camshaft.

Example:

A DTC will set if: 1) the difference between the target and actual valve timing is more than 5 degrees of the crankshaft angle (CA) and the condition continues for more than 4.5 sec.; or 2) the OCV is forcibly activated 70 times or more.

Advanced cam DTCs are subject to "1 trip" detection logic.

Retarded cam DTCs are subject to "2 trip" detection logic.

MONITOR STRATEGY

Related DTCs	P0011	VVT system advance (Bank 1)
	P0012	VVT system retard (Bank 1)
	P0021	VVT system advance (Bank 2)
	P0022	VVT system retard (Bank 2)
Required sensors/components	Main sensors/components	Camshaft position sensor
	Related sensors/components	Engine coolant temperature sensor, Crankshaft position sensor
Frequency of operation	Once per drive cycle	
Duration	10 sec.	
MIL operation	P0011, P0021: Immediate P0012, P0022: 2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-18	
Battery voltage	11 V	–
Engine RPM	500 rpm	4,000 rpm
ECT	75°C (167°F)	100°C (212°F)

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
P0011, P0021 (Advance):	
Deviation of actual valve timing and target valve timing	More than 5°CA (Crankshaft angle)
Valve timing	No change at advanced valve timing
P0012, P0022 (Retard):	
Deviation of actual valve timing and target valve timing	More than 5°CA (Crankshaft angle)
Valve timing	No change at retarded valve timing

WIRING DIAGRAM

Refer to DTCs P0010 on page [DI-70](#).

INSPECTION PROCEDURE

HINT:

- Bank 1 refers to bank that includes cylinder No. 1.
- Bank 2 refers to bank that does not include cylinder No. 1.
- If DTC P0011, P0012 is displayed, check the bank 1 VVT system.
- If DTC P0021, P0022 is displayed, check the bank 2 VVT system.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1	Check operation of OCV.
----------	--------------------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and warm it up.
- (c) Turn the ignition switch to ON and turn the hand-held tester ON.

CHECK:

- (a) Select the item: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1 or VVT CTRL B2.
- (b) Using the hand-held tester, operate the OCV and check the engine speed.

OK:**Standard:**

Tester operation	Specified condition
OCV is OFF	Normal engine speed
OCV is ON	Rough idle or engine stall

OK**VVT system is OK.***

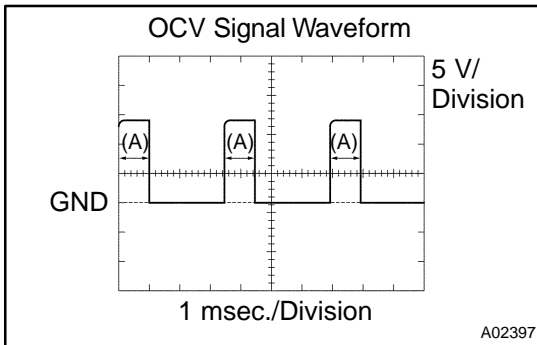

*: DTC P0011, P0012, P0021 or P0022 is also output when a foreign object is detected in some parts of the system in the engine oil, and then the system returns to normal in a short time. As ECM is controlled to eject a foreign object, there is no problem on the VVT. There is also no problem on the VVT as the oil filter should catch the foreign object in the engine oil.

NG

2	Check valve timing (See page EM-44).
----------	---

NG**Adjust valve timing.****OK**

3 Check voltage between terminals OCV+ and OCV- of ECM connector.

**CHECK:**

- (a) Inspection using the oscilloscope.
- (b) During idling, check the waveform between the specified terminals of the E5 ECM connector.

HINT:

The waveform frequency (A) is lengthened as the engine speed becomes higher.

OK:**Standard:**

The correct waveform is as shown.

**NG**

Replace ECM (See page [SF-66](#)).

OK

4 Check OCV (See page [EM-70](#)).

NG

Replace OCV, and then go to step 6.

OK

5 Check camshaft timing gear assembly (See page [EM-70](#)).

NG

Replace camshaft timing gear, and then go to step 7.

OK

6	Check oil control valve filter.
----------	--

NG	Replace oil control valve filter.
-----------	--

7	Check whether or not DTC P0010, P0012, P0021 or P0022 is stored.
----------	---

PREPARATION:

- (a) Clear the DTC (See page [DI-42](#)).
- (b) Perform simulation test.

CHECK:

Check whether or not DTC P0011, P0012, P0021 or P0022 is stored (See page [DI-42](#)).

OK:**Standard:**

DTC P0011, P0012, P0021 or P0022 is not stored.

OK	VVT system is OK.*
-----------	---------------------------

*: DTC P0011, P0012, P0021 or P0022 is also output when a foreign object is detected in some parts of the system in the engine oil, and then the system returns to normal in a short time. As ECM is controlled to eject a foreign object, there is no problem on the VVT. There is also no problem on the VVT as the oil filter should catch the foreign object in the engine oil.

Replace ECM (See page SF-66).
--

DTC	P0016	Crankshaft Position – Camshaft Position Correlation (Bank 1 Sensor A)
------------	--------------	--

DTC	P0018	Crankshaft Position – Camshaft Position Correlation (Bank 2 Sensor A)
------------	--------------	--

CIRCUIT DESCRIPTION

The crankshaft position sensor (CKP) system consists of a crankshaft position sensor plate and a pick-up coil.

The sensor plate has 34 teeth and is installed on the crankshaft. The pick-up coil is made of an iron core and magnet. The sensor plate rotates and as each tooth passes through the pick-up coil, a pulse signal is created. The pick-up coil generates 34 signals for each engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine RPM. Using these calculations, the fuel injection time and ignition timing are controlled.

DTC No.	DTC Detection Condition	Trouble Area
P0016	Deviation in crankshaft position sensor signal and VVT sensor 1 signal (2 trip detection logic)	<ul style="list-style-type: none"> • Mechanical system (Jumped tooth of timing chain, chain stretched) • ECM
P0018	Deviation in crankshaft position sensor signal and VVT sensor 2 signal (2 trip detection logic)	

MONITOR DESCRIPTION

The ECM optimizes the valve timing using the Variable Valve Timing (VVT) system to control the intake valve camshaft. The VVT system includes the ECM, the Oil Control Valve (OCV) and the VVT controller. The ECM sends a target "duty-cycle" control signal to the OCV. This control signal, applied to the OCV, regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake valve camshaft. The ECM calibrates the valve timing of the VVT system by setting the camshaft to the maximum retard angle when the engine speed is idling. The ECM closes the OCV to retard the cam. The ECM stores this value as "VVT learned value." (When the difference between the target valve timing and the actual valve timing is 5 degrees or less, the ECM stores this in its memory.)

If the learned value meets both of the following conditions ("a" and "b"), the ECM interprets this as a defect in the VVT system and sets a DTC.

- (a) "VVT learning" value is less than 22° CA or more than 47° CA.
- (b) Above condition continues for more than 18 seconds.

MONITOR STRATEGY

Related DTCs	P0016	Deviation in crankshaft position sensor signal and camshaft position sensor signal (Bank 1)

Engine RPM	500 rpm	1,000 rpm

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
One of the following condition is met	Condition (a) or (b)
(a) VVT learning value at maximum retarded valve timing	Less than 22.5° CA (Crankshaft angle)
(b) VVT learning value at maximum retarded valve timing	More than 45.2° CA (Crankshaft angle)

INSPECTION PROCEDURE

HINT:

- If DTC P0016 is displayed, check left bank VVT sensor.
- If DTC P0018 is displayed, check right bank VVT sensor.
- Read freeze frame data using hand-held tester. Because freeze frame records the engine conditions when the malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1	Check valve timing (Check for loose and jumping teeth of timing chain) (See page EM-44).

------------	--------------	--

HINT:

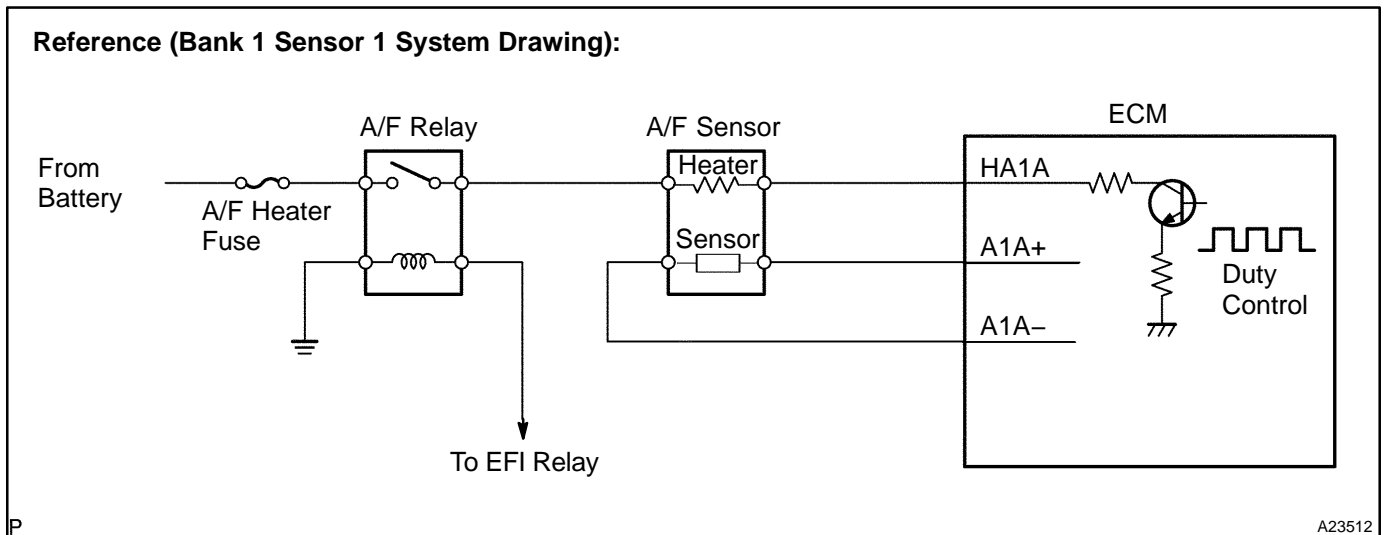

Although each DTC title (DTC description) says "oxygen sensor", these DTCs are related to the "A/F sensor".

CIRCUIT DESCRIPTION

Refer to DTC P2195 on page [DI-312](#).

HINT:

The ECM provides a pulse width modulated control circuit to adjust current through the heater. The A/F sensor heater circuit uses a relay on the B+ side of the circuit.

DTC No.	DTC Detection Condition	Trouble Area
P0031 P0051	Heated current is 0.8 A or less when heater operates (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in heater circuit of A/F sensor • A/F sensor heater
P0032 P0052	Hybrid IC high current limiter port is fail (1 trip detection logic)	<ul style="list-style-type: none"> • A/F sensor heater relay • ECM

HINT:

- Bank 1 refers to the bank that includes cylinder No.1.
- Bank 2 refers to the bank that does not include cylinder No.1.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR DESCRIPTION

The ECM uses the Air–Fuel Ratio sensor (A/F sensor) information to regulate the air–fuel ratio close to the stoichiometric ratio. This maximizes the catalytic converter’s ability to purify exhaust gases. The sensor detects oxygen levels in the exhaust gas and sends this signal to the ECM.

The inner surface of the sensor element is exposed to outside air. The outer surface of the sensor element is exposed to exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element. The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations of the exhaust and the outside air. The platinum coating amplifies the voltage generation. When heated, the sensor becomes very efficient. If the temperature of the exhaust is low, the sensor will not generate useful voltage signals without supplemental heating. The ECM regulates the supplemental heating using a duty–cycle approach to regulate the average current in the heater element. If the heater current is out of the normal range, the sensor’s output signals will be inaccurate and the ECM can not regulate the air–fuel ratio properly.

When the heater current is out of the normal operating range, the ECM interprets this as a malfunction and sets a DTC.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 Check resistance of air-fuel ratio (A/F) sensor heater.

PREPARATION:

Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Standard:

Tester Connection	Specified Condition
HT (1) - +B (2)	1.8 Ω to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

NG Replace air-fuel ratio (A/F) sensor.

OK

2 Check A/F relay.

PREPARATION:

Remove the A/F relay from the engine room J/B.

CHECK:

Inspect the A/F relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Usually	10 KΩ or higher
3 - 5	Apply B+ between terminals 2 and 4	Below 1 Ω

NG Replace A/F relay.

OK

3 Check voltage between terminals HA1A, HA2A of ECM connectors and body ground.

PREPARATION:

Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminals of the ECM connectors and body ground.

HINT:

- Connect terminal HA1A to the bank 1 sensor 1.
- Connect terminal HA2A to the bank 2 sensor 1.

OK:

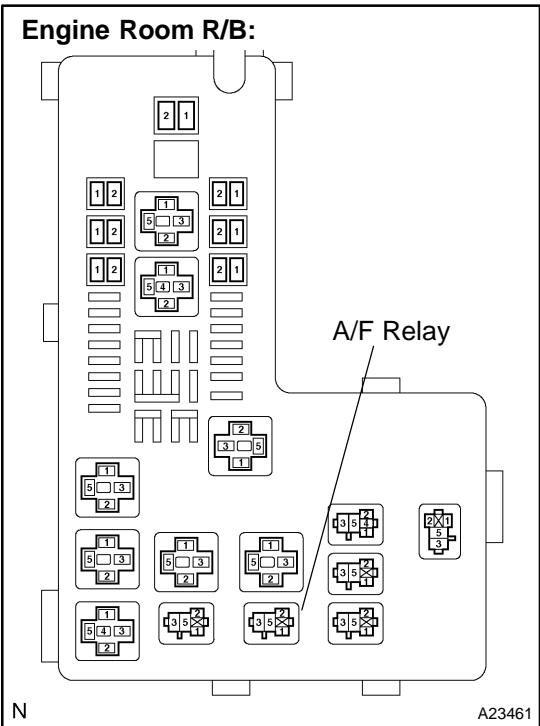

Standard:

Tester Connection	Specified Condition
HA1A (E6-2) - Body ground	9 V to 14 V
HA2A (E6-1) - Body ground	9 V to 14 V

NG Replace ECM (See page [SF-66](#)).

NG

4 Check for open and short circuit in harness and connector between A/F sensor and ECM, A/F sensor and A/F relay.

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Disconnect the E6 ECM connector.

CHECK:

Check for resistance between the wire harness side connectors.

OK:

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
HT (A10-1) - HA1A (E6-2)	Below 1 Ω
HT (A30-1) - HA2A (E6-1)	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
HT (A10-1) or HA1A (E6-2) - Body ground	10 kΩ or higher
HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Remove the A/F sensor heater relay from the engine room R/B.

CHECK:

Check for resistance between the wire harness side connectors.

OK:

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
+B (A10-2) - A/F sensor heater relay (3)	Below 1 Ω
+B (A47-2) - A/F sensor heater relay (3)	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
+B (A10-2) or A/F sensor heater relay (3) - Body ground	10 kΩ or higher
+B (A30-2) or A/F sensor heater relay (3) - Body ground	10 kΩ or higher

NG → **Repair or replace harness or connector.**

OK

Replace ECM (See page SF-66).

DTC	P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)
------------	--------------	---

DTC	P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)
------------	--------------	--

DTC	P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)
------------	--------------	---

DTC	P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)
------------	--------------	--

CIRCUIT DESCRIPTION

To obtain a high purification rate for the CO, HC and NO_x components of the exhaust gas, a three-way catalytic converter is used, but for the most efficient use of the three-way catalytic converter, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio.

The heated oxygen sensor has the characteristic which its output voltage changes suddenly in the vicinity of the stoichiometric air-fuel ratio. This characteristic is used to detect the oxygen concentration in the exhaust gas and provide the ECM with feedback to control the air-fuel ratio.

When the air-fuel ratio becomes LEAN, the oxygen concentration in the exhaust increases and the heated oxygen sensor informs the ECM of the LEAN condition (low voltage, i.e. less than 0.45 V).

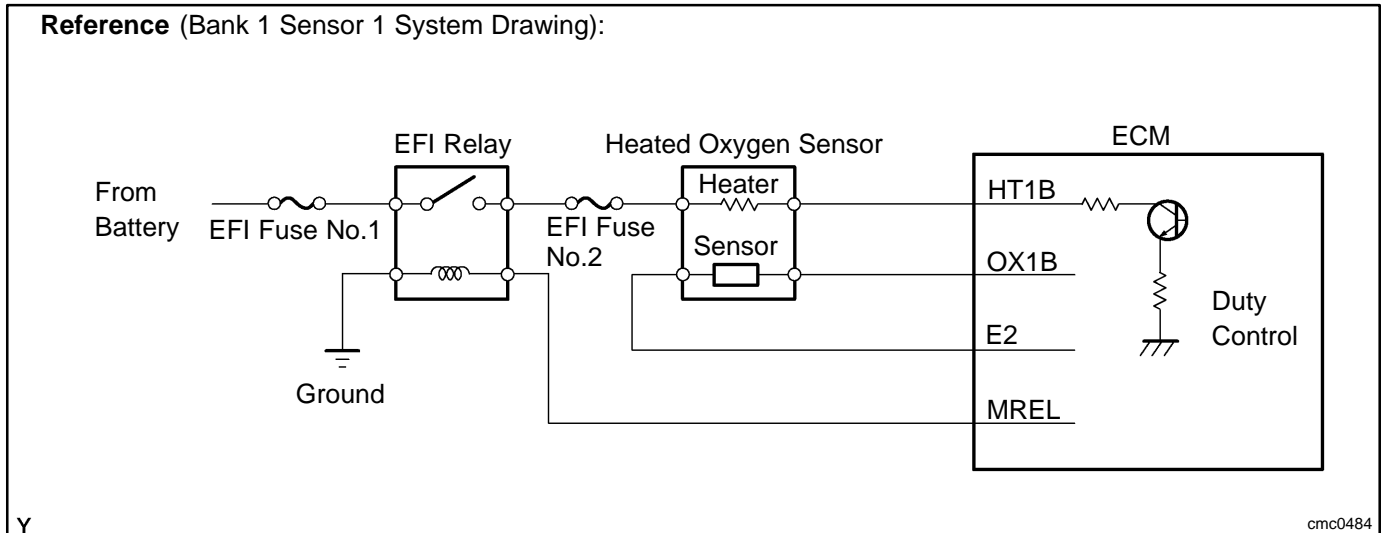

When the air-fuel ratio is RICHER than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas is reduced and the heated oxygen sensor informs the ECM of the RICH condition (high voltage, i.e. more than 0.45 V). The ECM judges by the voltage output from the heated oxygen sensor whether the air-fuel ratio is RICH or LEAN and controls the injection time accordingly. However, if malfunction of the heated oxygen sensor causes output of abnormal voltage, this disables the ECM for performing an accurate air-fuel ratio control. The heated oxygen sensors include a heater which heats the zirconia element. The heater is controlled by the ECM. When the intake air volume is low (the temperature of the exhaust gas is low) current flows to the heater to heat the sensor for accurate oxygen concentration detection.

HINT:

The ECM provides a pulse width modulated control circuit to adjust current through the heater. The heated oxygen sensor heater circuit uses a relay on the B+ side of the circuit.

Reference (Bank 1 Sensor 1 System Drawing):

Y

DTC No.	DTC Detecting Condition	Trouble Area
P0037 P0057	Heater current is less than 0.3 A when the heater operates with more than 10.5 V positive battery voltage	<ul style="list-style-type: none"> • Open in heater circuit of heated oxygen sensor • Heated oxygen sensor heater • EFI relay • ECM
P0038 P0058	When heater operates, heater current exceeds 2.0 A	<ul style="list-style-type: none"> • Short in heater circuit of heated oxygen sensor • Heated oxygen sensor heater • EFI relay • ECM

HINT:

- Bank 1 refers to bank that includes cylinder No. 1.
- Bank 2 refers to bank that does not includes cylinder No. 1.
- Sensor 1 refers to the sensor closer to the engine assembly.
- Sensor 2 refers to the sensor farther away from the engine assembly.

MONITOR DESCRIPTION

The sensing portion of the heated oxygen sensor has a zirconia element which is used to detect oxygen concentration in the exhaust. If the zirconia element is at the proper temperature and difference of the oxygen concentration between the inside and outside surface of sensor is large, the zirconia element will generate voltage signals. In order to increase the oxygen concentration detecting capacity in the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor. When current in the sensor is out of the standard operating range, the ECM interprets this as a fault in the heated oxygen sensor and sets a DTC.

Example:

The ECM will set a high current DTC if the current in the sensor is more than 2.0 A when the heater is OFF. Similarly, the ECM will set a low current DTC if the current is less than 0.3 A when the heater is ON.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using hand-held tester. Because freeze frame records the engine conditions when the malfunction is detected. When troubleshooting, it is useful to determine whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. when a malfunction occurred.

1 Check resistance of heated oxygen sensor heater.

PREPARATION:

Disconnect the H4 or H6 heated oxygen sensor connector.

CHECK:

Measure resistance between terminals of the heated oxygen sensor.

OK:

Standard:

Tester Connection	Specified Condition
HT (H4-1) - +B (H4-2)	11 to 16 Ω at 20°C (68°F)
HT (H6-1) - +B (H6-2)	11 to 16 Ω at 20°C (68°F)

NG Replace heated oxygen sensor.

OK

2 Check EFI relay.

PREPARATION:

Remove the EFI relay from the engine room J/B.

CHECK:

Inspect the EFI relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Usually	10 K Ω or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace EFI relay.

OK

3 Check voltage between terminals HT1B, HT2B of ECM connectors and body ground.

PREPARATION:

Turn the ignition switch ON.

CHECK:

Measure the voltage between terminals of the ECM connectors and body ground.

OK:

Standard:

Tester Connection	Specified Condition
HT1B (E7-1) - Body ground	9 to 14 V
HT2B (E6-5) - Body ground	9 to 14 V

HINT:

- Connect terminal HT1B to the bank 1 sensor 2.
- Connect terminal HT2B to the bank 2 sensor 2.

NG

Replace ECM (See page SF-66).

NG

Check and repair harness or connector between EFI relay and heated oxygen sensor, and heated oxygen sensor and ECM (See page SF-66).

DTC	P0100	Mass or Volume Air Flow Circuit
DTC	P0102	Mass or Volume Air Flow Circuit Low Input
DTC	P0103	Mass or Volume Air Flow Circuit High Input

CIRCUIT DESCRIPTION

The Mass Air Flow (MAF) meter measures the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and provide a proper air fuel ratio. Inside the MAF meter, there is a heated platinum wire exposed to the flow of intake air.

By applying a specific current to the wire, the ECM heats this wire to a given temperature. The flow of incoming air cools the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the airflow through the sensor. The ECM interprets this voltage as the intake air amount. The circuit is constructed so that the platinum hot wire and temperature sensor provide a bridge circuit, with the power transistor controlled so that the potential of A and B remains equal to maintain the set temperature.

DTC No.	DTC Detection Condition	Trouble Area
P0100	Open or short in mass air flow meter circuit for more than 3 sec.	<ul style="list-style-type: none"> • Open or short in mass air flow meter circuit • Mass air flow meter • ECM
P0102	Short in mass air flow meter circuit for more than 3 sec.	
P0103	Short in mass air flow meter circuit for more than 3 sec. (+B circuit)	

HINT:

After confirming DTC P0100, P0102 or P0103, use the hand-held tester to confirm the MAF ratio from the ALL menu (to reach the ALL menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL).

Mass Air Flow Value (gm/sec.)	Malfunction
Approx. 0.0	<ul style="list-style-type: none"> • Mass air flow meter power source circuit open • VG circuit open or short
271.0 or more	<ul style="list-style-type: none"> • EVG circuit open

MONITOR DESCRIPTION

If there is a defect in the MAF (Mass Air Flow) meter or an open or short circuit, the voltage level will deviate outside the normal operating range. The ECM interprets this deviation as a defect in the MAF meter and sets a DTC.

Example:

When the MAF meter voltage output is less than 0.2 V, or more than 4.9 V, and if either the condition continues for more than 3 sec.

MONITOR STRATEGY

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read value of mass air flow rate.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) Start the engine.
- (d) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / MAF.

CHECK:

Read the mass air flow rate on the hand-held tester.

RESULT:

Air Flow Rate (g/s)	Proceed to
0.0	A
271.0 or more	B
Between 1 and 270.0 (*1)	C

*1: The value must change when the throttle valve is opened or closed.

B

Go to step 6.

C

**Check for intermittent problems
(See page DI-11).**

A

2 Check voltage of mass air flow meter power source.

PREPARATION:

- (a) Disconnect the M1 mass air flow meter connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure voltage between terminal 1 of the mass air flow meter connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
+B (M1-1) - Body ground	9 to 14 V

NG Go to step 5.

OK

3 Check voltage between terminal VG of ECM connector and body ground.

PREPARATION:

Start the engine.

CHECK:

Measure the voltage between the specified terminal of the E7 ECM connector.

HINT:

The shift position should be P or N and the A/C switch should be turned OFF.

OK:

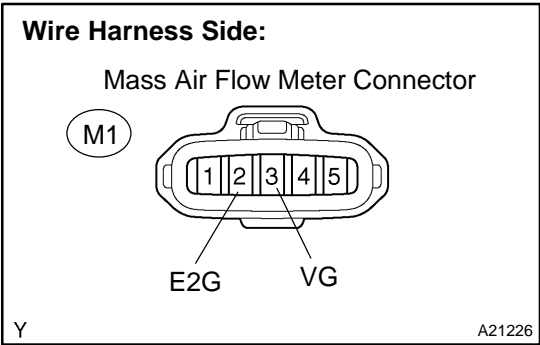

Standard:

Tester Connection	Condition	Specified Condition
VG (E7-30) - E2G (E7-29)	Engine is idling	0.5 to 3.0 V

NG Replace ECM (See page [SF-66](#)).

NG

4 Check for open and short in harness and connector between mass air flow meter and ECM.

PREPARATION:

- (a) Disconnect the M1 mass air flow meter connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

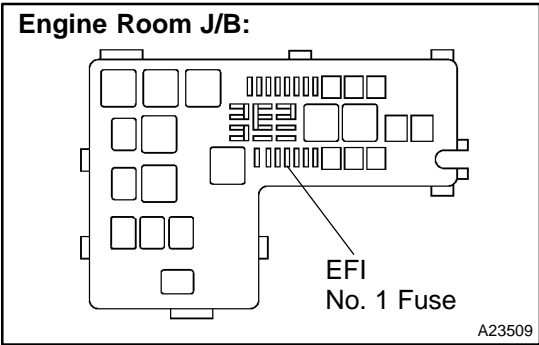

Tester Connection	Specified Condition
VG (M1-3) - VG (E7-30)	Below 1 Ω
E2G (M1-2) - E2G (E7-29)	Below 1 Ω
VG (M1-3) or VG (E7-30) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace mass air flow meter.

5 Check for open and short in harness and connector between mass air flow meter and EFI relay.

PREPARATION:

Remove the EFI No. 1 fuse from the engine room J/B.

CHECK:

Check for resistance in the EFI No. 1 fuse.

OK:

Standard:
Below 1 Ω

PREPARATION:

- (a) Install the EFI No. 1 fuse.
- (b) Disconnect the M1 mass air flow meter connector.
- (c) Remove the EFI relay from the engine room J/B.

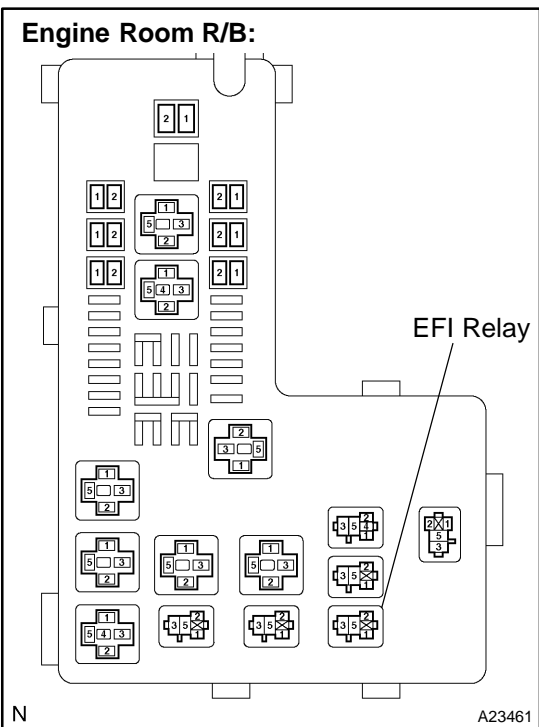

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
+B (M1-1) – Engine Room J/B (EFI relay terminal 1)	Below 1 Ω
+B (M1-1) or Engine room J/B (EFI relay terminal 1) – Body ground	10 kΩ or higher

NG → **Repair or replace harness or connector.**

OK

Check ECM power source circuit (See page DI-409).

6 Check continuity between terminal E2G of ECM connector and body ground.

CHECK:

Check the resistance between terminal of the E7 ECM connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
E2G (E7-29) - Body ground	Below 1 Ω

NG Replace ECM (See page [SF-66](#)).

OK

7 Check for open in harness and connector between mass air flow meter and ECM.

PREPARATION:

- (a) Disconnect the M1 mass air flow meter connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VG (M1-3) - VG (E7-30)	Below 1 Ω
E2G (M1-2) - E2G (E7-29)	Below 1 Ω
VG (M1-3) or VG (E7-30) - Body ground	10 kΩ or higher
E2G (M1-2) or E2G (E7-29) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace mass air flow meter.

DTC	P0101	Mass or Volume Air Flow Circuit Range/ Performance Problem
------------	--------------	---

CIRCUIT DESCRIPTION

Refer to DTC P0100, P0102 and P0103 on page [DI-98](#).

DTC No.	DTC Detecting Condition	Trouble Area
P0101	After engine is warmed up, conditions (a), (b), (c) and (d) continue for more than 10 seconds: (2 trip detection logic) (a) Throttle valve fully closed (b) Voltage output of the mass air flow meter is more than 2.2 V. (c) Engine coolant temperature is more than 70 °C (158 °F). (d) Engine speed is less than 2,000 rpm.	• Mass air flow meter
	Conditions (a), (b) and (c) continue for more than 10 seconds at engine speed: (2 trip detection logic) (a) Engine speed is more than 300 rpm. (b) VTA is more than 0.1 V. (c) Voltage output of the mass air flow meter is less than 0.83 V.	

MONITOR DESCRIPTION

The MAF (Mass Air Flow) meter helps the ECM calculate the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and provide a proper air fuel ratio. Inside the MAF meter, there is a heated platinum wire exposed to the flow of intake air. By applying a specific current to the wire, the ECM heats this wire to a given temperature. The flow of incoming air cools the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the air flow through the MAF meter. The ECM interprets this voltage as the intake air amount. If there is a defect in the MAF meter or an open or short circuit, the voltage level will deviate outside the normal operating range. The ECM interprets this deviation as a defect in the MAF meter and sets a DTC.

Example:

If the voltage is more than 2.2 V at idle or less than 0.83 V at idle OFF, the ECM interprets this as a defect in the MAF meter and sets a DTC.

MONITOR STRATEGY

Mass air flow meter voltage (High voltage)	More than 2.2 V (varies with throttle position sensor voltage)
Mass air flow meter voltage (Low voltage)	Less than 0.83 V (varies with throttle position sensor voltage)

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Are there any other codes (besides DTC P0101) being output?
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS/ENHANCED OBD II/DTC INFO/CURRENT CODES.

CHECK:

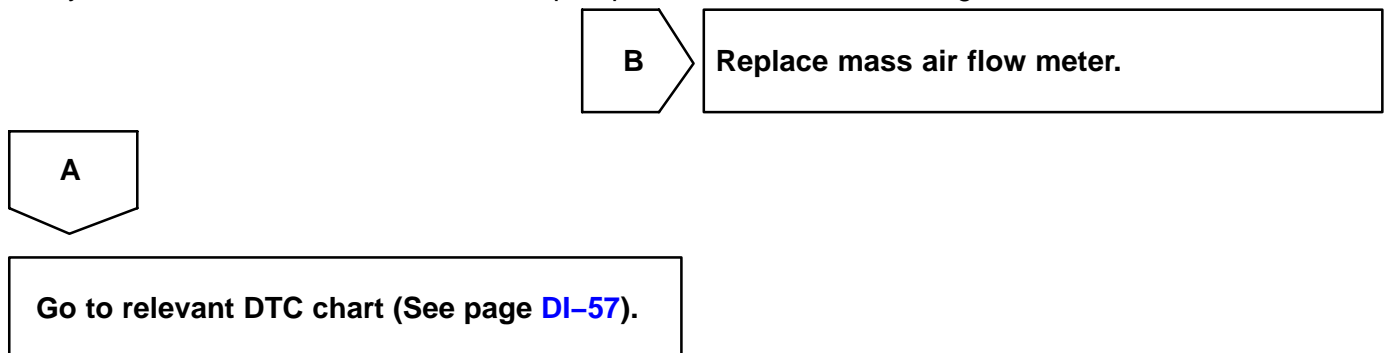

Read the DTC using the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
"P0101" and other DTCs	A
Only P0101	B

HINT:

If any other codes besides P0101 are output, perform the troubleshooting for those codes first.

DTC	P0110	Intake Air Temperature Circuit
------------	--------------	---------------------------------------

DTC	P0112	Intake Air Temperature Circuit Low Input
------------	--------------	---

DTC	P0113	Intake Air Temperature Circuit High Input
------------	--------------	--

CIRCUIT DESCRIPTION

The intake air temperature (IAT) sensor, mounted on the mass air flow (MAF) meter, monitors the intake air temperature. The IAT sensor has a thermistor that varies its resistance depending on the temperature of the intake air. When the air temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. The resistance varies as voltage changes to the ECM terminal.

(See Fig. 1).

The intake air temperature sensor is connected to the ECM (See below). The 5 V power source voltage in the ECM is applied to the intake air temperature sensor from terminal THA (THAR) via resistor R.

That is, the resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes in accordance with changes in the intake air temperature, the voltage at terminal THA (THAR) also changes. Based on this signal, the ECM increases the fuel injection volume to improve the driveability during cold engine operation.

DTC No.	Proceed to	DTC Detection Condition	Trouble Area
P0110	Step 1	Open or short in intake air temperature sensor circuit for 0.5 sec.	<ul style="list-style-type: none"> • Open or short in intake air temperature sensor circuit • Intake air temperature sensor (built in mass air flow meter) • ECM
P0112	Step 4	Short in intake air temperature sensor circuit for 0.5 sec.	
P0113	Step 2	Open in intake air temperature sensor circuit for 0.5 sec.	

HINT:

After confirming DTC "P0110, P0112 or P0113", use the hand-held tester to confirm the intake air temperature in the "DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL".

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or more	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the intake air temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the IAT (Intake Air Temperature) sensor and sets a DTC.

Example:

When the sensor voltage output is equal to -40°C (-40°F), or more than 140°C (284°F).

Intake air temperature sensor voltage (Intake air temperature)	Less than 0.18 V (More than 140°C (284°F))
P0113:	
Intake air temperature sensor voltage (Intake air temperature)	More than 4.91 V (Less than -40°C (-40°F))

COMPONENT OPERATING RANGE

Parameter	Standard Value
Intake air temperature sensor voltage	0.18 V (140°C (284°F)) to 4.91 V (-40°C (-40°F))

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read value of intake air temperature.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

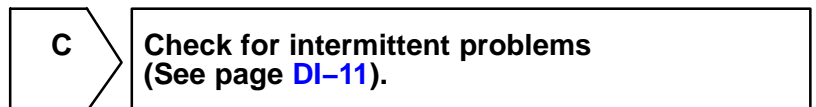

Same as actual intake air temperature.

RESULT:

Displayed Temperature	Proceed to
-40°C (-40°F)	A
140°C (284°F) or more	B
OK (Same as present temperature)	C

HINT:

- If there is an open circuit, the hand-held tester indicates -40°C (-40°F).
- If there is a short circuit, the hand-held tester indicates 140°C (284°F) or more.

2 Check for open in harness or ECM.

PREPARATION:

- (a) Disconnect the M1 mass air flow meter connector.
- (b) Connect terminals 4 and 5 of the mass air flow meter wire harness side connector.
- (c) Turn the ignition switch to ON.
- (d) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: 140°C (284°F)

OK Confirm good connection at sensor. If OK, replace mass air flow meter.

NG

3 Check for open in harness or ECM.

PREPARATION:

- (a) Connect terminals THA and E2 of the E7 ECM connector.
- HINT:**
Before checking, do a visual and contact pressure check for the ECM connector.
- (b) Turn the ignition switch to ON.
 - (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: 140°C (284°F) or more

OK Repair or replace harness or connector.

NG

Confirm good connection at ECM. If OK, replace ECM (See page SF-66).

4 Check for short in harness and ECM.

PREPARATION:

- Disconnect the M1 mass air flow meter connector.
- Turn the ignition switch to ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: -40°C (-40°F)

OK

Replace mass air flow meter.

NG

5 Check for short in harness or ECM.

PREPARATION:

- Disconnect the E7 ECM connector.
- Turn the ignition switch to ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: -40°C (-40°F)

OK

Repair or replace harness or connector.

NG

Replace ECM (See page [SF-66](#)).

DTC	P0115	Engine Coolant Temperature Circuit
------------	--------------	---

DTC	P0117	Engine Coolant Temperature Circuit Low Input
------------	--------------	---

DTC	P0118	Engine Coolant Temperature Circuit High Input
------------	--------------	--

CIRCUIT DESCRIPTION

A thermistor is built in the Engine Coolant Temperature (ECT) sensor and changes the resistance value according to the engine coolant temperature.

The structure of the sensor and connection to the ECM is the same as the Intake Air Temperature (IAT) sensor.

HINT:

If the ECM detects the DTC "P0115, P0117 or P0118", it operates the fail-safe function in which the ECT is assumed to be 80°C (176°F).

DTC No.	Proceed to	DTC Detection Condition	Trouble Area
P0115	Step 1	Open or short in engine coolant temperature sensor circuit for 0.5 sec.	<ul style="list-style-type: none"> • Open or short in engine coolant temperature sensor circuit • Engine coolant temperature sensor • ECM
P0117	Step 4	Short in engine coolant temperature sensor circuit for 0.5 sec.	
P0118	Step 2	Open in engine coolant temperature sensor circuit for 0.5 sec.	

HINT:

After confirming DTC "P0115, P0117 or P0118", use the OBD II scan tool or the hand-held tester to confirm the engine coolant temperature from the DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL.

Displayed Temperature	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or more	Short circuit

MONITOR DESCRIPTION

The ECT (Engine Coolant Temperature) sensor is used to monitor the engine coolant temperature. The ECT sensor has a thermistor that varies its resistance depending on the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. The resistance varies as output voltage from the sensor changes.

The ECM monitors the sensor voltage and uses this value to calculate the engine coolant temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and sets a DTC.

Example:

When the ECM calculates that the ECT is less than -40°C (-40°F), or more than 140°C (284°F), and if either the condition continues for 0.5 sec. or more, the ECM will set a DTC.

OK

Repair or replace harness or connector.

NG

Confirm good connection at ECM. If OK, replace ECM (See page SF-66).

4 Check for short in harness and ECM.

PREPARATION:

- Disconnect the E2 engine coolant temperature sensor connector.
- Turn the ignition switch to ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: -40°C (-40°F)

OK

Replace engine coolant temperature sensor.

NG

5 Check for short in harness or ECM.

PREPARATION:

- Disconnect the E7 ECM connector.
- Turn the ignition switch to ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: -40°C (-40°F)

OK

Repair or replace harness or connector.

NG

Replace ECM (See page SF-66).

DTC	P0116	Engine Coolant Temperature Circuit Range/ Performance Problem
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to DTC P0115 on page [DI-115](#).

DTC No.	DTC Detecting Condition	Trouble Area
P0116	If the engine coolant temperature was 35°C (95°F) or more but less than 60°C (140°F) when the engine is started, and if conditions (a) and (b) are met: (a) Vehicle has accelerated and decelerated. (b) Engine coolant temperature remains within 3°C (5.4°F) of the initial engine coolant temperature (2 trip detection logic)	• Engine coolant temperature sensor
	If the engine coolant temperature is more than 60°C (140°F) when the engine is started, and if conditions (a) and (b) are met: (a) Vehicle has accelerated and decelerated. (b) If the engine coolant temperature sensor records a temperature variation below 1°C (1.8°F) successively 6 times (6 trip detection logic)	

MONITOR DESCRIPTION

The ECT (Engine Coolant Temperature) sensor is used to monitor the engine coolant temperature. The ECT sensor has a thermistor that varies its resistance depending on the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. The variations in resistance are reflected in the voltage output from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the engine coolant temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and sets a DTC.

Examples:

- (1) Upon starting the engine, the ECT is between 35°C (95°F) and 60°C (140°F). If after driving for 250 sec., the ECT still remains within 3°C (5.4°F) of the starting temperature, a DTC will be set (2 trip detection logic).
- (2) Upon starting the engine, the ECT is over 60°C (140°F). If after driving for 250 sec., the ECT still remains within 1°C (1.8°F) of the starting temperature, a DTC will be set (6 trip detection logic).

MONITOR STRATEGY

Related DTCs	P0116	Engine coolant temperature sensor range check (Stuck)
Required sensors/components	Main sensors/components	Engine coolant temperature sensor
	Related sensors/components	Intake air temperature sensor, Crankshaft position sensor, Mass air flow meter
Frequency of operation	Continuous	
Duration	250 sec.	
MIL operation	2 driving cycles (When temperature is fixed between 35°C (95°F) and 60°C (140°F)) 6 driving cycles (When temperature is fixed at 60°C (140°F) or more)	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-18	
Case 1 (When temperature is fixed between 35°C (95°F) and 60°C (140°F)):		
Cumulative idle off period	250 sec.	–
Speed increase 18.6 mph (30 km/h) or more	10 times	–
Engine coolant temperature	35°C (95°F)	60°C (140°F)
Intake air temperature	–6.7°C (20°F)	–
Case 2 (When temperature is fixed at 60°C (140°F) or more):		
Engine coolant temperature at engine start	60°C (140°F)	–
Intake air temperature	–6.7°C (20°F)	–
Stop and go	Once or more (Stop for 20 sec. or more and accelerate to more than 43.5 mph (70 km/h) with in 40 sec.)	
Steady driving and stop *	Once or more	

*: Vehicle is driven by 40.4 mph (65 km/h) or more for 30 sec. or more and the vehicle speed reaches 43.5 mph (70 km/h). The vehicle is decelerated from 40.4 mph (65 km/h) to 1.86 mph (3 km/h) or less within 35 sec. and stopped for 10 sec.

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Case1 (When temperature is fixed between 35°C (95°F) and 60°C (140°F)):	
Change of engine coolant temperature value	Less than 3°C (5.4°F)
Case2 (When temperature is fixed at 60°C (140°F) or more):	
Change of engine coolant temperature value	1°C (1.8°F) or less

COMPONENT OPERATING RANGE

Standard Value
Engine coolant temperature changes with the actual engine coolant temperature.

INSPECTION PROCEDURE

HINT:

- If DTC P0115, P0116, P0117, P0118 and P0125 are output simultaneously, ECT sensor circuit may be open or shorted. Perform the troubleshooting of DTC P0115, P0117 or P0118 first.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

Replace engine coolant temperature sensor.

------------	--------------	---

DTC	P2135	Throttle/Pedal Position Sensor/Switch "A"/"B" Voltage Correlation
------------	--------------	--

HINT:

This is the purpose for the "throttle position sensor".

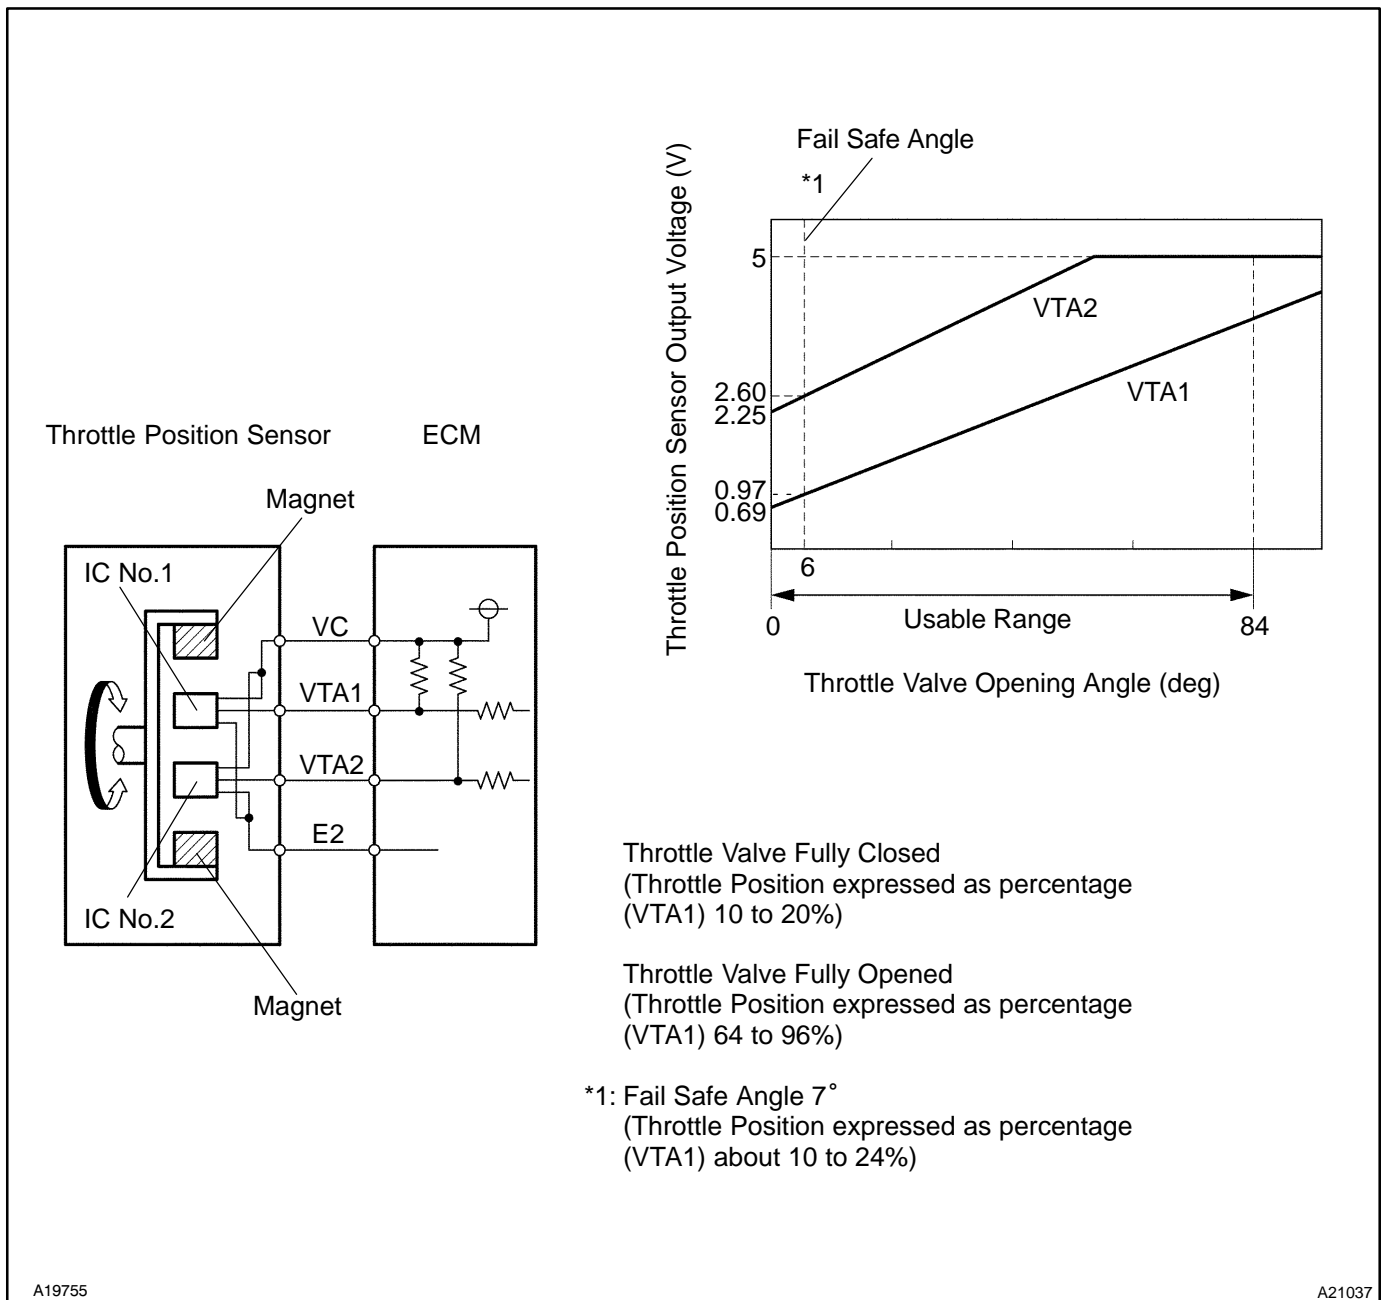

CIRCUIT DESCRIPTION

HINT:

- This Electrical Throttle Control System (ETCS) does not use a throttle cable.
- This throttle position sensor is a non-contact type.

The throttle position sensor is mounted on the throttle body. It detects the opening angle of the throttle valve. This sensor is electronically controlled and uses Hall-effect elements, so that accurate control and reliability can be obtained. The throttle position sensor has 2 sensor elements / signal outputs: VTA1 and VTA2. VTA1 used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. Voltage applied to VTA1 and VTA2 change between 0 V and 5 V in proportion to the opening angle of the throttle valve. There are several checks that the ECM performs to confirm proper operation of the throttle position sensor and VTA1.

The ECM judges the current opening angle of the throttle valve from these signals input from terminals VTA1 and VTA2, and the ECM controls the throttle motor to make the throttle valve angle properly in response to driver inputs.

DIAGNOSTICS - ENGINE (1GR-FE)

DTC No.	DTC Detection Condition	Trouble Area
Condition (a) of DTC P0120, P0122, P0123, P0220, P0222 or P0223 continues for 2 sec. (Open or short in the throttle control motor and sensor circuit)		
P0120	Detection conditions for DTCs P0122 and P0123 are not satisfied but condition (a) is satisfied (a) VTA1 is "0.2 V or less" or VTA1 is "4.535 V or more"	<ul style="list-style-type: none"> • Open or short in throttle control motor and sensor circuit • Throttle control motor and sensor • ECM
P0122	(a) VTA1 is 0.2 V or less	<ul style="list-style-type: none"> • Short in throttle control motor and sensor circuit • Throttle control motor and sensor • Short in VTA1 circuit • Open in VC circuit • ECM

HINT:

- After confirming DTCs, use the hand-held tester to confirm the throttle valve opening percentage and closed throttle position switch condition.
- THROTTLE POS means the VTA1 signal and the THROTTLE POS #2 means the VTA2 signal.

Reference (Normal condition):

Tester display	Accelerator pedal fully released	Accelerator pedal fully depressed
THROTTLE POS	10 to 24%	64 to 96%
THROTTLE POS #2	2.1 to 3.1 V	4.5 to 5.5 V

MONITOR DESCRIPTION

The ECM uses throttle position sensor to monitor the throttle valve opening angle.

- (a) There is an expected specific voltage difference between VTA1 and VTA2 for each throttle opening angle.
 - If the difference between VTA1 and VTA2 is incorrect the ECM interprets this as a fault and will set a DTC.
- (b) VTA1 and VTA2 each have a specific voltage operating range.
 - If VTA1 or VTA2 is out of the normal operating range the ECM interprets this as a fault and will set a DTC.
- (c) VTA1 and VTA2 should never be close to the same voltage levels.
 - If VTA1 is within the range of ± 0.02 V of VTA2 the ECM interprets this as a short circuit in the throttle position sensor system and will set a DTC.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
P0120:	
VTA1 voltage	0.2 V or less, or 4.535 V or more
P0122:	
VTA1 voltage	0.2 V or less
P0123:	
VTA1 voltage	4.535 V or more
P0220:	
VTA2 voltage	1.75 V or less, or 4.8 V or more
P0222:	
VTA2 voltage	1.75 V or less
P0223:	
Both of the following conditions are met for 2 sec. or more:	Condition 1 and 2
1. VTA1 voltage	0.2 to 2.02 V
2. VTA2 voltage	4.8 V or more
P2135:	
Different between VTA1 and VTA2 voltage	0.02 V or less
Both of the following conditions are met:	Condition 1 and 2
1. VTA1 voltage	0.2 V or less
2. VTA2 voltage	1.75 V or less

COMPONENT OPERATING RANGE

Parameter	Standard Value
Throttle position sensor VTA1 voltage	0.6 to 3.96 V
Throttle position sensor VTA2 voltage	2.25 to 5.0 V

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If DTCs related to different system that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read the voltage for throttle position sensor data.
----------	--

PREPARATION:

Enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / THROTTLE POS and THROTTLE POS #2.

CHECK:

Read voltage value displayed on the hand-held tester.

OK:

RESULT:

Throttle position expressed as percentage and voltage				Trouble area	Proceed to
Accelerator pedal released		Accelerator pedal depressed			
THROTTLE POS (VTA1)	THROTTLE POS #2 (VTA2)	THROTTLE POS (VTA1)	THROTTLE POS #2 (VTA2)		
0 %	0 to 0.2 V	0 %	0 to 0.2 V	VC circuit open	A
100 %	4.5 to 5.5 V	100 %	4.5 to 5.5 V	E2 circuit open	
0 % or 100 %	2.1 to 3.1 V (Fail safe)	0 % or 100 %	2.1 to 3.1 V (Fail safe)	VTA1 circuit open or ground short	
about 16 % (Fail safe)	0 to 0.2 or 4.5 to 5.5 V	about 16 % (Fail safe)	0 to 0.2 or 4.5 to 5.5 V	VTA2 circuit open or ground short	
10 to 24 %	2.15 to 3.05 V	64 to 96 % (Does not fail safe)	4.5 to 5.5 V (Does not fail safe)	Throttle position sensor circuit is normal	

B	Go to step 5.
----------	----------------------

A

2 Check for open and short in harness and connector between ECM and throttle position sensor.

PREPARATION:

- (a) Disconnect the T14 throttle control motor and sensor connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VC (T14-5) – VC (E7-23)	Below 1 Ω
VTA1 (T14-6) – VTA1 (E7-20)	Below 1 Ω
VTA2 (T14-4) – VTA2 (E7-19)	Below 1 Ω
E2 (T14-3) – E2 (E7-28)	Below 1 Ω
VC (T14-5) or VC (E7-23) – Body ground	10 kΩ or higher
VTA1 (T14-6) or VTA1 (E7-20) – Body ground	10 kΩ or higher
VTA2 (T14-4) or VTA2 (E7-19) – Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

3 Check voltage between terminals VC and E2 of ECM connector.

PREPARATION:

- (a) Disconnect the T14 throttle control motor and sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between the specified terminals of the E7 ECM connector.

OK:

Standard:

Tester Connection	Specified Condition
VC (E7-23) - E2 (E7-28)	4.5 to 5.5 V

NG → **Replace ECM (See page SF-66).**

OK

4 Replace throttle body (See page SF-40).

NEXT

5	Check if DTC output recur.
----------	-----------------------------------

PREPARATION:

- (a) Clear the DTC (See page [DI-42](#)).
- (b) Start the engine.
- (c) Run the engine at idle for 15 seconds or more.

CHECK:

Read the DTC.

RESULT:

Display (DTC Output)	Proceed to
"P0120, P0122, P0123, P0220, P0222, P0223 and/or P2135" are output again	A
No DTC output	B

Replace ECM (See page [SF-66](#)).

DTC	P0121	Throttle/Pedal Position Sensor/Switch "A" Circuit Range/Performance Problem
------------	--------------	--

HINT:

This is the purpose of the "throttle position sensor".

CIRCUIT DESCRIPTION

Refer to DTC P0120 on page [DI-123](#).

DTC No.	DTC Detecting Condition	Trouble Area
P0121	Condition (a) continues for 2.0 sec.: (a) Difference between VTA1 and VTA2 deviates from the threshold	Throttle body

MONITOR DESCRIPTION

The ECM uses throttle position sensor to monitor the throttle valve opening angle.

This sensor includes two signals, VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. There are several checks that the ECM performs confirm proper operation of the throttle position sensor and VTA1.

There is a specific voltage difference expected between VTA1 and VTA2 for each throttle opening angle. If the voltage output difference of the VTA1 and VTA2 deviates from the normal operating range, the ECM interprets this as a malfunction of the throttle position sensor. The ECM will turn on the MIL and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

Replace throttle body (See page [SF-40](#)).

DTC	P0125	Insufficient Coolant Temperature for Closed Loop Fuel Control
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to DTC P0115 on page [DI-115](#).

DTC No.	DTC Detection Condition	Trouble Area
P0125	If THW or THA is less than -19.45°C (-3°F) at engine start and 20 min. or more after starting engine, engine coolant temp. sensor value is 20°C (68°F) or less (2 trip detection logic)	<ul style="list-style-type: none"> • Cooling system • Engine coolant temperature sensor • Thermostat
	If THW and THA is between -19.45°C (-3°F) and -8.34°C (17°F) at engine start, 109 sec. or more after starting engine and engine coolant temp. sensor value is 20°C (68°F) or less (2 trip detection logic)	
	If THW and THA greater than -8.34°C (17°F) at engine start and 61 sec. or more after starting engine, engine coolant temp. sensor value is 20°C (68°F) or less (2 trip detection logic)	

MONITOR DESCRIPTION

The ECT (Engine Coolant Temperature) sensor is used to monitor the temperature of the engine coolant. The resistance of the sensor varies with the actual coolant temperature. The ECM applies a voltage to the sensor and the varying resistance of the sensor cause the signal voltage to vary. The ECM monitors the ECT signal voltage after engine start-up. If, after sufficient time has passed, the sensor still reports that the engine is not warmed up enough for closed-loop fuel control after sufficient time has passed, the ECM interprets this as a fault in the sensor or cooling system and sets a DTC.

Example:

The engine coolant temperature was 0°C (32°F) at engine start. After 5 min. running time, the ECT sensor still indicates that the engine is not warmed up enough to begin air fuel ratio feedback control of the air-fuel ratio. The ECM interprets this as a fault in the sensor or cooling system and will set a DTC.

MONITOR STRATEGY

Related DTCs	P0125	Insufficient coolant temperature for closed loop fuel control

Check that there is detect in the cooling system which causes overcool, such as abnormal radiator fan operation, modified cooling system and so on.

NG**Repair or replace cooling system.****OK****Replace engine coolant temperature sensor.**

DTC	P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)
------------	--------------	---

HINT:

This is the purpose of "thermostat" malfunction detection.

CIRCUIT DESCRIPTION

If the engine coolant temperature does not reach 75°C (167°F) despite sufficient warm-up time has elapsed.

DTC No.	DTC Detection condition	Trouble Area
P0128	Condition (a), (b) and (c) are met: (a) Cold start (b) After sufficient warm-up time has elapsed (c) Engine coolant temperature greater than 75°C (167°F)	<ul style="list-style-type: none"> • Thermostat • Cooling system • Engine coolant temperature sensor • ECM

MONITOR DESCRIPTION

The ECM estimates the coolant temperature based on starting temperature, engine loads, and engine speeds. The ECM then compares the estimated temperature with the actual ECT (Engine Coolant Temperature). When the estimated coolant temperature reaches 75°C (167°F), the ECM checks the actual ECT. If the actual ECT is less than 75°C (167°F), the ECM will interpret this as a fault in the thermostat or engine cooling system and set a DTC.

MONITOR STRATEGY

DTC	P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)
------------	--------------	--

DTC	P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)
------------	--------------	---

HINT:

Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.

CIRCUIT DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. less than 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. more than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is work-

ing improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

MONITOR DESCRIPTION

Active Air-Fuel Ratio Control

The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, one of the following DTCs is set: DTC P0136, P0156 (abnormal voltage output), P0137, P0157 (open circuit) and P0138, P0158 (short circuit).

Abnormal Voltage Output of HO2 Sensor (DTC P0136, P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to less than 0.21 V and does not increase to more than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and sets DTC P0136.

Open or Short in the Heated Oxygen (HO2) Sensor Circuit (DTC P0137, P0157, P0138 or P0158)

During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean.

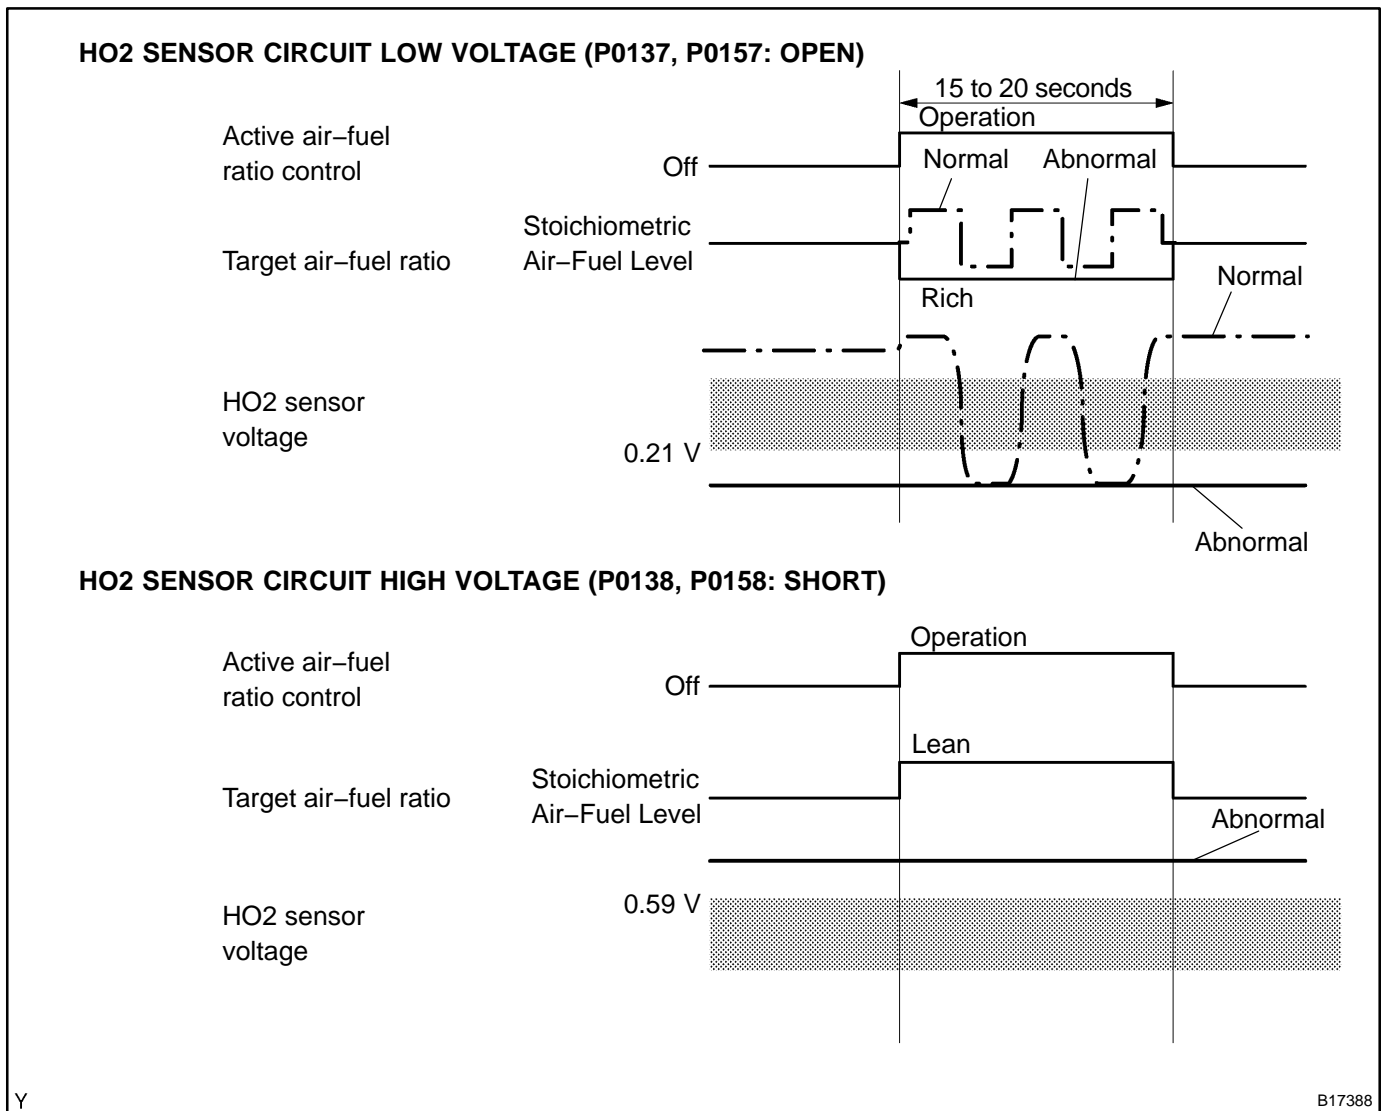

If the HO2 sensor has an open or short, or the voltage output of the sensor noticeably decreases, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and sets DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or more (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and sets DTC P0138 or P0158.

HINT:

DTC P0138 or P0158 is also set if the HO2 sensor voltage output is more than 1.2 V for 30 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated, based on the calculated OSC value (see page DI-228).

High or Low Impedance of Heated Oxygen (HO₂) Sensor (DTC P0136, P0156, P0137 or P0157)

Interrelation between temperature of the element and impedance:

During normal air–fuel ratio feedback control, there are small variations in the exhaust gas oxygen concentration. In order to continuously monitor the slight variation of the HO₂ sensor signal while the engine is running, the impedance* of the sensor is measured by the ECM. The ECM determines that there is a malfunction in the sensor when the measured impedance deviates from the standard range.

*: The effective resistance in an alternating current electrical circuit.

HINT:

- The impedance can not be measured using an ohmmeter.
- DTC P0136 or P0156 indicates the deterioration of the HO₂ sensor. The ECM sets the DTC by calculating the impedance of the sensor when the typical enabling conditions are satisfied (1 driving cycle).
- DTC P0137 or P0157 indicates an open or short circuit in the HO₂ sensor (1 driving cycle). The ECM sets this DTC when the impedance of the sensor exceeds the threshold 15 kΩ.

Active air-fuel ratio control being when all of following conditions met	-	
Battery voltage	11 V	-
ECT	75°C (167°F)	-
Idle	OFF	
Engine RPM	-	3,200 rpm
A/F sensor status	Activated	

Fuel system status	Closed loop	
Fuel-cut	OFF	
Engine load	10 to 70%	
Heated oxygen sensor impedance (Low):		
Battery voltage	11 V	-
Estimated sensor temperature	-	700°C (1,292°F)
ECM monitor	Completed	
P0606	Not set	
Heated oxygen sensor impedance (High):		
Battery voltage	11 V	-
Estimated sensor temperature	520°C (968°F)	-
ECM monitor	Completed	
P0606	Not set	
Heated oxygen sensor output voltage (Extremely high):		
Battery voltage	11 V	-
Time after engine start	2 sec.	-

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Heated oxygen sensor output voltage (Output voltage):	
Either of the following conditions is met:	Condition 1 or 2
1. All of the following conditions are met:	Condition (a), (b) and (c)
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2S voltage	0.21 to 0.59 V
(c) OSC (Oxygen Storage Capacity of catalyst)	2.5 g or more
2. All of the following conditions are met:	Condition (a), (b) and (c)
(a) Commanded air-fuel ratio	14.9 or more
(b) Rear HO2S voltage	0.21 to 0.59 V
(c) OSC (Oxygen Storage Capacity of catalyst)	2.5 g or more
Heated oxygen sensor output voltage (Low voltage):	
All of the following conditions are met:	Condition 1, 2 and 3
1. Commanded air-fuel ratio	14.3 or less
2. Rear HO2S voltage	Less than 0.21 V
3. OSC (Oxygen Storage Capacity of catalyst)	2.5 g or more
Heated oxygen sensor output voltage (High voltage):	
All of the following conditions are met:	Condition 1, 2 and 3
1. Commanded air-fuel ratio	14.9 or more
2. Rear HO2S voltage	More than 0.59 V
3. OSC (Oxygen Storage Capacity of catalyst)	2.5 g or more
Heated oxygen sensor impedance (Low):	
Duration of following condition	30 sec. or more
Heated oxygen sensor impedance	Less than 5 Ω
Heated oxygen sensor impedance (High):	
Duration of following condition	90 sec. or more
Rear oxygen sensor impedance	15 kΩ or more

Heated oxygen sensor output voltage (Extremely high):	
Duration of following condition	10 sec. or more
Rear oxygen sensor voltage	More than 1.2 V

COMPONENT OPERATING RANGE

Parameter	Standard Value
Rear oxygen sensor voltage	1.2 V or more

O2S TEST RESULT

Refer to page [DI-24](#) for detailed information on O2S TEST RESULT.

Test ID	Test Item	Description	Unit Conversion	Unit	Standard Value
\$07	Output Voltage	Minimum rear HO2 sensor output voltage	Multiply by 0.005	V	Less than TEST LIMIT
\$08	Output Voltage	Maximum rear HO2 sensor output voltage	Multiply by 0.005	V	More than TEST LIMIT
\$91	OSC	Maximum OSC in catalytic converter	Multiply by 0.0156	g	Less than TEST LIMIT

If the sensor voltage is outside the standard values, the ECM interprets this as a malfunction and sets a DTC.

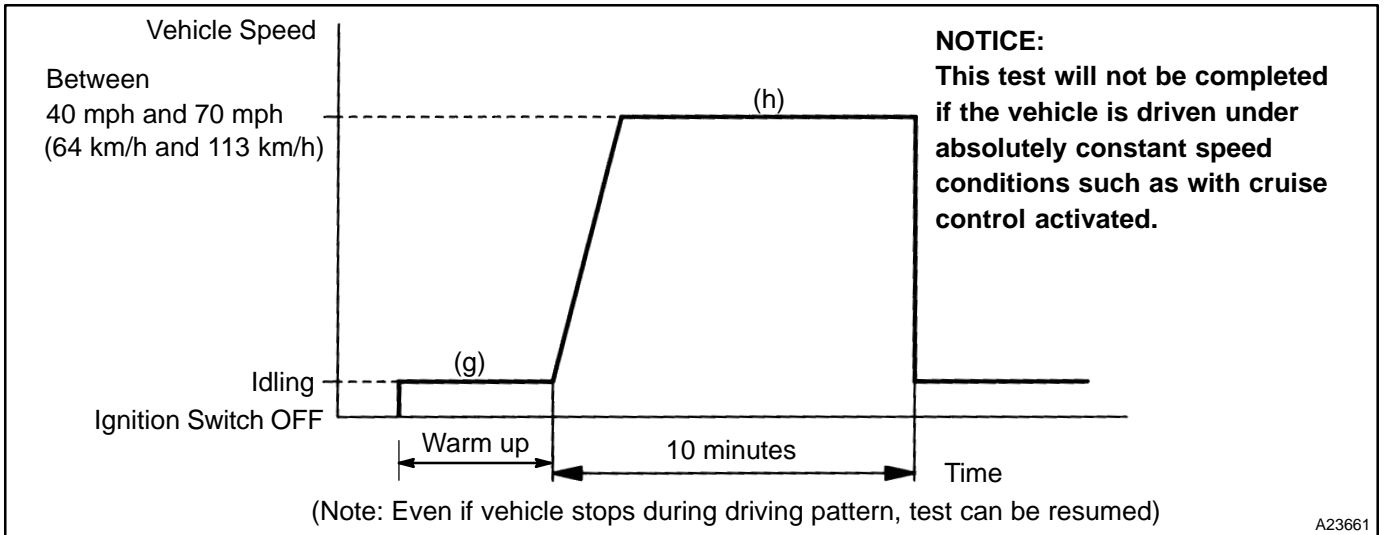

WIRING DIAGRAM

Refer to DTC P2195 on page [DI-312](#).

CONFIRMATION DRIVING PATTERN

HINT:

- This confirmation driving pattern is used in steps 5, 8 and 11 of the following diagnostic troubleshooting procedure when using a hand-held tester.
- Performing this confirmation pattern will activate the Heated Oxygen (HO2) sensor monitor. (The catalyst monitor is performed simultaneously.) This is very useful for verifying the completion of a repair.

READINESS TESTS	
MISFIRE MON	AVAIL
FUEL SYS MON	AVAIL
COMP MON	AVAIL
CAT EVAL	INCMPL
HTD CAT EVAL	N/A
EVAP EVAL	INCMPL
2nd AIR EVAL	N/A
A/C EVAL	N/A
O2S EVAL	INCMPL
O2S HTR EVAL	INCMPL
EGR EVAL	N/A

A76855 A23660

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Turn the tester ON.
- (d) Clear DTCs (where set) (see page DI-42).
- (e) Select the following menu items: DIAGNOSIS / CARB OBD II / READINESS TESTS.
- (f) Check that O2S EVAL is INCMPL (incomplete).
- (g) Start the engine and warm it up.
- (h) Drive the vehicle at 40 mph to 70 mph (64 km/h to 113 km/h) for at least 10 minutes.
- (i) Note the state of the Readiness Tests items. Those items will change to COMPL (complete) as O2S EVAL monitor operates.
- (j) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.

HINT:

If O2S EVAL does not change to COMPL, and any pending DTCs fail to set, extend the driving time.

INSPECTION PROCEDURE**HINT:**

Hand-held tester only:

Narrowing down the trouble area is possible by performing ACTIVE TEST of the following "A/F CONTROL" (Heated oxygen sensor or another can be distinguished).

- (a) Perform ACTIVE TEST by hand-held tester (A/F CONTROL).

HINT:

"A/F CONTROL" is the ACTIVE TEST which changes the injection volume to -12.5 % or +25 %.

- (1) Connect the hand-held tester to the DLC3 on the vehicle.
- (2) Turn the ignition switch ON.
- (3) Warm up the engine with the engine speed at 2,500 rpm for approximately 90 seconds.
- (4) Select the menu "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL".
- (5) Perform "A/F CONTROL" with the engine in an idle condition (press the right or left button).

RESULT:

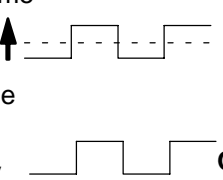

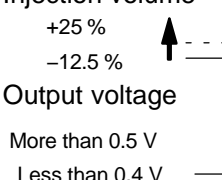

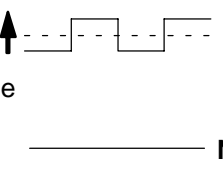

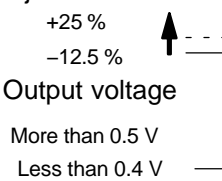

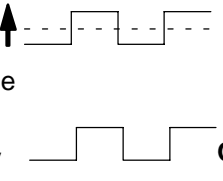

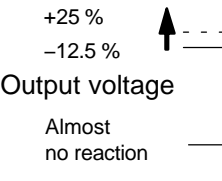

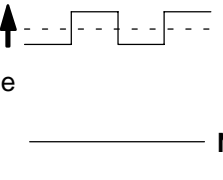

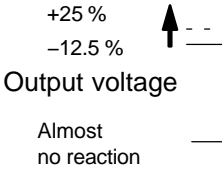

Heated oxygen sensor reacts in accordance with increase and decrease of injection volume
 +25 % → rich output: More than 0.5 V
 -12.5 % → lean output: Less than 0.4 V

NOTICE:

There is a few seconds delay in the sensor 1 (front sensor) output. And there is approximately 20 seconds delay in the sensor 2 (rear sensor).

The following A/F CONTROL procedure enables the technician to check and graph the voltage output of the heated oxygen sensors.

For displaying the graph indication, first enter "ACTIVE TEST / A/F CONTROL / USER DATA," then select "O2S B1S1 and O2S B1S2" by pressing "YES" button, and push "ENTER" button before pressing "F4" button.

	Output voltage of heated oxygen sensor (sensor 1: front sensor)	Output voltage of heated oxygen sensor (sensor 2: rear sensor)	Mainly suspected trouble area
Case 1	Injection volume +25 % ↑ -12.5 %  Output voltage More than 0.5 V Less than 0.4 V OK	Injection volume +25 % ↑ -12.5 %  Output voltage More than 0.5 V Less than 0.4 V OK	—
Case 2	Injection volume +25 % ↑ -12.5 %  Output voltage Almost no reaction NG	Injection volume +25 % ↑ -12.5 %  Output voltage More than 0.5 V Less than 0.4 V OK	Sensor 1: front sensor (sensor 1, heater, sensor 1 circuit)
Case 3	Injection volume +25 % ↑ -12.5 %  Output voltage More than 0.5 V Less than 0.4 V OK	Injection volume +25 % ↑ -12.5 %  Output voltage Almost no reaction NG	Sensor 2: rear sensor (sensor 2, heater, sensor 2 circuit)
Case 4	Injection volume +25 % ↑ -12.5 %  Output voltage Almost no reaction NG	Injection volume +25 % ↑ -12.5 %  Output voltage Almost no reaction NG	Extremely rich or lean actual air-fuel ratio (Injector, fuel pressure, gas leakage in exhaust system, etc.)

HINT:

- If different DTCs that are related to different system are output simultaneously while terminal E2 is used as a ground terminal, terminal E2 may be open.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. when a malfunction occurred.

1	Read output DTC.
----------	-------------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
P0138, P0158	A
P0137, P0157	B
P0136, P0156	C

HINT:

If any other codes besides P0136, P0137, P0138, P0156, P0157 and/or P0158 are output, perform the troubleshooting for those DTCs first.

2	Check output voltage of heated oxygen sensor.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) After warming up the engine, run the engine at 2,500 rpm for 3 minutes.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / O2S B1S2 or B2S2.
- (d) Allow the engine to idle.

CHECK:

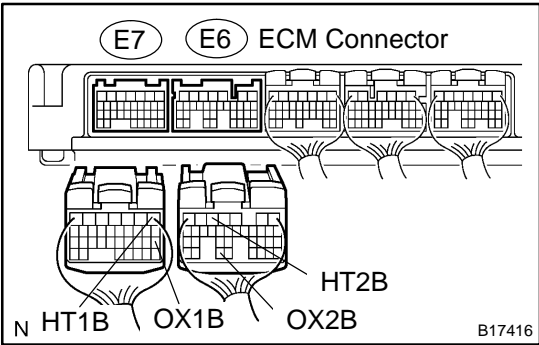

Read the Heated Oxygen (HO₂) sensor output voltage while idling.

RESULT:

HO ₂ Sensor Output Voltages	Proceed To
More than 1.2 V	A
Less than 1.0 V	B

3 Check for short in harness and connector between terminal OX1B and HT1B, OX2B and HT2B of ECM.

PREPARATION:

- (a) Turn the ignition switch to OFF and wait for 5 minutes.
- (b) Disconnect the E6 and E7 ECM connectors.

CHECK:

Check the resistance.

OK:

Standard:

Tester Connections	Specified Conditions
HT1B (E7-1) - OX1B (E7-18)	10 kΩ or higher
HT2B (E6-5) - OX2B (E6-33)	10 kΩ or higher

NG Replace ECM (See page SF-66).

NG

4 Check resistance of heated oxygen sensor heater.

PREPARATION:

Disconnect the heated oxygen sensor connector.

CHECK:

Measure resistance between terminals of the heated oxygen sensor.

OK:

Standard:

Tester Connection	Specified Condition
HT (1) - +B (2)	11 to 16 Ω at 20°C (68°F)
+B (2) - OX (3)	10 kΩ or higher

NG Replace heated oxygen sensor.

OK

Repair or replace harness or connector.

5 Perform confirmation driving pattern.

NEXT

6	Check whether DTC output recurs (DTC P0138, P0158)
----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P0138 or P0158	A
No output	B

B	Check for intermittent problems (See page DI-11).
----------	--

A

Replace heated oxygen sensor.

7	Check output voltage of heated oxygen sensor.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Start the engine.
- (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / O2S B1S2.
- (e) After warming up the engine, run the engine at an engine speed of 2,500 rpm for 3 minutes.

CHECK:

Read the output voltage of the HO2 sensor when the engine rpm is suddenly increased.

HINT:

Quickly accelerate the engine to 4,000 rpm 3 times using the accelerator pedal.

Standard: Fluctuates between 0.4 V or less and 0.5 V or more.

NG	Go to step 14.
-----------	-----------------------

OK

8	Perform confirmation driving pattern.
----------	--

NEXT

9	Check whether DTC output recurs (DTC P0136, P0156)
----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P0136 or P0156	A
No output	B

B

Check for intermittent problems (See page DI-11).

A

10	Replace heated oxygen sensor.
-----------	--------------------------------------

NEXT

11	Perform confirmation driving pattern.
-----------	--

NEXT

12	Check whether DTC output recurs (DTC P0136, P0156)
-----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P0136 or P0156	A
No output	B

B

Repair completed.

A

13	Perform active test (injection volume).
-----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and turn the tester ON.
- (c) Warm up the engine.
- (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INJ VOL.

CHECK:

Change the fuel injection volume using the tester, monitoring the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- Change the fuel injection volume within the range of -12 % and +12 %. The injection volume can be changed in 1 % graduations within the range.
- The A/F sensor is displayed as AFS B1S1, and the HO2 sensor is displayed as O2S B1S2, on hand-held testers.

RESULT:

Tester Display (Sensor)	Voltage Variations	Proceed To
AFS B1S1 (AFS B2S1) (A/F)	Alternates between more and less than 3.3 V	OK
AFS B1S1 (AFS B2S1) (A/F)	Remains at more than 3.3 V	NG
AFS B1S1 (AFS B2S1) (A/F)	Remains at less than 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or more than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	Replace air-fuel ratio (A/F) sensor.
-----------	---

OK

Check and repair extremely rich or lean actuarial air fuel ratio (injector, fuse pressure, gas leakages from exhaust system, etc.)

14 Check for exhaust gas leakage.

CHECK:

Check for exhaust gas leakage from the exhaust manifold and pipe.

OK:

No exhaust gas leakage.

NG Repair or replace exhaust gas leakage point.

OK

15 Inspect heated oxygen sensor.

PREPARATION:

Disconnect the HO2 sensor connector.

CHECK:

Measure the resistance between the terminals of the HO2 sensor connector.

OK:

Standard:

Tester Connections	Specified Conditions
HT (2) - +B (1)	11 to 16 Ω at 20°C (68°F)
HT (2) - E (3)	10 kΩ or higher

NG Replace heated oxygen sensor.

OK

16 Check EFI relay.
**PREPARATION:**

Remove the EFI relay from the engine room J/B.

CHECK:

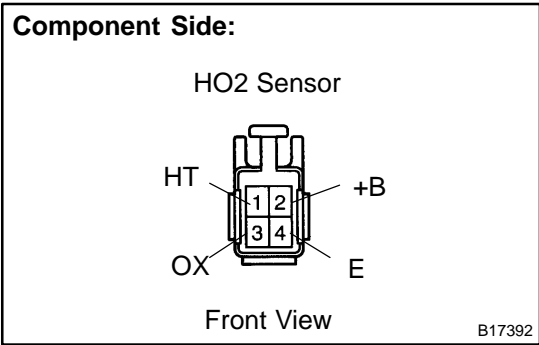

Inspect the EFI relay.

OK:**Standard:**

Terminal No.	Condition	Specified Condition
3 - 5	Usually	10 K Ω or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG**Replace EFI relay.****OK**

17 Check for open and short in harness and connector between ECM and heated oxygen sensor.

PREPARATION:

- (a) Disconnect the heated oxygen sensor connector.
- (b) Disconnect the E6 and E7 ECM connectors.

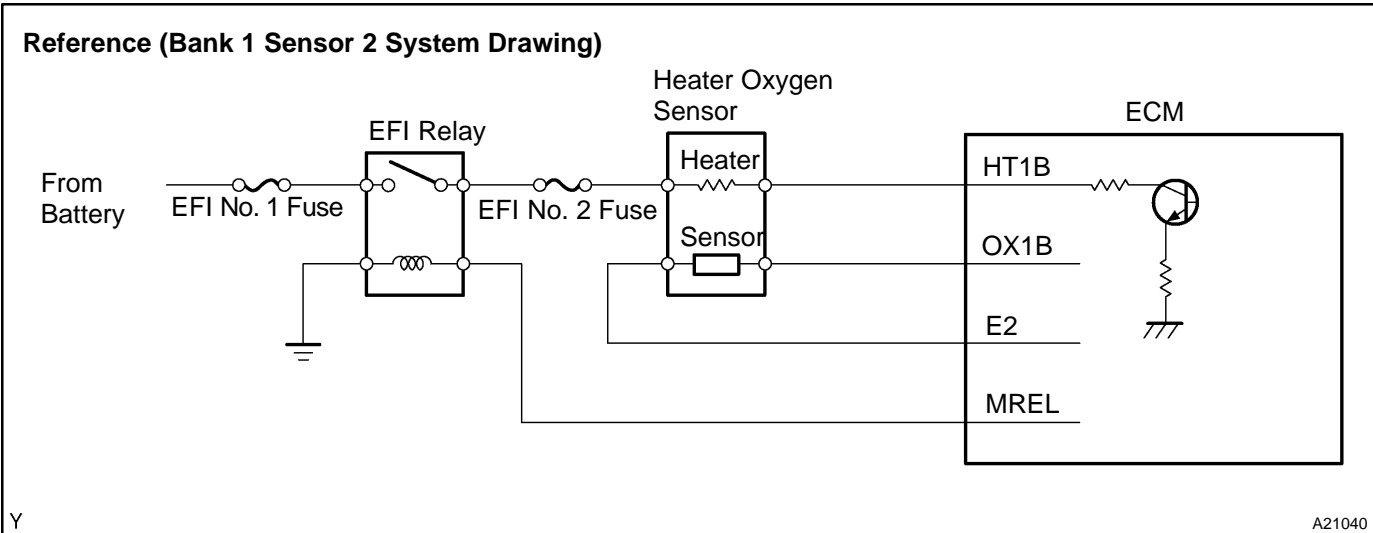

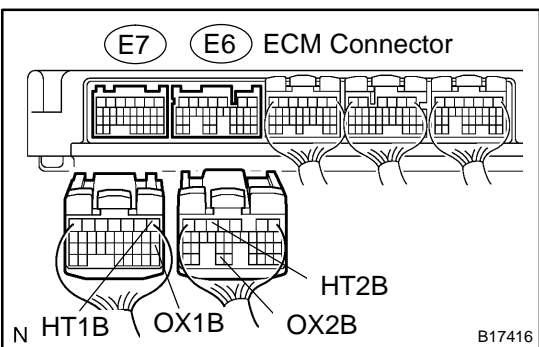

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
OX (H4-3) - OX1B (E7-18)	Below 1 Ω
HT (H4-1) - HT1B (E7-1)	Below 1 Ω
OX (H6-3) - OX2B (E6-33)	Below 1 Ω
HT (H6-1) - HT2B (E6-5)	Below 1 Ω
OX (H4-3) or OX1B (E7-18) - Body ground	10 kΩ or higher
HT (H4-1) or HT1B (E7-1) - Body ground	10 kΩ or higher
OX (H6-3) or OX2B (E6-33) - Body ground	10 kΩ or higher
HT (H6-1) or HT2B (E6-5) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace heated oxygen sensor.

DTC	P0171	System too Lean (Bank 1)
------------	--------------	---------------------------------

DTC	P0172	System too Rich (Bank 1)
------------	--------------	---------------------------------

DTC	P0174	System too Lean (Bank 2)
------------	--------------	---------------------------------

DTC	P0175	System too Rich (Bank 2)
------------	--------------	---------------------------------

CIRCUIT DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and long-term fuel trims.

The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.

Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.

If both the short-term and long-term fuel trims are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.

DIAGNOSTICS – ENGINE (1GR-FE)

DTC No.	DTC Detecting Condition	Trouble Area
P0171 P0174	When air–fuel ratio feedback is stable after warming up the engine, fuel trim is considered to be in error on LEAN side (2 trip detection logic)	<ul style="list-style-type: none"> • Air induction system • Injector blockage • Mass air flow meter • Engine coolant temperature sensor • Fuel pressure • Gas leakage in exhaust system • Open or short in heated oxygen sensor (bank 1, 2 sensor 1) circuit • Heated oxygen sensor (bank 1, 2 sensor 1) • Heated oxygen sensor heater (bank 1, 2 sensor 1) • EFI relay • PCV piping • ECM
P0172 P0175	When air–fuel ratio feedback is stable after warming up the engine, fuel trim is considered to be in error on RICH side (2 trip detection logic)	<ul style="list-style-type: none"> • Injector leak, blockage • Mass air flow meter • Engine coolant temperature sensor • Ignition system • Fuel pressure • Gas leakage in exhaust system • Open or short in heated oxygen sensor (bank 1, 2 sensor 1) circuit • Heated oxygen sensor (bank 1, 2 sensor 1) • ECM

HINT:

- When DTC P0171 or P0174 is recorded, the actual air–fuel ratio is on the LEAN side. When DTC P0172 or P0175 is recorded, the actual air–fuel ratio is on the RICH side.
- If the vehicle runs out of fuel, the air–fuel ratio is LEAN and DTC P0171 or P0174 may be recorded. The MIL then comes on.
- If the total of the short–term fuel trim value and long–term fuel trim value is within $\pm 35\%$ (engine coolant temperature is more than $75\text{ }^{\circ}\text{C}$ (167°F)), the system is functioning normally.

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction thresholds, the ECM interprets this a fault in the fuel system and sets a DTC.

Example:

The average fuel trim leaning value is more than +35 % or less than -35 %, the ECM interprets this as a fuel system malfunction.

MONITOR STRATEGY

Related DTCs	P0171	Fuel system lean (Bank 1)
	P0172	Fuel system rich (Bank 1)
	P0174	Fuel system lean (Bank 2)
	P0175	Fuel system rich (Bank 2)
Required sensors/components	Main sensors/components	Fuel system
	Related sensors/components	Engine coolant temperature sensor, Mass air flow meter, Crankshaft position sensor, A/F sensor
Frequency of operation	Continuous	
Duration	10 sec.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-18	
Battery voltage	11 V	-
Fuel system status	Closed-loop	
Either of the following conditions is met:	Condition 1 or 2	
1. Engine RPM	-	1,100 rpm
2. Intake air amount per revolution	0.22 g/sec.	-
Catalyst monitor	No executed	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
EVAP purge-cut	Executing
Either of the following conditions is met	Condition 1 or 2
1. Average between short-term fuel trim and long-term fuel trim	35% or more (varies with ECT)
2. Average between short-term fuel trim and long-term fuel trim	-35% or less (varies with ECT)

WIRING DIAGRAM

Refer to DTC P2195 on page [DI-312](#).

INSPECTION PROCEDURE

HINT:

Hand-held tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- (1) Connect a hand-held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 (AFS B2S1) and OS2 B1S2 (OS2 B2S2)) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

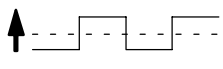

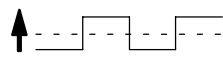

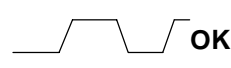

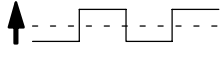

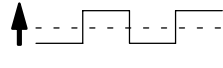

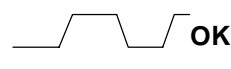

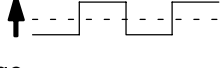

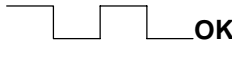

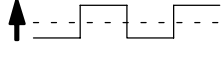

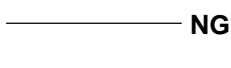

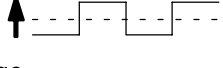

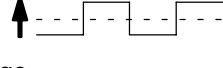

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 % ↑  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0 V	Injection volume +25 % ↑  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	—
2	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 % ↑  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 % ↑  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0V	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

HINT:

- Read freeze frame data using a hand-held tester or OBD II scan tool. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1	Check any other DTCs output (in addition to DTC P0171, P0172, P0174 or P0175).
----------	---

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read DTCs.

Result:

Display (DTC Output)	Proceed To
P0171, P0172, P0174 or P0175	A
P0171, P0172, P0174 or P0175 and other DTCs	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B	Go to DTC chart (See page DI-57).
----------	--

A

2	Check connection of PCV piping.
----------	--

OK:

PCV hose is connected correctly and is not damaged.

NG	Repair or replace PCV piping.
-----------	--------------------------------------

OK

3	Check air induction system (See page SF-1).
----------	--

CHECK:

Check the air induction system for vacuum leaks.

NG

Repair or replace air induction system.
--

OK

4	Perform active test (A/F control).
----------	---

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and turn the tester ON.
- (c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (f) Monitor the voltage outputs of A/F and HO2 sensors (AFS B1S1 (AFS B2S1) and O2S B1S2 (O2S B2S2)) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO2)	-12.5 %	Lean	Less than 0.4

Result:

Status AFS B1S1 (AFS B2S1)	Status O2S B1S2 (O2S B2S2)	A/F Condition and A/F Sensor Condition	Misfires	Suspected Trouble Areas	Proceed To
Lean/Rich	Lean/Rich	Normal	—	—	C
Lean	Lean	Actual air-fuel ratio lean	May occur	<ul style="list-style-type: none"> • PCV valve and hose • PCV hose connections • Injector blockage • Gas leakage from exhaust system • Air induction system • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor 	A
Rich	Rich	Actual air-fuel ratio rich	—	<ul style="list-style-type: none"> • Injector leakage or blockage • Gas leakage from exhaust system • Ignition system • Fuel pressure • MAF meter • ECT sensor 	A
Lean	Lean/Rich	A/F sensor malfunction	—	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	—	• A/F sensor	B

Lean: During A/F CONTROL, the A/F sensor output voltage (AFS) is consistently more than 3.35 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.

Rich: During A/F CONTROL, the AFS is consistently less than 3.0 V, and the O2S is consistently more than 0.55 V.

5	Read value of coolant temperature.
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

Read the COOLANT TEMP twice, when the engine is cold and also when warmed up.

OK:

With cold engine: Same as ambient air temperature.

With warm engine: Between 75°C and 95°C (167°F and 203°F)

6	Read value of mass air flow meter.
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / MAF and COOLANT TEMP.
- (d) Allow the engine to idle until the COOLANT TEMP reaches 75°C (167°F) or more.

CHECK:

Read the MAF with the engine in an idling condition and at an engine speed of 2,500 rpm.

Standard:

MAF while engine idling: Between 1.4 gm/s and 2.3 gm/s (shift position: N, A/C: OFF).

MAF at engine speed of 2,500 rpm: Between 5.4 gm/s and 7.9 gm/s (shift position: N, A/C: OFF).

NG	Replace mass air flow meter.
-----------	-------------------------------------

OK

7	Check fuel pressure (See page SF-5).
----------	---

CHECK:

Check the fuel pressure (high or low pressure).

NG	Check and replace fuel pump, pressure regulator, fuel pipe line and filter (See page SF-1).
-----------	--

OK

8	Check exhaust system for gas leakage.
----------	--

CHECK:

Check for exhaust gas leakage from the exhaust manifold and pipe.

OK:

No exhaust gas leakage.

NG	Repair or replace exhaust gas leakage point.
-----------	---

OK

9 Check for spark and ignition (See page IG-1).

HINT:

If the spark plugs or ignition system malfunction, engine misfire may occur. The misfire counter can be read with the hand-held tester. Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL#1 (to CYL#8).

NG → **Repair or replace ignition system.**

OK

10 Check injector injection (See page SF-26).

HINT:

If the injectors malfunction, engine misfires may occur. The misfire counter can be read with the hand-held tester. Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL#1 (to CYL#8).

NG → **Replace injector.**

OK

11 Check resistance of air-fuel ratio (A/F) sensor heater.

PREPARATION:

Disconnect the A10 or A30 air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Standard:

Tester Connection	Specified Condition
HT (1) - +B (2)	1.8 to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

NG → **Replace air-fuel ratio (A/F) sensor.**

OK

12 Check A/F relay.

PREPARATION:

Remove the A/F relay from the engine room J/B.

CHECK:

Inspect the A/F relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Usually	10 K Ω or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace A/F relay.

OK

13 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

OK:

Standard:

Tester Connections	Specified Conditions
+B (2) - Body ground	9 to 14 V

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E6 ECM connector.

CHECK:

Check the resistance.

OK:

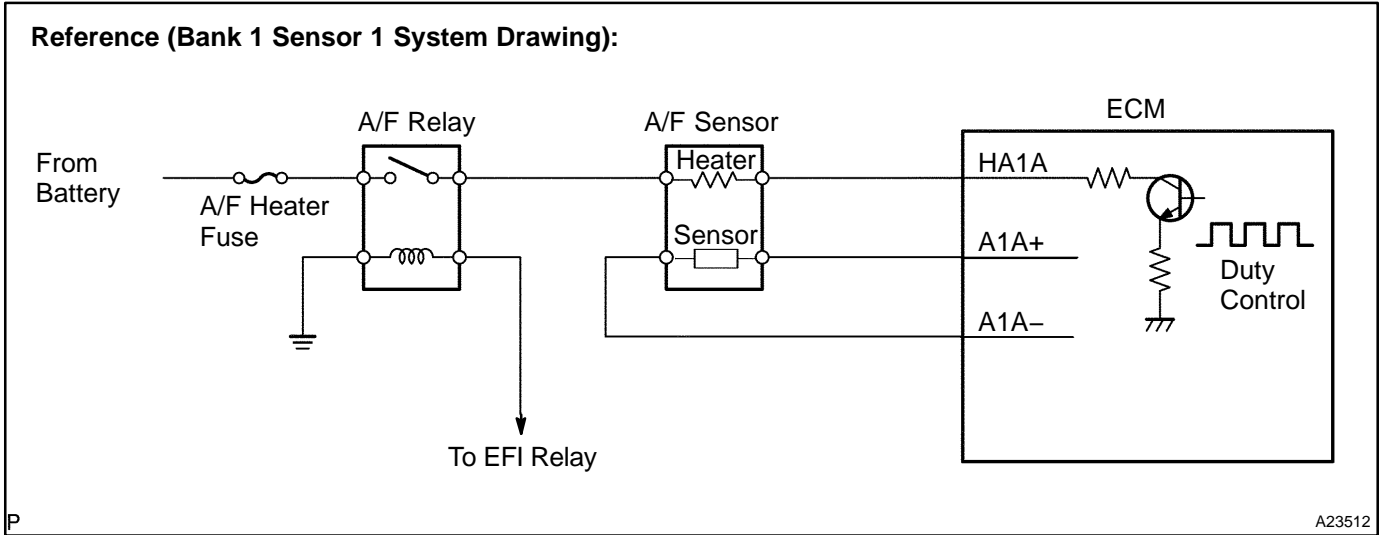

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω
AF+ (A10-3) - A1A+ (E6-22) AF+ (A30-3) - A2A+ (E6-23)	Below 1 Ω
AF- (A10-4) - A1A- (E6-30) AF- (A30-4) - A2A- (E6-31)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher
AF+ (A10-3) or A1A+ (E6-22) - Body ground AF+ (A30-3) or A2A+ (E6-23) - Body ground	10 kΩ or higher
AF- (A10-4) or A1A- (E6-30) - Body ground AF- (A30-4) or A2A- (E6-31) - Body ground	10 kΩ or higher

Reference (Bank 1 Sensor 1 System Drawing):

P

A23512

NG → **Replace or replace harness or connector.**

OK

14 **Replace air fuel ratio sensor.**

NEXT

15	Perform confirmation driving pattern.
-----------	--

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Clear DTCs (see page [DI-42](#)).
- (d) Switch the ECM from normal mode to check mode using the tester (see page [DI-43](#)).
- (e) Start the engine and warm it up with all the accessories switched OFF.
- (f) Drive the vehicle at 38 mph to 75 mph (60 km/h to 120 km/h) and at an engine speed of between 1,400 rpm and 3,200 rpm for 3 to 5 minutes.

HINT:

If the system is still malfunctioning, the MIL will be illuminated during step (e).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16	Check whether DTC output recurs (DTC P0171, P0172, P0174 or P0175)
-----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P0171, P0172, P0174 or P0175	A
No output	B

B → **Go to step 5.**

A

END

DTC	P0230	Fuel Pump Primary Circuit
------------	--------------	----------------------------------

CIRCUIT DESCRIPTION

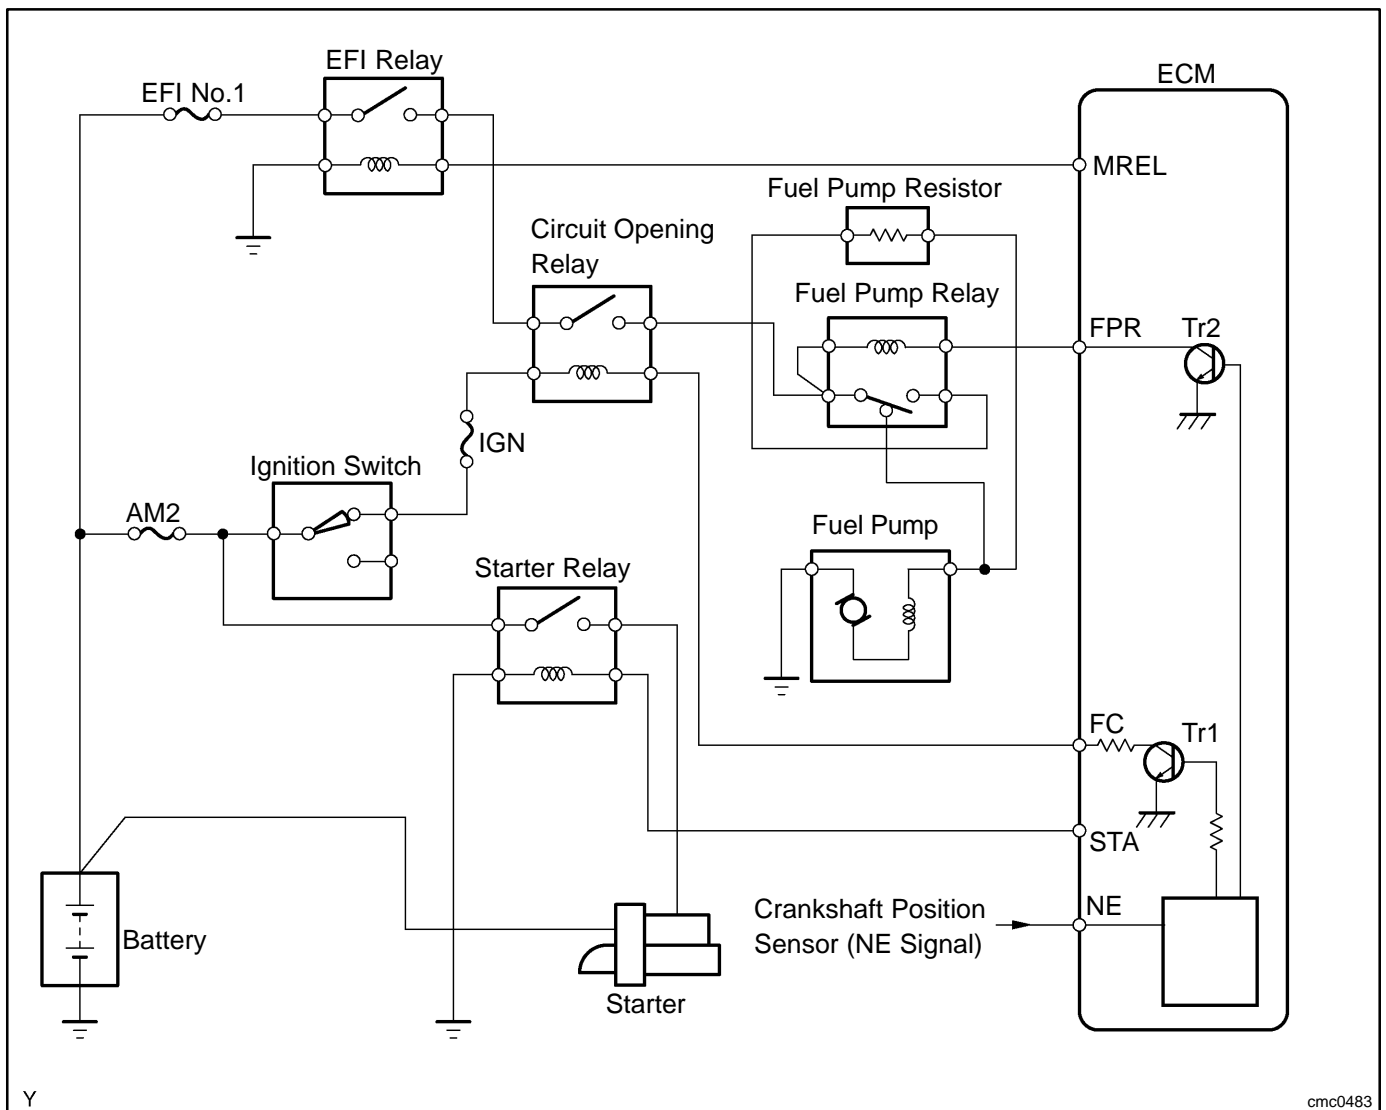

In the diagram below, when the engine is cranked, current flows from terminal STAR of the ECM to the starter relay coil and also current flows to terminal STA of the ECM (STA signal).

When the STA signal and NE signal are input to the ECM, the Tr1 is turned ON, current flows to the coil of the circuit opening relay, the relay switches on, power is supplied to the fuel pump, and the fuel pump operates.

While the NE signal is generated (engine running), the ECM keeps the Tr1 ON (circuit opening relay ON) and the fuel pump also keeps operating.

The fuel pump speed is controlled at two levels (high speed or low speed) by the condition of the engine (starting, light load, heavy load). When the engine starts (STA ON), the Tr2 in the ECM is OFF, so the fuel pump relay closes and battery positive voltage is applied directly to the fuel pump. The fuel pump operates at high speed.

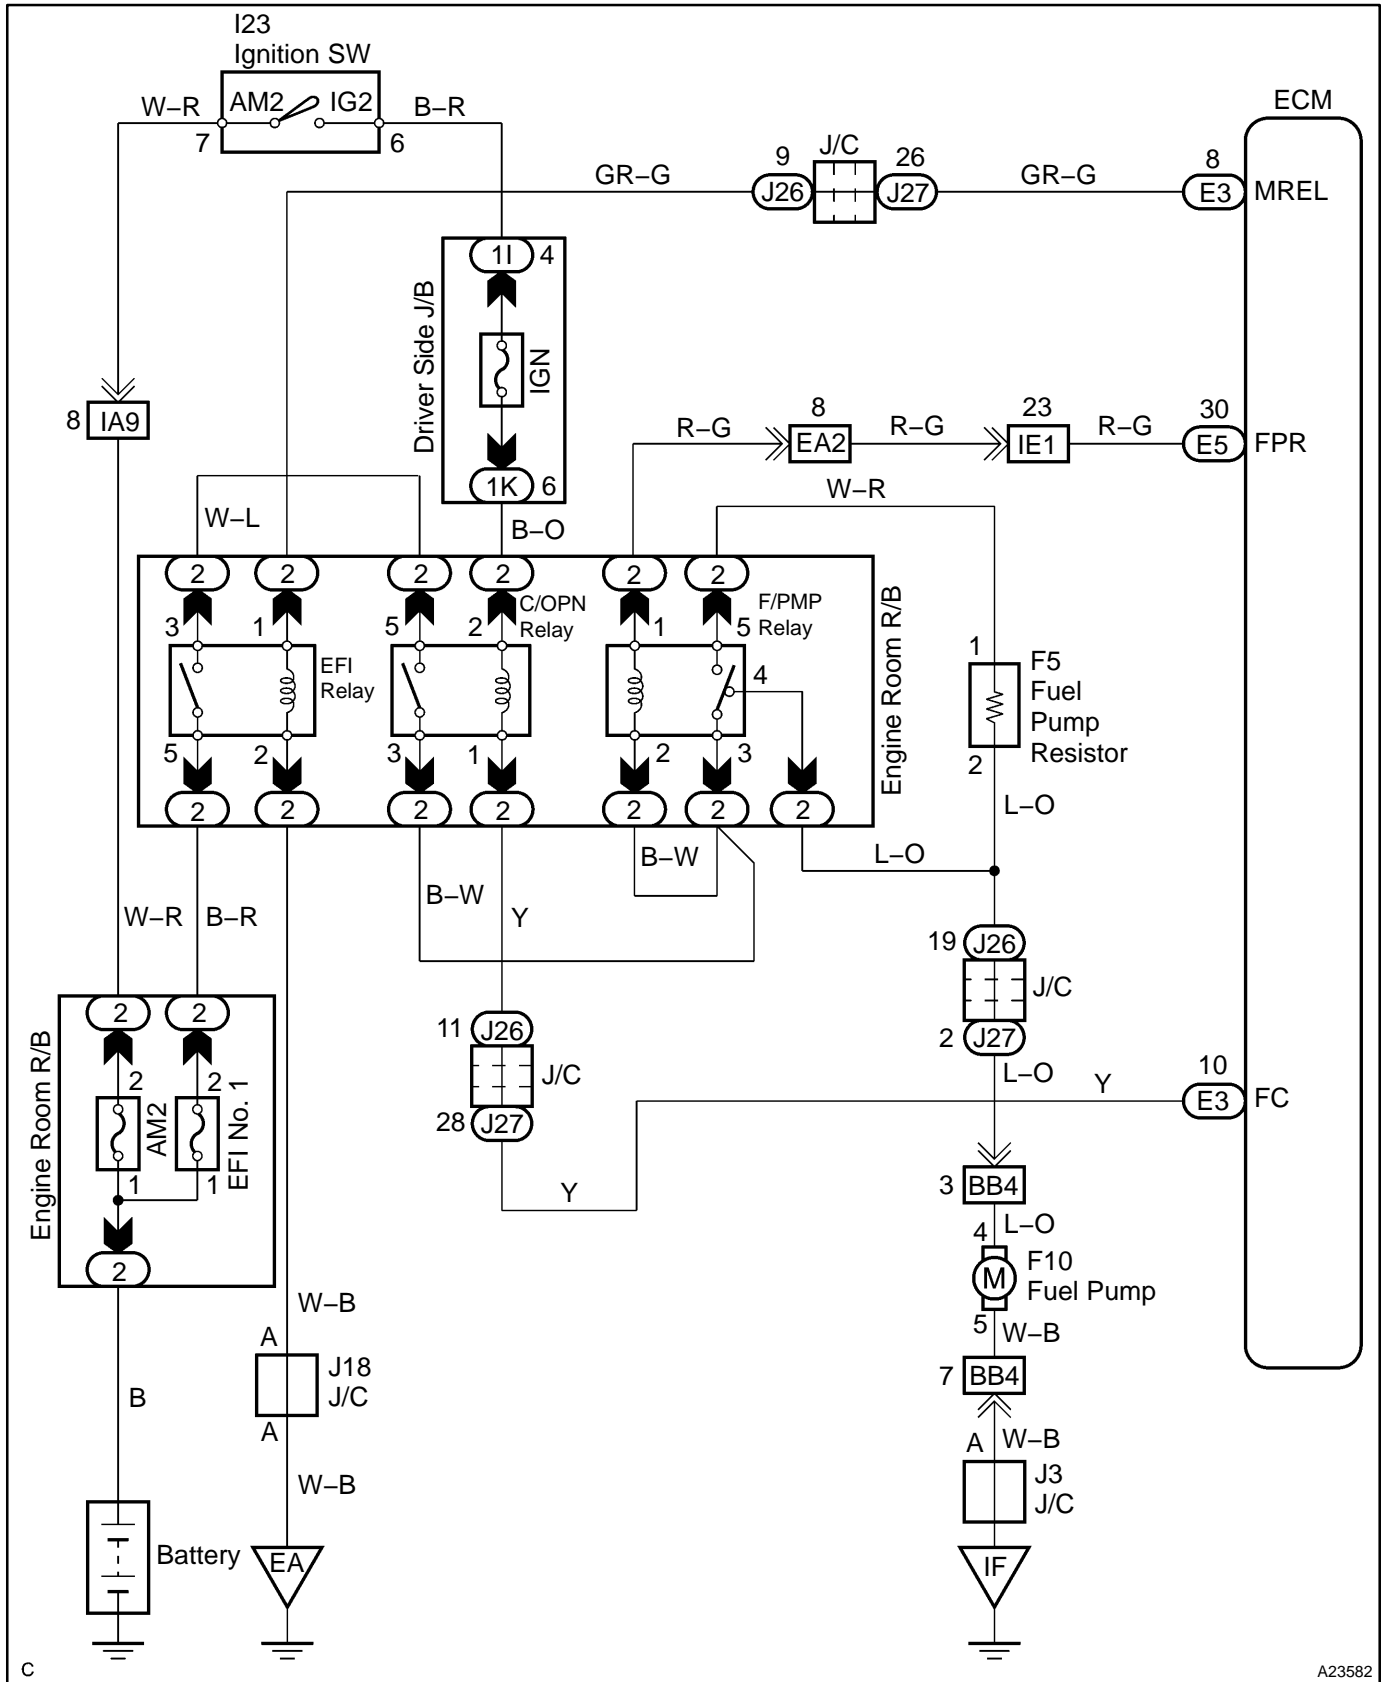

After the engine starts while idling or light loads, since the Tr2 goes ON, power is supplied to the fuel pump via the fuel pump resistor. The fuel pump operates at low speed.

DIAGNOSTICS - ENGINE (1GR-FE)

DTC No.	DTC Detecting Condition	Trouble Area
P0230	Open or short in fuel pump relay circuit	<ul style="list-style-type: none">• Open or short in fuel pump relay circuit• Fuel pump relay• Circuit opening relay• Fuel pump• ECM

WIRING DIAGRAM

HINT:

This diagnostic chart is based on premise that engine is started. If the engine is not started, proceed to problem symptoms table on [DI-33](#).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 Check voltage between terminal FPR and E1 of ECM.

CHECK:

Measure the voltage between terminals of E5 ECM connectors.

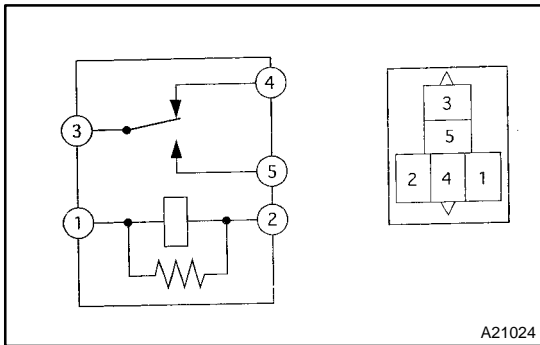

OK:

Tester Connection	Condition	Specified Condition
FPR (E5-30) - E1 (E5-1)	STA signal ON	9 to 14 V
FPR (E5-30) - E1 (E5-1)	STA signal OFF	0 to 3 V

OK Replace ECM (See page SF-66).

NG

2 Check fuel pump relay.

PREPARATION:

Remove the fuel pump relay from the engine room R/B.

CHECK:

Inspect the fuel pump relay.

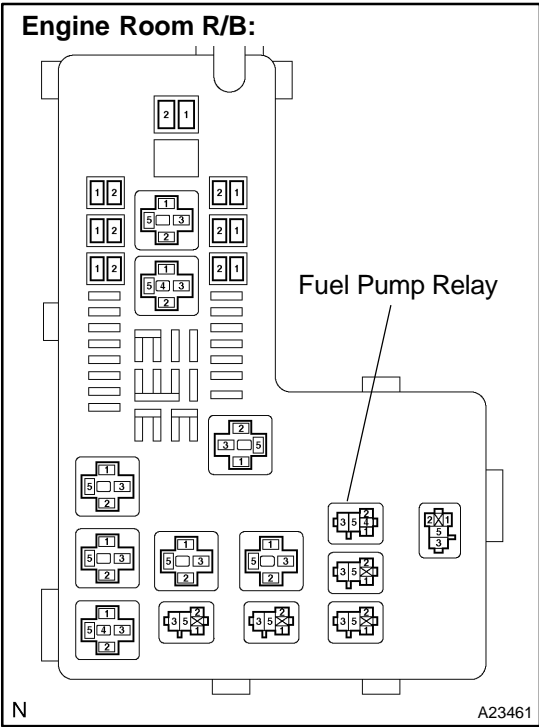

OK:

Terminal No.	Condition	Specified Condition
3 - 4	Apply B+ between terminals 1 and 2	10 kΩ or higher
3 - 4	Usually	Below 1 Ω
3 - 5	Usually	10 kΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace fuel pump relay.

OK

3 Check for open and short in harness and connector between fuel pump relay and ECM.

PREPARATION:

- (a) Remove the fuel pump relay from the engine room J/B.
- (b) Disconnect the E5 ECM connector.

CHECK:

Measure the resistance between wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Engine Room J/B (Fuel pump relay terminal 1) – FPR (E5-30)	Below 1 Ω
Engine Room J/B (Fuel pump relay terminal 1) or FPR (E5-30) – Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace ECM (See page [SF-66](#)).

DTC	P0300	Random/Multiple Cylinder Misfire Detected
DTC	P0301	Cylinder 1 Misfire Detected
DTC	P0302	Cylinder 2 Misfire Detected
DTC	P0303	Cylinder 3 Misfire Detected
DTC	P0304	Cylinder 4 Misfire Detected
DTC	P0305	Cylinder 5 Misfire Detected
DTC	P0306	Cylinder 6 Misfire Detected

CIRCUIT DESCRIPTION

When a misfire occurs in the engine, hydrocarbons (HC) enter the exhaust in high concentrations. If this HC concentration is high enough, there could be an increase in exhaust emission levels. High concentrations of HC can also cause the temperature of the catalyst to increase, possibly damaging the catalyst. To prevent this increase in emissions and limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the catalyst reaches a point of thermal degradation, the ECM will blink the MIL. For monitoring misfire, the ECM uses both the camshaft position sensor and the crankshaft position sensor. The camshaft position sensor is used to identify misfiring cylinders and the crankshaft position sensor is used to measure variations in the crankshaft rotation speed. The misfire counter increments when crankshaft rotation speed variations exceed threshold values.

If the misfiring rate exceeds the threshold value, which could cause emissions deterioration, the ECM illuminates the MIL.

DTC No.	DTC Detecting Condition	Trouble Area
P0300	Misfiring of random cylinders is detected	<ul style="list-style-type: none"> • Open or short in engine wire • Connector connection • Vacuum hose connection • Ignition system
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of each cylinder is detected	<ul style="list-style-type: none"> • Injector • Fuel pressure • Mass air flow meter • Engine coolant temperature sensor • Compression pressure • Valve clearance • Valve timing • PCV piping • ECM

HINT:

When several codes for a misfiring cylinder are recorded repeatedly but no random misfire code is recorded, it indicates that the misfires have been detected and recorded at different times.

Reference: Inspection using the oscilloscope.

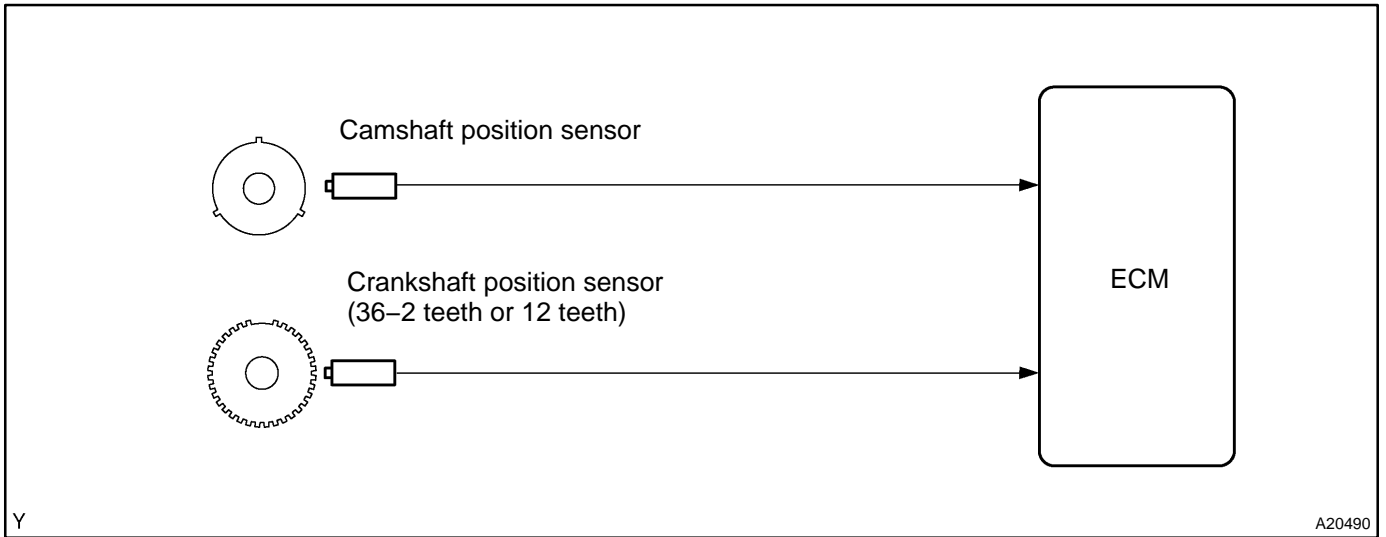

With the engine idling, check the waveform between terminals #1 to #8 and E01 of the ECM connectors.

HINT:

The correct waveform is as shown in the illustration.

MONITOR DESCRIPTION

The ECM illuminates the MIL (2 trip detection logic) if:

The ECM will illuminate the MIL when the percentage of misfire exceeds the specified limit per 1,000 engine revolutions. One occurrence of excessive misfire during engine start will set the MIL. Four occurrences are required to set the MIL 1,000 revolutions after engine start.

The ECM blinks the MIL (the MIL blinks immediately) if:

- Within 200 engine revolutions at a high rpm, the threshold for "percentage of misfire causing catalyst damage" is reached 1 time.
- Within 200 engine revolutions at a normal rpm, the threshold for "percentage of misfire causing catalyst damage" is reached 3 time.

MONITOR STRATEGY

Related DTCs	P0300	Random/Multiple cylinder misfire detected
	P0301	Cylinder 1 misfire detected
	P0302	Cylinder 2 misfire detected
	P0303	Cylinder 3 misfire detected
	P0304	Cylinder 4 misfire detected
	P0305	Cylinder 5 misfire detected
	P0306	Cylinder 6 misfire detected
Required sensors/components	Main sensors/components	Camshaft position sensor, Crankshaft position sensor
	Related sensors/components	Engine coolant temperature sensor, Intake air temperature sensor, Throttle position sensor
Frequency of operation	Continuous	
Duration	Every 1,000 revolutions (soon after engine is started: 1 time, other: 4 times) (emission related misfire) Every 200 revolutions (1 or 3 times) (catalyst deteriorating misfire)	
MIL operation	2 driving cycles: MIL ON Immediate: MIL flashing (Catalyst deteriorating misfire)	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

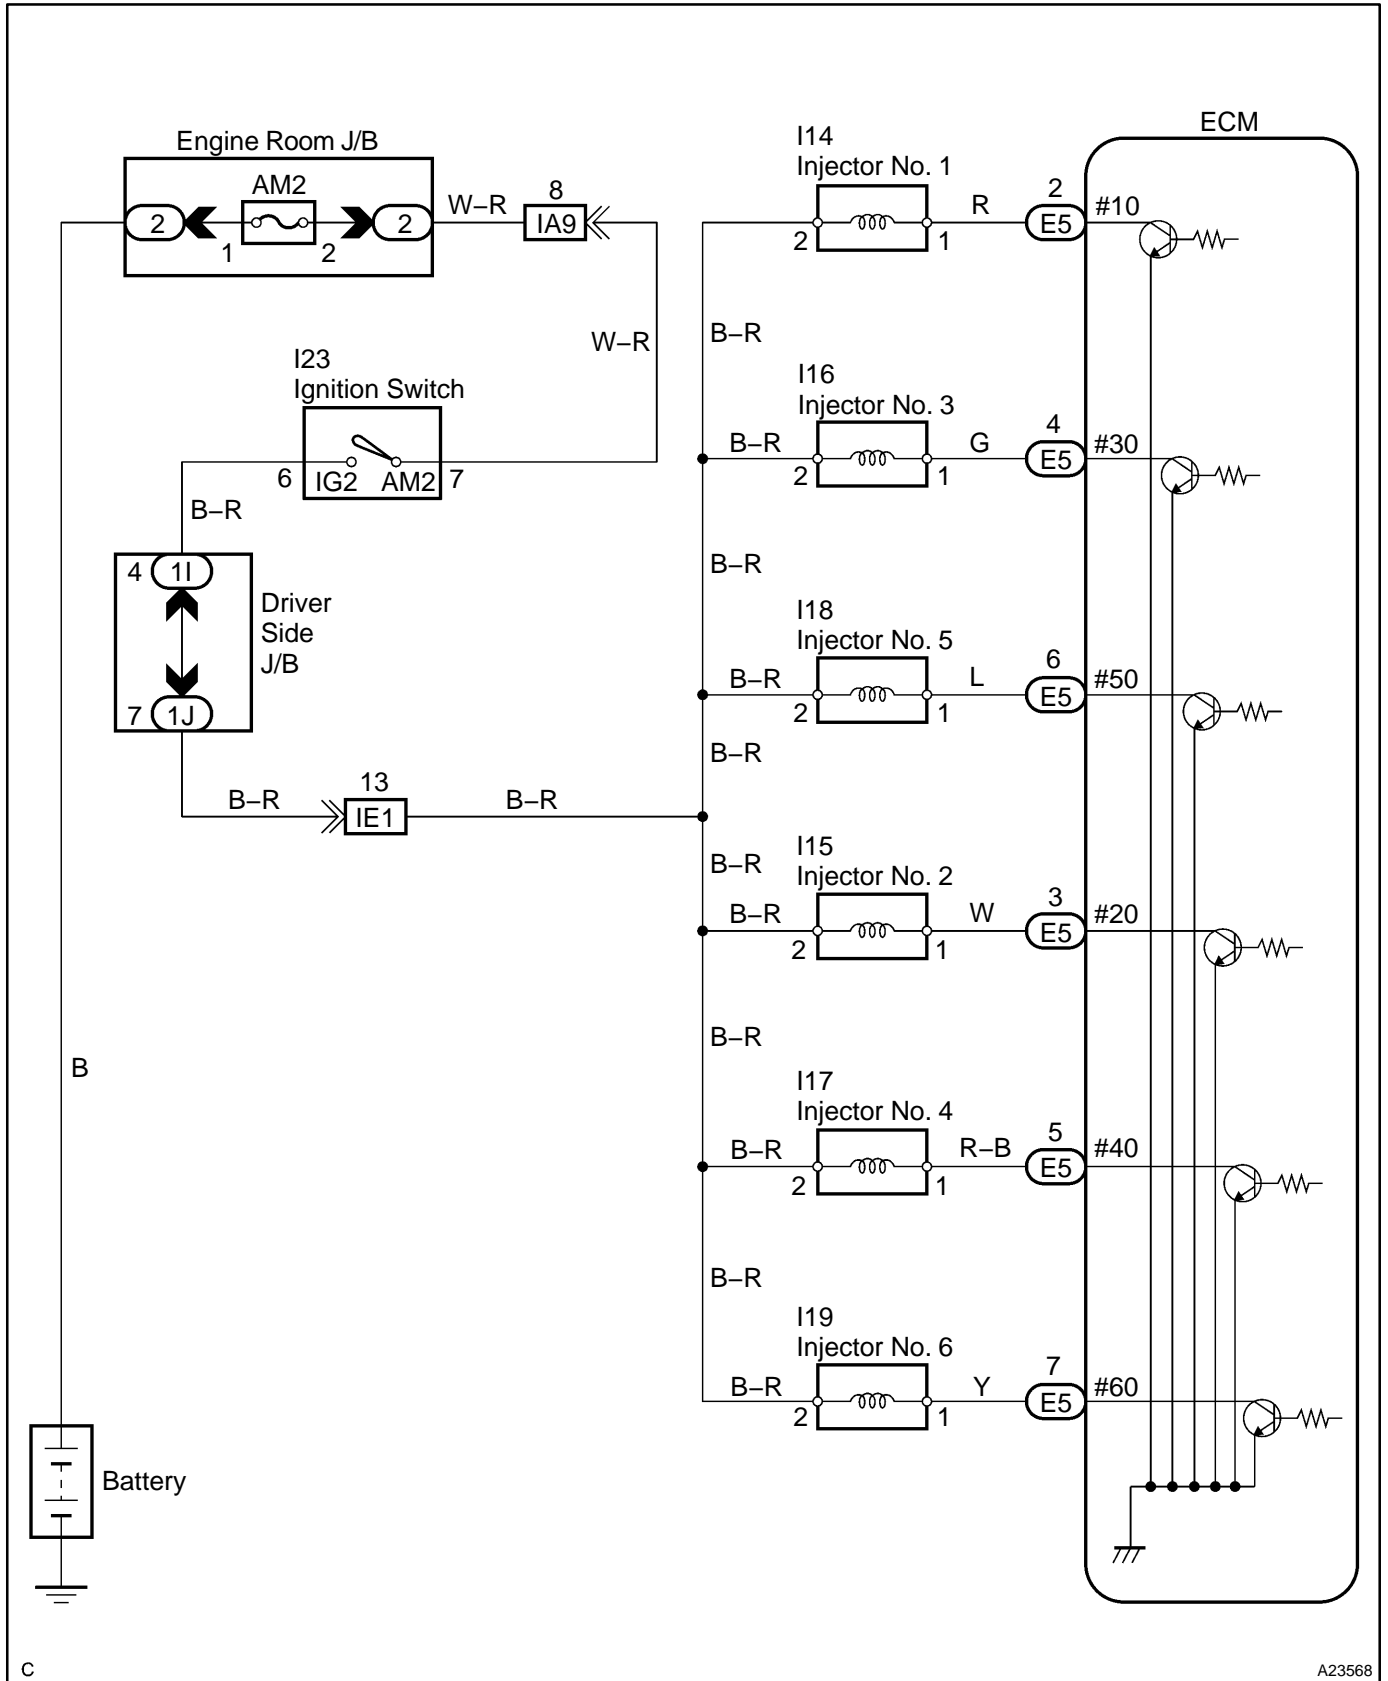

Item	Specification	
	Minimum	Maximum
All:		
The monitor will run whenever these DTCs are not present	See page DI-18	
Battery voltage	8 V	-
VVT system	Not operate by scan tool	
Engine RPM	450 to 5,400rpm (Manual transmission) 400 to 5,400rpm (Automatic transmission)	
Either of the following conditions is met:	Condition (a) or (b)	
(a) ECT at engine start	-7°C (19°F)	-
(b) ECT	20°C (68°F)	-
Fuel-cut	OFF	
Emission-related-misfire:		
First 1,000 revolutions after engine start, or check mode	Crankshaft 1,000 revolutions	
Except above	Crankshaft 1,000 revolutions x 4	
Catalyst-damage-misfire (MIL blinks):		
All of the following conditions 1, 2 and 3 are met	Crankshaft 200 revolutions	
1. Driving cycle	1st	
2. Check mode	OFF	
3. Engine RPM	-	2,800 rpm
Except above	Crankshaft 200 revolutions x 3	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Emission-related-misfire:	
Misfire rate:	2.9% or more (Manual transmission) 2.0% or more (Automatic transmission)
Catalyst-damage-misfire (MIL blinks):	
Number of misfire per 200 revolutions	77 or more (varies with intake air amount and RPM)
Paired cylinders misfire	Detected

WIRING DIAGRAM

Refer to DTC P0351 on page [DI-216](#) for the wiring diagram of the ignition system.

CONFIRMATION DRIVING PATTERN

- (a) Connect the hand-held tester to the DLC3.
- (b) Record DTC and the freeze frame data.
- (c) Use the hand-held tester to set the check mode (See page [DI-43](#)).
- (d) Read the value on the misfire counter for each cylinder when idling. If the value is displayed on the misfire counter, skip the following procedure of confirmation driving.
- (e) Drive the vehicle several times with the engine speed, load and surrounding range shown as ENGINE SPD, CALC LOAD in the freeze frame data or MISFIRE RPM, MISFIRE LOAD in the DATA LIST.

If you have no hand-held tester, turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again.

HINT:

In order to memorize the DTC of misfire, it is necessary to drive around MISFIRE RPM, MISFIRE LOAD in the DATA LIST for the following period of time. Take care not to turn the ignition switch OFF. Turning the ignition switch OFF switches the diagnosis system from check mode to normal mode, and all DTCs, etc., are erased.

Engine Speed	Time
Idling	3 minutes 30 seconds or more
1,000 rpm	3 minutes or more
2,000 rpm	1 minute 30 seconds or more
3,000 rpm	1 minute or more

- (f) Check if there is misfire, and the DTC and the freeze frame data. Record the DTC's, freeze frame data and misfire counter data.
- (g) Turn the ignition switch OFF and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- If DTCs besides misfire DTCs are memorized simultaneously, troubleshoot the non-misfire DTCs first.
- If the misfire does not occur when the vehicle is brought to the workshop, the misfire can be confirmed by reproducing the condition of the freeze frame data. Also, after finishing the repair, confirm that there is no misfire (See confirmation driving pattern).
- On 6 or 8 cylinder engines, misfiring cylinder identification is disabled at high engine speed and only a general misfire fault code P0300 is stored instead of a cylinder specific misfire fault code (P0301 to P0306).

If the misfire starts in a high engine speed area or the misfire occurs only in a high engine speed area, only code P0300 may be stored.

When only a general misfire fault code like P0300 is stored:

- Erase the general misfire fault code using the hand-held tester
- Start the engine and drive the confirmation pattern.
- Read the value of the misfire ratio for each cylinder. Or read the DTC.
- Repair the cylinder that has a high misfire ratio. Or repair the cylinder indicated by the DTC.
- After finishing repairs, drive the confirmation pattern again and confirm that no misfire occurs.
- When either of SHORT FT #1, LONG FT #1, SHORT FT #2 or LONG FT #2 in the freeze frame data is over the range of $\pm 20\%$, there is a possibility that the air-fuel ratio is becoming RICH (-20% or less) or LEAN ($+20\%$ or more).
- When COOLANT TEMP in the freeze frame data is less than 80°C (176°F), there is a possibility of misfire only during engine warm-up.
- If the misfire cannot be reproduced, the following reasons may apply: 1) the vehicle has low fuel, 2) improper fuel is being used, or 3) the ignition plug is contaminated.
- Be sure to check the value on the misfire counter after the repair.

1	Are there any other codes (besides DTC P0300, P0301, P0302, P0303, P0304 P0305 or P0306) being output?
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTCs using hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
"P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306"	A
"P0300, P0301, P0302, P0303, P0304, P0305 or P0306" and other DTCs	B

HINT:

If any other codes besides "P0300, P0301, P0302, P0303, P0304, P0305 or P0306" are output, perform the troubleshooting for those DTCs.

B	Go to DTC chart (See page DI-57).
----------	--

A

2	Check wire harness, connector and vacuum hose in engine room.
----------	--

CHECK:

- (a) Check the connection conditions of the wire harness and connector.
- (b) Check for the disconnection and damaged of the vacuum hose.

NG	Repair or replace, then confirm that there is no misfire (See confirmation driving pattern).
-----------	---

OK

3	Check connection of PCV hose.
----------	--------------------------------------

OK:

PCV hose is connected correctly and is not damaged.

4	Connect hand-held tester, and read the number of misfire.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) Start the engine.
- (d) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / CYL#1 to CYL#6.

CHECK:

Read the number of misfire on the hand-held tester.

HINT:

When a misfire is not reproduced, be sure to branch below based on the stored DTC.

RESULT:

High Misfire Rate Cylinder	Proceed to
1 or 2 cylinders	A
More than 3 cylinders	B

5 Check spark plug and spark of misfiring cylinder.

PREPARATION:

- Remove the ignition coil assembly.
- Remove the spark plug.

CHECK:

- Check the electrode for carbon deposits.
- Check the spark plug type (See page [IG-1](#)).
- Check electrode gap.

OK:

No large carbon deposit present.

Not wet with gasoline or oil.

Electrode gap: 1.0 to 1.1 mm (0.039 to 0.043 in.)

NOTICE:

If adjusting the gap of a new spark plug, bend only "the base / ground" electrode. Do not touch the tip. Never attempt to adjust the gap of a used plug.

NG

Replace spark plug.

OK

6 Change normal spark plug and check spark of misfiring cylinder.**PREPARATION:**

- (a) Change to the normal spark plug.
 - (1) Remove the spark plug that may be faulty from the ignition coil assembly.
 - (2) Install another spark plug to the ignition coil assembly.
- (b) Disconnect the injector connectors.
- (c) Ground the spark plug.

CHECK:

Check if spark occurs while the engine is being cranked.

CAUTION:

Always disconnect each injector connector.

NOTICE:

Do not crank the engine for more than 2 seconds.

OK:

Spark jumps across electrode gap.

OK**Go to step 8.****NG**

7 Check for open and short in harness and connector between ignition coil and ECM.

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Ignition coil (I3-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I4-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I5-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I6-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I7-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I8-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I3-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher
Ignition coil (I4-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher
Ignition coil (I5-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher
Ignition coil (I6-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher
Ignition coil (I7-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher
Ignition coil (I8-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Ignition coil (I3-3) - IGT1 (E7-8)	Below 1 Ω
Ignition coil (I4-3) - IGT2 (E7-9)	Below 1 Ω
Ignition coil (I5-3) - IGT3 (E7-10)	Below 1 Ω
Ignition coil (I6-3) - IGT4 (E7-11)	Below 1 Ω
Ignition coil (I7-3) - IGT5 (E7-12)	Below 1 Ω
Ignition coil (I8-3) - IGT6 (E7-13)	Below 1 Ω
Ignition coil (I3-3) or IGT1 (E7-8) - Body ground	10 kΩ or higher
Ignition coil (I4-3) or IGT2 (E7-9) - Body ground	10 kΩ or higher
Ignition coil (I5-3) or IGT3 (E7-10) - Body ground	10 kΩ or higher
Ignition coil (I6-3) or IGT4 (E7-11) - Body ground	10 kΩ or higher
Ignition coil (I7-3) or IGT5 (E7-12) - Body ground	10 kΩ or higher
Ignition coil (I8-3) or IGT6 (E7-13) - Body ground	10 kΩ or higher

OK Replace ignition coil with igniter, then confirm that there is no misfire.

NG

Repair or replace harness or connector.

8 Check ECM terminal of misfiring cylinder.

PREPARATION:

Turn the ignition switch to ON.

CHECK:

Measure the voltage between the terminals of the E5 and E7 ECM connectors.

OK:

Standard:

Tester Connection	Specified Condition
#10 (E5-2) – E01 (E7-7)	9 to 14 V
#20 (E5-3) – E01 (E7-7)	9 to 14 V
#30 (E5-4) – E01 (E7-7)	9 to 14 V
#40 (E5-5) – E01 (E7-7)	9 to 14 V
#50 (E5-6) – E01 (E7-7)	9 to 14 V
#60 (E5-7) – E01 (E7-7)	9 to 14 V

OK → Go to step 11.

NG

9 Check injector resistance of misfiring cylinder (See page SF-21).

NG → Replace injector.

OK

10 Check for open and short in harness and connector between ignition SW and injector, injector and ECM of misfiring cylinder.

Wire Harness Side:
Injector Connector

C

A21343

PREPARATION:

- Disconnect the I14, I15, I16, I17, I18 or I19 injector connector.
- Disconnect the E5 ECM connector.

CHECK:

Measure the resistance of the wire harness side connectors between the ECM and injector.

OK:

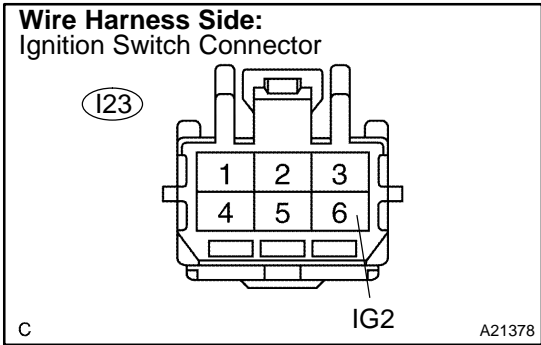

Standard:

N

B17414

Tester Connection	Specified Condition
Injector (I14-1) - #10 (E5-2)	Below 1 Ω
Injector (I15-1) - #20 (E5-3)	Below 1 Ω
Injector (I16-1) - #30 (E5-4)	Below 1 Ω
Injector (I17-1) - #40 (E5-5)	Below 1 Ω
Injector (I18-1) - #50 (E5-6)	Below 1 Ω
Injector (I19-1) - #60 (E5-7)	Below 1 Ω
Injector (I14-1) or #10 (E5-2) - Body ground	10 k Ω or higher
Injector (I15-1) or #20 (E5-3) - Body ground	10 k Ω or higher
Injector (I16-1) or #30 (E5-4) - Body ground	10 k Ω or higher
Injector (I17-1) or #40 (E5-5) - Body ground	10 k Ω or higher
Injector (I18-1) or #50 (E5-6) - Body ground	10 k Ω or higher
Injector (I19-1) or #60 (E5-7) - Body ground	10 k Ω or higher

PREPARATION:

- (a) Disconnect the I14, I15, I16, I17, I18 or I19 injector connector.
- (b) Disconnect the I23 ignition switch connector.

CHECK:

Measure the resistance of the wire harness side connectors between the injector and ignition switch.

OK:

Standard:

Tester Connection	Specified Condition
Injector (I14-2) - IG2 (I23-6)	Below 1 Ω
Injector (I15-2) - IG2 (I23-6)	Below 1 Ω
Injector (I16-2) - IG2 (I23-6)	Below 1 Ω
Injector (I17-2) - IG2 (I23-6)	Below 1 Ω
Injector (I23-2) - IG2 (I23-6)	Below 1 Ω
Injector (I19-2) - IG2 (I23-6)	Below 1 Ω
Injector (I14-2) or IG2 (I23-6) - Body ground	10 kΩ or higher
Injector (I15-2) or IG2 (I23-6) - Body ground	10 kΩ or higher
Injector (I16-2) or IG2 (I23-6) - Body ground	10 kΩ or higher
Injector (I17-2) or IG2 (I23-6) - Body ground	10 kΩ or higher
Injector (I18-2) or IG2 (I23-6) - Body ground	10 kΩ or higher
Injector (I19-2) or IG2 (I23-6) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

11 Check injector injection of misfiring cylinder (See page SF-26).

NG Replace injector.

OK

12 Check compression pressure of misfiring cylinder (See page [EM-3](#)).

NG Repair or replace.

OK

13 Check valve clearance of misfiring cylinder (See page [EM-4](#)).

NG Adjust valve clearance.

OK

14 Check result of step 4, and proceed to each step.

RESULT:

High misfire rate cylinder	Proceed to
1 or 2 cylinders	A
More than 3 cylinders	B

B Check for intermittent problems (See page [DI-11](#)).

A

15 Check valve timing (Check for looseness or a jumped tooth of timing chain) (See page [EM-44](#)).

NG Adjust valve timing (Repair or replace timing belt).

OK

16 Check fuel pressure (See page SF-5).

NG Check and replace fuel pump, pressure regulator, fuel pipe line and filter (See page SF-1).

OK

17 Check intake air temperature and mass air flow rate.

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.

CHECK:

Check the intake air temperature.

- (1) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.
- (2) Read its value displayed on the hand-held tester.

OK:

Equivalent to ambient temperature

CHECK:

Check the air flow rate.

- (1) When using hand-held tester, enter the following menu: DIAGNOSIS/ENHANCED OBD II/DATA LIST/ALL/MAF.
- (2) Read its value displayed on the hand-held tester.

OK:

Condition	Air Flow Rate (g/s)
Ignition switch ON (do not start engine)	0
Idling	4 to 6
Running without load (2,500 rpm)	13 to 20
Idling to quickly accelerating	Air flow rate fluctuates

NG Replace mass air flow meter.

OK

18 Check engine coolant temperature sensor.

PREPARATION:

Remove the engine coolant temperature sensor.

CHECK:

Measure the resistance between the terminals of the engine coolant temperature sensor.

Resistance:

Tester Connection	Specified Condition
1 - 2	2.32 to 2.59 kΩ (20°C (68°F))
1 - 2	0.310 to 0.326 kΩ (80°C (176°F))

NOTICE:

In case of checking the engine coolant temperature sensor in the water, be careful not to allow water to go into the terminals. After checking, dry the sensor.

HINT:

Alternate procedure: Connect an ohmmeter to the installed engine coolant temperature sensor and read the resistance. Use an infrared thermometer to measure the engine temperature in the immediate vicinity of the sensor. Compare these values to the resistance/temperature graph. Change the engine temperature (by warming up or cooling down) and repeat the test.

NG Replace engine coolant temperature sensor.

OK

19 Check result of step 4, and proceed to each step.

High misfire rate cylinder	Proceed to
1 or 2 cylinders	A
More than 3 cylinders	B

B Go to step 5.

A

Check for intermittent problems (See page DI-11).

DTC	P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)
------------	--------------	---

DTC	P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)
------------	--------------	--

DTC	P0332	Knock Sensor 2 Circuit Low Input (Bank 2)
------------	--------------	--

DTC	P0333	Knock Sensor 2 Circuit High Input (Bank 2)
------------	--------------	---

CIRCUIT DESCRIPTION

A flat type knock sensor (non-resonant type) has the structure that can detect the vibration in a wider band of frequency from about 6 kHz to 15 kHz and has the following features.

Knock sensors are fitted on the right bank and left bank of the cylinder block to detect engine knocking. Each knock sensor contains a piezoelectric element which generates voltage when it becomes deformed. Generation of the voltage occurs when the cylinder block vibrates due to knocking. If engine knocking occurs, the ignition timing is retarded in order to suppress the knocking.

DTC No.	DTC Detection Condition	Trouble Area
P0327 P0332	Output voltage of the knock sensor 1 or 2 is 0.5 V or less	<ul style="list-style-type: none"> • Short in knock sensor 1 or 2 circuit • Knock sensor 1 or 2 • ECM
P0328 P0333	Output voltage of the knock sensor 1 or 2 is 4.5 V or more	<ul style="list-style-type: none"> • Open in knock sensor 1 or 2 circuit • Knock sensor 1 or 2 • ECM

Reference: Inspection using the oscilloscope.
The correct waveform is as shown.

Item	Details
Terminal	KNK1 - EKNK or KNK2 - EKN2
Equipment Settings	0.01 to 10 V/Division, 0.01 to 10 msec./Division
Condition	After warming up the engine, keep the engine speed at 4,000 rpm.

MONITOR DESCRIPTION

The knock sensor located on the cylinder block detects spark knock.

When spark knock occurs, the sensor pick-up vibrates in a specific frequency range. When the ECM detects the voltage in this frequency range, it retards the ignition timing to suppress the spark knock.

If there is a defect in the knock sensor or an open or short circuit, the voltage level will deviate outside the normal operating range. The ECM interprets this deviation as a defect in the knock sensor and sets a DTC.

Example:

When the knock sensor voltage output is less than 0.5 V, or more than 4.5 V, and if either the condition continues for more than 3 sec.

MONITOR STRATEGY

Related DTCs	P0327	Knock sensor (Bank 1) range check (Low voltage)

INSPECTION PROCEDURE

HINT:

- DTC P0327 and P0328 are for the bank 1 knock sensor circuit.
- DTC P0332 and P0333 are for the bank 2 knock sensor circuit.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 Connect hand-held tester, and check knock sensor circuit.

PREPARATION:

- (a) Disconnect the EF2 connector.
- (b) Using lead wires, connect the EF2 connectors as follows.

Male Connector – Female Connector
Terminal 5 – Terminal 6
Terminal 2 – Terminal 4
Terminal 6 – Terminal 5
Terminal 4 – Terminal 2

- (c) Warm up the engine.
- (d) Run the engine at 3,000 rpm for 10 seconds or more.

CHECK:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the hand-held tester ON.
- (c) Select the item: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (d) Read DTCs.

Result :

Display	Proceed to
DTCs same as when vehicle brought in P0327, P0328 → P0327, P0328 or P0332, P0333 → P0332, P0333	A
DTCs different from when vehicle brought in P0327, P0328 → P0332, P0333 or P0332, P0333 → P0327, P0328	B

- (e) Reconnect the EF2 connector.

B

Go to step 4.

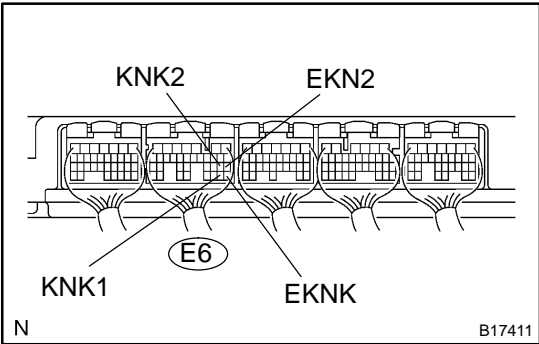

2 Check for open and short in harness and connector between EF2 connector and ECM (See page [IN-30](#)).

NG Repair or replace harness or connector.

OK

3 Measure voltage between terminals KNK1 and EKNK, KNK2 and EKN2 of ECM.

PREPARATION:

- (a) Disconnect the E6 ECM connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between the specified ECM terminals.

OK:

Standard:

Tester Connection	Specified Condition
KNK1 (E6-29) - EKNK (E6-28)	4.5 to 5.5 V
KNK2 (E6-21) - EKN2 (E6-20)	4.5 to 5.5 V

- (a) Reconnect the ECM connector.

NG Replace ECM (See page [SF-66](#)).

OK

Check for intermittent problems (See page [DI-11](#)).

4 Check knock sensor.

Wire Harness Side:

Male Connector

Front View

Y

A23674

PREPARATION:

Disconnect the EF2 connector.

CHECK:

- (a) Check the resistance between the terminals of the EF2 male connector.

OK:

Standard:

Tester Connection	Specified Condition
EF2 male connector 2 - 5	120 to 280 kΩ
EF2 male connector 4 - 6	120 to 280 kΩ

- (b) Reconnect the EF2 connector.

OK

Check for intermittent problems
(See page [DI-11](#)).

NG

5 Check for open and short in harness and connector between EF2 connector and knock sensor (See page [IN-30](#)).

HINT:

- If DTC P0327 or P0328 has changed to P0332 or P0333, check the knock sensor circuit on the right bank side.
- If DTC P0332 or P0333 has changed to P0327 or P0328, check the knock sensor circuit on the left bank side.

NG

Repair or replace harness or connector.

OK

Replace knock sensor.

DTC	P0335	Crankshaft Position Sensor "A" Circuit
------------	--------------	---

DTC	P0339	Crankshaft Position Sensor "A" Circuit Intermittent
------------	--------------	--

CIRCUIT DESCRIPTION

The crankshaft position sensor system consists of a crankshaft position sensor plate and a pick-up coil. The sensor plate has 34 teeth and is installed on the crankshaft. The pick-up coil is made of an iron core and magnet. The sensor plate rotates and as each tooth passes through the pick-up coil, a pulse signal is created. The pick-up coil generates 34 signals for each engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine RPM. Using these calculations, the fuel injection time and ignition timing are controlled.

DTC No.	DTC Detecting Condition	Trouble Area
P0335	No crankshaft position sensor signal to ECM with engine speed 600 rpm or more (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in crankshaft position sensor circuit • Crankshaft position sensor • Signal plate • ECM
P0339	In condition (a), (b) and (c), when no crankshaft position sensor (NE) signal is input for 0.05 sec. or more. : (1 trip detection logic) (c) Engine revolution 1,000 rpm or more (d) STA signal is OFF (e) 3 sec. or more has lapsed after STA signal is switched from ON to OFF.	<ul style="list-style-type: none"> • Open or short in crankshaft position sensor circuit • Crankshaft position sensor • Signal plate • ECM

Reference: Inspection using the oscilloscope.

The correct waveform is as shown in the illustration.

Tester Connection	Specified Condition
VV1+ (E5-19) - VV1- (E5-29)	Correct waveform is as shown
VV2+ (E5-18) - VV2- (E5-28)	
NE+ (E5-21) - NE- (E5-20)	

MONITOR DESCRIPTION

If there are no signals from the crankshaft sensor even though the engine is revolving, the ECM interprets this as a malfunction of the sensor.

INSPECTION PROCEDURE

HINT:

- Read freeze frame data using the hand-held tester. Freeze frame records the engine conditions when a malfunction is detected. When troubleshooting it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio lean or rich, etc. at the time of the malfunction.
- READ VALUE ON HAND-HELD TESTER
 - (a) Connect the hand-held tester to the DLC3.
 - (b) Start the engine and push the hand-held tester tool main switch ON.
 - (c) When using hand-held tester, enter the following menu: "DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / ENGINE SPD".
- The engine speed can be confirmed in DATA LIST using the hand-held tester. If there are no NE signals from the crankshaft position sensor despite the engine revolving, the engine speed will be indicated as zero. If voltage output of the crankshaft position sensor is insufficient, the engine speed will be indicated as lower RPM (than the actual RPM).

1 Check resistance of crankshaft position sensor.

Component Side

Crankshaft Position Sensor

A21026

PREPARATION:

Disconnect the C2 crankshaft position sensor connector.

CHECK:

Measure the resistance between terminals 1 and 2.

OK:

Standard:

Tester Connection	Specified Condition
1 - 2	985 to 1,600 Ω at cold
1 - 2	1,265 to 1,890 Ω at hot

NOTICE:

"Cold" and "Hot" shown above mean the temperature of the coils themselves. "Cold" is from -10°C (14°F) to 50°C (122°F) and "Hot" is from 50°C (122°F) to 100°C (212°F).

NG

Replace crankshaft position sensor.

OK

2 Check for open and short in harness and connector between ECM and crankshaft position sensor.

PREPARATION:

- (a) Disconnect the C2 crankshaft position sensor connector.
- (b) Disconnect the E5 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Crankshaft position sensor (C2-1) - NE+ (E5-21)	Below 1 Ω
Crankshaft position sensor (C2-2) - NE- (E5-20)	Below 1 Ω
Crankshaft position sensor (C2-1) or NE+ (E5-21) - Body ground	10 kΩ or higher
Crankshaft position sensor (C2-2) or NE- (E5-20) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

3 Check sensor installation (crankshaft position sensor).

CHECK:

Check the crankshaft position sensor installation.

OK:

The crankshaft position sensor is installed properly.

NG Tighten sensor installation bolt.

OK

4	Inspect teeth of sensor plate.
----------	---------------------------------------

PREPARATION:

Remove the crankshaft angle sensor plate (See page [EM-111](#)).

CHECK:

Check the teeth of sensor plate.

DTC	P0340	Camshaft Position Sensor "A" Circuit (Bank 1 or Single Sensor)

------------	--------------	--

DTC	P0348	Camshaft Position Sensor "A" Circuit High Input (Bank 2)
------------	--------------	---

CIRCUIT DESCRIPTION

The camshaft position sensor (G signal) consists of a magnet and MRE element.

The camshaft drive gear has 5 teeth on its inner circumference. When the camshaft gear rotates, air gap changes between the protrusion on the gear and the pickup coil. The change affects the magnetic field and result in change in the resistance of the MRE element. The crankshaft angle sensor plate has 32 teeth and output 32 signals every engine revolution. The ECM detects the standard crankshaft angle based on the G signal and actual crankshaft angle and engine speed by NE signal.

DTC No.	DTC Detection Condition	Trouble Area
P0340 P0345	No camshaft position sensor signal to ECM during cranking for 4 seconds or more. (2 trip detection logic)	<ul style="list-style-type: none"> • Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing pulley • Jumping teeth of timing belt • ECM
P0340 P0345	No camshaft position sensor signal to ECM at engine speed 600 rpm or more for 5 seconds or more. (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing pulley • Jumping teeth of timing belt • ECM

P0340 P0345	Input voltage to ECM remains 0.3 V or less, or 4.7 V or higher for more than 5 seconds, when 2 or more seconds have elapsed after turning the ignition switch ON. WIRING DIAGRAM

Refer to DTC P0335 on page [DI-203](#).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 Check camshaft position sensor power source.

PREPARATION:

Disconnect the camshaft position sensor connector.

CHECK:

Measure the voltage between terminal 3 of the camshaft position sensor wire harness side connector and body ground.

OK:

Standard:
4.5 to 5.5 V

NG Check and repair harness and connector.

OK

2 Check signal of camshaft position sensor.

PREPARATION:

Start the engine.

CHECK:

Using oscilloscope, measure the signal waveform between terminal 3 of the camshaft position sensor and body ground.

OK:

Standard:

Tester Connection	Specified Condition
VV1+ (E5-19) - VV1- (E5-29)	Correct waveform is as shown
VV2+ (E5-18) - VV2- (E5-28)	Correct waveform is as shown
NE+ (E5-21) - NE- (E5-20)	Correct waveform is as shown

OK Replace ECM (See page SF-66).

NG

3 Check for open and short in harness and connector between ECM and camshaft position sensor.

PREPARATION:

- (a) Disconnect the camshaft position sensor connector.
- (b) Disconnect the E5 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Camshaft position sensor (V17-1) - VV1+ (E5-19)	Below 1 Ω
Camshaft position sensor (V17-2) - VV1- (E5-29)	Below 1 Ω
Camshaft position sensor (V16-1) - VV2+ (E5-18)	Below 1 Ω
Camshaft position sensor (V16-2) - VV2- (E5-28)	Below 1 Ω
Camshaft position sensor (V17-1) or VV1+ (E5-19) - Body ground	10 kΩ or higher
Camshaft position sensor (V16-2) or VV1- (E5-29) - Body ground	10 kΩ or higher
Camshaft position sensor (V16-1) or VV2+ (E5-18) - Body ground	10 kΩ or higher
Camshaft position sensor (V16-2) or VV2- (E5-28) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

4 Check sensor installation (Camshaft position sensor).

CHECK:

Check the VVT position sensor installation.

OK:

The VVT sensor is installed properly.

NG Tighten sensor installation bolt.

OK

5	Inspect teeth of camshaft timing belt pulley.
----------	--

PREPARATION:

Remove the camshaft timing belt pulley (See page [EM-53](#)).

CHECK:

Check the camshaft timing belt pulley.

NG	Replace camshaft timing pulley.
-----------	--

OK

Replace Camshaft position sensor (See page IG-11).

DTC	P0351	Igniter Coil "A" Primary/Secondary Circuit
DTC	P0352	Igniter Coil "B" Primary/Secondary Circuit
DTC	P0353	Igniter Coil "C" Primary/Secondary Circuit
DTC	P0354	Igniter Coil "D" Primary/Secondary Circuit
DTC	P0355	Igniter Coil "E" Primary/Secondary Circuit
DTC	P0356	Igniter Coil "F" Primary/Secondary Circuit

HINT:

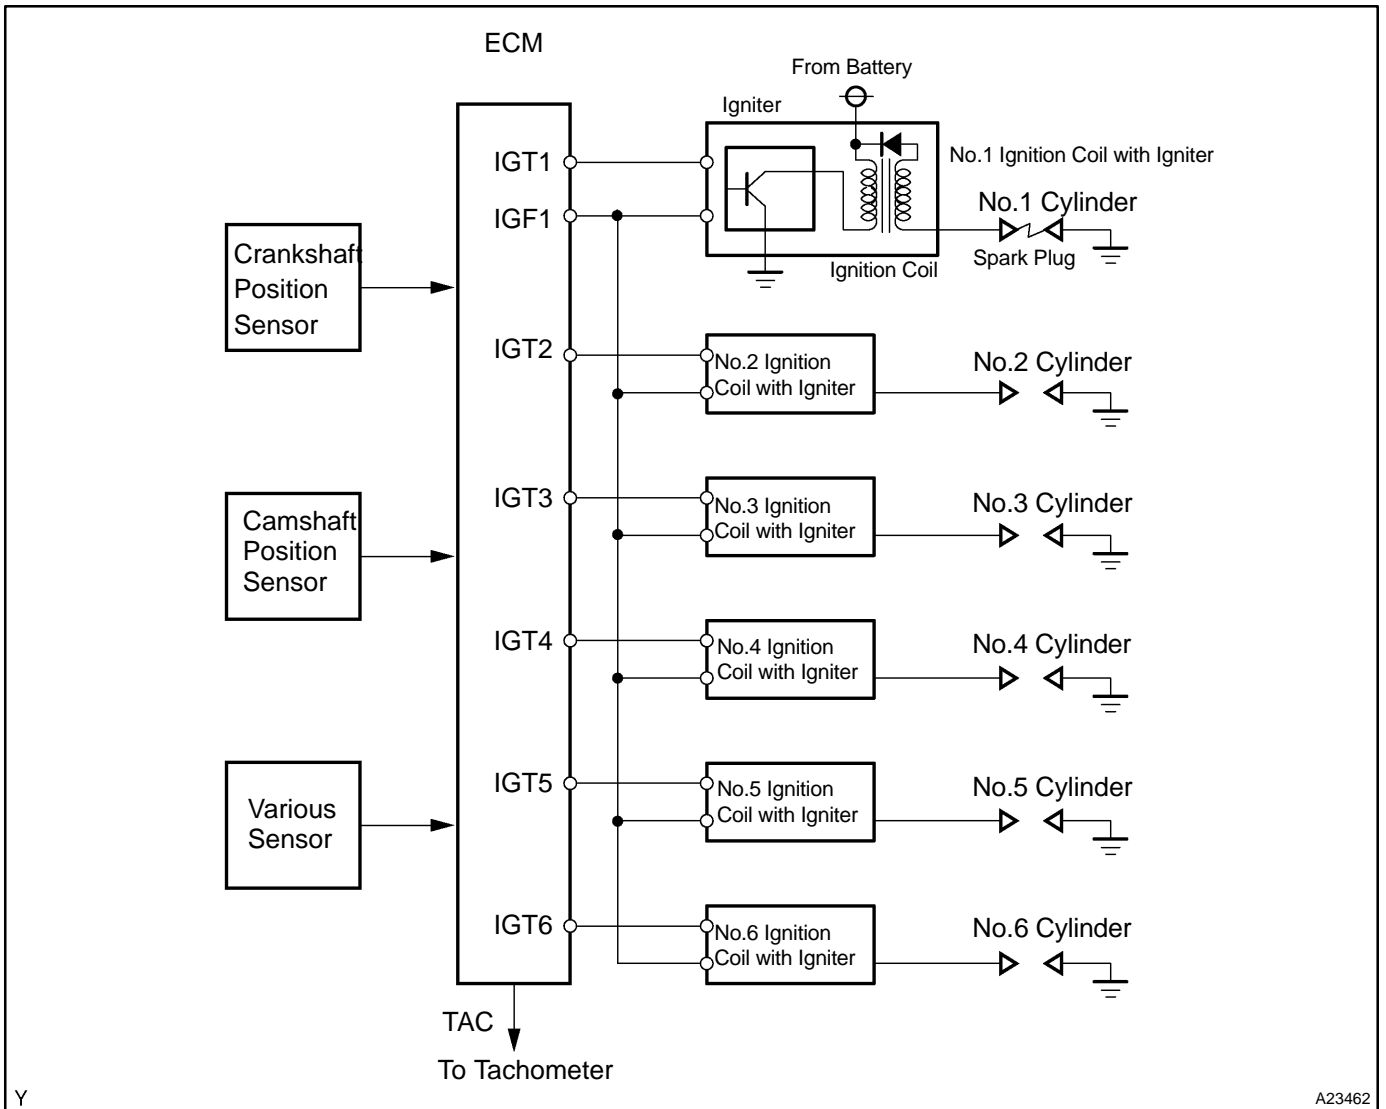

- These DTCs indicate a malfunction related to primary circuit.
- If DTC P0351 is displayed, check No. 1 ignition coil with igniter circuit.
- If DTC P0352 is displayed, check No. 2 ignition coil with igniter circuit.
- If DTC P0353 is displayed, check No. 3 ignition coil with igniter circuit.
- If DTC P0354 is displayed, check No. 4 ignition coil with igniter circuit.
- If DTC P0355 is displayed, check No. 5 ignition coil with igniter circuit.
- If DTC P0356 is displayed, check No. 6 ignition coil with igniter circuit.

CIRCUIT DESCRIPTION

These DTCs indicate a malfunction related to primary circuit.

The DIS is a 1-cylinder ignition system which ignites one cylinder with one ignition coil. In the 1-cylinder ignition system, the one spark plug is connected to the end of the secondary winding. High voltage generated in the secondary winding is applied directly to the spark plug. The spark of the spark plug passes from the center electrode to the ground electrode.

The ECM determines the ignition timing and outputs the ignition signals (IGTs) for each cylinder. Using the IGT, the ECM turns on and off the power transistor inside the igniter and this switches on and off the current to the primary coil. When the current to the primary coil is cut off, high-voltage is generated in the secondary coil and this voltage is applied to the spark plugs to create sparks inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back the ignition confirmation signal (IGF) for each cylinder ignition to the ECM.

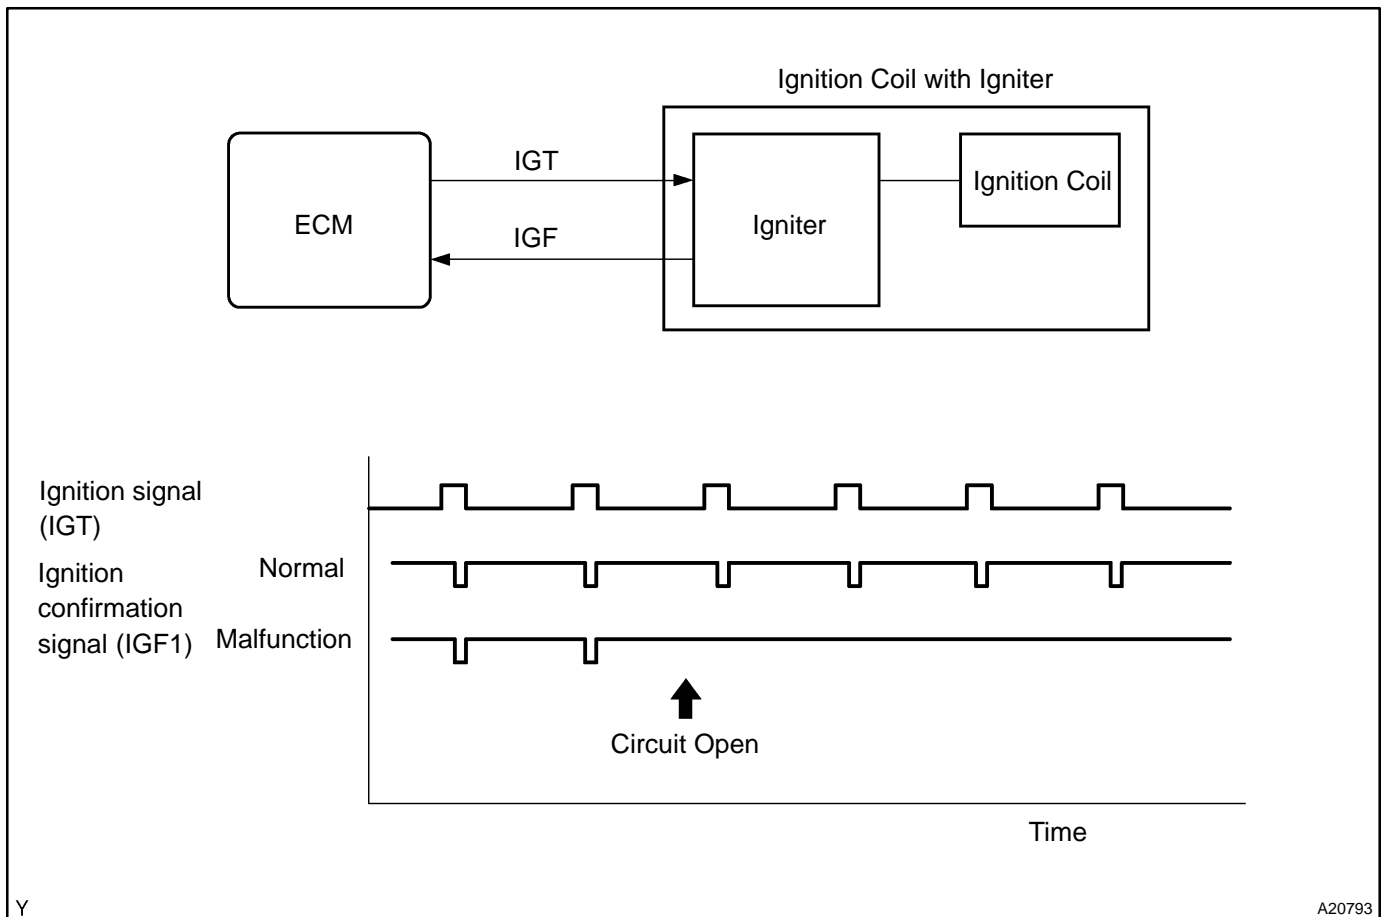

DTC No.	DTC Detecting Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356	No IGF1 signal to ECM while engine is running	<ul style="list-style-type: none"> • Open or short in IGF1 and IGT1 to IGT6 circuit from ignition coil with igniter to ECM • No. 1 to No. 6 ignition coil with igniter (primary ignition) • Ignition system • ECM

Reference: Inspection using the oscilloscope.

During cranking or idling, check the waveform between terminals IG1 to IG6 and E1, and terminal IGF1 and E1 of the E5 and E7 ECM connectors.

MONITOR DESCRIPTION

If the ECM does not receive the IGF1 after sending the IGT it interprets this as a fault in the igniter and sets a DTC.

MONITOR STRATEGY

Related DTCs	P0351	No. 1 ignition coil with igniter circuit malfunction
	P0352	No. 2 ignition coil with igniter circuit malfunction

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-18	
Engine speed	–	1,500 rpm
Either of the following conditions is met:	Condition 1 or 2	
1. Following conditions are met:	Condition (a) and (b)	
(a) Engine speed	–	500 rpm
(b) Battery voltage	6 V	–
2. Following conditions are met:	Condition (a) and (b)	
(a) Engine speed	500 rpm	–
(b) Battery voltage	10 V	–

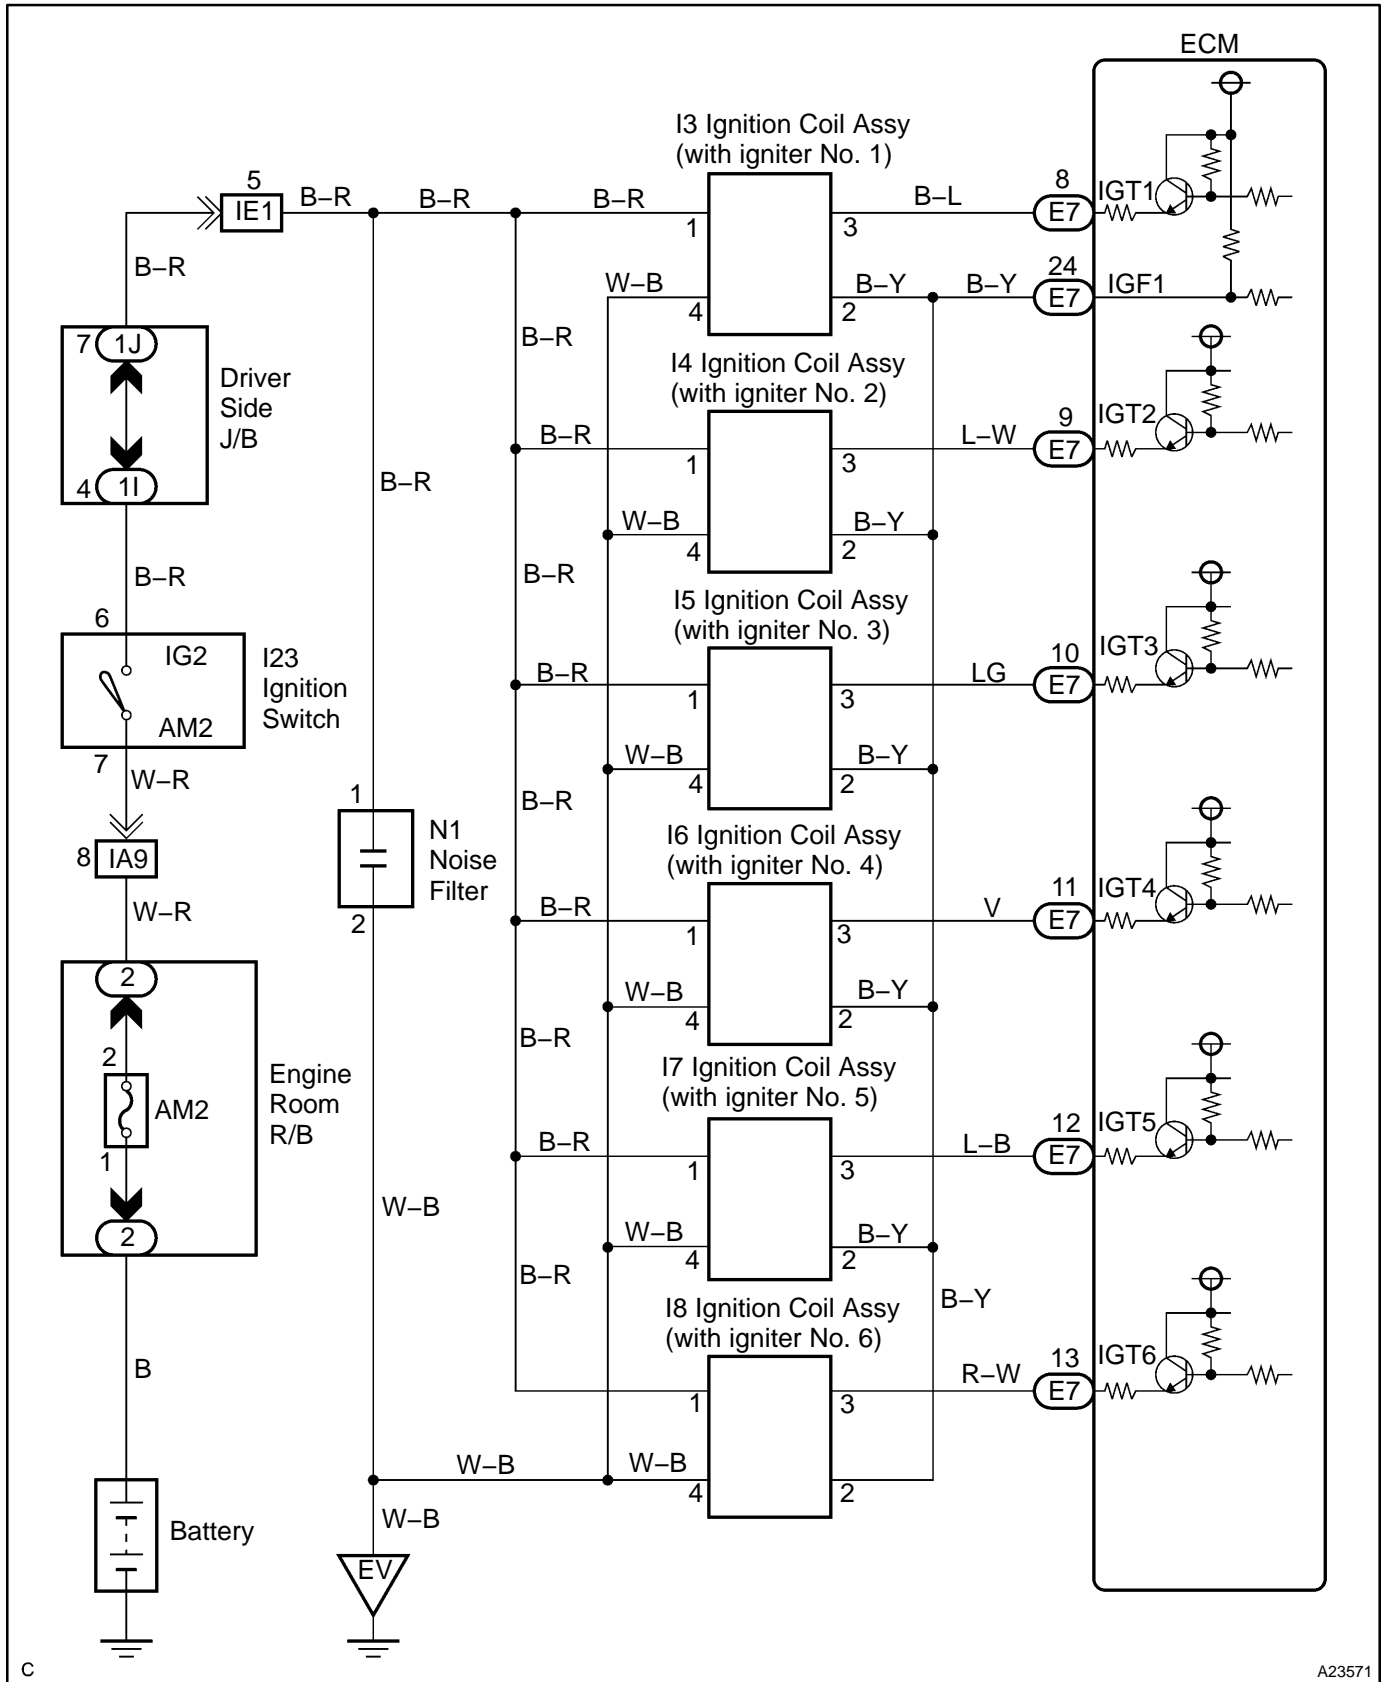

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
"Ignition signal fail count"	More than 2
"Ignition signal fail count" is on the right:	When IGF does not return despite sending IGT.

COMPONENT OPERATING RANGE

Standard Value
Confirmed signal number = ignition signal number

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check spark plug and spark (See page IG-1).
----------	--

NG	Go to step 4.
-----------	----------------------

OK

2	Check for open and short in harness and connector in IGF signal circuits between ECM and ignition coil with igniter.
----------	---

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil with igniter connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Ignition coil (I3-2) – IGF1 (E7-24)	Below 1 Ω
Ignition coil (I4-2) – IGF1 (E7-24)	Below 1 Ω
Ignition coil (I5-2) – IGF1 (E7-24)	Below 1 Ω
Ignition coil (I6-2) – IGF1 (E7-24)	Below 1 Ω
Ignition coil (I7-2) – IGF1 (E7-24)	Below 1 Ω
Ignition coil (I8-2) – IGF1 (E7-24)	Below 1 Ω
Ignition coil (I3-2) or IGF1 (E7-24) – Body ground	10 kΩ or higher
Ignition coil (I4-2) or IGF1 (E7-24) – Body ground	10 kΩ or higher
Ignition coil (I5-2) or IGF1 (E7-24) – Body ground	10 kΩ or higher
Ignition coil (I6-2) or IGF1 (E7-24) – Body ground	10 kΩ or higher
Ignition coil (I7-2) or IGF1 (E7-24) – Body ground	10 kΩ or higher
Ignition coil (I8-2) or IGF1 (E7-24) – Body ground	10 kΩ or higher

NG

Repair or replace harness or connector.

OK

3

Disconnect ignition coil with igniter connector, and check voltage between terminals IGF1 and E1 of ECM connector.

**PREPARATION:**

- (a) Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil with igniter connector.
- (b) Turn the ignition switch ON.

CHECK:

Measure the voltage between the E8 and E6 ECM connectors.

OK:**Standard:**

Tester Connection	Specified Condition
IGF1 (E7-24) - E1 (E5-1)	4.5 to 5.5 V

NG

Replace ECM (See page [SF-66](#)).

OK

Replace ignition coil with igniter.

4 Check for open and short in harness and connector in IGT signal circuit between ECM and ignition coil with igniter.

Wire Harness Side:

Y A21025

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Ignition coil (I3-3) - IGT1 (E7-8)	Below 1 Ω
Ignition coil (I4-3) - IGT2 (E7-9)	Below 1 Ω
Ignition coil (I5-3) - IGT3 (E7-10)	Below 1 Ω
Ignition coil (I6-3) - IGT4 (E7-11)	Below 1 Ω
Ignition coil (I7-3) - IGT5 (E7-12)	Below 1 Ω
Ignition coil (I8-3) - IGT6 (E7-13)	Below 1 Ω
Ignition coil (I3-3) or IGT1 (E7-8) - Body ground	10 kΩ or higher
Ignition coil (I4-3) or IGT2 (E7-9) - Body ground	10 kΩ or higher
Ignition coil (I5-3) or IGT3 (E7-10) - Body ground	10 kΩ or higher
Ignition coil (I6-3) or IGT4 (E7-11) - Body ground	10 kΩ or higher
Ignition coil (I7-3) or IGT5 (E7-12) - Body ground	10 kΩ or higher
Ignition coil (I8-3) or IGT6 (E7-13) - Body ground	10 kΩ or higher

B17412

NG Repair or replace harness or connector.

OK

5 Check voltage between terminals IGT1 to IGT6 and E1 of ECM connector.
**PREPARATION:**

Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil with igniter connector.

CHECK:

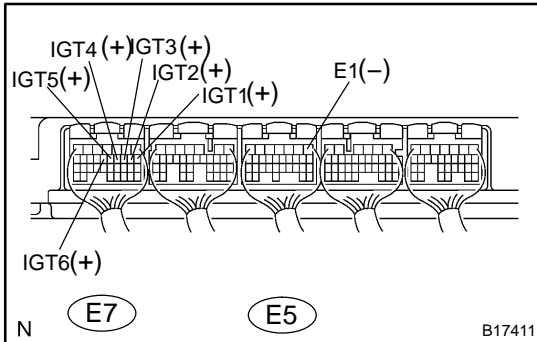

Measure the voltage between terminals the E5 and E7 ECM connectors when the engine is cranked.

OK:**Standard:**

Tester Connection	Specified Condition
IGT1 (E7-8) - E1 (E5-1)	More than 0.1 V or less than 4.5 V
IGT2 (E7-9) - E1 (E5-1)	
IGT3 (E7-10) - E1 (E5-1)	
IGT4 (E7-11) - E1 (E5-1)	
IGT5 (E7-12) - E1 (E5-1)	
IGT6 (E7-13) - E1 (E5-1)	

NG**Replace ECM (See page SF-66).****OK**

- 6 Disconnect ignition coil with igniter connector, and check voltage between terminals IGT1 to IGT6 and E1 of ECM connector.**

**PREPARATION:**

- Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil with igniter connector.
- Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminals the E5 and E7 ECM connectors when the engine is cranked.

OK:**Standard:**

Tester Connection	Specified Condition
IGT1 (E7-8) - E1 (E5-1)	4.5 V or more
IGT2 (E7-9) - E1 (E5-1)	4.5 V or more
IGT3 (E7-10) - E1 (E5-1)	4.5 V or more
IGT4 (E7-11) - E1 (E5-1)	4.5 V or more
IGT5 (E7-12) - E1 (E5-1)	4.5 V or more
IGT6 (E7-13) - E1 (E5-1)	4.5 V or more

NG**Replace ECM (See page SF-66).****OK**

7 Check ignition coil with igniter power source circuit.
Wire Harness Side:

Y

A21025

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil with igniter connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between the terminal of the wire harness side connector and body ground.

OK:
Standard:

Tester Connection	Specified Condition
I3-1 - Body ground	9 to 14 V
I4-1 - Body ground	9 to 14 V
I5-1 - Body ground	9 to 14 V
I6-1 - Body ground	9 to 14 V
I7-1 - Body ground	9 to 14 V
I8-1 - Body ground	9 to 14 V

OK
Repair ignition coil with igniter.
NG

8 Check for open and short in harness and connector between ignition switch and ignition coil with igniter.

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7 or I8 ignition coil with igniter connector.
- (b) Disconnect the I23 ignition switch connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Ignition coil (I3-1) - IG2 (I23-6)	Below 1 Ω
Ignition coil (I4-1) - IG2 (I23-6)	Below 1 Ω
Ignition coil (I5-1) - IG2 (I23-6)	Below 1 Ω
Ignition coil (I6-1) - IG2 (I23-6)	Below 1 Ω
Ignition coil (I7-1) - IG2 (I23-6)	Below 1 Ω
Ignition coil (I8-1) - IG2 (I23-6)	Below 1 Ω
Ignition coil (I3-1) or IG2 (I23-6) - Body ground	10 kΩ or higher
Ignition coil (I4-1) or IG2 (I23-6) - Body ground	10 kΩ or higher
Ignition coil (I5-1) or IG2 (I23-6) - Body ground	10 kΩ or higher
Ignition coil (I6-1) or IG2 (I23-6) - Body ground	10 kΩ or higher
Ignition coil (I7-1) or IG2 (I23-6) - Body ground	10 kΩ or higher
Ignition coil (I8-1) or IG2 (I23-6) - Body ground	10 kΩ or higher

NG **Repair or replace harness or connector.**

OK

Replace ignition coil with igniter.

DTC	P0420	Catalyst System Efficiency Below Threshold (Bank 1)
------------	--------------	--

DTC	P0430	Catalyst System Efficiency Below Threshold (Bank 2)
------------	--------------	--

MONITOR DESCRIPTION

The ECM uses the two sensors, mounted in front of and behind the Three-way Catalytic Converter (TWC), to monitor its efficiency.

The first sensor, the Air-Fuel Ratio (A/F) sensor (sensor 1), sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor (sensor 2), sends post-catalyst information to the ECM. The ECM compares the information transmitted by these two sensors to determine the efficiency of the TWC performance and its ability to store oxygen.

When the TWC is functioning properly, the variation in the oxygen concentration in the exhaust gas, after it has passed through the TWC, is small. In this condition, the voltage output of sensor 2 slowly alternates between the rich and lean signal voltages (shown in the illustration below). As the TWC performance efficiency deteriorates, its oxygen storage capacity decreases, and the variation in the oxygen concentration in the exhaust gas increases. As a result, the sensor voltage output fluctuates frequently.

While the catalyst monitor is running, the ECM measures the signal lengths of both sensors 1 and 2, and calculates the ratio of the signal lengths to determine the extent of the TWC deterioration. If the deterioration level exceeds the preset threshold, the ECM interprets this as the TWC malfunction. The ECM then illuminates the MIL and sets the DTC.

DTC No.	DTC Detecting Condition	Trouble Area
P0420 P0430	After engine and catalyst are warmed up, and while vehicle is driven within set vehicle and engine speed range, each waveform of heated oxygen sensors has same amplitude (2 trip detection logic)	<ul style="list-style-type: none"> • Gas leakage on exhaust system • Heated oxygen sensor (bank 1, 2 sensor 1, 2) • Three-way catalytic converter

HINT:

- Bank 1 refers to the bank that includes cylinder No.1.
- Bank 2 refers to the bank that does not include cylinder No.1.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR STRATEGY

Related DTCs	P0420	Bank 1 catalyst is deteriorated
	P0430	Bank 2 catalyst is deteriorated
Required sensors/components	Main sensors/components	Front and rear heated oxygen sensor
	Related sensors/components	Mass air flow meter, Engine coolant temperature sensor, Engine speed sensor, Intake air temperature sensor
Frequency of operation	Once per driving cycle	
Duration	30 sec.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-18	
Battery voltage	11 V	-
IAT	-10°C (14°F)	-
ECT	75°C (167°F)	-
Atmospheric pressure coefficient	0.75	-
Idle	OFF	
Engine RPM	-	3,200 rpm
A/F sensor	Activated	
Fuel system status	Closed loop	
Engine load	10 to 70 %	
All of the following conditions are met	Condition 1, 2 and 3	
1. MAF	5 to 70 g/sec	
2. Front catalyst temperature (estimated)	650 to 840°C (1,202 to 1,544°F)	
3. Rear catalyst temperature (estimated)	100 to 900°C (212 to 1,652°F)	
Rear HO2S monitor	Completed	
Shift position	4th	-

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Oxygen storage capacity (OSC) of catalyst	Less than 0.04

MONITOR RESULT

Refer to page [DI-26](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (see page [DI-27](#)).

- TID (Test Identification Data) is assigned to each emissions-related component.
- TLT (Test Limit Type):
If TLT is 0, the component is malfunctioning when the test value is higher than the test limit.
If TLT is 1, the component is malfunctioning when the test value is lower than the test limit.
- CID (Component Identification Data) is assigned to each test value.
- Unit Conversion is used to calculate the test value indicated on generic OBD II scan tools.

TID \$01: Catalyst (Active A/F control method)

TLT	CID	Unit Conversion	Description of Test Data	Description of Test Limit
1	\$01	Multiply by 0.0078 (no dimension)	Oxygen storage capacity (bank 1): Calculated by HO2S 2 output	Malfunction criteria for catalyst deterioration
1	\$02	Multiply by 0.0078 (no dimension)	Oxygen storage capacity (bank 2): Calculated by HO2S 2 output	Malfunction criteria for catalyst deterioration

WAVEFORMS OF AIR-FUEL RATIO (A/F) AND HEATED OXYGEN (HO2) SENSORS

HINT:

Perform the operation with the engine speeds and time durations described below prior to check the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and warm it up with all the accessories switched OFF, until the engine coolant temperature stabilizes.
- (c) Run the engine at an engine speed of between 2,500 rpm and 3,000 rpm for at least 3 minutes.
- (d) After confirming that the waveform of the heated oxygen sensor (bank 1, 2 sensor 1 (OX1A, OX2A)), oscillate around 0.5 V during feedback to the ECM, check the waveform of the heated oxygen sensor (bank 1, 2 sensor 2 (OX1B, OX2B)).

HINT:

- If either of the voltage outputs of the Air-Fuel Ratio (A/F) or Heated Oxygen (HO2) sensors does not fluctuate, or either of the sensors makes a noise, the sensor may be malfunctioning.
- If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following A/F CONTROL using a hand-held tester.

- If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO₂ sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).

A/F CONTROL

HINT:

Hand-held tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO₂) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- Connect a hand-held tester to the DLC3.
- Start the engine and turn the tester ON.
- Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- Monitor the voltage outputs of the A/F and HO₂ sensors (AFS B1S1 and OS2 B1S2) displayed on the tester.

HINT:

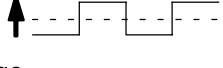

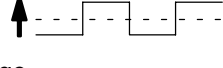

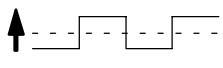

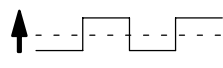

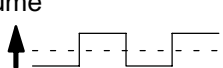

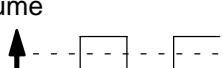

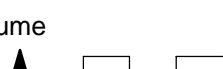

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 % ↑  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0 V	Injection volume +25 % ↑  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	—
2	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 % ↑  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 % ↑  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0V	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Are there any other codes (besides DTC P0420 or P0430) being output?
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
"P0420 and/or P0430"	A
"P0420 or P0430" and other DTCs	B

HINT:

If any other codes besides "P0420 and/or P0430" are output, perform the troubleshooting for those DTCs first.

B

Go to DTC chart (See page [DI-57](#)).

A

2	Check gas leakage on exhaust system.
----------	---

NG

Repair or replace exhaust gas leakage point.

OK

3	Check A/F sensor (bank 1, 2 sensor 1) (See page SF-64).
----------	--

HINT:

Refer to the HINT following the end of this flowchart.

NG

Replace A/F sensor.

OK

4	Check heated oxygen sensor (bank 1, 2 sensor 2) (See page SF-64).
----------	--

HINT:

Refer to the HINT following the end of this flowchart.

Replace front and rear three-way catalytic converter in the bank a malfunction is detected.

HINT:

Hand-held tester only:

Narrowing down the trouble area is possible by performing ACTIVE TEST of the following "A/F CONTROL" (Heated oxygen sensor or another can be distinguished).

(a) Perform ACTIVE TEST by hand-held tester (A/F CONTROL).

HINT:

"A/F CONTROL" is the ACTIVE TEST which changes the injection volume to -12.5 % or +25 %.

- (1) Connect the hand-held tester to the DLC3 on the vehicle.
- (2) Turn the ignition switch to ON.
- (3) Warm up the engine with the engine speed at 2,500 rpm for approximately 90 seconds.
- (4) Select the menu "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL".
- (5) Perform "A/F CONTROL" with the engine in an idle condition (press the right or left button).

RESULT:

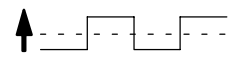

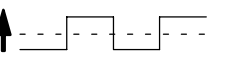

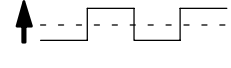

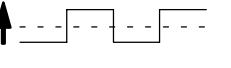

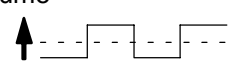

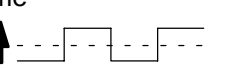

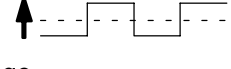

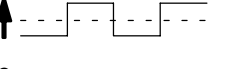

Heated oxygen sensor reacts in accordance with increase and decrease of injection volume

+25 % → rich output: More than 0.5 V

-12.5 % → lean output: Less than 0.4 V

NOTICE:

There is a few second delay in the sensor 1 (front sensor) output. And there is approximately 20 seconds delay in the sensor 2 (rear sensor).

	Output voltage of heated oxygen sensor (sensor 1: front sensor)	Output voltage of heated oxygen sensor (sensor 2: rear sensor)	Mainly suspected trouble area
Case 1	Injection volume +25 % ↑ -12.5 % ↓  Output voltage More than 0.5 V ↑ Less than 0.4 V ↓  OK	Injection volume +25 % ↑ -12.5 % ↓  Output voltage More than 0.5 V ↑ Less than 0.4 V ↓  OK	—
Case 2	Injection volume +25 % ↑ -12.5 % ↓  Output voltage Almost no reaction  NG	Injection volume +25 % ↑ -12.5 % ↓  Output voltage More than 0.5 V ↑ Less than 0.4 V ↓  OK	Sensor 1: front sensor (sensor 1, heater, sensor 1 circuit)
Case 3	Injection volume +25 % ↑ -12.5 % ↓  Output voltage More than 0.5 V ↑ Less than 0.4 V ↓  OK	Injection volume +25 % ↑ -12.5 % ↓  Output voltage Almost no reaction  NG	Sensor 2: rear sensor (sensor 2, heater, sensor 2 circuit)
Case 4	Injection volume +25 % ↑ -12.5 % ↓  Output voltage Almost no reaction  NG	Injection volume +25 % ↑ -12.5 % ↓  Output voltage Almost no reaction  NG	Extremely rich or lean actual air-fuel ratio (Injector, fuel pressure, gas leakage in exhaust system, etc.)

The following A/F CONTROL procedure enables the technician to check and graph the voltage output of the heated oxygen sensors (sensor 1 and 2).

For displaying the graph indication, enter "ACTIVE TEST / A/F CONTROL / USER DATA" then select "O2S B1S1 and O2S B1S2" by pressing "YES" button and push "ENTER" button before pressing "F4" button.

NOTICE:

If the vehicle is short of fuel, the air-fuel ratio becomes LEAN and DTCs P0133 and/or P0153 will be recorded, and the MIL then comes on.

- If different DTCs related to different systems while terminal E2 as ground terminal are output simultaneously, terminal E2 may be open.
- Read freeze frame data using the hand-held tester or the OBD II scan tool. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.
- A high heated oxygen sensor (sensor 1) voltage (0.5 V or more) could be caused by a rich air fuel mixture. Check for conditions that would cause the engine to run rich.
- A low heated oxygen sensor (sensor 1) voltage (0.4 V or less) could be caused by a lean air fuel mixture. Check for conditions that would cause the engine to run lean.

DTC	P0441	Evaporative Emission Control System Incorrect Purge Flow
------------	--------------	---

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0441	Purge VSV (Vacuum Switching Valve) stuck open	Vacuum pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak pressure standard is measured at the start and at the end of the leak check. If stabilized pressure higher than [second 0.02 inch leak pressure standard x 0.2], ECM determines that purge VSV stuck open	<ul style="list-style-type: none"> • Purge VSV • Connector/wire harness (Purge VSV – ECM) • ECM • Pump module • Leakage from EVAP system 	While ignition Switch OFF	2 trip
P0441	Purge VSV stuck closed	After EVAP leak check performed, purge VSV turned ON (open), and atmospheric air introduced into EVAP system. 0.02 inch leak pressure standard is measured at the start and at the end of the leak check. If pressure does not return to near atmospheric pressure, ECM determines that purge valve stuck closed	<ul style="list-style-type: none"> • Purge VSV • Connector/wire harness (Purge VSV – ECM) • ECM • Pump module • Leakage from EVAP system 	While ignition Switch OFF	2 trip
P0441	Purge flow	While engine running, following conditions successively met: <ul style="list-style-type: none"> • Negative pressure not created in EVAP system when purge VSV turned ON (open) • EVAP system pressure change less than 0.5 kPa (3.75 mmHg) when vent valve turned ON (closed) • Atmospheric pressure change before and after purge flow monitor less than 0.1 kPa (0.75 mmHg) 	<ul style="list-style-type: none"> • Purge VSV • Connector/wire harness (Purge VSV – ECM) • Leakage from EVAP line (Purge VSV – Intake manifold) • ECM 	While engine running	2 trip

CIRCUIT DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) Inspection Procedure (see page [DI-368](#)).

MONITOR DESCRIPTION

The two monitors, Key-Off and Purge Flow, are used to detect malfunctions relating to DTC P0441. The Key-Off monitor is initiated by the ECM internal timer, known as the soak timer, 5 hours* after the ignition switch is turned to OFF. The purge flow monitor runs while the engine is running.

1. KEY-OFF MONITOR

5 hours* after the ignition switch is turned OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure is not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	Leak check is performed after second 0.02 inch leak pressure standard is measured. If stabilized system pressure higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

(a) Purge VSV stuck open

In operation C, the vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The EVAP system pressure is then measured by the ECM using the pressure sensor. If the stabilized system pressure is higher than [second 0.02 inch leak pressure standard x 0.2], the ECM interprets this as the purge VSV (Vacuum Switching Valve) being stuck open. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

(b) Purge VSV stuck closed

In operation D, the pressure sensor measures the EVAP system pressure. The pressure measurement for purge VSV monitor is begun when the purge VSV is turned ON (open) after the EVAP leak check. When the measured pressure indicates an increase of 0.3 kPa (2.25 mmHg) or more, the purge VSV is functioning normally. If the pressure does not increase, the ECM interprets this as the purge VSV being stuck closed. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

2. PURGE FLOW MONITOR

The purge flow monitor consists of the two step monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
The vent valve is turned ON (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:

In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

MONITOR STRATEGY

Related DTCs	P0441	Purge VSV stuck open
		Purge VSV stuck closed
		Purge flow
Required sensors/components	Purge VSV, Pump module	
Frequency of operation	Once per driving cycle

HINT:

The pressure sensor is built into the pump module.

CIRCUIT DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) Inspection Procedure (see page [DI-368](#)).

MONITOR DESCRIPTION

- (a) DTC P0450: Pressure sensor voltage abnormal fluctuation.
If the pressure sensor voltage output rapidly fluctuates between less than 0.45 V and more than 4.9 V, the ECM interprets this as an open or short circuit malfunction in the pressure sensor or its circuit, and stops the EVAP (Evaporative Emission) system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
- (b) DTC P0451: Pressure sensor noising or stuck
If the pressure sensor voltage output fluctuates rapidly for 10 seconds, the ECM stops the EVAP system monitor. The ECM interprets this as noise from the pressure sensor, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC.
Alternatively, if the sensor voltage output does not change for 10 seconds, the ECM interprets this as the sensor being stuck, and stops the monitor. The ECM then illuminates the MIL and sets the DTC.
(Both the malfunctions are detected by 2 trip detection logic)
- (c) DTC P0452: Pressure sensor voltage low
If the pressure sensor voltage output is below 0.45 V, the ECM interprets this as an open or short circuit malfunction in the pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
- (d) DTC P0453: Pressure sensor voltage high
If the pressure sensor voltage output is 4.9 V or more, the ECM interprets this as an open or short circuit malfunction in the pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Pressure sensor noise:	
Frequency that EVAP pressure change is 0.3 kPa (2.3 mmHg) or more	10 times or more for 10 sec.
Pressure sensor stuck:	
EVAP pressure change during reference pressure measurement	Less than 0.65 kPa (4.9 mmHg)
Pressure sensor chattering:	
EVAP pressure	Less than 42.11 kPa (315.90 mmHg), or more than 123.761 kPa (928.440 mmHg)
Pressure sensor low voltage:	
EVAP pressure	Less than 42.11 kPa (315.90 mmHg)
Pressure sensor high voltage:	
EVAP pressure	More than 123.761 kPa (928.440 mmHg)

INSPECTION PROCEDURE

NOTICE:

- When a vehicle is brought into the workshop, leave it as it is. Do not change the vehicle condition. For example, do not tighten the fuel tank cap.
- Do not disassemble the pump module.
- A hand-held tester is required to conduct the following diagnostic troubleshooting procedure.

1	Confirm DTC and EVAP pressure.
----------	---------------------------------------

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON (do not start the engine).
- (c) Turn the tester ON.

CHECK:

- (a) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (b) Read DTCs.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / VAPOR PRESS.
- (d) Read the EVAP (Evaporative Emission) pressure displayed on the tester.

RESULT:

Display (DTC Output)	Test Results	Suspected Trouble Areas	Proceed To
P0451	—	• Pressure sensor	C
P0452	Less than 45 kpa (338 mmHg)	• Wire harness/connector (ECM – pressure sensor) • Pressure sensor • Short in ECM circuit	A
P0453	More than 120 kPa (900 mmHg)	• Wire harness/connector (ECM – pressure sensor) • Pressure sensor • Open in ECM circuit	B

B

Go to step 4.

C

Go to EVAP inspection procedure (See page [DI-368](#)).

A

2 Measure resistance between terminal PPMP of ECM and body ground.

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between PPMP terminal of the ECM connector and the body ground.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
10 Ω or less	<ul style="list-style-type: none"> • Wire harness/connector (ECM – pressure sensor) • Short in pressure sensor circuit 	A
10 k Ω or more	<ul style="list-style-type: none"> • Wire harness/connector (ECM – pressure sensor) • Short in ECM circuit 	B

B

Go to step 7.

A

3 Measure resistance between terminal PPMP of ECM and body ground.

PREPARATION:

- (a) Disconnect the L4 canister connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Check the resistance between PPMP terminal of the ECM connector and the body ground.

Result:

Test Results	Suspected Trouble Areas	Proceed To
10 kΩ or more	• Short in pressure sensor circuit	A
10 Ω or less	• Short in wire harness/connector (ECM – pressure sensor)	B

A → **Go to step 5.**

B → **Go to step 6.**

4 Measure voltage and resistance of pump module connector.

PREPARATION:

- (a) Disconnect the L4 canister connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage and resistance of the L4 connector.

OK:

Standard:

Tester Connections	Specified Conditions
L4-4 - Body ground	Between 4.5 V and 5.5 V
L4-3 - Body ground	Between 4.5 V and 5.5 V
L4-2 - Body ground	100 Ω or less

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Voltage and resistance within standard ranges	• Open in pressure sensor circuit	A
Voltage and resistance outside standard ranges	• Open in wire harness/connector (ECM - pressure sensor)	B

B Go to step 6.

A

5 Replace charcoal canister assembly.

NEXT Go to step 8.

6 Repair or replace wire harness and connectors.

HINT:

If the exhaust tail pipe has been removed, go to the next step before reinstalling it.

NEXT Go to step 8.

7	Replace ECM (See page SF-66).
----------	--

NEXT

8	Check whether DTC output recurs.
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Wait for at least 60 seconds.

CHECK:

On the tester, select the following menu items: DIAGNOSIS/ENHANCED OBD II/DTC INFO/PENDING CODES.

HINT:

If no pending DTC is displayed on the tester, the repair has been successfully completed.

NEXT

Completed

DTC	P0455	Evaporative Emission Control System Leak Detected (Gross Leak)
------------	--------------	---

DTC	P0456	Evaporative Emission Control System Leak Detected (Very Small Leak)
------------	--------------	--

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0455	EVAP gross leak	Vacuum pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak pressure standard is measured at the start and at the end of the leak check. If stabilized pressure higher than [second 0.02 inch leak pressure standard x 0.2], ECM determines that EVAP system has large leakage.	<ul style="list-style-type: none"> • Fuel tank cap (loose) • Leakage from EVAP line (Canister – Fuel tank) • Leakage from EVAP line (Purge VSV – Canister) • Pump module • Leakage from fuel tank • Leakage from canister 	While ignition switch OFF	2 trip
P0456	EVAP small leak	Vacuum pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak pressure standard is measured at the start and at the end of the leak check. If stabilized pressure larger than second 0.02 inch leak pressure, ECM determines that EVAP system has small leakage.	Same above	While ignition switch OFF	2 trip

CIRCUIT DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) Inspection Procedure (see page [DI-368](#)).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure is not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	Leak check is performed after second 0.02 inch leak pressure standard is measured. If stabilized system pressure higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

(a) P0455: EVAP (Evaporative Emission) gross leak

In operation C, the vacuum pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than [second 0.02 inch leak pressure standard x 0.2] (near atmospheric pressure), the ECM determines that the EVAP system has a large leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

(b) P0456: EVAP very small leak

In operation C, the vacuum pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than second 0.02 inch leak pressure standard, the ECM determines that the EVAP system has a small leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

EVAP pressure	Saturated within 12 minutes	
5. EVAP canister purge valve close stuck check	-	
Next sequence is run if the following condition is set	-	
EVAP pressure change after purge valve is open	0.3 kPa (2.25 mmHg)	-

6. Second reference pressure measurement	–	
Next sequence is run if all of the following conditions are set	Condition 1, 2, 3 and 4	
1. EVAP pressure just after reference pressure measurement	–	–1 kPa (–7.5 mmHg)
2. Reference pressure	–4.85 to –1.057 kPa (–36.4 to –7.92 mmHg)	
3. Reference pressure	Saturated	
4. Difference between first reference pressure and second reference pressure	–	0.7 kPa (5.25 mmHg)
7. Leak check	–	
Next sequence is run if the following condition is set	–	
EVAP pressure when vacuum introduction is complete	–	Less than second reference pressure
8. Atmospheric pressure	–	
EVAP monitor is complete is the following condition is set	–	
Atmospheric pressure difference between sequence 1 and 8	–	0.3 kPa (2.25 mmHg)

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Small leak (0.020 inch) malfunction detection:	
EVAP pressure when vacuum introduction is complete	Between reference pressure and reference pressure x 0.2
Gross leak detection:	
EVAP pressure when vacuum introduction is complete	Higher than reference pressure x 0.2

MONITOR RESULT (MODE 06 DATA)

Refer to page [DI-26](#) for detailed information.

INSPECTION PROCEDURE

Refer to the EVAP Inspection Procedure (see page [DI-368](#)).

DTC	P0500	Vehicle Speed Sensor "A"
------------	--------------	---------------------------------

DTC	P0503	Vehicle Speed Sensor "A" Intermittent/ Erratic/High
------------	--------------	--

CIRCUIT DESCRIPTION

The No.1 vehicle speed sensor outputs a 4-pulse signal for every revolution of the rotor shaft, which is rotated by the transmission output shaft via the driven gear. After this signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter, it is then transmitted to the ECM. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC No.	Proceed to	DTC Detection Condition	Trouble Area
P0500	Step 1	No vehicle speed sensor signal to ECM under following conditions: (1 trip detection logic) • Vehicle is being driven	<ul style="list-style-type: none"> • Combination meter • Open or short in vehicle speed sensor circuit • Vehicle speed sensor • ECM
P0503	DI-11	Intermittent problem in the vehicle speed sensor circuit	<ul style="list-style-type: none"> • Combination meter • Open or short in vehicle speed sensor circuit • Vehicle speed sensor • ECM

MONITOR DESCRIPTION

The ECM assumes that the vehicle is driven when the park/neutral position switch is OFF and it has been over 4 sec. since the actual vehicle speed was 6 mph (9 km/h) or more.

If there is no signal from the vehicle speed sensor when these conditions are satisfied, the ECM concludes that there is a fault in the vehicle speed sensor. The ECM will turn on the MIL and a DTC is set.

MONITOR STRATEGY

Related DTCs	P0500	Vehicle speed sensor "A" pulse input error
Required sensors/components	Main sensors	Vehicle speed sensor
	Related sensors	Park/Neutral position switch, Engine coolant temperature sensor, Combination meter
Frequency of operation	Continuous

Starter	OFF	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Case 1, 2	
Sensor signal	No pulse input

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check operation of speedometer.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) Start the engine.
- (d) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / VEHICLE SPD.

CHECK:

Read the mass air flow rate on the hand-held tester.

RESULT:

Vehicle speed	Proceed to
Vehicle speed remains 0 km/h (0 mph)	A
Vehicle speed is lower than actual speed	A
Vehicle speed is same as actual speed	B

NG

Check speedometer circuit. See combination meter troubleshooting (See page [BE-2](#)).

OK

2 Check voltage between terminal SPD and E1 of ECM connector.
**PREPARATION:**

- Shift the shift lever to neutral.
- Jack up the rear wheel on one side.
- Turn the ignition switch to ON.

CHECK:

Measure the voltage between the specified terminal of the E4 and E5 ECM connectors when the wheel is turned slowly.

OK:**Standard:**

Tester Connection	Specified Condition
SPD (E4-8) - E1 (E5-1)	Generated intermittently

HINT:

The output voltage should fluctuate up and down similarly to the diagram on the left when the wheel is turned slowly.

**NG**

Check and repair harness and connector between combination meter and ECM.

OK

Replace ECM (See page [SF-66](#)).

DTC	P0504	Brake Switch "A"/"B" Correlation
------------	--------------	---

CIRCUIT DESCRIPTION

In addition to turning on the stop lamps, the stop lamp switch signals are used for a variety of engine, transmission, and suspension functions as well as being an input for diagnostic checks. It is important that the switch operates properly, therefore this switch is designed with two complementary signal outputs: STP and STI-. The ECM analyzes these signal outputs to detect malfunctions in the stop lamp switch.

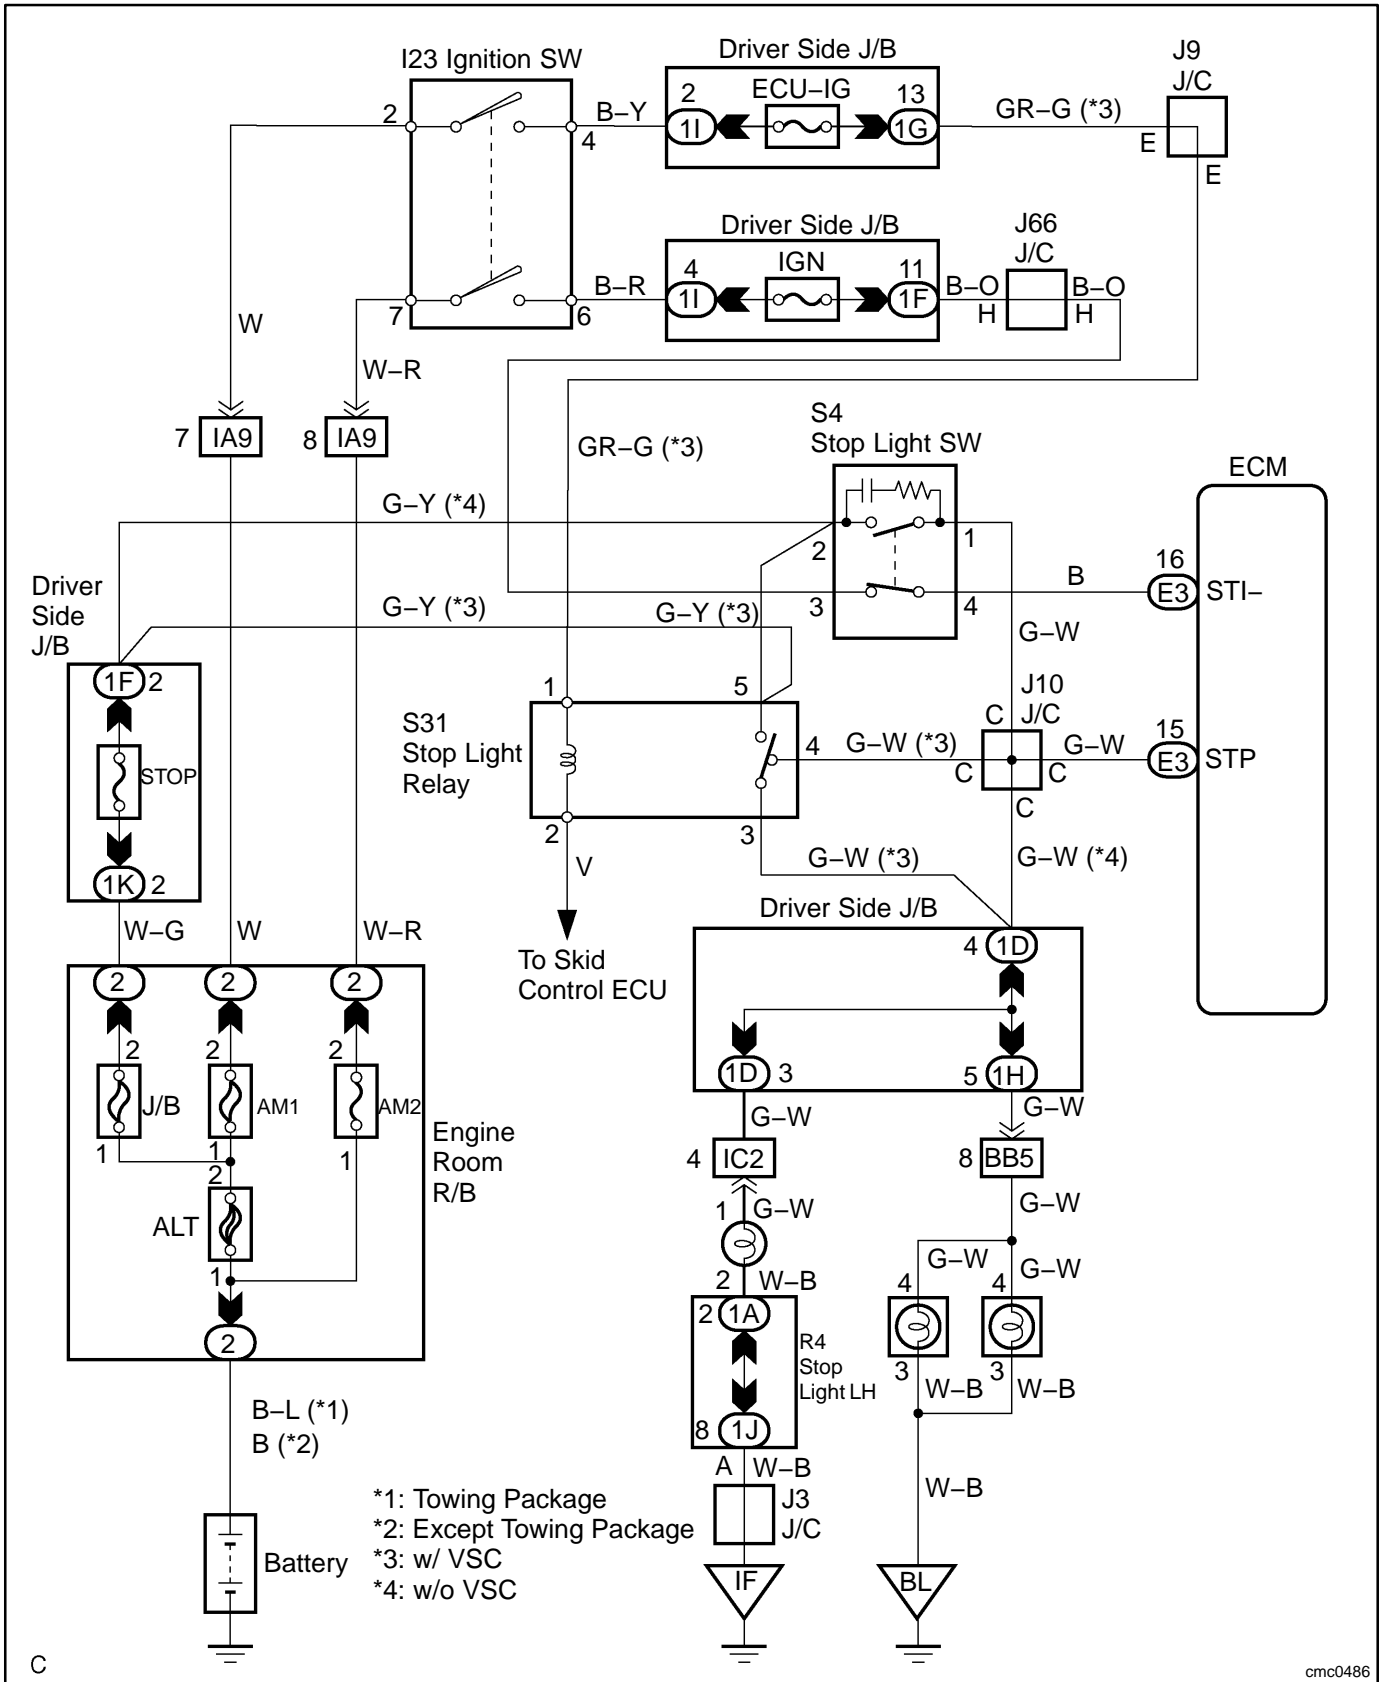

HINT:

Normal condition is as shown in the table.

Signal	Brake pedal released	In transition	Brake pedal depressed
STP	OFF	ON	ON
STI-	ON	ON	OFF

DTC No.	DTC Detection Condition	Trouble Area
P0504	Conditions (a), (b) and (c) continue for 0.5 sec. or more: (a) Ignition switch ON (b) Brake pedal released (c) STP signal is OFF when the STI- signal is OFF	<ul style="list-style-type: none"> • Short in stop lamp switch signal circuit • Stop lamp fuse • Stop lamp switch • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check operation of stop light.
----------	---------------------------------------

CHECK:

Check if the stop lights come on and go off normally when the brake pedal is depressed and released.

NG	Check and repair stop light circuit.
-----------	---

2	Check stop light switch (See page BE-70).
----------	--

NG	Replace stop light switch.
-----------	-----------------------------------

3 Check STP signal and STI- voltage.

PREPARATION:

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch to ON.
- Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / STOP LIGHT SW".

CHECK:

Read the signal displayed on the hand-held tester.

OK:

Standard:

Brake Pedal	Specified Condition
Depressed	STP Signal ON
Released	STP Signal OFF

CHECK:

Measure the voltage between the specified terminals of the E3 and E5 ECM connectors.

OK:

Standard:

Tester Connection	Brake Pedal	Specified Condition
STI- (E3-16) - E1 (E5-1)	Depressed	Below 1.5 V
STI- (E3-16) - E1 (E5-1)	Released	7.5 to 14 V

OK

Check for intermittent problems (See page [DI-11](#)).

NG

4 Check harness and connector between ECM and stop light switch.

Wire Harness Side:

Stop Light Switch Connector

A23478

PREPARATION:

- (a) Disconnect the S4 stop light switch connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Stop light switch (S4-1) - STP (E3-15)	Below 1 Ω
Stop light switch (S4-4) - STI- (E3-16)	Below 1 Ω
Stop light switch (S4-1) or STP (E3-15) - Body ground	10 kΩ or higher
Stop light switch (S4-4) or STI- (E3-16) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace ECM (See page [SF-66](#)).

DTC	P0505	Idle Air Control System
------------	--------------	--------------------------------

CIRCUIT DESCRIPTION

The idle speed is controlled by the ETCS (Electronic Throttle Control System).

The ETCS is composed of the throttle motor which operates the throttle valve, and the throttle position sensor, which detects the opening angle of the throttle valve.

The ECM controls the throttle motor to provide the proper throttle valve opening angle to obtain the target idle speed.

DTC No.	DTC Detection Condition	Trouble Area
P0505	Idle speed continues to vary greatly from target speed (2 trip detection logic)	<ul style="list-style-type: none"> • ETCS • Air induction system • PCV hose connection • ECM

MONITOR DESCRIPTION

The ECM regulates the idle speed by opening and closing the throttle valve using the ETCS. The ECM concludes that the idle speed control ECM function is malfunctioning if: 1) the actual idle RPM varies more than the specified amount, or 2) a learning value of the idle speed control remains at the maximum or minimum five times or more during a driving cycle. The ECM will turn on the MIL and set a DTC.

Example:

If the actual idle RPM varies from the target idle RPM by more than 100 (*1) rpm five times during a driving cycle, the ECM will turn on the MIL and a DTC is set.

HINT:

*1: RPM threshold varies with engine load.

MONITOR STRATEGY

Related DTCs	P0505	Idle air control malfunction
Required sensors/components	Main sensors/components	Crankshaft position sensor
	Related sensors/components	Vehicle speed sensor, Engine coolant temperature sensor
Frequency of operation	Once per driving cycle	
Duration	10 min.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-18	
Engine	Running	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Either of the following conditions is met:	Condition 1 or 2
1. Frequency that both of the following conditions (a) and (b) are met:	5 times or more
(a) Engine RPM - target engine RPM	Less than -100 rpm or more than 150 rpm
(b) Vehicle condition	Stop after vehicle was driven by 6.25 mph (10 km/h) or more
2. Frequency that both of the following conditions (c) and (d) are met:	Once
(c) Engine RPM - target engine RPM	Less than -100 rpm or more than 150 rpm
(d) Intake air control flow rate learning value	1.3 L/sec. or less, or 8.5 L/sec. or more

INSPECTION PROCEDURE

HINT:

- When the throttle position is slightly opened (the accelerator pedal is slightly depressed) because a floor carpet is overlapped on the accelerator pedal, or if the accelerator pedal is not fully released, etc., DTC P0505 will possibly be detected.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Are there any other codes (besides P0505) being output?
----------	--

PREPARATION:

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch to ON and push the hand-held tester main switch ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
P0505	A
"P0505" and other DTCs	B

HINT:

If any other codes besides P0505 are output, perform the troubleshooting for those DTCs first.

2	Check connection of PCV hose.
----------	--------------------------------------

3	Check air induction system (See page SF-1).
----------	--

CHECK:

Check for vacuum leaks in air induction system.

OK:

No leakage.

NG	Repair or replace air induction system.
-----------	--

OK

Check electric throttle control system (See page SF-39).

DTC	P050A	Cold Start Idle Air Control System Performance
------------	--------------	---

DTC	P050B	Cold Start Ignition Timing Performance
------------	--------------	---

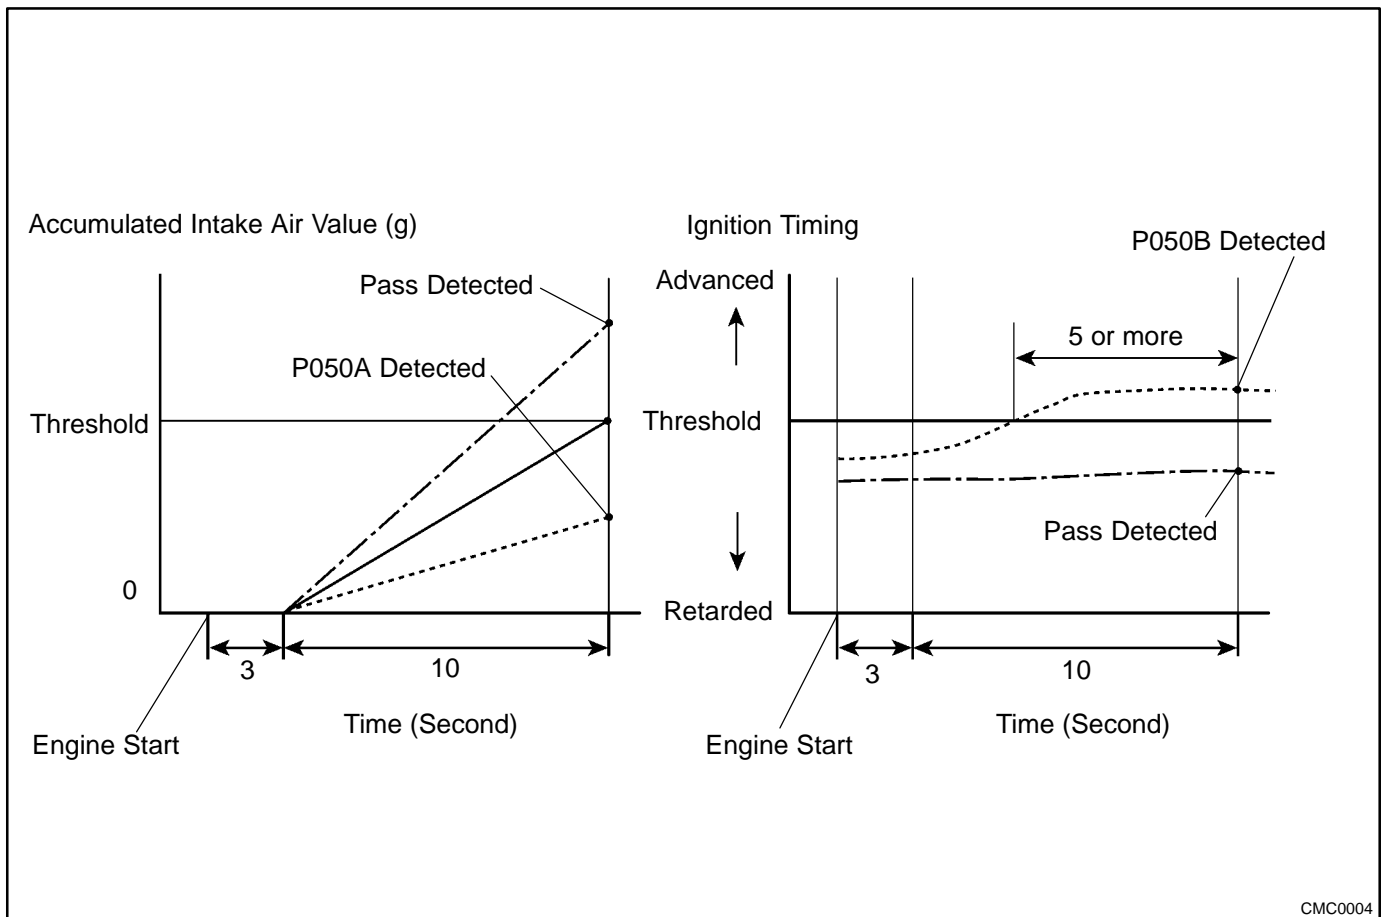

DESCRIPTION

The Electronic Throttle Control System (ETCS) controls the engine idling speed. The ETCS operates the throttle actuator to open and close the throttle valve, and adjusts the intake air amount to achieve the target idling speed.

In addition, the ECM retards the ignition timing and the ETCS increases the intake air amount to quickly increase the catalyst temperature at cold start.

DTC No.	DTC Detection Conditions	Trouble Areas
P050A	Accumulated intake air amount during 10 seconds of idling after cold start, less than threshold (2 trip detection logic)	<ul style="list-style-type: none"> • Throttle body assembly • Mass air flow meter • Air induction system • PCV hose connections • ECM
P050B	Ignition timing retard value insufficient for 5 seconds or more during 10 seconds of P050A monitoring duration at cold start (2 trip detection logic)	<ul style="list-style-type: none"> • Throttle body assembly • Mass air flow meter • Air induction system • PCV hose connections • ECM

MONITOR DESCRIPTION

The ECM monitors the intake air amount during idling and the ignition timing.

When the engine coolant temperature is between -10°C and 50°C (14°F and 122°F), the ECM calculates the idling intake air amount for 10 seconds, beginning 3 seconds after the engine starts.

When the accumulated value is below the threshold, the ECM interprets this as a malfunction in the Idle Speed Control (ISC) system at cold start.

The ECM also monitors the ignition timing at cold start, and judges it to be incorrect when it is advanced to the same value for a warm engine for 5 seconds or more of the 10 second monitoring period.

Example:

P050A is detected when all conditions below are met (2 trip detection logic).

1. The engine coolant temperature is -10°C (14°F) or more when the engine starts.
2. The engine idles for 13 seconds after engine start.
3. The accumulated intake air amount is below the threshold.

If a malfunction is not repaired successfully, the ECM sets the DTC and illuminates the MIL 13 seconds after the engine is next started.

NOTICE:

When the negative battery terminal is disconnected during inspection or repairs, the ISC learning values are cleared. The ISC learning must be performed by warming up the engine and idling for 5 minutes with the engine coolant temperature at 75°C (167°F) or more because DTCs cannot be detected with the ISC learning values cleared.

MONITOR STRATEGY

Related DTCs	P050A	Idle speed control problem at cold
	P050B	Idle ignition timing problem at cold
Required Sensors/Components (Main)	Mass air flow meter	
Required Sensors/Components (Related)	Engine Coolant Temperature (ECT) sensor, Throttle position sensor, Vehicle speed sensor	
Frequency of Operation	Once per driving cycles	
Duration	10 seconds	
MIL Operation	2 driving cycles	
Sequence of Operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-18	
P050A:		
Battery voltage	8 V	-
Time after engine start	3 seconds	-
Starter	OFF	
ECT at engine start	-10°C (14°F)	-
ECT	-10°C (14°F)	50°C (122°F)
Engine idling time	3 seconds	-
Fuel-cut	OFF	
Vehicle speed	-	1.875 mph (3 km/h)
Time after shift position changed	1 second	-
P050B:		
Battery voltage	8 V	-
Time after engine start	3 seconds	-
Starter	OFF	
ECT at engine start	-10°C (14°F)	-
ECT	-10°C (14°F)	50°C (122°F)
Engine idling time	3 seconds	-
Fuel-cut	OFF	
Vehicle speed	-	1.875 mph (3 km/h)

TYPICAL MALFUNCTION THRESHOLDS

P050A:

Accumulated air flow amount (M/T)	Varies with ECT (Example: Less than 42.5 g)
Accumulated air flow amount (A/T)	Varies with ECT (Example: Less than 47.5 g, or less than 42.5 g)

P050B:

Accumulated time when ignition timing retard is cut off	5 seconds or more
---	-------------------

INSPECTION PROCEDURE

HINT:

Read the freeze frame data using the intelligent tester. The freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, the freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Check any other DTCs output (In addition to DTC P050A and/or P050B).
----------	---

- (a) Connect the intelligent tester to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Turn the tester ON.
- (d) Select the following the menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (e) Read the DTCs.

Result:

Display (DTC Output)	Proceed To
P050A and/or P050B	A
P050A and/or P050B and other DTCs	B

HINT:

If any DTCs other than P050A and P050B are output, troubleshoot those DTCs first.

2	Read value using intelligent tester (Fuel trim).
----------	---

HINT:

Calculate the total fuel trim values to check the characteristic deviation of the mass air flow meter.

- (a) Connect the intelligent tester to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Turn the tester ON.
- (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / SHORT FT #1 and LONG FT #1.
- (e) Read the values displayed on the tester.
- (f) Add together the SHORT FT #1 and LONG FT #1 values to obtain the total FUEL TRIM.

OK:

Total of the SHORT FT #1 and LONG FT #1 values is between -20 % and 20 %.

OK**Go to step 8.****NG****3****Check PCV hose connections.****OK:****PCV hose is connected correctly and is not damaged.****NG****Go to step 5.****OK****4****Check air induction system.**

(a) Check the air induction system for vacuum leakage.

OK:**No leakage from the air induction system.****OK****Go to step 6.****NG****Go to step 7.****5****Repair or replace PCV hose.****NEXT****Go to step 11.****6****Replace mass air flow meter.****NEXT****Go to step 11.****7****Repair or replace air induction system.****NEXT****Go to step 11.**

8 Check throttle valve.

(a) Check for deposits around the throttle valve.

OK:

No deposits around the throttle valve.

OK

Go to step 9.

NG

Go to step 10.

9 Replace ECM.

NEXT

Go to step 11.

10 Replace throttle body assembly.

NEXT

11 Check whether DTC output recurs (DTC P050A and/or P050B).

NOTICE:

In this operation, the engine must be cold (the same level as the engine coolant temperature recorded in the freeze frame data).

- (a) Connect the intelligent tester to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Turn the tester ON.
- (d) Clear DTCs (See page DI-42).
- (e) Switch the ECM from normal mode to check mode using the tester (See page DI-43)
- (f) Start the engine to idle for a minute.

OK:

Stable fast idling.

- (g) Read DTCs.

OK:

No DTCs output.

NEXT

END

DTC	P0560	System Voltage
------------	--------------	-----------------------

MONITOR DESCRIPTION

The battery supplies electricity to the ECM even when the ignition switch is OFF. This electricity allows the ECM to store data such as DTC history, freeze frame data, fuel trim values, and other data.

If the battery voltage falls below a minimum level, the ECM will conclude that there is a fault in the power supply circuit. The next time the engine starts, the ECM will turn on the MIL and a DTC will be set.

DTC No.	DTC Detecting Condition	Trouble Area
P0560	Open in back up power source circuit	<ul style="list-style-type: none"> • Open in back-up power source circuit • EFI No. 1 fuse • ECM

HINT:

If DTC P0560 present, the ECM will not store another DTC.

MONITOR STRATEGY

Related DTCs	P0560	System voltage malfunction
Required sensors/components	ECM	
Frequency of operation	Continuous	
Duration	3 sec.	
MIL operation	Immediate (*1)	
Sequence of operation	None	

*1: The DTC is set immediate. The MIL will be illuminated after the engine starts in the next time.

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Battery voltage	Less than 3.5 V

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check battery voltage.
----------	-------------------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Select the item: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / BATTERY VOLTAGE.

CHECK:

Read the battery voltage on the hand-held tester

RESULT:

Battery voltage	Proceed to
0 V	A
Except 0 V	B

B → **Go to step 5.**

A

2 Check EFI No. 1 fuse of engine room J/B.

Engine Room J/B:

A23509

PREPARATION:

Remove the EFI No. 1 fuse from the engine room J/B.

CHECK:

Check the resistance of the EFI No. 1 fuse.

OK:

Standard: Below 1 Ω

NG

Check for short in all harness and components connected to EFI No. 1 fuse and replace the fuse.

OK

3 Check voltage between terminal BATT and E1 of ECM connector.

N

B17411

CHECK:

Measure the voltage between terminals of the E5 and E3 ECM connectors.

OK:

Standard:

Tester Connection	Specified Condition
BATT (E3-3) - E1 (E5-1)	9 to 14 V

OK

Check for intermittent problems (See page [DI-11](#)).

NG

4 Check for open and short in harness and connector between ECM and EFI No. 1 fuse, EFI No. 1 fuse and battery.

PREPARATION:

- (a) Remove the EFI No. 1 fuse from the engine room J/B.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connector.

OK:

Standard:

Tester Connection	Specified Condition
Engine Room J/B (EFI No. 1 fuse terminal 2) - BATT (E3-3)	Below 1 Ω
Engine Room J/B (EFI No. 1 fuse terminal 2) or BATT (E3-3) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

5 Check the battery (See page CH-1).

NG Replace battery.

OK

Check and replace engine room J/B.

DTC	P0604	Internal Control Module Random Access Memory (RAM) Error
DTC	P0606	ECM/PCM Processor
DTC	P0607	Control Module Performance
DTC	P0657	Actuator Supply Voltage Circuit / Open

MONITOR DESCRIPTION

The ECM continuously monitors its internal memory status, internal circuits, and output signals to the throttle actuator. This self-check insures that the ECM is functioning properly. If any malfunction is detected, the ECM will set the appropriate DTC and illuminate the MIL.

The ECM memory status is diagnosed by internal "mirroring" of the main CPU and the sub CPU to detect RAM (Random Access Memory) errors. The two CPUs also perform continuous mutual monitoring.

The ECM sets a DTC if: 1) outputs from the 2 CPUs are different and deviate from the standards, 2) the signals to the throttle actuator deviate from the standards, 3) a malfunction is found in the throttle actuator supply voltage, and 4) any other ECM malfunction is found.

DTC No.	DTC Detecting Condition	Trouble Area
P0604 P0606 P0607 P0657	ECM malfunction	• ECM

MONITOR STRATEGY

Related DTCs	P0604	Random access memory (RAM) error
	P0606	CPU malfunction

Detection Criteria	Threshold
P0604:	
RAM	RAM check fail
P0606:	
Either of the following conditions is met	Condition 1 or 2
1. Difference between TP of main CPU and TP of sub CPU	0.3 V or more
2. Difference between APP of main CPU and APP of sub CPU	0.3 V or more
P0607:	
Either of the following conditions is met	Condition 1 or 2
1. All of the following conditions are met	Condition (a), (b) and (c)
(a) CPU reset	1 time or more
(b) Difference between TP and APP learned	0.4 V or more
(c) Electronic throttle actuator	OFF
2. CPU reset	2 times or more
P0657:	
ECTS power supply when ignition switch OFF to ON	7 V or more

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

Replace ECM (See page [SF-66](#)).

DTC	P0617	Starter Relay Circuit High
------------	--------------	-----------------------------------

MONITOR DESCRIPTION

While the engine is being cranked, the battery positive voltage is applied to terminal STA of the ECM. If the vehicle is being driven and the ECM detects the starter control signal (STA), the ECM concludes that the starter control circuit is malfunctioning. The ECM will turn on the MIL and a DTC is set.

DTC No.	DTC Detection Condition	Trouble Area
P0617	When all conditions (a), (b) and (c) are satisfied for 20 seconds with battery (+B) voltage 10.5 V or more (a) Vehicle speed \geq 12.43 mph (20 km/h) (b) Engine revolution \geq 1,000 rpm (c) STA signal ON	<ul style="list-style-type: none"> • Park/neutral position switch • Starter relay circuit • Ignition switch • ECM

MONITOR STRATEGY

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and check STA signal.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON, and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / STARTER SIG.

CHECK:

Read the STA signal on the hand-held tester while the starter operates.

OK:

Standard:

Ignition Switch Position	ON	START
STARTER SIG	OFF	ON

OK	Go to step 5.
-----------	----------------------

NG

2	Check park/neutral position switch (See page DI-993).
----------	--

NG	Replace park/neutral position switch. Go to step 4 after the replacement.
-----------	--

OK

3	Check ignition switch (See page BE-37).
----------	--

NG	Replace ignition switch. Go the step 5 after the replacement.
-----------	--

OK

4	Connect hand-held tester, and check STA signal.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON, and push the hand-held tester main switch ON.
- (c) On the hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / STARTER SIG.

CHECK:

Read the STA signal on the hand-held tester while the starter operates.

OK:**Standard:**

Ignition Switch Position	ON	START
STARTER SIG	OFF	ON

NG

Repair or replace harness or connector.

OK

5	Check DTC reoccur
----------	--------------------------

PREPARATION:

- (a) Connect the hand-held tester.
- (b) Turn the ignition switch to ON and hand-held tester main switch ON.
- (c) Clear DTC (See page [DI-42](#)).
- (d) Drive the vehicle more than 25 mph (40 km/h) for 20 seconds or more.

CHECK:

Check DTC reoccur.

RESULT:

Display (DTC Output)	Proceed to
P0617	A
No DTC output	B

A

Replace ECM (See page [SF-66](#)).

B

**Check for intermittent problems
(See page [DI-11](#)).**

DTC	P0630	VIN not Programmed or Mismatch ECM/PCM
------------	--------------	---

CIRCUIT DESCRIPTION

DTC P0630 is set when the Vehicle Identification Number (VIN) is not stored in the Engine Control Module (ECM) or the input VIN is not accurate. Input the VIN with the hand-held tester.

DTC No.	DTC Detecting Condition	Trouble Area
P0630	<ul style="list-style-type: none"> • VIN is not stored in ECM. • Input VIN in ECM is not accurate. 	ECM

MONITOR STRATEGY

INSPECTION PROCEDURE

1	Read current DTC.
----------	--------------------------

NOTICE:

If P0630 is present, the VIN must be input to the ECM using the hand-held tester. However, all DTCs are cleared automatically by the tester when inputting the VIN. If DTCs other than P0630 are present, check them first.

NEXT

2	Input VIN with hand-held tester (See page DI-14).
----------	--

NEXT

END

DTC	P2102	Throttle Actuator Control Motor Circuit Low
------------	--------------	--

DTC	P2103	Throttle Actuator Control Motor Circuit High
------------	--------------	---

CIRCUIT DESCRIPTION

The throttle motor is operated by the ECM. It opens and closes the throttle valve.

The opening angle of the throttle valve is detected by the throttle position sensor which is mounted on the throttle body. The throttle position sensor provides feedback to the ECM. This feedback allows the ECM to control the throttle motor and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This Electrical Throttle Control System (ETCS) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds: (1 trip detection logic) (a) Throttle control motor output duty 80 % or more (b) Throttle control motor current less than 0.5 A or less	<ul style="list-style-type: none"> • Open in throttle control motor and sensor circuit • Throttle control motor and sensor • ECM
P2103	Either of the following condition is met. (1 trip detection logic) (a) Hybrid IC diagnosis signal fail (b) Hybrid IC current limiter port fail	<ul style="list-style-type: none"> • Short in throttle control motor and sensor circuit • Throttle control motor and sensor • Throttle valve • Throttle body • ECM

MONITOR DESCRIPTION

The ECM monitors the current through the electronic throttle motor and detects malfunctions or open circuit in the throttle motor based on the voltage of the current. When the current deviates from the standard, the ECM concludes that there is a fault in the throttle motor.

Or, if the throttle valve is not functioning properly (for example, stuck ON), the ECM concludes that there is a fault, turns on the MIL and sets a DTC is set.

Example:

When the current is more than 10 A. Or the current is less than 0.5 A when the motor driving duty ratio is exceeding 80%. The ECM concludes that the current is out of range, turns on the MIL and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check throttle control motor.
----------	--------------------------------------

Component Side:
Throttle Control Motor and Sensor

The diagram shows the component side of the throttle control motor and sensor connector. It has six terminals numbered 1 to 6 from right to left. Terminals 2 and 1 are labeled M+ and M- respectively. The component is identified as T14.

PREPARATION:

Disconnect the throttle control motor and sensor connector.

CHECK:

Measure the resistance between terminals of the throttle control motor.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M- (T14-1)	0.3 to 100 Ω (20°C (68°F))

NG → Replace throttle body (See page [SF-40](#)).

OK

2 Check for open and short in harness and connector between throttle control motor and ECM.

Wire Harness Side:

Throttle Control Motor and Sensor

A21022

PREPARATION:

- Disconnect the T14 throttle control motor and sensor connector.
- Disconnect the E7 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M+ (E7-5)	Below 1 Ω
M- (T14-1) - M- (E7-4)	Below 1 Ω
M+ (T14-2) or M+ (E7-5) - Body ground	10 k Ω or higher
M- (T14-1) or M- (E7-4) - Body ground	10 k Ω or higher

B17412

NG

Repair or replace harness or connector.

OK

3 Visually check throttle valve.

CHECK:

Check the area between the throttle valve and the housing for foreign objects. Also, check if the valve can open and close smoothly.

OK:

The throttle valve is not contaminated by foreign objects and can move smoothly.

NG

Remove foreign object and clean throttle body.

OK

Replace ECM (See page [SF-66](#)).

DTC	P2111	Throttle Actuator Control System -Stuck Open
------------	--------------	---

DTC	P2112	Throttle Actuator Control System -Stuck Closed
------------	--------------	---

CIRCUIT DESCRIPTION

The throttle motor is operated by the ECM. It opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the throttle position sensor, which is mounted on the throttle body. The throttle position sensor provides feedback to the ECM to control the throttle motor and set the throttle valve angle in response to driver input.

HINT:

This Electrical Throttle Control System (ETCS) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2111	Throttle motor locked during ECM order to close. (1 trip detection logic)	<ul style="list-style-type: none"> • Throttle control motor and sensor circuit • Throttle control motor and sensor
P2112	Throttle motor locked during ECM order to open. (1 trip detection logic)	<ul style="list-style-type: none"> • Throttle body • Throttle valve

MONITOR DESCRIPTION

The ECM concludes that there is a malfunction of the ETCS (Electronic Throttle Control System) when the throttle valve remains at a fixed angle despite high drive current from the ECM. The ECM will turn on the MIL and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand–held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check any other DTC output (in addition to DTC P2111 or P2112).
----------	--

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- (a) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P2111 and/or P2112	A
P2111 and/or P2112 and other DTCs	B

HINT:

If any DTCs other than P2111 and/or P2112 are output, troubleshoot those DTCs first.

2	Visually check throttle valve.
----------	---------------------------------------

PREPARATION:

Remove the air cleaner assy.

CHECK:

Check whether or not a foreign body is caught between the throttle valve and housing. Also, check if the valve can open and close smoothly.

OK:

The throttle valve is not contaminated by foreign objects and can move smoothly.

3 Check throttle control motor.

Component Side:

Throttle Control Motor and Sensor

A21034

PREPARATION:

Disconnect the throttle control motor and sensor connector.

CHECK:

Measure the resistance between terminals of the throttle control motor.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M- (T14-1)	0.3 to 100 Ω (20°C (68°F))

NG

Replace throttle body (See page SF-40).

OK

4 Check for open and short in harness and connector between ECM and throttle control motor.

Wire Harness Side:

Throttle Control Motor and Sensor

A21022

PREPARATION:

- (a) Disconnect the T14 throttle control motor and sensor connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M+ (E7-5)	Below 1 Ω
M- (T14-1) - M- (E7-4)	Below 1 Ω
M+ (T14-2) or M+ (E7-5) - Body ground	10 kΩ or higher
M- (T14-1) or M- (E7-4) - Body ground	10 kΩ or higher

NG

Repair or replace harness or connector.

OK

Check for intermittent problems (See page DI-11).

B17412

DTC	P2118	Throttle Actuator Control Motor Current Range/Performance
------------	--------------	--

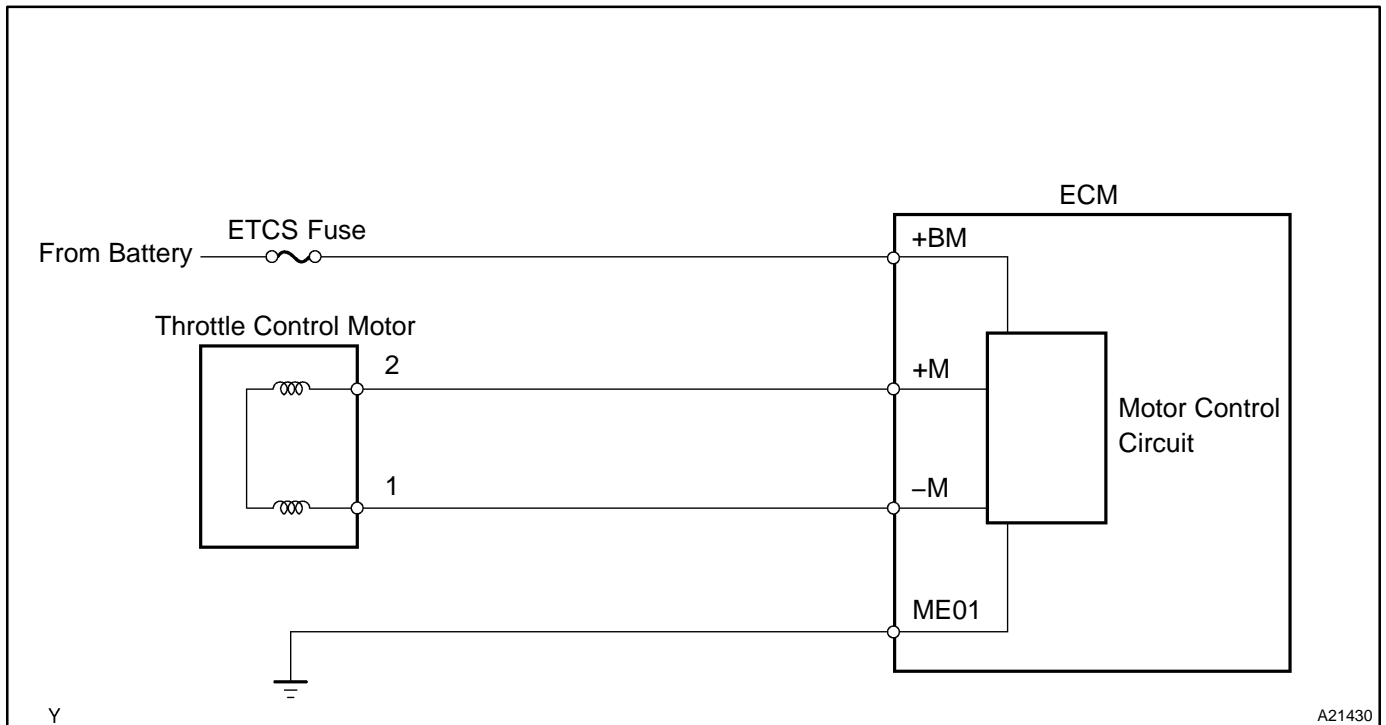

CIRCUIT DESCRIPTION

The Electronic Throttle Control System (ETCS) has a dedicated power supply circuit. The voltage (+BM) is monitored and when the voltage is low (less than 4V), the ECM concludes that the ETCS has a fault and current to the throttle control motor is cut.

When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the motor is cut. If repairs are made and the system has returned to normal, turn the ignition switch OFF. The ECM then allows current to flow to the motor and the motor can be restarted.

HINT:

This Electrical Throttle Control System (ETCS) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2118	Open in ETCS power source circuit (+BM)	<ul style="list-style-type: none"> • Open in ETCS power source circuit • ETCS fuse • ECM

MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the electronic throttle motor +BM. When the power supply voltage drops below the threshold, the ECM concludes that the power supply has an open circuit. The MIL is turned on and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 Check ETCS fuse.

Engine Room J/B:

A23509

PREPARATION:

Remove the ETCS fuse from the engine room J/B.

CHECK:

Check the resistance of the ETCS fuse.

OK:

Below 1 Ω

NG

Check for short in all harness and components connected to ETCS fuse.

OK

2 Check voltage between terminal +BM and E1 of ECM connector.

N

B17411

CHECK:

Measure the voltage between the specified terminals of the E5 and E3 ECM connector.

OK:

Standard:

Tester Connection	Specified Condition
+BM (E3-7) - E1 (E5-1)	9 to 14 V

OK

Check for intermittent problems (See page [IN-30](#)).

NG

3 Check for open or short in harness or connector between battery and ETCS fuse, ETCS fuse and ECM.

PREPARATION:

- (a) Remove the ETCS fuse from the engine room J/B.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connector.

OK:

Standard:

Tester Connection	Specified Condition
Engine Room J/B (ETCS fuse terminal 2) - +BM (E3-7)	Below 1 Ω
Engine Room J/B (ETCS fuse terminal 2) or +BM (E3-7) - Body ground	10 kΩ or higher

PREPARATION:

Disconnect the battery cable from the battery positive terminal.

CHECK:

Measure the resistance between the battery cable and engine room J/B.

OK:

Standard:

Tester Connection	Specified Condition
Engine Room J/B (ETCS fuse terminal 1) - Battery positive cable	Below 1 Ω
Engine Room J/B (ETCS fuse terminal 1) or Battery positive cable - Body ground	10 kΩ or higher

NG **Repair or replace harness or connector.**

OK

Check engine room J/B.

DTC	P2119	Throttle Actuator Control Throttle Body Range/Performance
------------	--------------	--

CIRCUIT DESCRIPTION

The Electric Throttle Control System (ETCS) is composed of a throttle motor that operates the throttle valve, a throttle position sensor that detects the opening angle of the throttle valve, an accelerator pedal position sensor that detects the accelerator pedal position, and the ECM that controls the ETCS system.

The ECM operates the throttle motor to position the throttle valve for proper response to driver inputs. The throttle position sensor, mounted on the throttle body, detects the opening angle of the throttle valve and provides this signal to the ECM so that the ECM can regulate the throttle motor.

DTC No.	DTC Detection Condition	Trouble Area
P2119	Throttle opening angle continues to vary greatly from target throttle opening angle (1 trip detection logic)	<ul style="list-style-type: none"> • Electric throttle control system • Throttle body

MONITOR DESCRIPTION

The ECM determines the "actual" throttle angle based on the throttle position sensor signal. The "actual" throttle position is compared to the "target" throttle position commanded by the ECM. If the difference of these two values exceeds a specified limit, the ECM interprets this as a fault in the ETCS (Electronic Throttle Control System). The ECM turns on the MIL and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

TYPICAL ENABLING CONDITIONS

The monitor will run whenever this DTC is not present	See page DI-18	
System guard*	ON	
*System guard is ON when the following conditions are met:	-	
Throttle actuator	ON	
Throttle actuator duty calculation	Executing	
Throttle position sensor	Fail determined	
Throttle actuator current-cut	Not executing	
Throttle actuator power supply	4 V	-
Throttle actuator	Fail determined	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Either of the following conditions is met:	Condition (a) or (b)
(a) Commanded closed throttle position - current throttle position	0.3 V or more
(b) Commanded open throttle position - current throttle position	0.3 V or more

COMPONENT OPERATING RANGE

Standard Value
Commanded throttle position and current throttle position are nearly the same

WIRING DIAGRAM

Refer to DTC P2102 and P2103 on page [DI-283](#).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 Are there any other codes (besides DTC P2119) being output?

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
P2119	A
"P2119" and other DTC	B

HINT:

If any other codes besides P2119 are output, perform the troubleshooting for those DTCs first.

B Go to DTC chart (See page [DI-57](#)).

A

2 Check throttle control motor.

Component Side:

Throttle Control Motor and Sensor

A21034

PREPARATION:

Disconnect the throttle control motor and sensor connector.

CHECK:

Measure the resistance between terminals of the throttle control motor.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M- (T14-1)	0.3 to 100 Ω (20°C (68°F))

NG Replace throttle body (See page [SF-40](#)).

OK

3	Replace ECM and clear DTC (Check if DTC outputs reoccur).
----------	--

PREPARATION:

- (a) Replace ECM.
- (b) Clear the DTC (See page [DI-42](#)).
- (c) Start and warm up the engine.
- (d) Run the engine at idle for 15 seconds or more.

CHECK:

Read the DTC using the hand-held tester (See page [DI-42](#)).

OK:

No DTC output.

OK

System is normal.

NG

Replace throttle body.

DTC	P2120	Throttle/Pedal Position Sensor/Switch "D" Circuit
DTC	P2122	Throttle/Pedal Position Sensor/Switch "D" Circuit Low Input
DTC	P2123	Throttle/Pedal Position Sensor/Switch "D" Circuit High Input
DTC	P2125	Throttle/Pedal Position Sensor/Switch "E" Circuit
DTC	P2127	Throttle/Pedal Position Sensor/Switch "E" Circuit Low Input
DTC	P2128	Throttle/Pedal Position Sensor/Switch "E" Circuit High Input
DTC	P2138	Throttle/Pedal Position Sensor/Switch "D"/"E" Voltage Correlation

HINT:

This is the repair procedure for the "accelerator pedal position sensor".

CIRCUIT DESCRIPTION

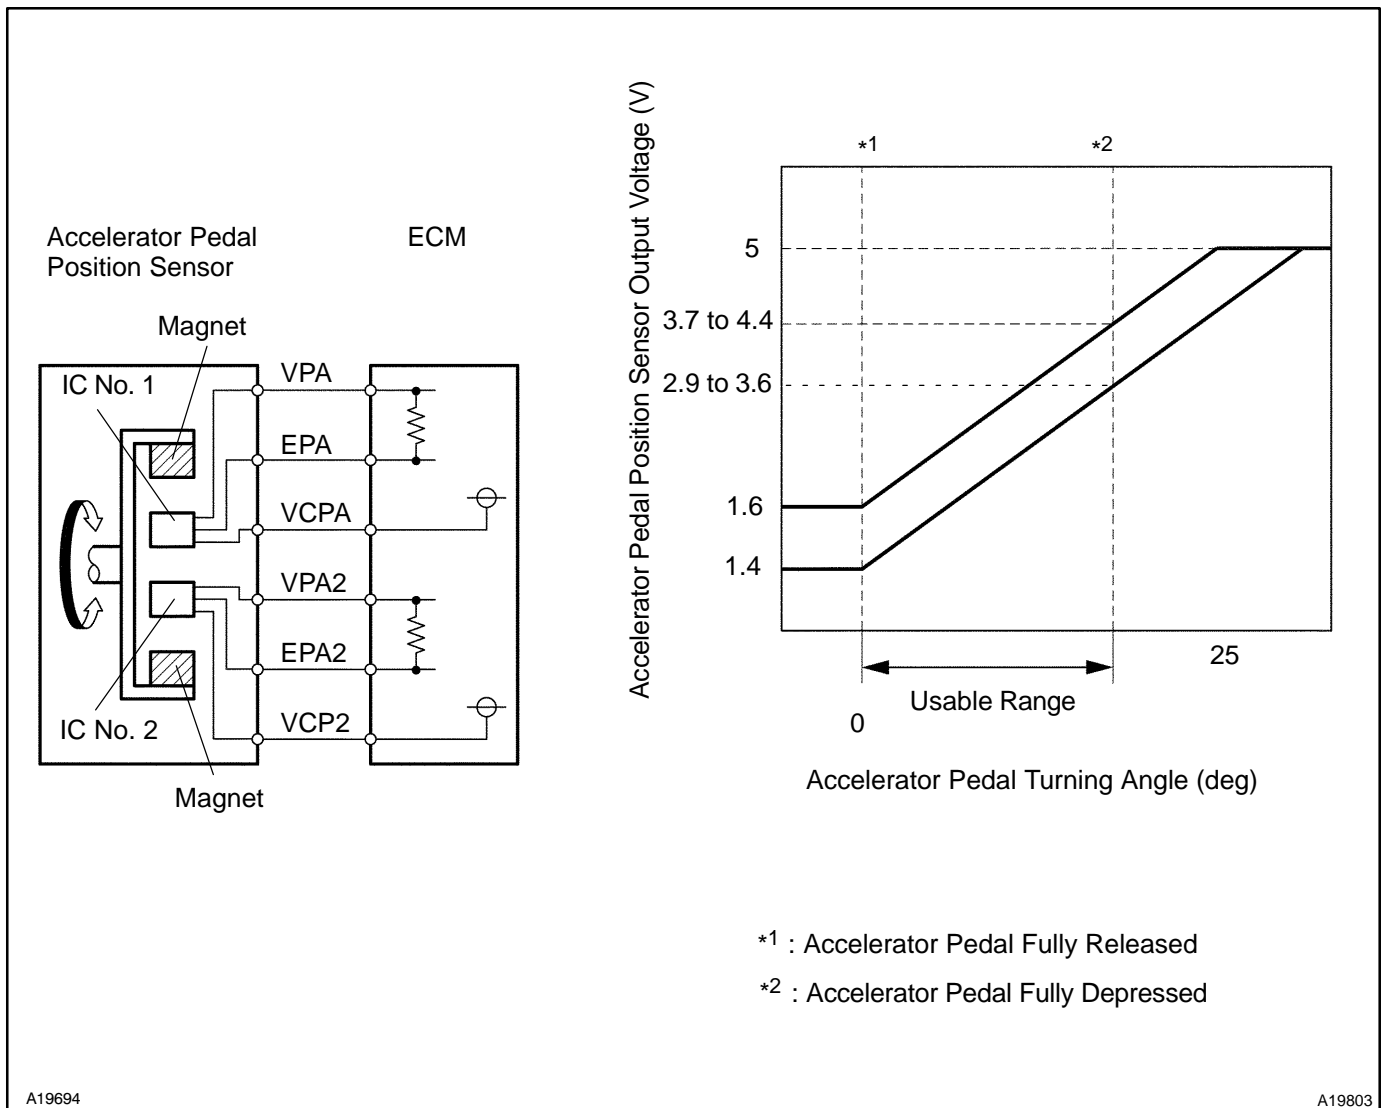

HINT:

- This electrical throttle control system does not use a throttle cable.
- This accelerator pedal position sensor is a non-contact type.

The accelerator pedal position sensor is mounted in the accelerator pedal to detect the angle of the accelerator pedal. This sensor is electronically controlled and uses Hall-effect elements.

In the accelerator pedal position sensor, the voltage applied to terminals VPA and VPA2 of the ECM changes between 0 V and 5 V in proportion to the angle of the accelerator pedal. The VPA is a signal to indicate the actual accelerator pedal angle and is used for the engine control. VPA2 is used to detect malfunctions of the sensor itself.

The ECM judges the current angle of the accelerator pedal from these signals input from terminals VPA and VPA2, and the ECM controls the throttle motor based on these signals.

DIAGNOSTICS – ENGINE (1GR-FE)

DTC No.	DTC Detection Condition (Open or short in accelerator pedal position sensor circuit)	Main trouble Area
P2120	Condition (a) continues for 0.5 seconds or more: (a) $VPA \leq 0.4\text{ V}$ or $VPA \geq 4.8\text{ V}$	<ul style="list-style-type: none"> Accelerator pedal position sensor ECM
P2122	Condition (a) and (b) continues for 0.5 seconds or more: (a) $VPA \leq 0.4\text{ V}$ (b) $VPA2 \geq 0.04\text{ V}$	<ul style="list-style-type: none"> Accelerator pedal position sensor VCPA circuit open VPA circuit open or ground short ECM
P2123	Condition (a) continues for 2.0 seconds or more: (a) $VPA \geq 4.8\text{ V}$	<ul style="list-style-type: none"> Accelerator pedal position sensor EPA circuit open ECM
P2125	Condition (a) continues for 0.5 seconds or more: (a) $VPA2 \leq 1.2\text{ V}$ or $VPA2 \geq 4.8\text{ V}$ and $0.4\text{ V} \leq VPA \leq 3.45\text{ V}$	<ul style="list-style-type: none"> Accelerator pedal position sensor ECM
P2127	Condition (a) and (b) continues for 0.5 seconds or more: (a) $VPA2 \leq 1.2\text{ V}$ (b) $VPA \geq 0.04\text{ V}$	<ul style="list-style-type: none"> Accelerator pedal position sensor VCP2 circuit open VPA2 circuit open or ground short ECM
P2128	Condition (a) and (b) continues for 2.0 seconds or more: (a) $VPA2 \geq 4.8\text{ V}$ (a) $0.4\text{ V} \leq VPA \leq 3.45\text{ V}$	<ul style="list-style-type: none"> Accelerator pedal position sensor EPA circuit open ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more: (a) $ VPA - VPA2 \leq 0.02\text{ V}$ (b) $VPA \leq 0.4\text{ V}$ and $VPA2 \leq 1.2\text{ V}$	<ul style="list-style-type: none"> VPA and VPA2 circuit are short circuited Accelerator pedal position sensor ECM

HINT:

After confirming DTC P2120, P2122, P2123, P2125, P2127, P2128 and P2138 use the OBD II scan tool or the hand-held tester to confirm the accelerator pedal opening percentage.

Trouble area	Accelerator pedal position expressed as voltage			
	Accelerator pedal completely released		Accelerator pedal fully depressed	
	ACCEL POS #1	ACCEL POS #2	ACCEL POS #1	ACCEL POS #2
VC circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
VPA circuit open or ground short	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.3 V
VPA2 circuit open or ground short	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
E2 circuit open	4.5 to 5.5 V	4.5 to 5.5 V	4.5 to 5.5 V	4.5 to 5.5 V

MONITOR DESCRIPTION

When VPA or VPA2 deviates from the standard, or the difference between the voltage outputs of the two sensors is less than threshold, the ECM concludes that there is a defect in the accelerator pedal position sensor. The ECM turns on the MIL and a DTC is set.

Example:

When the voltage output of the VPA is below 0.4 V or exceeds 4.8 V.

FAIL SAFE

The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the remaining circuit is used to calculate the accelerator pedal opening to allow the vehicle to continue driving.

If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal to be fully closed. In this case, the throttle valve will remain closed as if the engine is idling.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

VPA voltage	More than 0.4 V and less than 4.8 V
VPA2 voltage	More than 1.2 V and Less than 4.8 V
Difference between VPA and VPA2 voltages	More than 0.02 V

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 **Connect hand-held tester, and read the voltage for accelerator pedal position sensor data.**

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) Enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / ACCEL POS #1 and ACCEL POS #2.

CHECK:

Read the voltage for the accelerator pedal position sensor data.

OK:

Standard:

Accelerator pedal	ACCEL POS #1	ACCEL POS #2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.3 V

OK **Go to step 5.**

NG

2 Check for open and short in harness and connector in VCPA, VCP2, VPA, VPA2 EPA and EPA2 circuit between ECM and accelerator pedal position sensor.

Wire Harness Side:

Accelerator Pedal Position Sensor (M/T)

**Wire Harness Side:**

Accelerator Pedal Position Sensor (A/T)

**PREPARATION:**

- Disconnect the A20 accelerator pedal position sensor connector.
- Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:**Standard:**

Tester Connection	Specified Condition
VPA (A20-5) - VPA (E3-18) ^{*1}	Below 1 Ω
VPA (A20-6) - VPA (E3-18) ^{*2}	Below 1 Ω

*2: A/T

NG Repair or replace harness and connector.

OK

3 Check voltage between terminals VCPA and EPA, and VCP2 and EPA2 of ECM terminals.

PREPARATION:

- (a) Disconnect the A20 accelerator pedal position sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between the specified terminals of the E3 ECM connector.

OK:

Standard:

Tester Connection	Specified Condition
VCPA (E3-26) - EPA (E3-20)	4.5 to 5.5 V
VCP2 (E3-27) - EPA2 (E3-21)	4.5 to 5.5 V

NG Replace ECM (See page SF-66).

OK

4 Replace accelerator pedal assembly.

NEXT

5	Check whether DTC output recurs (DTC P2120, P2122, P2123, P2125, P2127, P2128 or P2138)
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Disconnect the battery terminals or remove the EFI No. 1 fuse and ETCS fuse (Clear DTCs).
- (c) Start the engine.
- (d) Drive the engine at idle for 15 seconds or more.
- (e) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

CHECK:

Read the DTC output.

RESULT:

Display (DTC Output)	Proceed To
P2120, P2122, P2123, P2125, P2127, P2128 or P2138	A
No output	B

Replace ECM (See page [SF-66](#)).

DTC	P2121	Throttle/Pedal Position Sensor/Switch "D" Circuit Range/Performance
------------	--------------	--

HINT:

This is repair procedure for the "accelerator pedal position sensor".

CIRCUIT DESCRIPTION

Refer to DTC P2120 on page [DI-299](#).

DTC No.	DTC Detecting Condition	Trouble Area
P2121	Conditions (a) and (b) continue for 0.5 seconds: (a) Difference between VPA and VPA2 exceeds the threshold (b) IDL is OFF	<ul style="list-style-type: none"> • Accelerator pedal position sensor circuit • Accelerator pedal position sensor • ECM

MONITOR DESCRIPTION

The accelerator pedal position sensor is mounted on the accelerator pedal bracket. The accelerator pedal position sensor has 2 sensor elements/signal outputs: VPA1 and VPA2. VPA1 is used to detect the actual accelerator pedal angle (used for engine control) and VPA2 is used to detect malfunctions in VPA1. When the difference between the voltage outputs of VPA1 and VPA2 deviates from the standard, the ECM concludes the accelerator pedal position sensor has a malfunction. The ECM turns on the MIL and a DTC is set.

FAIL SAFE

The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the remaining circuit is used to calculate the accelerator pedal opening to allow the vehicle to continue driving.

If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal to be fully closed. In this case, the throttle valve will remain closed as if the engine is idling.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

Related DTCs	P2121	Accelerator position sensor (rationality)
Required sensors/components	Accelerator position sensor	
Frequency of operation	Continuous	
Duration	0.5 sec.	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification

Either of the following conditions is met	Condition 1 or 2	
1. Ignition switch	ON	
2. Throttle control motor power	ON	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Difference between VPA1 voltage (learned value) and VPA2 voltage (learned value)	Less than 0.4 V, or more than 1.2 V

WIRING DIAGRAM

Refer to DTC P2120 on page [DI-299](#).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read the voltage for accelerator pedal position sensor data.
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) Enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / ACCEL POS #1 and ACCEL POS #2.

CHECK:

Read the voltage for the accelerator pedal position sensor data.

OK:

Standard:

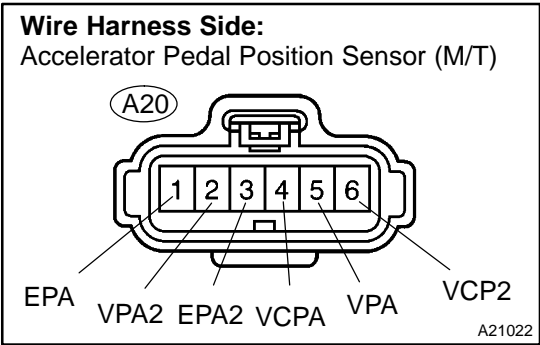

Accelerator pedal	ACCEL POS #1	ACCEL POS #2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.3 V

OK

Replace ECM (See page [SF-66](#)).

NG

2 Check for open and short in harness and connector between accelerator pedal position sensor and ECM.

PREPARATION:

- (a) Disconnect the A20 accelerator pedal position sensor connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VPA (A20-5) - VPA (E3-18) ^{*1}	Below 1 Ω
VPA (A20-6) - VPA (E3-18) ^{*2}	Below 1 Ω

DTC	P2195	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)
------------	--------------	--

DTC	P2196	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)
------------	--------------	--

DTC	P2197	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)
------------	--------------	--

DTC	P2198	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)
------------	--------------	--

HINT:

- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

CIRCUIT DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor, in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are narrower than the conventional type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: Value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted to a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

DTC No.	DTC Detection Conditions	Trouble Areas
P2195 P2197	While fuel-cut operation performing (during vehicle deceleration), air-fuel ratio sensor current is 3.6 mA or more for 3 seconds.	<ul style="list-style-type: none"> • A/F sensor (sensor 1) • ECM
P2196 P2198	While fuel-cut operation performing (during vehicle deceleration), air-fuel ratio sensor current is less than 1.4 mA for 3 seconds.	<ul style="list-style-type: none"> • A/F sensor (sensor 1) • ECM

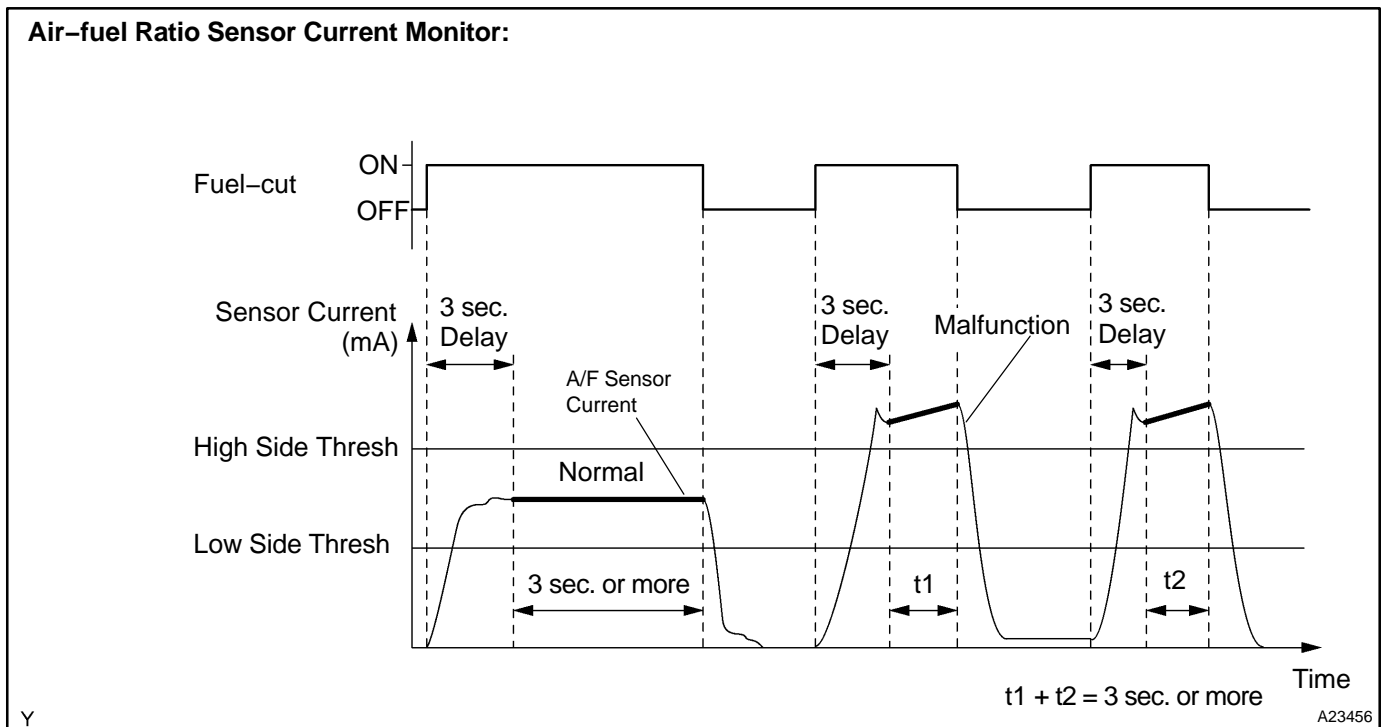

HINT:

- When any of these DTCs are set, check the A/F sensor voltage output by selecting the following menu items on a hand-held tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / AFS B1S1.
- Short-term fuel trim values can also be read using a hand-held tester.

MONITOR DESCRIPTION

A rich air-fuel mixture causes a low air-fuel ratio sensor current, and a lean air fuel mixture causes a high air fuel ratio sensor current. Therefore, the sensor output becomes high during acceleration, and the sensor becomes low during deceleration.

The ECM monitors the air-fuel ratio sensor current during fuel-cut and detects an unusual current value. If the cumulative time the sensor output is out of range exceeds more than 3 seconds, the ECM interprets a malfunction in the air-fuel ratio sensor and sets a DTC.

MONITOR STRATEGY

Related DTCs	P2195	A/F sensor (Bank 1) signal stuck lean
		A/F sensor (Bank 1) current (high side)

Continuous time of fuel-cut	3 to 10 sec.	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
P2195, P2197 (A/F sensor signal stuck lean):	
A/F sensor voltage	More than 3.8 V
P2196, P2198 (A/F sensor signal stuck rich):	
A/F sensor voltage	Less than 2.8 V
P2195, P2197 (A/F sensor current (High side)):	
A/F sensor current	3.6 mA or more
P2196, P2198 (A/F sensor current (Low side)):	
A/F sensor current	Less than 1.57 mA

MONITOR RESULT

Refer to page [DI-26](#) for detailed information.

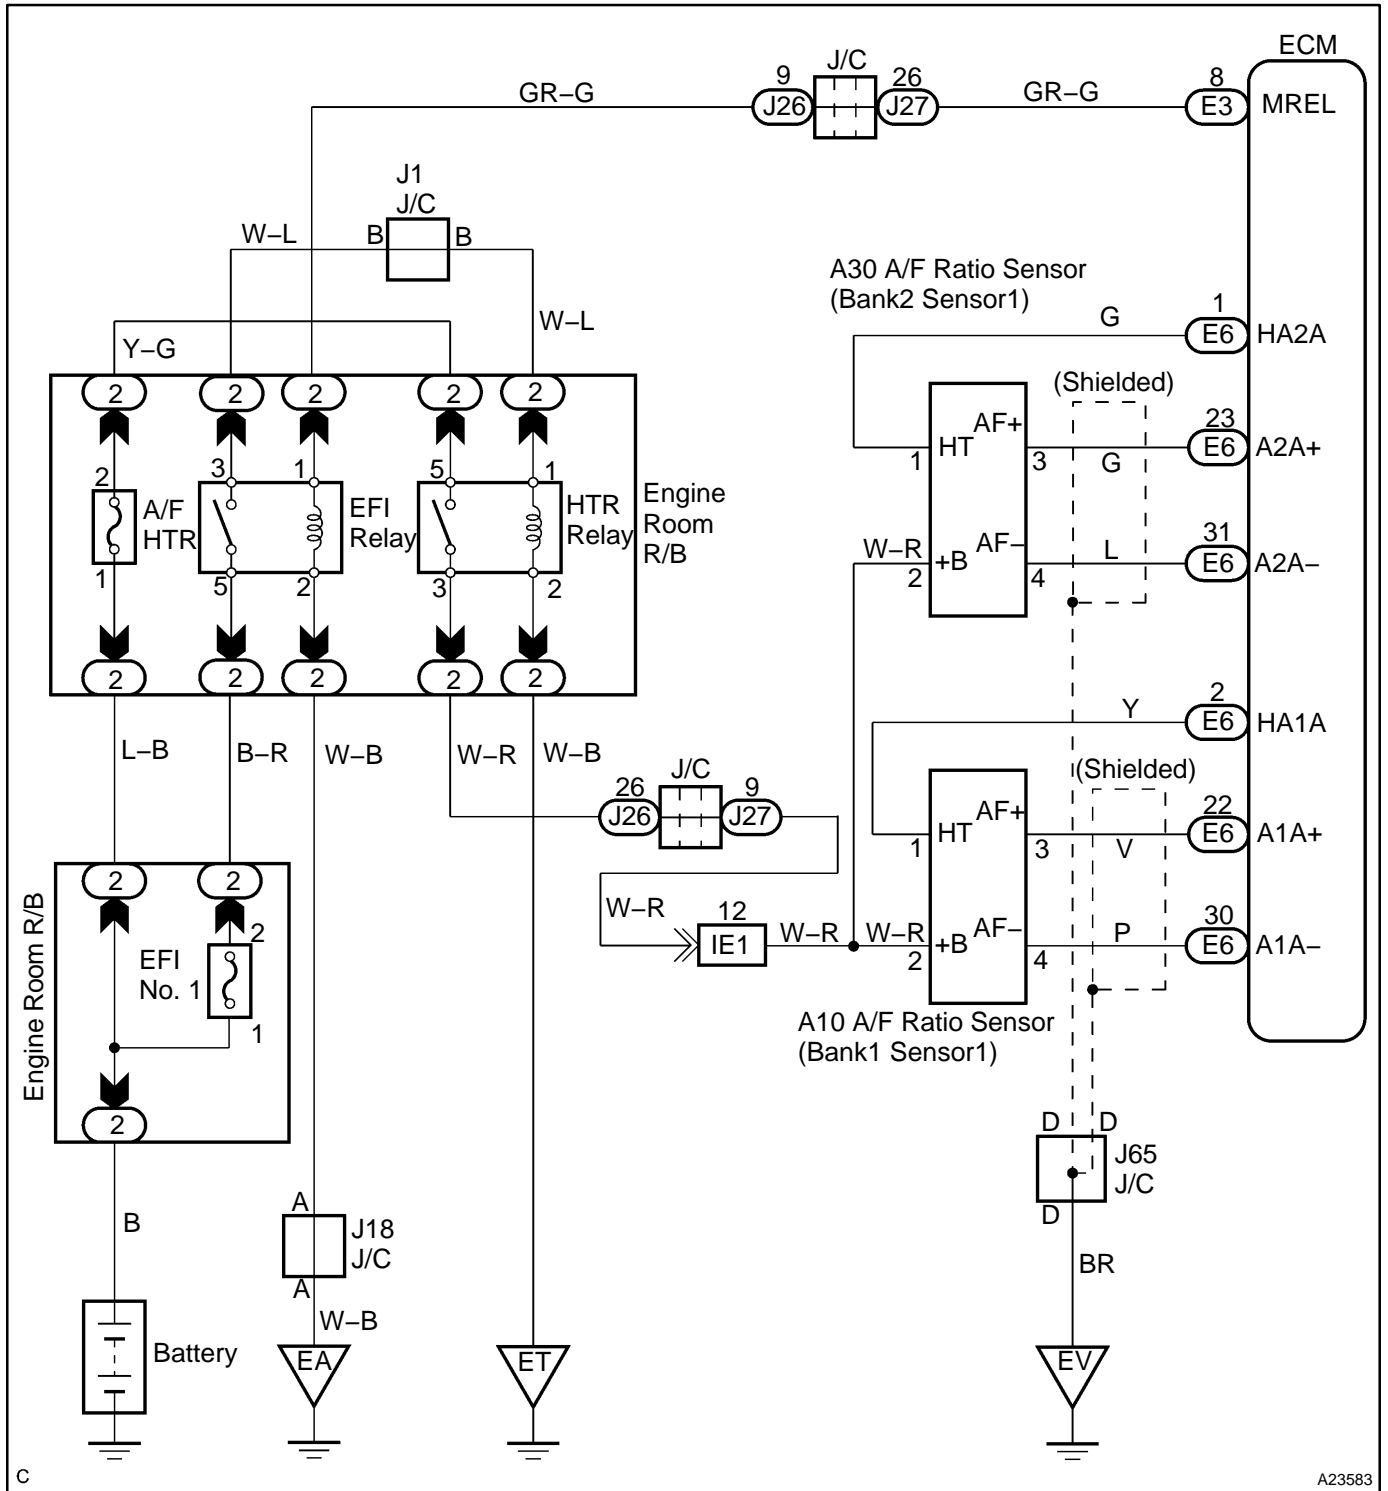

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (see page [DI-27](#)).

- TID (Test Identification Data) is assigned to each emissions-related component.
- TLT (Test Limit Type):
If TLT is 0, the component is malfunctioning when the test value is higher than the test limit.
If TLT is 1, the component is malfunctioning when the test value is lower than the test limit.
- CID (Component Identification Data) is assigned to each test value.
- Unit Conversion is used to calculate the test value indicated on generic OBD II scan tools.

TID \$06: A/F sensor (Active A/F control method)

TLT	CID	Unit Conversion	Description of Test Data	Description of Test Limit
1	\$01	Multiply by 0.0003 (V)	Cumulative A/F sensor locus length (Bank 1)	Lower malfunction criterion for A/F sensor
0	\$01	Multiply by 0.0003 (V)	Cumulative A/F sensor locus length (Bank 1)	Upper malfunction criterion for A/F sensor
1	\$11	Multiply by 0.0003 (V)	Cumulative A/F sensor locus length (Bank 2)	Lower malfunction criterion for A/F sensor
0	\$11	Multiply by 0.0003 (V)	Cumulative A/F sensor locus length (Bank 2)	Upper malfunction criterion for A/F sensor
1	\$02	Multiply by 0.000039 (A)	A/F sensor current (Bank 1)	Lower malfunction criterion for A/F sensor
0	\$02	Multiply by 0.000039 (A)	A/F sensor current (Bank 1)	Upper malfunction criterion for A/F sensor
1	\$12	Multiply by 0.000039 (A)	A/F sensor current (Bank 2)	Lower malfunction criterion for A/F sensor
0	\$12	Multiply by 0.000039 (A)	A/F sensor current (Bank 2)	Upper malfunction criterion for A/F sensor

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

HINT:

This confirmation driving pattern is used in steps 2, 4, 7, 17 and 21 of the following diagnostic troubleshooting procedure when using a hand-held tester.

- (a) Connect the hand-held tester to DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Clear DTC (See page DI-42).
- (d) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
- (e) On the hand-held tester, select the following menu items: DIAGNOSIS/ENHANCED OBD II/DATA LIST/FC IDL.
- (f) Drive the vehicle at 40 mph (64 km/h) or more for at least 10 minutes.
- (g) Change the transmission to 2nd gear.
- (h) Drive the vehicle at proper vehicle speed to perform fuel-cut operation.

HINT:

Fuel-cut is performed under following conditions met:

- Accelerator pedal fully released.
 - Engine speed 2,500 rpm or more (fuel injection returns at 1,000 rpm).
- (i) Accelerate the vehicle to 30 mph (48 km/h) or more by depressing the accelerator pedal for at least 10 seconds.
 - (j) Soon after performing step (8) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
 - (k) Stop the vehicle and allow the engine to idle for 10 seconds or more.
 - (l) Allow the vehicle to decelerate until the vehicle speed declines to less than 6 mph (10 km/h).
 - (m) Repeat steps from (8) through (10) above at least 3 times in one driving cycle.

HINT:

Completing all A/F sensor monitors are required to change the value in TEST RESULT.

CAUTION:

Strictly observe of posted speed limits, traffic laws, and road conditions when performing these drive pattern.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO₂) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- (1) Connect a hand-held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO₂ sensors (AFS B1S1 (AFS B2S1) and OS2 B1S2 (O2S B2S2)) displayed on the tester.

HINT:

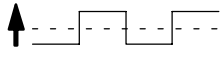

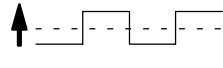

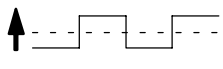

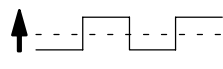

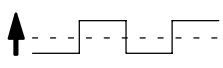

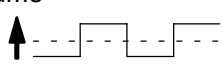

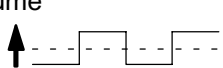

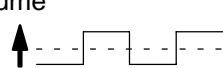

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO ₂)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO ₂)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0 V	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	—
2	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0V	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- Read freeze frame data using a hand-held tester or OBD II scan tool. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1	Check any other DTCs output (in addition to DTC P2195, P2196, P2197 or P2198).
----------	---

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- (a) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
P2195, P2196, P2197 or P2198 and other DTCs	B

HINT:

If any DTCs other than P2195, P2196, P2197 or P2198 are output, troubleshoot those DTCs first.

B	Go to DTC chart (See page DI-57).
----------	--

A

2	Check A/F sensor output current.
----------	---

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Clear DTC (See page [DI-42](#)).
- (d) On the hand-held tester, select the following menu items: DIAGNOSIS/ENHANCED OBD II/MONITOR INFO/MONITOR STATUS.
- (e) Check that the status of O2S MON is COMPL.
- (f) On the hand-held tester, select the following menu items: DIAGNOSIS/ENHANCED OBD II/MONITOR INFO/TEST RESULT/RANGE B1S1 and B2S1.
- (g) Check the test value of the air-fuel ratio sensor output current during fuel-cut.

RESULT:

Test Value	Proceed to
Out of normal range (1.4 mA or more, and less than 3.6 mA)	A
Within normal range (Less than 1.4 mA, or 3.6 mA or more)	B

B	Go to step 20.
----------	-----------------------

A

3	Read value output voltage of A/F sensor.
----------	---

PREPARATION:

- (a) Connect the OBD II scan tool to the DLC3.
- (b) Start the engine and turn the scan tool ON.
- (c) Warm up the Air-Fuel Ratio (A/F) sensor at an engine speed of 2,500 rpm for 90 seconds.

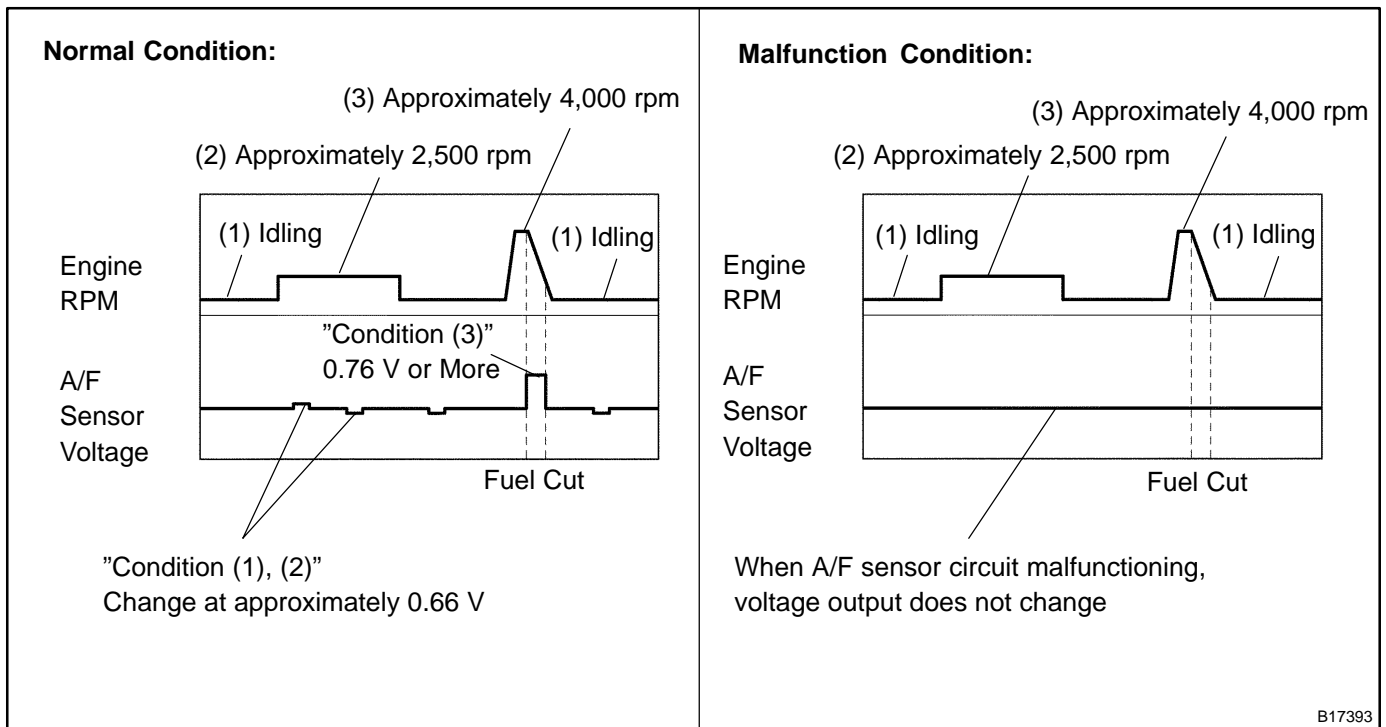

CHECK:

- (a) Using the scan tool, check the A/F sensor voltage 3 times, once when the engine is in each of the following conditions:
 - (1) While idling (check for at least 30 seconds)
 - (2) At an engine speed of approximately 2,500 rpm (without any sudden changes in engine speed)
 - (3) Raise the engine speed to 4,000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.

Standard:

Conditions	A/F Sensor Voltage Variations	Reference
(1) and (2)	Changes at approx 0.66 V	Between 0.62 V and 0.7 V
(3)	Increases to 0.76 V or more	This occurs during engine deceleration (when fuel-cut performed)

For more information, see the diagrams below.

B17393

HINT:

- If the output voltage of the A/F sensor remains at approximately 0.66 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)
- If the output voltage of the A/F sensor remains at either approximately 0.76 V or more, or 0.56 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.
- The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.

- The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 10 mph (16 km/h) to allow the ECM to learn the closed throttle valve position.
- When the vehicle is driven:
The output voltage of the A/F sensor may be below 0.56 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.

NG Go to step 9.

OK

4 Perform confirmation driving pattern.

NEXT

5 Check whether DTC output recurs (DTC P2195, P2196, P2197 or P2198)

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
No output	B

B Go to step 5.

A

6 Replace air fuel ratio sensor.

NEXT

7 Perform confirmation driving pattern.

NEXT

8 Check whether DTC output recurs (DTC P2195, P2196, P2197 or P2198)

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
 (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
No output	B

B

Go to step 5.

A

9 Confirm whether vehicle has run out of fuel in past.

NO

Check for intermittent problems
(See page [DI-11](#)).

YES

DTC caused by running out of fuel.

10 Check resistance of air-fuel ratio (A/F) sensor heater.

PREPARATION:

Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Tester Connection	Specified Condition
HT (1) - +B (2)	Between 1.8 Ω and 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

NG Replace air-fuel ratio (A/F) sensor.

OK

11 Check A/F relay.

PREPARATION:

Remove the A/F relay from the engine room J/B.

CHECK:

Inspect the A/F relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 KΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace EFI relay.

OK

12 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

Standard:

Tester Connections	Specified Conditions
+B (2) - Body ground	Between 9 V and 14 V

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E6 ECM connector.

CHECK:

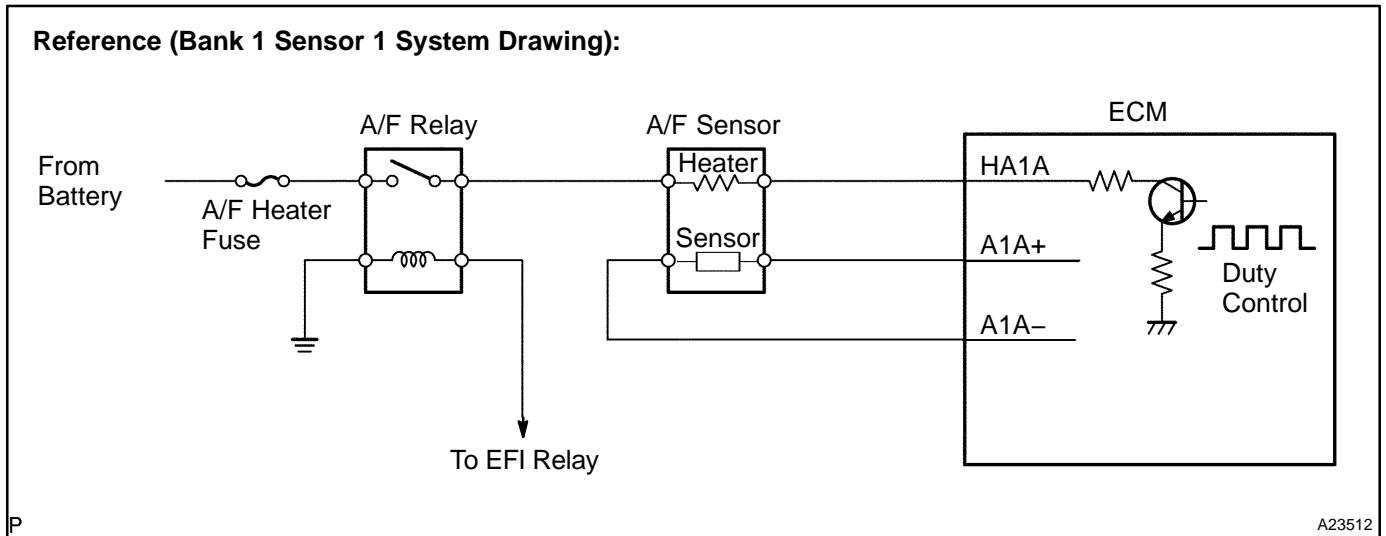

- (a) Check the resistance.

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω
AF+ (A10-3) - A1A+ (E6-22) AF+ (A30-3) - A2A+ (E6-23)	Below 1 Ω
AF- (A10-4) - A1A- (E6-30) AF- (A30-4) - A2A- (E6-31)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher
AF+ (A10-3) or A1A+ (E6-22) - Body ground AF+ (A30-3) or A2A+ (E6-23) - Body ground	10 kΩ or higher
AF- (A10-4) or A1A- (E6-30) - Body ground AF- (A30-4) or A2A- (E6-31) - Body ground	10 kΩ or higher

NG

Replace or replace harness or connector.

OK

13 Check air induction system (See page SF-1).

CHECK:

Check the air induction system for vacuum leaks.

NG

Repair or replace air induction system.

OK

14 Check fuel pressure (See page SF-5).

CHECK:

Check the fuel pressure (high or low pressure).

NG

Check and replace fuel pump, pressure regulator, fuel pipe line and filter (See page SF-1).

OK

15 Check injector injection (See page SF-26).

NG

Replace injector.

OK

16 Replace air fuel ratio sensor.

NEXT

17 Perform confirmation driving pattern.

NEXT

18 Check whether DTC output recurs (DTC P2195, P2196, P2197 or P2198)

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
 (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
No output	B

B

Replace ECM (See page [SF-66](#)) and perform confirmation driving pattern.

A

19 Confirm whether vehicle has run out of fuel in past.

NO

Check for intermittent problems (See page [DI-11](#)).

YES

DTC caused by running out of fuel.

20	Replace air fuel ratio sensor.
-----------	---------------------------------------

NEXT

21	Perform confirmation driving pattern.
-----------	--

NEXT

22	Check whether DTC output recurs (DTC P2195, P2196, P2197 or P2198)
-----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
No output	B

A → **Replace ECM (See page SF-66).**

B

END

DTC	P2238	Oxygen Sensor Pumping Current Circuit Low (For A/F Sensor)(Bank 1 Sensor1)
DTC	P2239	Oxygen Sensor Pumping Current Circuit High (For A/F Sensor)(Bank 1 Sensor1)
DTC	P2241	Oxygen Sensor Pumping Current Circuit Low (For A/F Sensor)(Bank 2 Sensor1)
DTC	P2242	Oxygen Sensor Pumping Current Circuit High (For A/F Sensor)(Bank 2 Sensor1)
DTC	P2252	Oxygen Sensor Reference Ground Circuit Low (For A/F Sensor)(Bank 1 Sensor1)
DTC	P2253	Oxygen Sensor Reference Ground Circuit High (For A/F Sensor)(Bank 1 Sensor1)
DTC	P2255	Oxygen Sensor Reference Ground Circuit Low (For A/F Sensor)(Bank 2 Sensor1)
DTC	P2256	Oxygen Sensor Reference Ground Circuit High (For A/F Sensor)(Bank 2 Sensor1)

HINT:

- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

CIRCUIT DESCRIPTION

Refer to DTC P2195 on page [DI-312](#).

DTC No.	DTC Detection Conditions	Trouble Areas
P2238 P2241	<ul style="list-style-type: none"> • Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) AF+ voltage 0.5 V or less (b) (AF+) - (AF-) = 0.1 V or less • Case 2: A/F sensor admittance: Less than 0.022 1/Ω (1 trip detection logic) 	<ul style="list-style-type: none"> • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater • EFI relay • A/F sensor heater and relay circuits • ECM

MONITOR DESCRIPTION

The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or voltage output deviates greatly from the standard range, the ECM determines that there is an open or short malfunction in the A/F sensor circuit.

MONITOR STRATEGY

INSPECTION PROCEDURE

HINT:

Hand-held tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- (1) Connect a hand-held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 (AFS B2S1) and OS2 B1S2 (O2S B2S2)) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

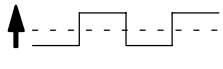

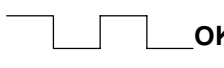

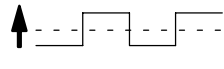

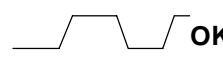

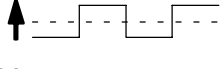

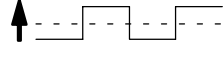

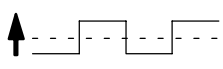

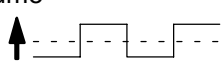

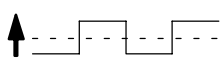

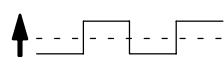

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0 V	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	—
2	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0V	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

HINT:

Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 Check resistance of air-fuel ratio (A/F) sensor heater.

PREPARATION:

Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Tester Connection	Specified Condition
HT (1) - +B (2)	1.8 Ω to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 k Ω or higher

NG Replace air-fuel ratio (A/F) sensor.

OK

2 Check A/F relay.

PREPARATION:

Remove the A/F relay from the engine room J/B.

CHECK:

Inspect the A/F relay.

OK:

Terminal No.	Condition	Specified Condition
3 - 5	Usually	10 k Ω or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace EFI relay.

OK

3 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

OK:

Standard:

Tester Connections	Specified Conditions
+B (2) - Body ground	9 V to 14 V

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E6 ECM connector.

CHECK:

- (a) Check the resistance.

OK:

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω
AF+ (A10-3) - A1A+ (E6-22) AF+ (A30-3) - A2A+ (E6-23)	Below 1 Ω
AF- (A10-4) - A1A- (E6-30) AF- (A30-4) - A2A- (E6-31)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher
AF+ (A10-3) or A1A+ (E6-22) - Body ground AF+ (A30-3) or A2A+ (E6-23) - Body ground	10 kΩ or higher
AF- (A10-4) or A1A- (E6-30) - Body ground AF- (A30-4) or A2A- (E6-31) - Body ground	10 kΩ or higher

NG

Replace or replace harness or connector.

OK

Replace ECM (See page [SF-66](#)).

DTC	P2401	Evaporative Emission System Leak Detection Pump Control Circuit Low
------------	--------------	--

DTC	P2402	Evaporative Emission System Leak Detection Pump Control Circuit High
------------	--------------	---

CIRCUIT DESCRIPTION

Refer to EVAP Inspection Procedure (see page [DI-368](#)).

DTCs	Monitoring Item	DTC Detection Condition	Trouble Areas	Detection Timing	Detection Logic
P2401	Vacuum pump stuck OFF	One of following conditions are met: <ul style="list-style-type: none"> • 0.02 inch orifice low-flow • 0.02 inch orifice high-low • Vacuum pump ON stuck • Vacuum pump OFF stuck • Vent valve ON (Closed) stuck 	<ul style="list-style-type: none"> • Pump module • Connector / Wire harness (Pump module - ECM) • ECM 	While ignition switch OFF	2 trips
P2402	Vacuum pump stuck ON	NOTE: P043E, P043F, P2401, P2402 and P2419 have same DTC detection conditions.			

WIRING DIAGRAM

Refer to EVAP Inspection Procedure (see page [DI-368](#)).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
–	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	–
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure is not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	Leak check is performed after second 0.02 inch leak pressure standard is measured. If stabilized system pressure higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	–

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

In sequence B and E, to determine the leak criterion, the vacuum pump creates negative pressure in the canister pump module through the 0.02 inch orifice. If the pressure is out of specified range or is not saturated, the ECM illuminates the MIL and sets DTCs P043E, P043F, P2401, P2402 and P2419 (2-trip detection logic).

MONITOR STRATEGY

Related DTCs	P2401	Vacuum pump stuck OFF

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

(a) P2419: Vent valve stuck ON (Closed)

In sequence B and E, to determine the leak criterion, the vacuum pump creates negative pressure in the canister pump module through the 0.02 inch orifice. If the pressure is out of specified range or is not saturated, the ECM illuminates the MIL and sets DTCs P043E, P043F, P2401, P2402 and P2419 (2-trip detection logic).

(b) P2420: Vent valve stuck OFF (vent)

In sequence C, the vent valve turns ON (closes) and the EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the pressure sensor, to conduct an EVAP leak check. If the pressure does not increase when the vent valve turned ON (closed), the ECM interprets this as the vent valve being stuck OFF (vent). The ECM illuminates the MIL and sets the DTC.

MONITOR STRATEGY

Related DTCs	P2419	Vent valve stuck open
	P2420	Vent valve stuck closed
Required sensors/components	Vent valve	
Frequency of operation	Once per driving cycle	
Duration	Within 2 minutes	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-18	
Atmospheric pressure	70 to 110 kPa (525 to 825 mmHg)	
Battery voltage	10.5 V	-
Vehicle speed	-	2.5 mph (4 km/h)
Ignition switch	OFF	
EVAP pressure sensor malfunction (P450, P0452, P0453)	Not detected	
EVAP canister purge valve	Not operated by scan tool	
EVAP canister vent valve	Not operated by scan tool	
EVAP leak detection pump	Not operated by scan tool	

DIAGNOSTICS – ENGINE (1GR-FE)

Both of the following conditions are met before IG switch OFF	Condition 1 and 2	
1. Duration that vehicle is driven	5 min.	-
2. EVAP purge operation	Performed	
ECT	4.4 to 35°C (40 to 95°F)	
IAT	4.4 to 35°C (40 to 95°F)	
Time after key off	5 or 7 or 9.5 hours	
EVAP key-off monitor sequence	1 to 8	
1. Atmospheric pressure	-	
Next sequence is run if the following condition is set	-	
Atmospheric pressure change	-	0.3 kPa (2.25 mmHg) for 1 sec.
2. First reference pressure measurement	-	
Next sequence is run if all of the following conditions are set	Condition 1, 2 and 3	
1. EVAP pressure just after reference pressure measurement start	-	-1 kPa (-7.5 mmHg)
2. Reference pressure	-4.85 to -1.057 kPa (-36.38 to -7.93 mmHg)	
3. Reference pressure	Saturated	
3. EVAP canister vent valve close stuck check	-	
Next sequence is run if the following condition is set	-	
EVAP pressure change after vent valve is ON	0.3 kPa (2.25 mmHg)	-
4. Vacuum introduction	-	
Next sequence is run if the following condition is set	Condition 1 and 2	
EVAP pressure	Saturated within 12 minutes	
5. EVAP canister purge valve close stuck check	-	
Next sequence is run if the following condition is set	-	
EVAP pressure change after purge valve is open	0.3 kPa (2.25 mmHg)	-
6. Second reference pressure measurement	-	
Next sequence is run if all of the following conditions are set	Condition 1, 2, 3 and 4	
1. EVAP pressure just after reference pressure measurement	-	-1 kPa (-7.5 mmHg)
2. Reference pressure	-4.85 to -1.057 kPa (-36.4 to -7.92 mmHg)	
3. Reference pressure	Saturated	
4. Difference between first reference pressure and second reference pressure	-	0.7 kPa (5.25 mmHg)

7. Leak check	–	
Next sequence is run if the following condition is set	–	
EVAP pressure when vacuum introduction is complete	–	Second reference pressure
8. Atmospheric pressure	–	
EVAP monitor is complete is the following condition is set	–	
Atmospheric pressure difference between sequence 1 and 8	–	0.3 kPa (2.25 mmHg)

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Vent valve stuck open:	
One of the following conditions is set	Condition 1, 2, 3, 4 or 5
1. EVAP pressure just after reference pressure measurement start	–1 kPa (–7.5 mmHg) or more
2. Reference pressure	–4.85 kPa (–36.38 mmHg) or less
3. Reference pressure	–1.057 kPa (–7.93 mmHg) or more
4. Reference pressure	Not saturated
5. Difference between first reference pressure and second reference pressure	More than 0.7 kPa (5.25 mmHg)
Vent valve stuck closed:	
EVAP pressure change after EVAP canister vent valve is ON	Less than 0.3 kPa (2.25 mmHg)

MONITOR RESULT (MODE 06 DATA)

Refer to page [DI-26](#) for detailed information.

INSPECTION PROCEDURE

Refer to the EVAP Inspection Procedure (see page [DI-368](#)).

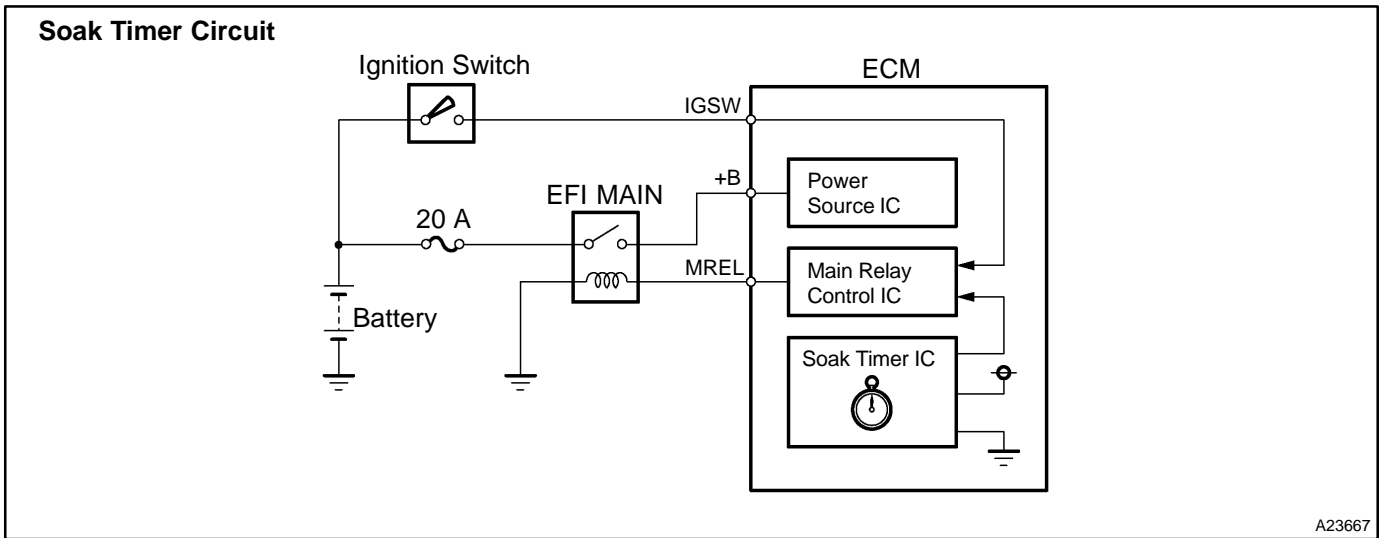

DTC	P2610	ECM/PCM Internal Engine OFF Timer Performance
------------	--------------	--

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2610	Soak timer (built into ECM)	ECM internal malfunction	ECM	Engine running	2 trip

CIRCUIT DESCRIPTION

To ensure the accuracy of the EVAP (Evaporative Emission) monitor values, the soak timer, which is built into the ECM, measures 5 hours (± 15 minutes) from when the ignition switch is turned OFF, before the monitor is run. This allows the fuel to cool down, which stabilizes the Fuel Tank Pressure (FTP). When 5 hours have elapsed, the ECM turns on.

MONITOR DESCRIPTION

5 hours after the ignition switch is turned OFF, the soak timer activates the ECM to begin the EVAP system monitor. While the engine is running, the ECM monitors the synchronization of the soak timer and the CPU clock. If these two are not synchronized, the ECM interprets this as a malfunction, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Related DTCs	P2610	Soak timer (built into ECM)
Required sensors/components	ECM	
Frequency of operation	Once per driving cycle	
Duration	10 min.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-18	
Battery voltage	8 V	-
Ignition switch	ON	
Starter	OFF	
Engine	Running	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Soak time measurement when ECM CPU clock counts 10 min.	Less than 7 min., or more than 13 min.

INSPECTION PROCEDURE

HINT:

- DTC P2610 is set if an internal ECM problem is detected. Diagnostic procedures are not required. ECM replacement is required.
- Read freeze frame data using a hand-held tester or OBD II scan tool. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Replace ECM (See page SF-66).
----------	--

NEXT

Check whether DTC output recurs.

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Clear DTCs (see page [DI-42](#)).
- (d) Start the engine and wait for 10 minutes or more.
- (e) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (f) If no pending DTC is displayed, the repair has been successfully completed.

DTC	P043E	Evaporate Emission System Reference Orifice Clog Up
------------	--------------	--

DTC	P043F	Evaporate Emission System Reference Orifice High Flow
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to the EVAP Inspection Procedure (see page [DI-368](#)).

DTC	Monitoring Item	Detection Conditions	Trouble Areas	Detection Timing	Detection Logic
P043E	0.02 inch orifice clogged	One of following conditions are met: <ul style="list-style-type: none"> • 0.02 inch orifice low-flow • 0.02 inch orifice high-flow • Vacuum pump ON stuck • Vacuum pump OFF stuck • Vent valve ON (Closed) stuck 	<ul style="list-style-type: none"> • Pump module • Connector / Wire harness (Pump module - ECM) • ECM 	While ignition switch OFF	2 trips
P043F	0.02 inch orifice high-flow	NOTE: P043E, P043F, P2401, P2402 and P2419 have same DTC detection conditions.			

WIRING DIAGRAM

Refer to the EVAP Inspection Procedure (see page [DI-368](#)).

MONITOR DESCRIPTION

5 hours after the ignition switch is turned to OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) after 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure does not reach between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	0.02 inch leak pressure measurement	Leak check is performed after 0.02 inch reference pressure is measured. If stabilized system pressure higher than 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

In sequence B and E, to determine the leak criterion, the vacuum pump creates negative pressure in the canister pump module through the 0.02 inch orifice. If the pressure is out of specified range or is not saturated, the ECM illuminates the MIL and sets DTCs P043E, P043F, P2401, P2402 and P2419 (2-trip detection logic).

MONITOR STRATEGY

3. Reference pressure	-1.057 kPa (-7.9 mmHg) or more
4. Reference pressure	Not saturated
5. Difference between first reference pressure and second reference pressure	0.7 kPa (5.3 mmHg) or more

MONITOR RESULT (MODE 06 DATA)

Refer to page [DI-26](#) for detailed information on Monitor Result.

INSPECTION PROCEDURE

Refer to the EVAP Inspection Procedure (see page [DI-368](#)).

DTC	P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)
------------	--------------	---

DTC	P2A03	A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)
------------	--------------	---

CIRCUIT DESCRIPTION

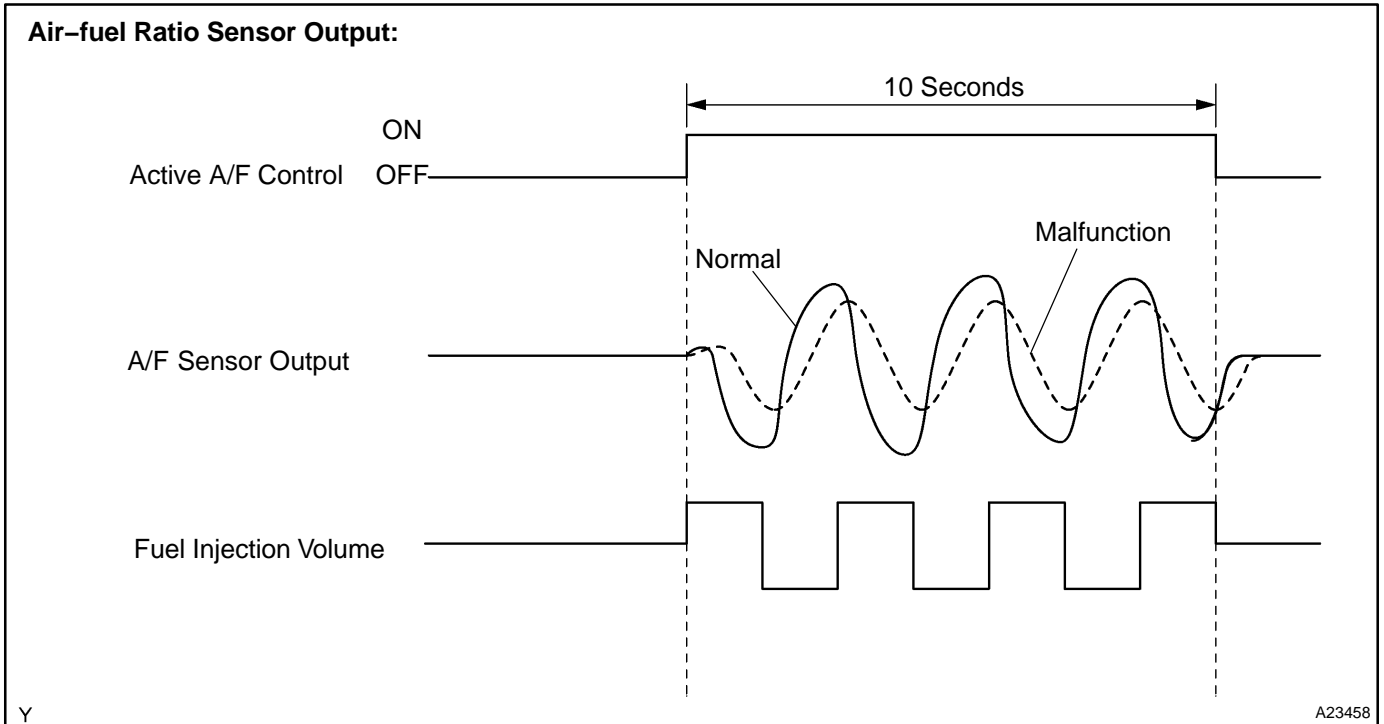

Refer to DTC P2195 on page [DI-312](#).

DTC No.	DTC Detection Conditions	Trouble Areas
P2A00 P2A03	Calculated test value for A/F sensor response rate deterioration level is less than threshold.	<ul style="list-style-type: none"> • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • ECM

MONITOR DESCRIPTION

After engine is warmed up, the ECM performs air-fuel ratio feedback control to regulate the air-fuel ratio at stoichiometric ratio. In addition, this vehicle performs Active A/F Ratio Control for approximately 10 seconds after preconditions met in order to measure the A/F sensor response rate. During active air-fuel ratio control, the ECM forcibly increases and decreases the injection volume for certain amount based on learned stoichiometric air -fuel ratio during usual air-fuel feedback control, and measures the A/F sensor response rate. The ECM calculates the signal from the A/F sensor while value for A/F sensor response rate deterioration level.

If the test value for A/F sensor response rate deterioration level is less than threshold, ECM interprets this as a malfunction, and sets the DTC.

CONFIRMATION DRIVING PATTERN

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Turn the hand-held tester ON.
- (d) Clear DTCs.
- (e) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/MONITOR INFO/MONITOR RESULT.
- (f) Check that RES RATE B1 S1 is INCOMPL.
- (g) Start the engine and warm it up.
- (h) Drive the vehicle at between 25 mph and 75 mph (40 km/h and 120km/h) for 3 minutes. However, the vehicle should be driven at constant-speed.
- (i) When detection is complete, Response rate of MONITOR RESULT changes.
If the value does not change, perform step (h) once more.
- (j) Notes the value of the Monitor Result.
- (k) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/DTC INFO/ PENDING CODES.
- (l) Check if any DTCs (any pending DTCs) are set.

MONITOR STRATEGY

Related DTCs	P2A00	A/F sensor (Bank 1) slow response

INSPECTION PROCEDURE

HINT:

Hand-held tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- (1) Connect a hand-held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 (AFS B2S1) and OS2 B1S2 (O2S B2S2)) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

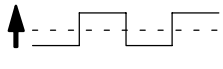

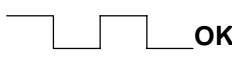

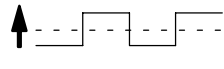

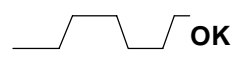

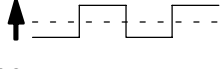

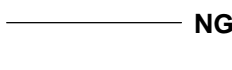

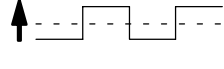

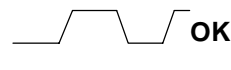

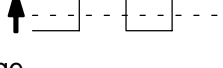

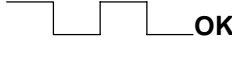

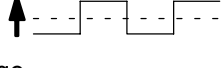

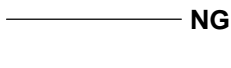

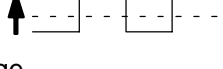

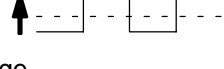

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0 V	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	—
2	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0V	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

HINT:

- DTC P2A00 and/or P2A03 may be also set, when the air-fuel ratio is stuck rich or lean.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.
- Read freeze frame data using a hand-held tester or OBD II scan tool. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 Check any other DTCs output (in addition to DTC P2A00 or P2A03).

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- (a) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P2A00 and/or P2A03	A
P2A00 and/or P2A03 and other DTCs	B

HINT:

If any DTCs other than P2A00 and/or P2A03 are output, troubleshoot those DTCs first.

B Go to DTC chart (See page [DI-57](#)).

A

2 Check resistance of air-fuel ratio (A/F) sensor heater.

PREPARATION:

Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Standard:

Tester Connection	Specified Condition
HT (1) - +B (2)	1.8 Ω to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

NG Replace air-fuel ratio (A/F) sensor.

OK

3 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

OK:

Standard:

Tester Connections	Specified Conditions
+B (2) - Body ground	9 V to 14 V

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E6 ECM connector.

CHECK:

- (a) Check the resistance.

OK:

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω
AF+ (A10-3) - A1A+ (E6-22) AF+ (A30-3) - A2A+ (E6-23)	Below 1 Ω
AF- (A10-4) - A1A- (E6-30) AF- (A30-4) - A2A- (E6-31)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher
AF+ (A10-3) or A1A+ (E6-22) - Body ground AF+ (A30-3) or A2A+ (E6-23) - Body ground	10 kΩ or higher
AF- (A10-4) or A1A- (E6-30) - Body ground AF- (A30-4) or A2A- (E6-31) - Body ground	10 kΩ or higher

NG

Replace or replace harness or connector.

OK

4 Perform confirmation driving pattern.

NEXT

5 Check whether DTC output recurs (DTC P2A00 or P2A03)

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2A00 or P2A03	A
No output	B

B

Check for intermittent problems
(See page [DI-11](#)).

A

6 Replace air fuel ratio sensor.

NEXT

7 Perform confirmation driving pattern.

NEXT

8	Check whether DTC output recurs (DTC P2A00 or P2A03)
----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2A00 or P2A03	A
No output	B

A → **Check air-fuel ratio extremely lean or rich (See page [DI-160](#)).**

B

END

Vent valve stuck closed											●	

NOTICE:

If the 0.02 inch reference pressure difference between the first and second checks is greater than the specification, the DTCs corresponding to the reference pressure (P043E, P043F, P0441, P0455, P0456, P2401, P2420) will be all stored.

CIRCUIT DESCRIPTION

HINT:

The canister is located near the fuel tank, underneath the body.

While the engine is running, if a predetermined condition (closed-loop, etc.) is met, the purge VSV is opened by the ECM and stored fuel vapors in the canister are purged to the intake manifold. The ECM changes the duty cycle ratio of the purge VSV to control purge flow volume.

The purge flow volume is also determined by the intake manifold pressure. Atmospheric pressure is allowed into the canister through the vent valve to ensure that the purge flow is maintained when the negative pressure (vacuum) is applied to the canister.

The following two monitors run to confirm appropriate EVAP system operation.

Key-off monitor

This monitor checks for EVAP (Evaporative Emission) system leaks and pump module malfunctions. The monitor starts 5 hours* after the ignition switch is turned OFF. More than 5 hours are required to allow enough time for the fuel to cool down to stabilize the Fuel Tank Pressure (FTP), thus making the EVAP system monitor more accurate.

The electric vacuum pump creates negative pressure (vacuum) in the EVAP system and the pressure is measured. Finally, the ECM monitors for leaks from the EVAP system, and malfunctions in both the pump module and purge VSV, based on the EVAP pressure.

HINT:

*:If the engine coolant temperature is not below 35°C 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

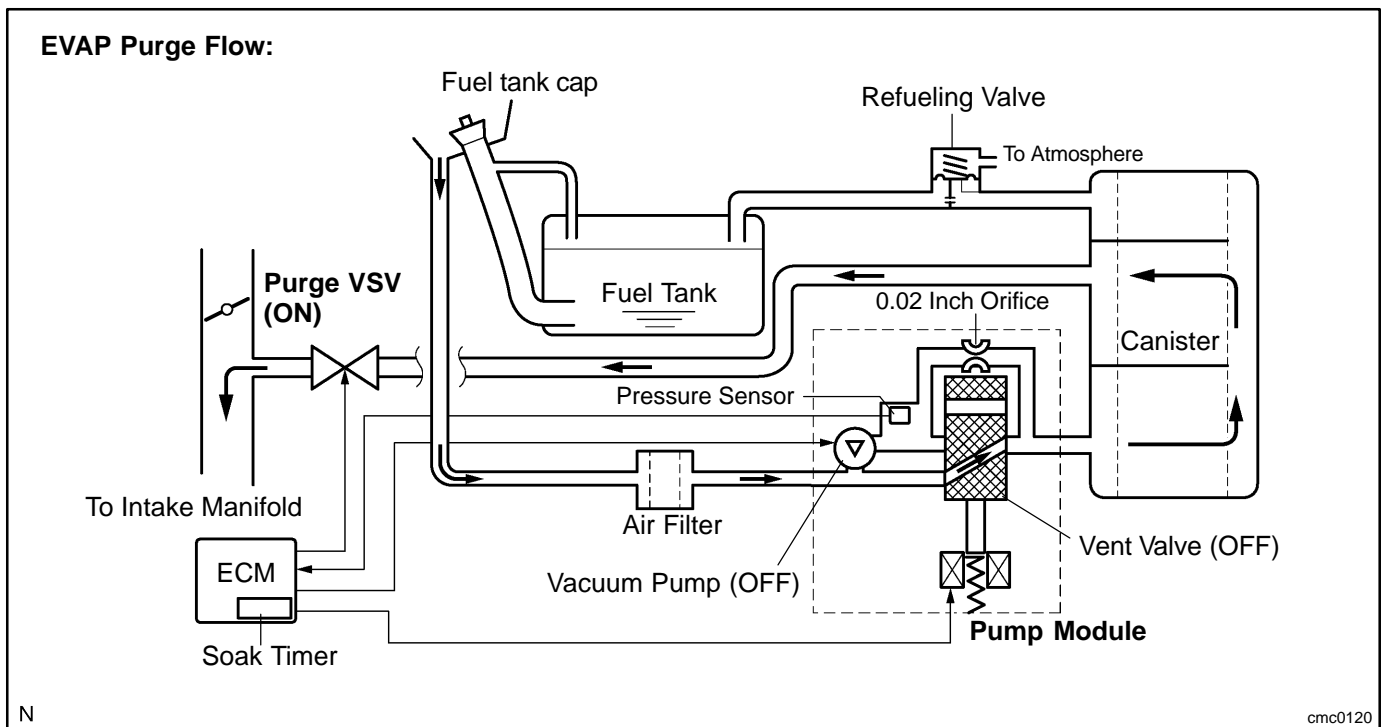

Purge flow monitor

The purge flow monitor consists of the two monitors. The 1st monitor is always conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
The vent valve is turned ON (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kpa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:

In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

DIAGNOSTICS – ENGINE (1GR-FE)

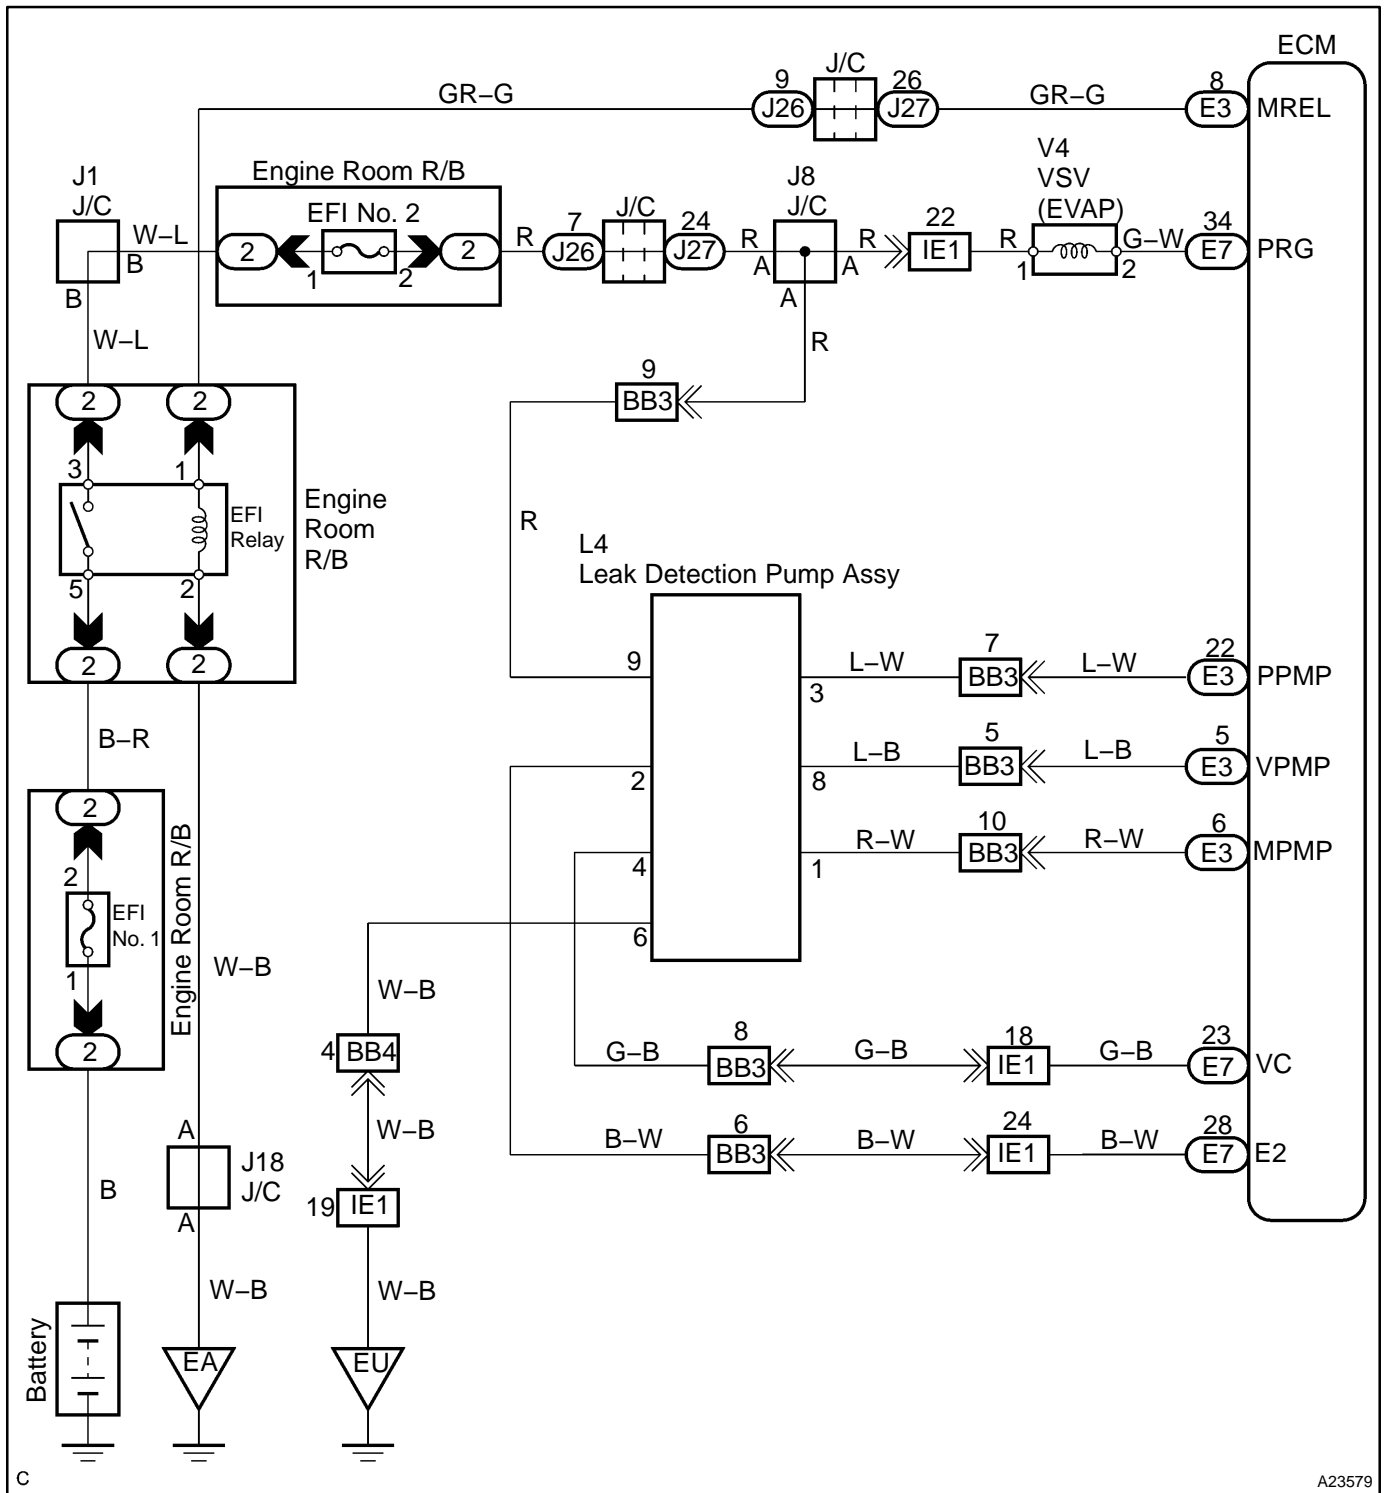

Components	Operations
Canister	Contains activated charcoal to absorb EVAP (Evaporative Emissions) generated in fuel tank.
Cut-off valve	Located in fuel tank. Valve floats and closes when fuel tank is 100 % full.
Purge VSV (Vacuum Switching Valve)	Opens or closes line between canister and intake manifold. ECM uses purge VSV to control EVAP purge flow. In order to discharge EVAP absorbed by canister to intake manifold, ECM opens purge VSV. EVAP discharge volume to intake manifold controlled by purge VSV duty cycle ratio (current-carrying time). (Open: ON, Close: OFF)
Refueling valve	Controls EVAP pressure from fuel tank to canister. Valve consists of diaphragm, spring and restrictor (diameter: 0.08 inch). When fuel vapor and pressure inside fuel tank increase, valve opens. While EVAP purged, valve closes and restrictor prevents large amount of vacuum from affecting pressure in fuel tank. Valve opened while refueling. When valve open, adding fuel into fuel tank possible.
Roll-over valve	Located in fuel tank. Valve closes by its own weight when vehicle overturns to prevent fuel from spilling out.
Service port	Used for connecting vacuum gauge for inspecting EVAP system.
Soak timer	Built into ECM. To ensure accurate EVAP monitor, measures 5 hours* after ignition switch turned to OFF. This allows fuel to cool down, stabilizing Fuel Tank Pressure (FTP). When approx. 5 hours* elapsed, ECM activates.
Pump module	Consists of (a) to (d) below. Pump module cannot be disassembled.
(a) Vent valve	Vents and closes EVAP system. When ECM turns valve ON, EVAP system closed. When, ECM turns valve OFF, EVAP system vented. Negative pressure (vacuum) created in EVAP system to check for EVAP leaks by closing purge VSV, turning on vent valve (closed) and operating vacuum pump (refer to fig. 1).
(b) Pressure sensor	Indicates pressure as voltages. ECM supplies regulated 5 V to pressure sensor, and uses feedback from sensor to monitor EVAP system pressure (refer to fig 2).
(c) Vacuum pump	Creates negative pressure (vacuum) in EVAP system for leak check.
(d) 0.02 inch orifice	Has opening with 0.02 inch diameter. Vacuum produced through orifice by closing purge VSV, turning off vent valve and operating vacuum pump, to monitor 0.02 inch leak pressure. 0.02 inch leak pressure indicates small leak of EVAP.

HINT:

*:If the engine coolant temperature is not below 35°C after 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

A hand-held tester is required to conduct the following diagnostic troubleshooting procedure.

HINT:

- Using hand-held tester monitor results enables the EVAP (Evaporative Emission) system to be confirmed.
- Read freeze frame data using a hand-held tester Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Confirm DTC.
----------	---------------------

- Turn the ignition switch to OFF and wait for 10 seconds.
- Turn the ignition switch to ON.
- Turn the ignition switch to OFF and wait for 10 seconds.
- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON and turn the tester ON.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- Confirm DTCs and freeze frame data.

If any EVAP system DTCs are set, the malfunctioning area can be determined using the table below.

Malfunctioning Areas	DTCs											
	P043E P043F	P0441	P0450	P0451	P0452	P0453	P0455	P0456	P2401 P2402	P2419	P2420	
0.02 inch orifice clogged	●								●	●		
0.02 inch orifice high-flow	●								●	●		
Purge VSV stuck open		●					●					
Purge VSV stuck closed		●										
Pressure sensor signal becomes fixed/flat				●								
Pressure sensor noise				●								
Pressure sensor voltage low			●		●							
Pressure sensor voltage high			●			●						
Gross leak		●					●					
Small leak								●				
Vacuum pump stuck OFF	●								●	●		
Vacuum pump stuck ON	●								●	●		
Vent valve stuck ON (closed)	●								●	●		
Vent valve stuck OFF (vent)											●	

NOTICE:

If the 0.02 inch reference pressure difference between the first and second checks is greater than the specification, the DTCs corresponding to the reference pressure (P043E, P043F, P0441, P0455, P0456, P2401, P2420) will be all stored.

NEXT

2	Perform EVAP system check.
----------	-----------------------------------

NOTICE:

- **In the EVAP SYSTEM CHECK (AUTO OPERATION), the series of 5 EVAP SYSTEM CHECK steps is performed automatically by the hand-held tester. It takes a maximum of approximately 18 minutes.**
 - **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.**
 - **Do not run the engine in this step.**
 - **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**
- (a) Clear DTC (See page [DI-42](#)).
- (b) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.
- (c) After the EVAP SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

HINT:

If no pending DTC is displayed, perform the Monitor Confirmation after this repair is completed. After this confirmation, check for pending DTCs. If no DTC is displayed, the EVAP system is normal.

3 Perform EVAP system manual operation check.

NOTICE:

- In the EVAP SYSTEM CHECK (MANUAL OPERATION), the series of 5 EVAP SYSTEM CHECK steps is performed manually by the hand-held tester.
 - Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.
 - Do not run the engine in this step.
 - When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).
- (a) Clear DTC (See page DI-42).
 - (b) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / MANUAL OPERATION.

NEXT

4 Perform EVAP system step 1/5 check.

(a) Check the EVAP pressure in step 1/5.

Result:

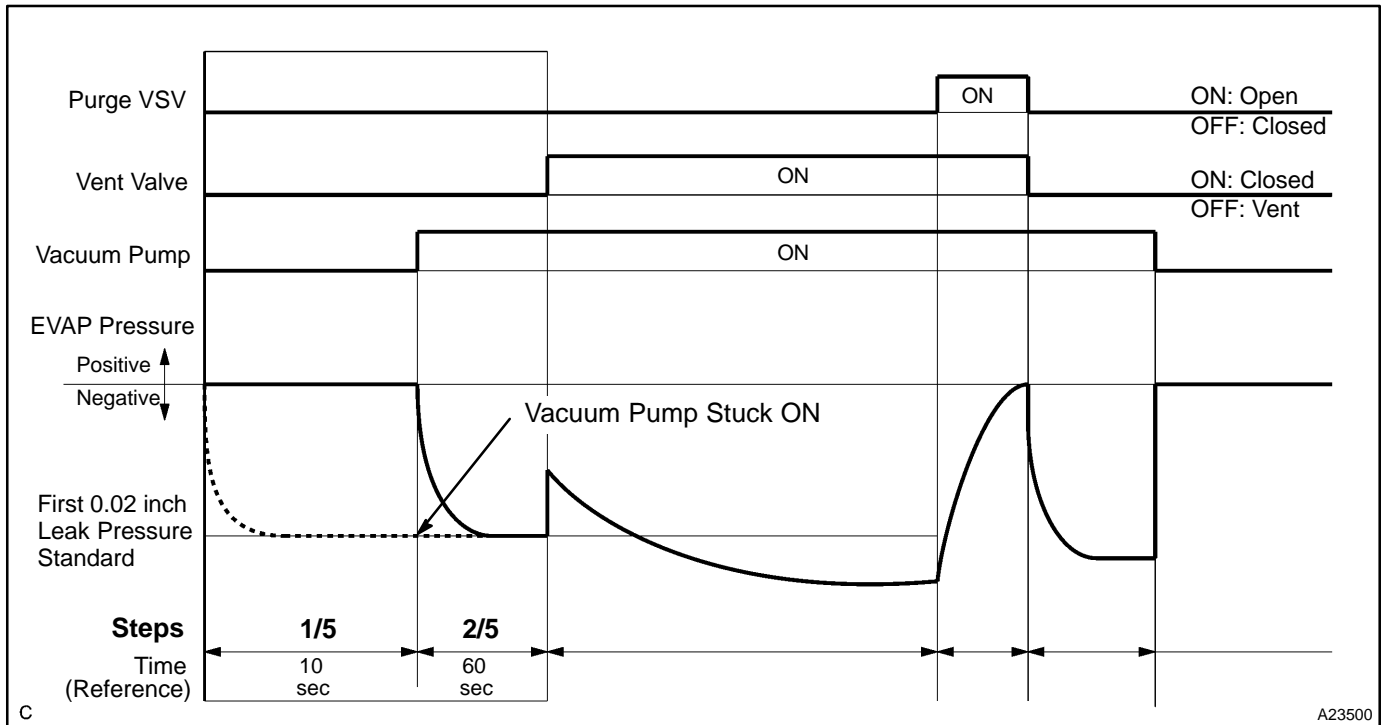

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	Virtually no variation in EVAP pressure	Not yet determined	A
P0451	EVAP pressure fluctuates by ± 0.3 kPa (2.25 mmHg) or more	Pressure sensor noising	B

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

B Go to step 30

A

5 Perform EVAP system step 1/5 to 2/5 check.

(a) Check the EVAP pressure in step 1/5 and 2/5.

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	Virtually no variation in EVAP pressure during step 1/5. Then decreases to 0.02 inch leak pressure standard*	Not yet determined	A
P2402	Small difference between EVAP pressures during steps 1/5 and 2/5	Vacuum pump stuck ON	B

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

HINT:

The 0.02 inch leak pressure standard is the value determined in step 2/5.

B Go to step 23.

A

6 Perform EVAP system step 2/5 check.

HINT:

Make a note of the pressures checked in steps (a) and (b) below.

- (a) Check the EVAP pressure 4 seconds after the vacuum pump is activated*.
- (b) Check the EVAP pressure again when it has stabilized. This pressure is the 0.02 inch leak pressure standard.

*: The vacuum pump begins to operate as step 1/5 is proceeded to step 2/5.

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure in step (b) between -4.85 kPa and -1.06 kPa (-36.38 mmHg and -7.95 mmHg)	Not yet determined	A
P043F and P2401	EVAP pressure in step (b) -1.06 kPa (-7.95 mmHg) or more	<ul style="list-style-type: none"> • 0.02 inch orifice high-flow • Vacuum pump stuck OFF 	B
P043E	EVAP pressure in step (b) below -4.85 kPa (-36.38 mmHg)	0.02 inch orifice clogged	C
P2419	EVAP pressure in step (a) more than -1.06 kPa (-7.95 mmHg)	Vent valve stuck closed	D

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

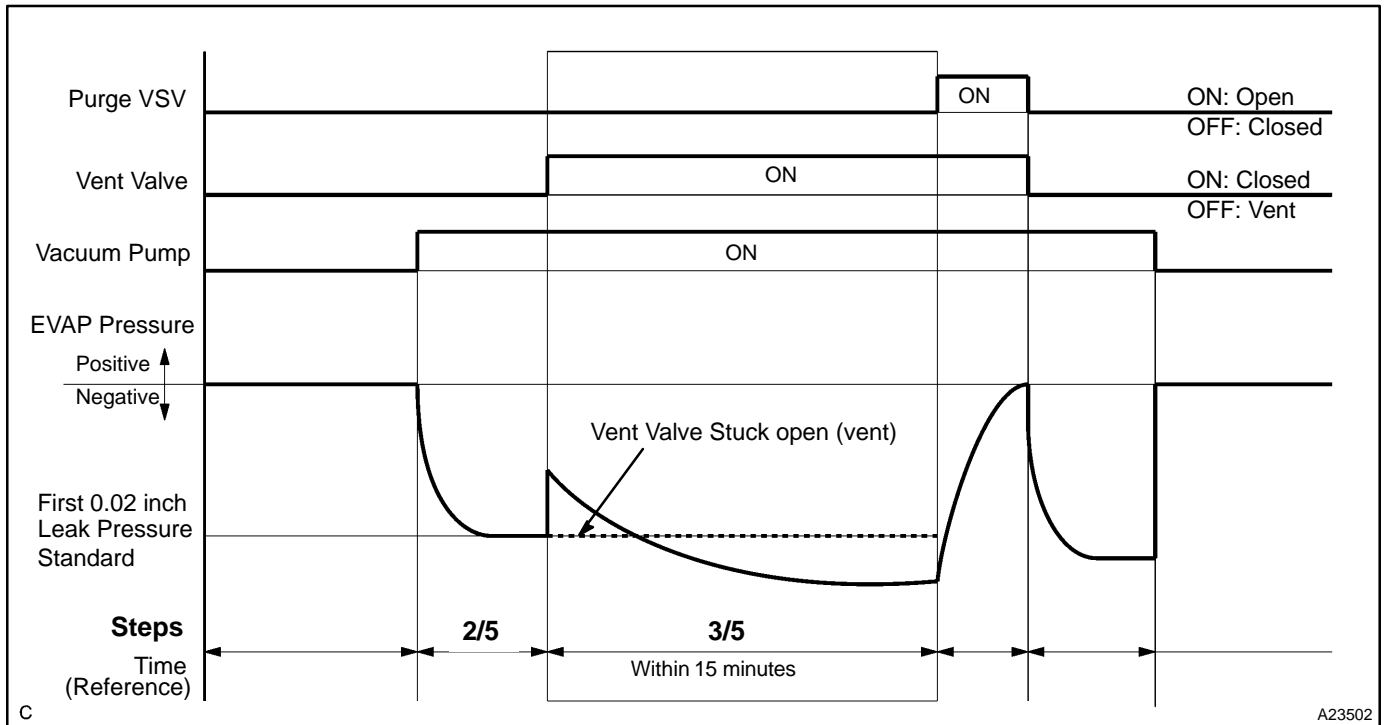

B Go to step 11

C Go to step 30

D Go to step 19

A

7 Perform EVAP system step 2/5 to 3/5 check.

(a) Check the EVAP pressure increase in step 3/5.

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 2/5 to step 3/5	Not yet determined	A
P2420	No variation in EVAP pressure despite proceeding from step 2/5 to step 3/5	Vent valve stuck open (vent)	B
P0451	No variation in EVAP pressure during steps 1/5 through 3/5	Pressure sensor malfunction stuck	C

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

B Go to step 19.

C Go to step 30.

A

8 Perform EVAP system step 3/5 check.

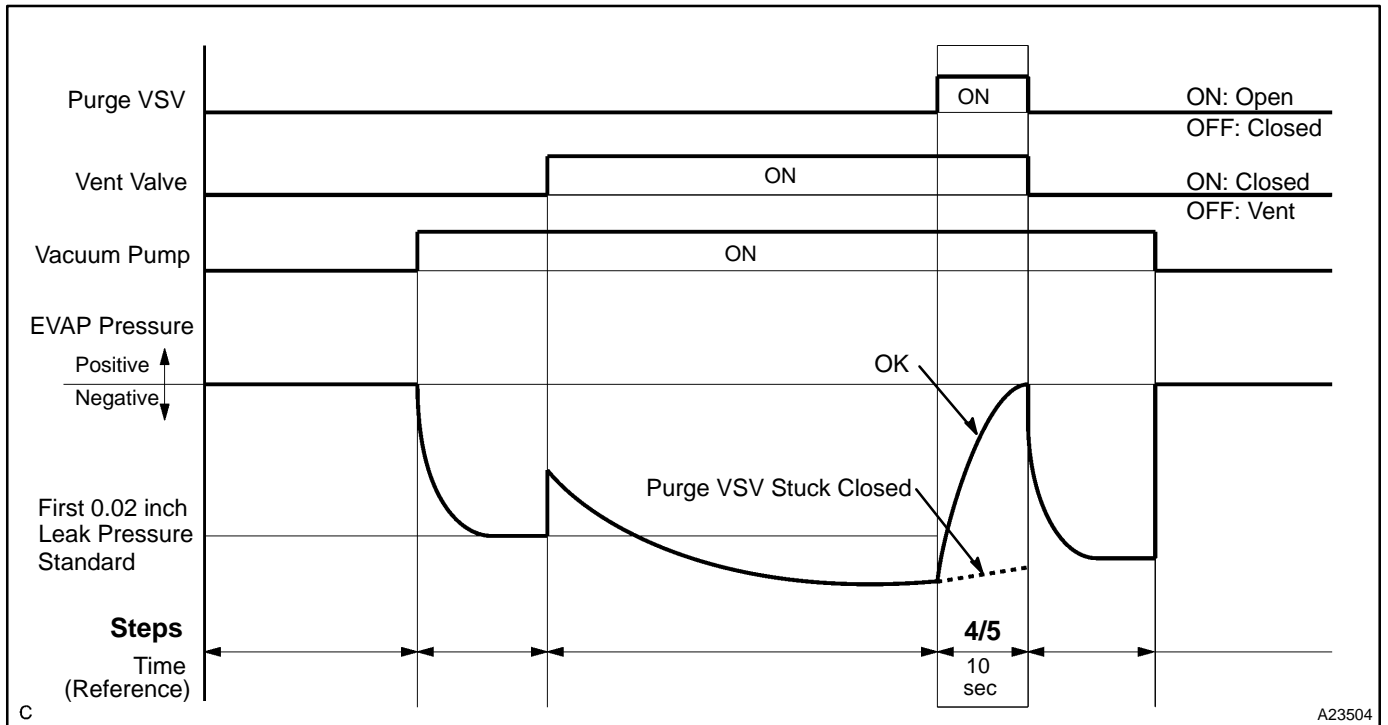

- (a) Wait until the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) for 30 seconds.
- (b) Measure the EVAP pressure and record it.

HINT:

A few minutes are required for the EVAP pressure to become saturated. When there is little fuel in the fuel tank, it takes up to 12 minutes.

NEXT

9 Perform EVAP system step 4/5 check.

(a) Check the EVAP pressure in step 4/5.

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Not yet determined	A
P0441	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Problems in EVAP hose between pure VSV and throttle body	B
P0441	Variation in EVAP pressure is less than 0.3 kPa (2.25 mmHg) for 10 seconds, after proceeding from step 3/5 to step 4/5	Purge VSV stuck closed	C

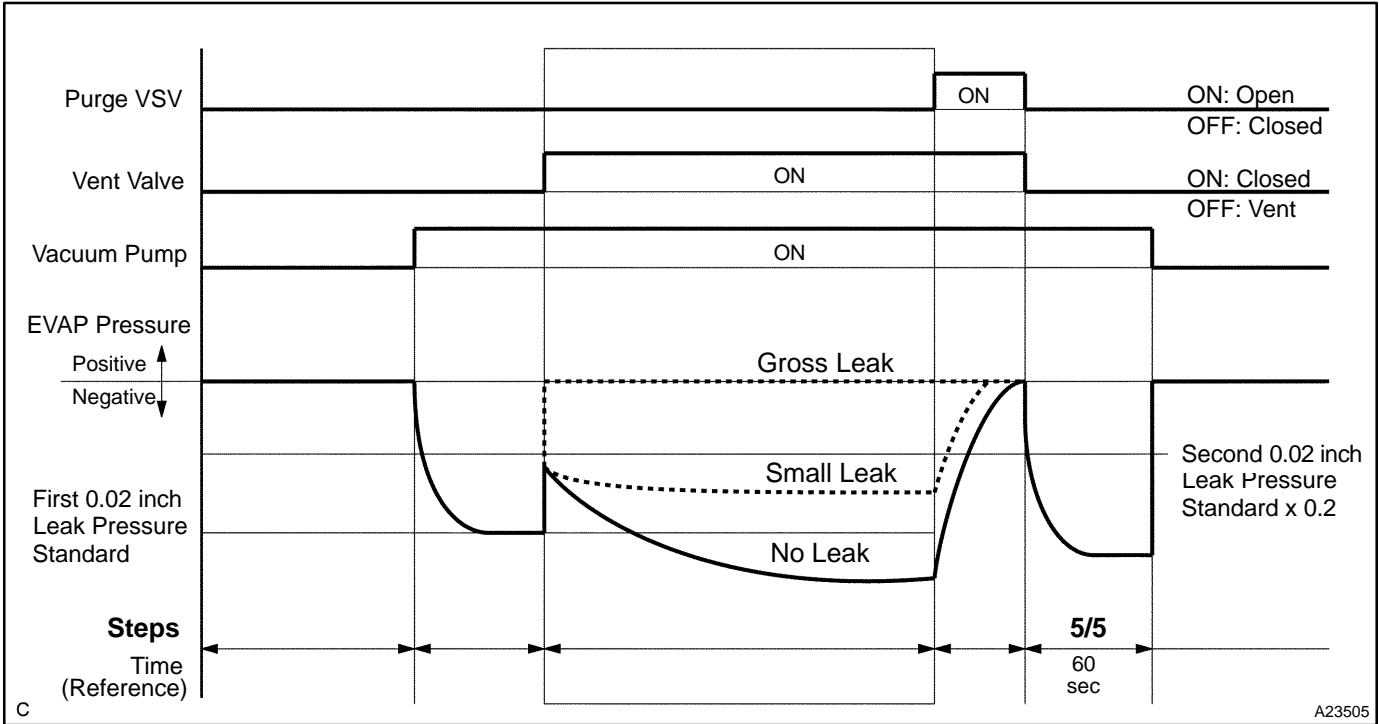

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

B Go to step 15.

C Go to step 12.

A

10 Perform EVAP system step 5/5 check.

- (a) Check the EVAP pressure in step 5/5.
- (b) Compare the EVAP pressure in step 3/5 and the second 0.02 inch leak pressure standard (step 5/5).

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure (step 3/5) lower than the second 0.02 inch leak pressure standard (step 5/5)	Not yet determined (no leakage from EVAP system)	A
P0441 and P0455	EVAP pressure (step 3/5) higher than [second 0.02 inch leak pressure standard (step 5/5) x 0.2]	<ul style="list-style-type: none"> • Purge VSV stuck open • EVAP gross leak 	B
P0456	EVAP pressure (step 3/5) higher than second 0.02 inch leak pressure standard (step 5/5)	EVAP small leak	B

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

11 Perform EVAP system step 3/5 check.

(a) Check the EVAP pressure in step 3/5.

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure less than [0.02 inch leak pressure standard x 0.2]	0.02 inch orifice high-flow	A
—	EVAP pressure more than [0.02 inch leak pressure standard x 0.2]	Vacuum pump stuck OFF	B

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

HINT:

The 0.02 inch leak pressure standard is the value determined in step 2/5.

12 Perform active test of purge VSV.

PREPARATION:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II/ ACTIVE TEST / EVAP VSV.
- (b) Disconnect the hose (connected to the canister) from the purge VSV.
- (c) Start the engine.

CHECK:

- (a) On the tester, turn off the purge VSV (EVAP VSV: OFF).
- (b) Use your finger to confirm that the purge VSV has no suction.
- (c) Using the tester, turn on the purge VSV (EVAP VSV: ON).
- (d) Use your finger to confirm that the purge VSV has suction.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
No suction when purge VSV turned OFF, and suction applied when tuned ON	Purge VSV normal	A
Suction applied when purge VSV turned OFF	Purge VSV stuck open	B
No suction when purge VSV turned ON	<ul style="list-style-type: none"> • Purge VSV stuck closed • Problems with EVAP hose between purge VSV and throttle body 	C

B Go to step 14.

C Go to step 15.

A

13	Check fuel tank cap.
-----------	-----------------------------

CHECK:

(a) Check that the fuel tank cap is correctly installed and confirm the fuel tank cap meets OEM specification.

HINT:

If an EVAP tester is available, check the fuel tank cap using the tester.

- (1) Tighten the fuel tank cap.
- (2) Remove the fuel tank cap and install it onto a fuel tank cap adaptor.
- (3) Connect an EVAP tester pump hose to the adaptor, and pressurize to 3.2 to 3.7 kPa (24 to 28 mmHg) using an EVAP tester pump.
- (4) Seal the adaptor and wait for 2 minutes.
- (5) Check the pressure. If the pressure is 2 kPa (15 mmHg) or more, the fuel tank cap is normal.

PREPARATION:

Test Results	Suspected Trouble Areas	Proceed To
Fuel tank cap correctly installed	—	A
Fuel tank cap loose	<ul style="list-style-type: none"> • Fuel tank cap improperly installed • Defective fuel tank cap • Fuel tank cap does not meet OEM specifications 	B
No fuel tank cap	—	C

A	Go to step 29.
B	Go to step 27.
C	Go to step 28.

14 Inspect EVAP VSV.

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the V4 purge VSV connector.
- (c) Disconnect the hose (connected to the canister) from the purge VSV.
- (d) Start the engine.

CHECK:

Use your finger to confirm that the purge VSV has no suction.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
No suction	ECM	A
Suction applied	Purge VSV	B

A Go to step 34.

B Go to step 30.

15 Check EVAP hose between purge VSV and throttle body.

PREPARATION:

- (a) Disconnect the hose (connected to the throttle body) from the purge VSV.
- (b) Start the engine.

CHECK:

- (a) Use your finger to confirm that the hose has suction.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between purge VSV and throttle body normal	A
No suction	<ul style="list-style-type: none"> • Throttle body • EVAP hose between purge VSV and throttle body 	B

B Go to step 26.

A

16 Inspect EVAP VSV.

PREPARATION:

- (a) Remove the purge VSV.
- (b) Apply battery voltage to the terminals of the purge VSV.

CHECK:

Using an air gun, confirm that air flows from port A to port B.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between purge VSV and throttle body normal	A
No suction	<ul style="list-style-type: none"> • Throttle body • EVAP hose between purge VSV and throttle body 	B

B → **Go to step 31.**

A

17 Measure purge VSV terminal voltage.

PREPARATION:

- (a) Disconnect the V4 purge VSV connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between terminal 1 of the purge VSV connector and the body ground.

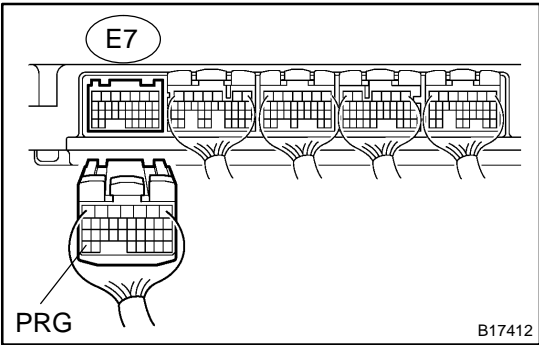

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Between 11 V and 14 V	Normal	A
Other than result above	Wire harness or connectors between purge VSV and ECM	B

B → **Go to step 32.**

A

18 Check for open and short circuit in harness and connector between purge VSV and ECM.

PREPARATION:

Disconnect the E7 ECM connector and the V4 purge VSV connector.

CHECK:

Check the resistance.

OK:

Standard:

Tester Connections	Specified Conditions
E7-34 (PRG) - V4-1	Below 1 Ω
E7-34 (PRG) - Body ground	10 kΩ or higher
V4-1 - Body ground	10 kΩ or higher

OK → Go to step 35.

NG → Go to step 32.

19 Perform active test for vent valve.

PREPARATION:

- (a) Turn the ignition switch to ON.
- (b) On the hand-held tester, select the following menu items: DIAGNOSIS/ ENHANCED OBD II/ ACTIVE TEST/ VENT VALVE (ALONE).

CHECK:

Measure the voltage between terminal VPMP of the ECM connector and the body ground when the vent valve is turned ON (close) and OFF (vent) using the tester.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V when OFF Below 3 V when ON	Vent valve	A
Below 3 V when OFF and ON	ECM	B

A → Go to step 22.

B → Go to step 35.

20 Perform active test for vent valve.

PREPARATION:

- (a) Turn the ignition switch to ON.
- (b) On the hand-held tester, select the following menu items:
DIAGNOSIS/ ENHANCED OBD II/ ACTIVE TEST/ VENT VALVE (ALONE).

CHECK:

Measure the voltage between terminal VPMP of the ECM connector and the body ground when the vent valve is turned ON (close) and OFF (vent) using the tester.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Below 3 V when OFF and ON	Power source of vent valve	A
Between 9 V and 14 V when OFF Below 3 V when ON	Vent valve	B
Between 9 V and 14 V when OFF and ON	ECM	C

B
Go to step 24.
C
Go to step 35.
A

21 Inspect pump module power source circuit.

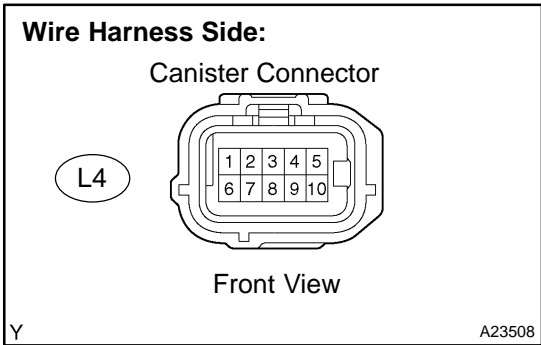

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the L4 canister connector.
- (c) Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminal 9 of the canister connector and the body ground.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V	Normal	A
Between 0 V and 3 V	Power source wire harness of vent valve	B

B Go to step 32.

A

22 Inspect vent valve operation of pump module.

PREPARATION:

- (a) Disconnect the L4 canister connector.
- (b) Turn the ignition switch to OFF.
- (c) Apply the battery voltage to terminals 9 and 8 of the pump module.

CHECK:

Touch the pump module to confirm the vent valve operation.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Operating	Wire harness between vent valve and ECM	A
Not operating	Vent valve	B

A

Go to step 32.

B

Go to step 30.

23 Perform active test for vacuum pump.

PREPARATION:

On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP (ALONE).

CHECK:

Measure the voltage between terminal MPMP of the ECM connector and the body ground when the vacuum pump is turned ON and OFF using the tester.

Result:

Tests Results	Suspected Trouble Areas	Proceed To
Between 0 V and 3 V when OFF Between 9 V and 14 V when ON	ECM normal	A
Between 9 V and 14 V when OFF Between 0 V and 3 V when ON	ECM	B

B

Go to step 35.

A

24 Check for open and short circuit in harness and connector between pump module and ECM.

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the L4 canister connector.
- (c) Turn the ignition switch to ON.
- (d) On the hand-held tester, select the following menu items:DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP (ALONE).
- (e) Turn the vacuum pump ON.

CHECK:

Measure the voltage between terminal 1 of the canister connector and the body ground.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V	Normal	A
Between 0 V and 3 V	Wire harness between ECM and vacuum pump	B

B Go to step 32.

A

25 Check for open and short in harness and connector between pump module and ECM.

PREPARATION:

- (a) Disconnect the L4 canister connector.
- (b) Turn the ignition switch to OFF.

CHECK:

Check the resistance between terminal 6 of the canister connector and the body ground.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Below 1 Ω	Vacuum pump	A
10 kΩ or more	Wire harness between vacuum pump and body ground	B

A Go to step 30.

B Go to step 32.

26 Inspect throttle body.

PREPARATION:

- (a) Stop the engine.
- (b) Disconnect the EVAP hose from the throttle body.
- (c) Start the engine.

CHECK:

- (a) Use your finger to confirm that the port of the throttle body has suction.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between throttle body and purge VSV	A
No suction	Throttle body	B

A Go to step 33.

B Go to step 34.

27	Correctly reinstall or replace fuel tank cap.
-----------	--

HINT:

- When reinstalling the fuel tank cap, tighten it until a few click sounds are heard.
- When replacing the fuel tank cap, use a fuel tank cap that meets OEM specifications, and install it until a few click sounds are heard.

NEXT	Go to step 37.
-------------	-----------------------

28	Replace fuel tank cap.
-----------	-------------------------------

HINT:

When installing the fuel tank cap, tighten it until a few click sounds are heard.

NEXT	Go to step 37.
-------------	-----------------------

29	Locate EVAP leak.
-----------	--------------------------

(a) Disconnect the vent hose.

- (b) Connect the EVAP pressure tester tool to the canister with the adapter.

- (c) Pressurize the EVAP system by 3.2 to 3.7 kPa (24 to 28 mmHg).
 (d) Apply soapy water to the piping and the connecting parts of the EVAP system.
 (e) Look for areas where bubbles appear. This indicates leak point.
 (f) Repair or replace the leak point.

NEXT

Go to step 37.

30

Replace charcoal canister.

NEXT

Go to step 37.

31

Replace EVAP VSV.

- (a) Disconnect the connector and the hoses from the purge VSV.
 (b) Remove the purge VSV.
 (c) Install a new purge VSV.
 (d) Reconnect the connector and hoses.

NEXT

Go to step 37.

32

Repair or replace wire harness or connector.

NEXT

Go to step 37.

33	Replace EVAP hose between EVAP VSV and throttle body.
-----------	--

NEXT

Go to step 37.

34	Inspect throttle body.
-----------	-------------------------------

- (a) Remove the throttle body (see page [SF-40](#)).
- (b) Check that the EVAP purge port of the throttle body is not clogged. If necessary, replace the throttle body.

NEXT

Go to step 37.

35	Replace ECM (See page SF-66)
-----------	---

NEXT

Go to step 37.

36	Repair or replace parts and components indicated by output DTCs.
-----------	---

- (a) Repair the malfunctioning areas indicated by the DTCs that had been confirmed when the vehicle was brought in.

NEXT

Go to step 37.

37	Perform EVAP system auto operation check.
-----------	--

NOTICE:

- In the EVAP SYSTEM CHECK (AUTO OPERATION), the series of 4 EVAP SYSTEM CHECK steps is performed automatically by the hand-held tester. It takes a maximum of approximately 15 minutes.
 - Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90 % full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.
 - Do not run the engine in this step.
 - When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing an EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).
- (a) Clear DTCs (see page [DI-42](#)).
- (b) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.
- (c) After the SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

HINT:

If no pending DTC is found, the repair has been successfully completed.

NEXT**Completed**

Monitor Confirmation

HINT:

After a repair, check Monitor Status by performing the Key–Off Monitor Confirmation and Purge Flow Monitor Confirmation described below.

1. KEY–OFF MONITOR CONFIRMATION

(a) Preconditions

The monitor will not run unless:

- The vehicle has been driven for 10 minutes or more (in a city area or on a free way)
- The fuel tank is less than 90 % full
- The altitude is less than 8,000 ft (2,400 m)
- The Engine Coolant Temperature (ECT) is between 4.4°C and 35°C (40°F and 95°F)
- The Intake Air Temperature (IAT) is between 4.4°C and 35°C (40°F and 95°F)
- The vehicle remains stationary (the vehicle speed is 0 mph [0 km/h])

(b) Monitor Conditions

- (1) Allow the engine to idle for at least 5 minutes.
- (2) Turn the ignition switch to OFF and wait for 6 hours (8 or 10.5 hours).

HINT:

Do not start the engine until checking MONITOR STATUS. If the engine is started, the steps described above must be repeated.

(c) Monitor Status

- (1) Connect a hand–held tester to the DLC3.
- (2) Turn the ignition switch to ON and turn the tester ON.
- (3) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
- (4) Check the Monitor Status displayed on the tester.

HINT:

If INCMP is displayed, the monitor is not completed. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

2. PURGE FLOW MONITOR CONFIRMATION (P0441)

HINT:

Perform this monitor confirmation after the Key–Off Monitor Confirmation shows COMPL (complete).

(a) Preconditions

The monitor will not run unless:

- The vehicle has been driven for 10 minutes or more (in a city area or on a free way)
- The ECT is between 4.4°C and 35°C (40°F and 95°F)
- The IAT is between 4.4°C and 35°C (40°F and 95°F)

(b) Monitor Conditions

- (1) Release the pressure from the fuel tank by removing and reinstalling the fuel tank cap.
- (2) Warm the engine up until the ECT reaches more than 75°C (167°F).
- (3) Increase the engine speed to 3,000 rpm once.
- (4) Allow the engine to idle and turn A/C ON for 1 minute.

(c) Monitor Status

- (1) Turn the ignition switch to OFF (where ON or the engine is running).
- (2) Connect a hand-held tester to the DLC3.
- (3) Turn the ignition switch to ON and turn the tester ON.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
- (5) Check the Monitor Status displayed on the tester.

HINT:

If INCMP is displayed, the monitor is not completed. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

MONITOR RESULT

Refer to page [DI-26](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (refer to "Confirmation Monitor").

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

EVAP-Key-off monitor

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$3D	\$C9	Multiply by 0.01 (kPa)	Test value for small leak (P0456): Refer to pressure D*.	Minimum test limit for small leak	Maximum test limit for small leak
\$3D	\$CA	Multiply by 0.01 (kPa)	Test value for gross leak (P0455): Refer to pressure E*.	Minimum test limit for gross leak	Maximum test limit for gross leak
\$3D	\$CB	Multiply by 0.01 (kPa)	Test value for vacuum pump stuck OFF (P2401): Refer to pressure A*.	Minimum test limit for vacuum pump stuck OFF	Maximum test limit for vacuum pump stuck OFF
\$3D	\$CD	Multiply by 0.01 (kPa)	Test value for vacuum pump stuck ON (P2402): Refer to pressure A*.	Minimum test limit for vacuum pump stuck ON	Maximum test limit for vacuum pump stuck ON
\$3D	\$CE	Multiply by 0.01 (kPa)	Test value for vent valve stuck OFF (vent) (P2420): Refer to pressure C*.	Minimum test limit for vent valve stuck ON	Maximum test limit for vent valve stuck ON
\$3D	\$CF	Multiply by 0.01 (kPa)	Test value for vent valve stuck ON (closed) (P2419): Refer to pressure A*.	Minimum test limit for vent valve stuck OFF	Maximum test limit for vent valve stuck OFF
\$3D	\$D0	Multiply by 0.01 (kPa)	Test value for 0.02 inch orifice low flow (P043E): Refer to pressure B*.	Minimum test limit for 0.02 inch orifice low flow	Maximum test limit for 0.02 inch orifice low flow
\$3D	\$D1	Multiply by 0.01 (kPa)	Test value for 0.02 inch orifice high flow (P043F): Refer to pressure A*.	Minimum test limit for 0.02 inch orifice high flow	Maximum test limit for 0.02 inch orifice high flow
\$3D	\$D4	Multiply by 0.01 (kPa)	Test value for purge VSV stuck close (P0441): Refer to pressure F*.	Minimum test limit for purge VSV stuck close	Maximum test limit for purge VSV stuck close
\$3D	\$D5	Multiply by 0.01 (kPa)	Test value for purge VSV stuck open (P0441): Refer to pressure E*.	Minimum test limit for purge VSV stuck open	Maximum test limit for purge VSV stuck open
\$3D	\$D7	Multiply by 0.01 (kPa)	Test value for purge flow (P0441): Refer to pressure G*.	Minimum test limit for purge flow	Maximum test limit for purge flow

* Pressure A to G are indicated as shown in the diagram below.

IACV Control VSV Circuit

CIRCUIT DESCRIPTION

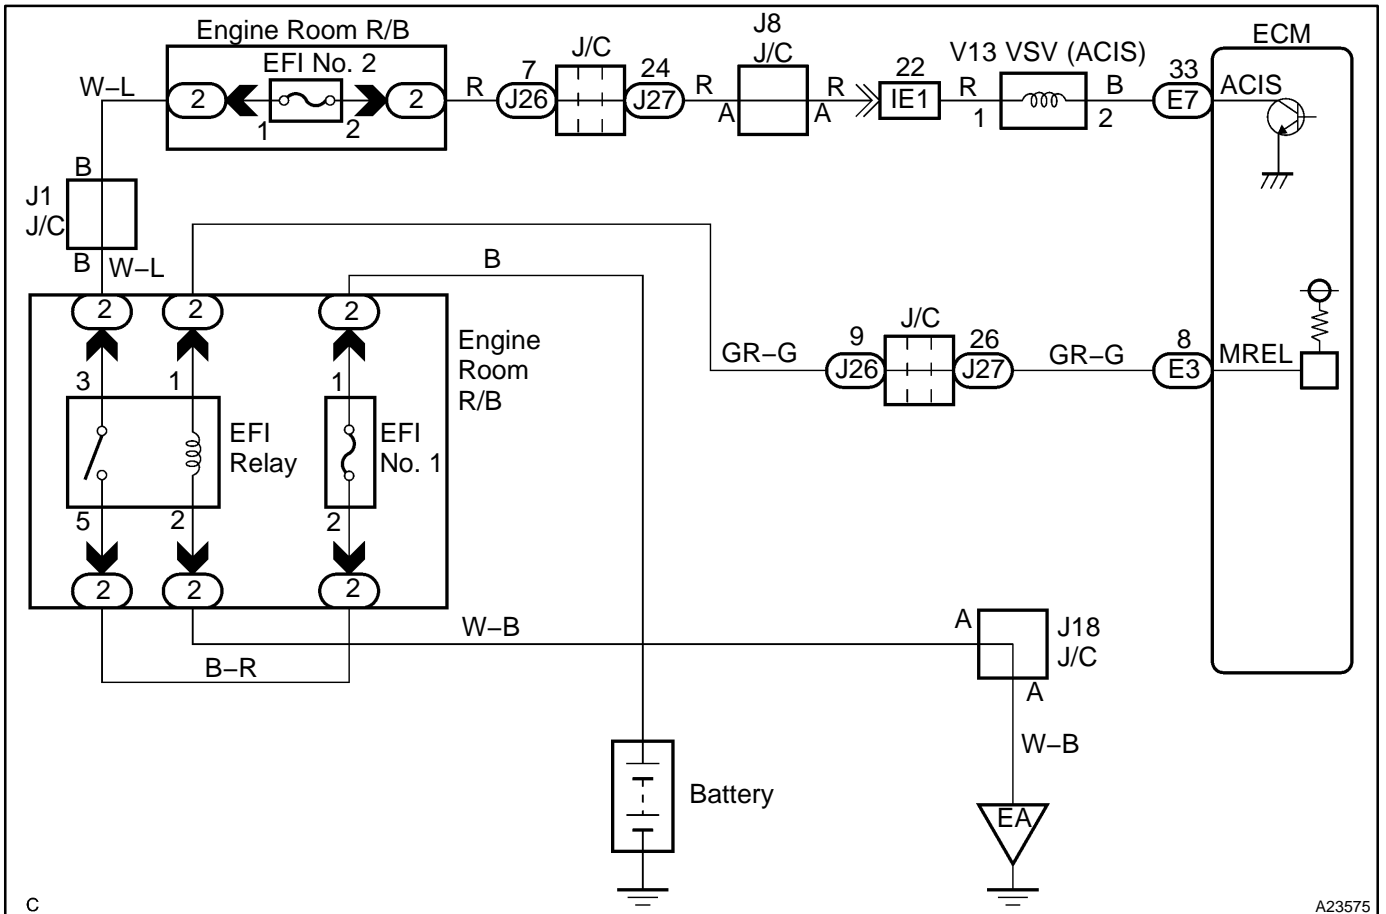

This circuit opens and closes the Intake Air Control Valve (IACV) in response to the engine load in order to increase the intake efficiency (ACIS: Acoustic Control Induction System).

When the engine speed is between 2,200 and 4,100 rpm and the throttle valve opening angle is 60° or more, the ECM supplies current to the VSV (ON status), so the IACV will close. Besides that condition, the VSV is usually OFF and the IACV is open.

A23562

WIRING DIAGRAM

c

A23575

INSPECTION PROCEDURE

1 Connect hand-held tester and check operation of VSV for ACIS.

**PREPARATION:**

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch to ON and hand-held tester main switch ON.
- Select the item: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INTAKE CTL VSV1. Operate the VSV for AICS.

CHECK:

Check operation of VSV when VSV is operated by the hand-held tester.

OK:

VSV is ON:

Air from pipe E is flowing out through pipe F.

VSV is OFF:

Air from pipe E is flowing out through the air filter.

OK

Check for ACIS system (See page [SF-49](#)).

NG

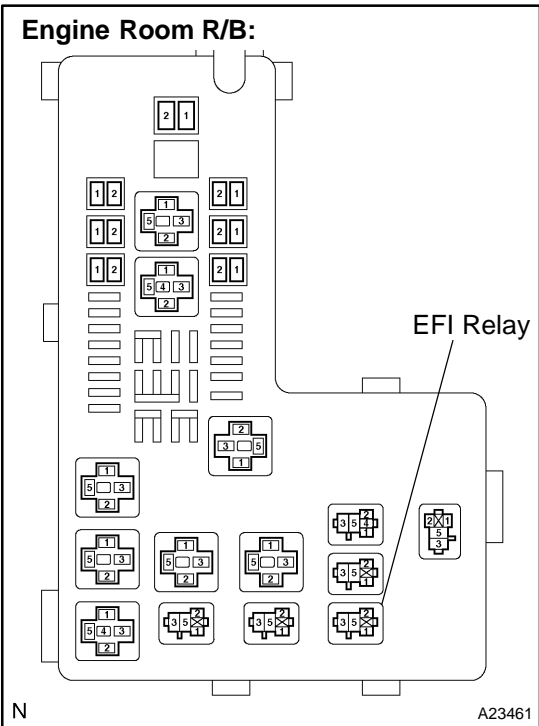

2 Check VSV for ACIS (See page [SF-49](#)).

NG

Replace VSV for ACIS.

OK

3 Check for open and short in harness and connector between EFI main relay (Marking: EFI) and ECM.

- (a) Check the wire harness between the VSV for ACIS and connector the ECM connector.
- (1) Disconnect the VSV for ACIS connector.
 - (2) Disconnect the E5 and E7 ECM connector.
 - (3) Check for resistance between the wire harness side connectors.

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
VSV for ACIS (V13-2) - ACIS (E7-33)	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
VSV for ACIS (V13-2) or ACIS (E7-33) - E1 (E5-1)	10 kΩ or higher

- (b) Check the wire harness between the VSV for ACIS connector and the EFI relay.
- (1) Disconnect the VSV for ACIS connector.
 - (2) Remove the EFI relay from the engine room R/B.
 - (3) Check for resistance between the wire harness side connectors.

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
VSV for ACIS (V13-1) - EFI relay terminal 3 of R/B	Below 1 Ω

NG → **Repair or replace harness or connector.**

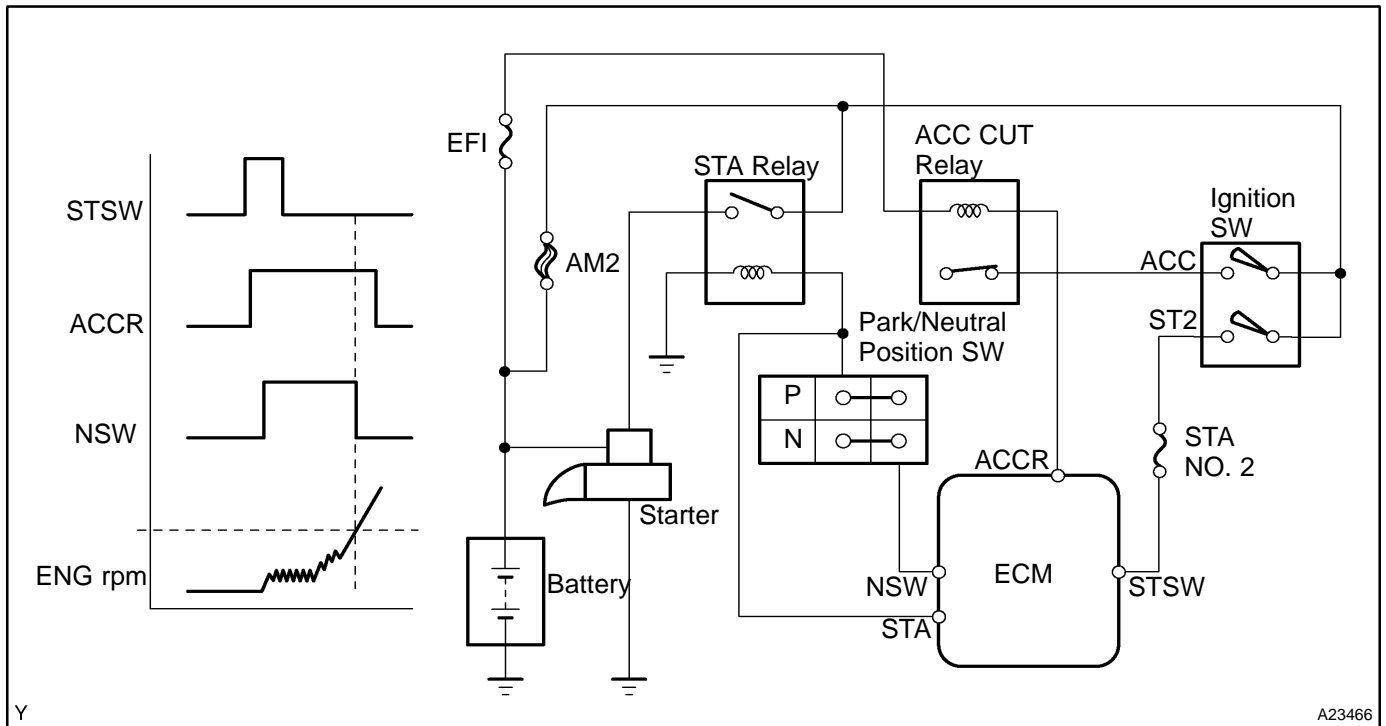

OK

Replace ECM (See page SF-66).

Cranking Holding Function Control Circuit

CIRCUIT DESCRIPTION

The system detects the ignition switch's starting signal (STSW signal) and then supplies current to the starter until the ECM judges that the engine has started successfully. The purpose is to reduce the holding time of the ignition key.

WIRING DIAGRAM

Refer to DTC P0617 on page [DI-276](#).

INSPECTION PROCEDURE

1	Check operation of engine cranking.
---	--

CHECK:

When turning the ignition switch to the START position, check whether the starter motor starts.

OK:

Engine is cranked.

OK

Check for intermittent problems
(See page [DI-11](#)).

NG

2 Connect hand-held tester, and check STA signal.

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON, and push the hand-held tester main switch ON.
- (c) On the hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / STARTER SIG.

CHECK:

Read the STA signal on the hand-held tester while the starter operates.

OK:

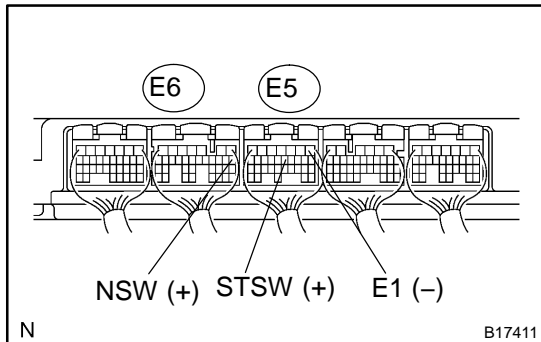

Standard:

Ignition Switch Position	ON	START
STARTER SIG	OFF	ON

NG → **Repair or replace harness or connector.**

OK

3 Check voltage between terminals STSW and STAR/NSW of ECM connector.

- (a) Measure the voltage between the terminals of the E6 and E5 ECM connectors, while cranking the engine (ignition switch START position).

Standard:

Symbols (Terminal No.)	Specified condition
NSW (E6-8) - E1 (E5-1)	9 to 14 V
STSW (E5-12) - E1 (E5-1)	9 to 14 V

Result:

Terminal STAR	Terminal STSW	Proceed to
9 to 14 V	9 to 14 V	A
0 V	9 to 14 V	B
0 V	0 V	C

B → **Replace ECM (See page SF-66).**

C → **Go to step 8.**

A

4 Check park/neutral position switch assembly.

- (a) Disconnect the park/neutral position switch connector.
- (b) Check for resistance between each terminal shown below when the shift lever is moved to each range.

Standard:

Shift range	Terminal No.	Specified condition
P	1 - 3	Below 1 Ω
	6 - 9	
R	2 - 3	Below 1 Ω
N	3 - 5	Below 1 Ω
	6 - 9	
D	3 - 7	Below 1 Ω
3	3 - 4	Below 1 Ω
2, L	3 - 8	Below 1 Ω

NG Check and repair harness and connector.

OK

5 Check starter relay.

- (a) Remove the starter relay from the engine room R/B.
- (b) Inspect the starter relay.

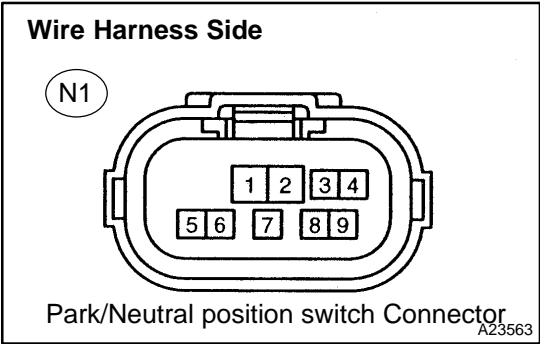

Standard:

Terminal No.	Specified condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (Apply battery voltage terminals 1 and 2)

NG Replace starter relay.

OK

6 Check harness and connector park/neutral position switch and starter relay.

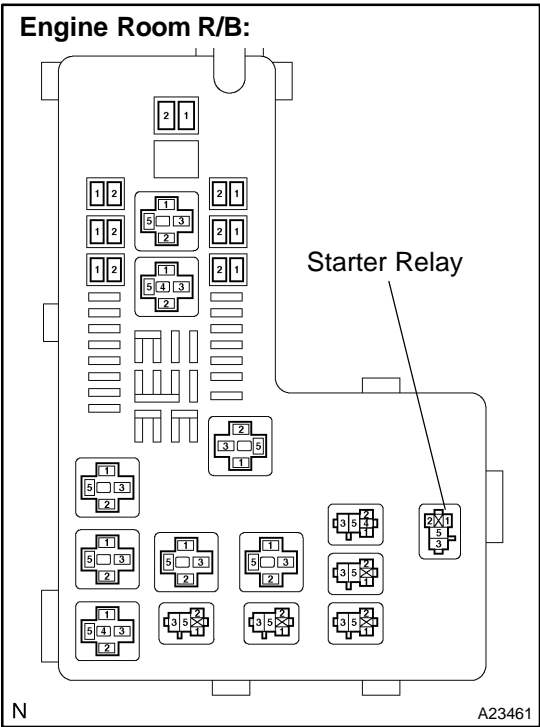

- (a) Check the harness and the connector between the park/neutral position switch connector and the starter relay.
 - (1) Disconnect the park/neutral position switch connector.
 - (2) Remove the starter relay from the engine room R/B.
 - (3) Check for resistance between the wire harness side connectors.

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
Park/Neutral position switch (N1-6) - Starter relay (1)	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
Park/Neutral position switch (N1-6) or Starter relay (1) - Body ground	10 kΩ or higher

- (b) Check the harness and the connector between the starter relay and the body ground.
 - (1) Remove the starter relay from the engine room R/B.
 - (2) Check for resistance between the starter relay and the body ground.

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
Starter relay (2) - Body ground	Below 1 Ω

OK

NG Repair or replace harness or connector.

7 Check starter assembly (See page ST-12 (1.6 kw) or ST-24 (2.0 kw))

OK

NG Replace starter assembly.

8 Check STA fuse.

- (a) Remove the starter relay from the engine room R/B.
- (b) Measure the voltage between the terminal of the engine room R/B and the body ground.

Standard:

Symbols (Terminal No.)	Specified condition
Starter relay (5) - Body ground	9 to 14 V

NG Check for short in all harness and components connected to STA fuse, and replace fuse.

OK

9 Check ignition switch.

- (a) Check for resistance between the connector terminals shown in the chart below.

Standard:

Switch position	Terminal No.	Specified condition
LOCK	All terminal to terminal	10 kΩ or higher
ACC	2 - 3	Below 1 Ω
ON	2 - 3, 2 - 4, 3 - 4 6 - 7	Below 1 Ω
START	1 - 2, 1 - 4, 2 - 4 6 - 7, 6 - 8, 7 - 8	Below 1 Ω

NG Replace ignition switch.

OK

Check and repair harness and connector.

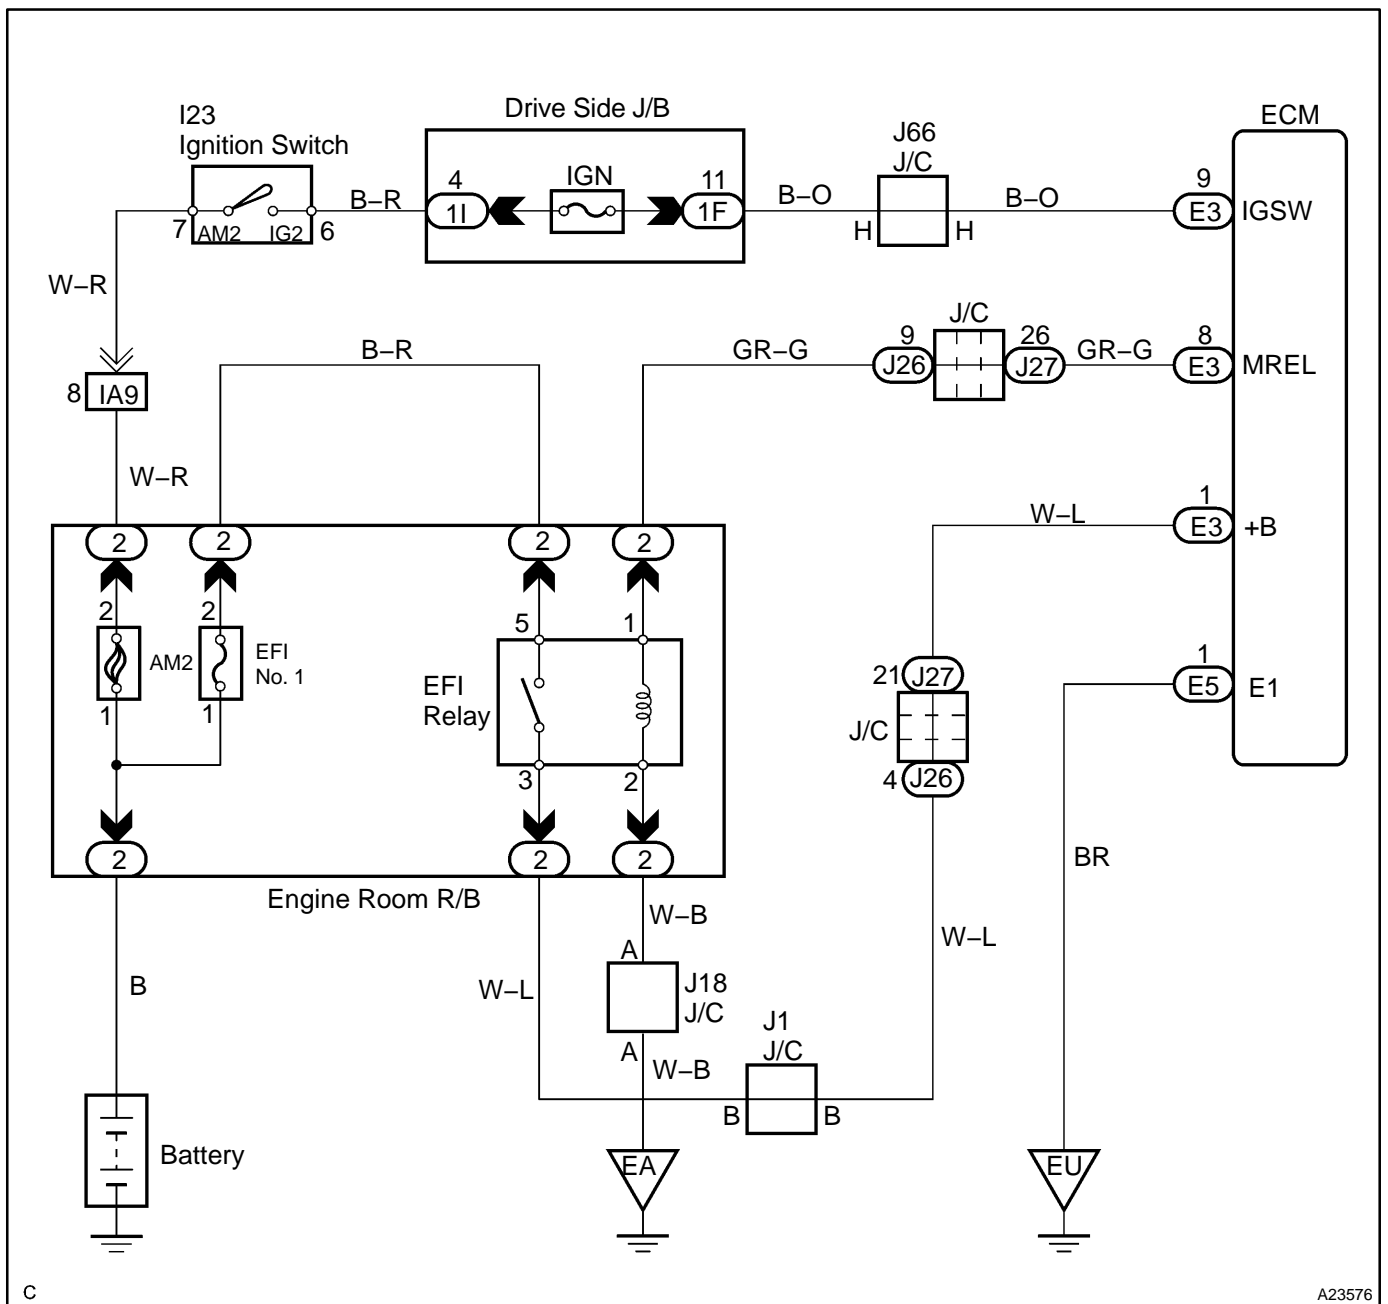

ECM Power Source Circuit

CIRCUIT DESCRIPTION

When the ignition switch is turned ON, battery positive voltage is applied to terminal IGSW of the ECM and the EFI relay control circuit in the ECM sends a signal to terminal MREL of the ECM switching on the EFI relay.

This signal causes current to flow to the coil, closing the contacts of the EFI relay and supplying power to terminal +B of the ECM.

WIRING DIAGRAM

INSPECTION PROCEDURE

- 1 Check voltage between terminals +B and E1 of ECM connector.

**PREPARATION:**

Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminals +B and E1 of the ECM connectors.

OK:

Standard: 9 to 14 V

OK

Proceed to next circuit inspection shown in the Problem symptoms table (See page [DI-33](#)).

NG

- 2 Check for open in harness and connector between terminal E1 of ECM and body ground (See page [IN-30](#)).

NG

Repair or replace harness or connector.

OK

- 3 Check voltage between terminal IGSW of ECM connector and body ground.

**PREPARATION:**

Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminal IGSW of the ECM connector and body ground.

OK:

Standard: 9 to 14 V

OK

Go to step 6.

NG

4 Check IGN fuse.

PREPARATION:
Remove the IGN fuse from the instrument panel J/B.

CHECK:
Check the resistance of the IGN fuse.

OK:
Below 1 Ω

NG Check for short in all harness and components connected to IGN fuse, and replace the fuse.

OK

5 Check ignition switch (See page BE-37).

NG Replace ignition switch.

OK

Check and repair harness and connector between battery and ignition switch, and ignition switch and ECM.

6 Check voltage between terminal MREL of ECM connector and body ground.

PREPARATION:
Turn the ignition switch to ON.

CHECK:
Measure the voltage between terminal MREL of the ECM connector and body ground.

OK:
Standard: 9 to 14 V

NG Replace ECM (See page SF-66).

OK

7 Check EFI No. 1 fuse of engine room J/B.

PREPARATION:

Remove the EFI No. 1 fuse from the engine room J/B.

CHECK:

Check resistance of EFI No. 1 fuse.

OK:

Below 1 Ω

NG Check for short in all harness and components connected to EFI No. 1 fuse, and replace the fuse.

OK

8 Check EFI relay).

PREPARATION:

Remove the EFI relay from the engine room J/B.

CHECK:

Inspect the EFI relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 KΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace EFI relay.

OK

9 Check for open and short in harness and connector between terminal MREL of ECM and body ground (See page IN-30).

NG Repair or replace harness or connector.

OK

Check and repair harness or connector between EFI No. 1 fuse and battery.

Fuel Pump Control Circuit

CIRCUIT DESCRIPTION

Refer to DTC P0230 on page [DI-174](#).

WIRING DIAGRAM

Refer to DTC P0230 on page [DI-174](#).

INSPECTION PROCEDURE

1 Check fuel pump operation (See page [SF-5](#)).

OK

Go to step 8.

NG

2 Connect hand-held tester, and check operation of fuel pump relay.

PREPARATION:

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch to ON and push the hand-held tester main switch ON.
- Enter the following menu: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL PUMP / SPD.

CHECK:

Check the operation of the fuel pump relay when it is switched ON and OFF by the hand-held tester.

OK:

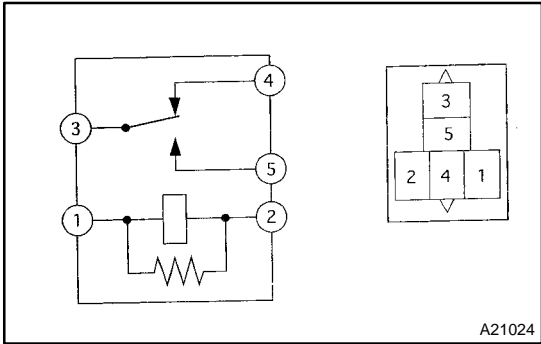

Operating noise can be heard from the fuel pump relay.

OK

Go to step 4.

NG

3 Check fuel pump relay.

PREPARATION:

Remove the fuel pump relay from the engine room R/B.

CHECK:

Inspect the fuel pump relay.

OK:

Terminal No.	Condition	Specified Condition
3 - 4	Apply B+ between terminals 1 and 2	10 KΩ or higher
3 - 4	Always	Below 1 Ω
3 - 5	Always	10 KΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace fuel pump relay.

OK

4 Check fuel pump (See page SF-13).

NG Repair or replace fuel pump.

OK

5 Check circuit opening relay.

PREPARATION:

Remove the C/OPN relay from the engine room J/B.

CHECK:

Inspect the C/OPN relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 KΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace circuit opening relay.

OK

- 6** Check for open in harness and connector between EFI relay and fuel pump, and fuel pump and body ground (See page [IN-30](#)).

NG

Repair or replace harness or connector.

OK

- 7** Check voltage between terminal FC and E1 of ECM connector.

PREPARATION:

Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminal FC of the ECM connector and body ground.

OK:

Voltage: 9 to 14 V

NG

Check for open in harness and connector between battery and FC terminal of ECM (See page [SF-66](#)).

OK

Proceed to problem symptoms table (See page [DI-33](#)).

- 8** Check fuel pump resistor (See page [SF-57](#)).

NG

Replace fuel pump resistor.

OK

Check and repair harness and connector between fuel pump relay and fuel pump resistor, and fuel pump resistor and fuel pump (See page [IN-30](#)).

INSPECTION PROCEDURE

HINT:

Troubleshoot each trouble symptom in accordance with the chart below.

MIL remains on	Start inspection from step 1
MIL does not light up	Start inspection from step 3
1	Clear DTC.

PREPARATION:

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch to ON and push the hand-held tester main switch ON.
- Read the DTC (See page [DI-42](#)).
- Clear the DTC (See page [DI-42](#)).

CHECK:

- Check for DTCs.

OK:

DTC is not output.

NG

Repair circuit indicated by output code
(See page [DI-57](#)).

OK

2 Check Harness and connector (Check for short in wire harness).

PREPARATION:

- Disconnect the E4 ECM connector.
- Turn the ignition switch ON.

CHECK:

Check that MIL goes off.

OK:

MIL goes off.

OK

Replace ECM (See page [SF-66](#)).

NG

Check and repair harness and connector between combination meter and ECM.

3	Check that MIL lights up.
----------	----------------------------------

CHECK:

Check that MIL lights up when turning the ignition switch to ON.

OK:

MIL lights up (Engine stopped)

OK	System OK.
-----------	-------------------

NG

4	Inspect combination meter assy (MIL circuit).
----------	--

See the combination meter troubleshooting on page [BE-86](#).

NG	Repair or replace bulb or combination meter assembly.
-----------	--

OK

Check and repair harness and connector between combination meter and ECM.
--

ENGINE (2UZ-FE)

D1DQ0-01

PRECAUTION

NOTICE:

Perform the **RESET MEMORY (AT initialization)** when replacing the automatic transmission assembly, engine assembly or ECM (See page [DI-1126](#)).

HINT:

Initialization can not be completed by only removing the battery.

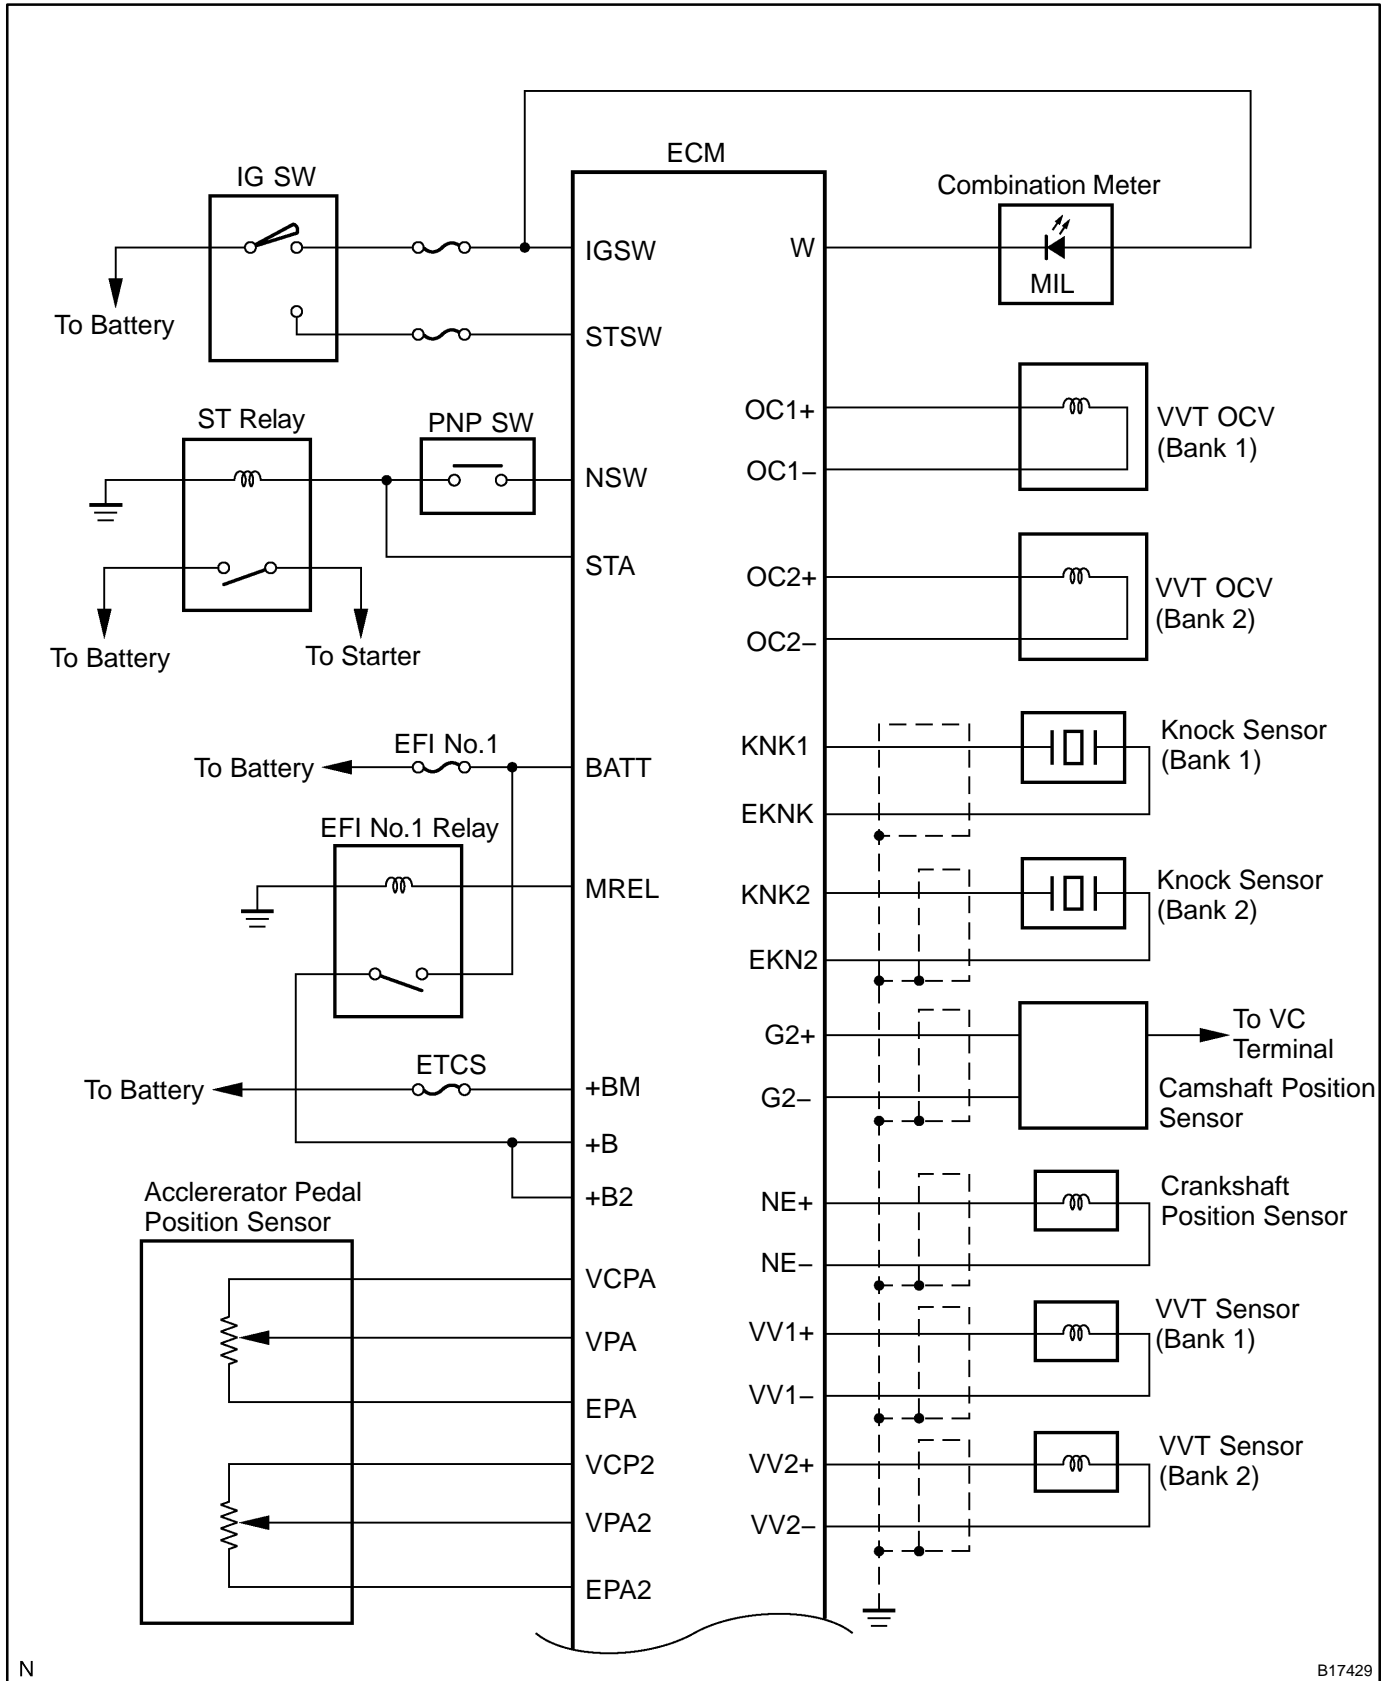

DEFINITION OF TERMS

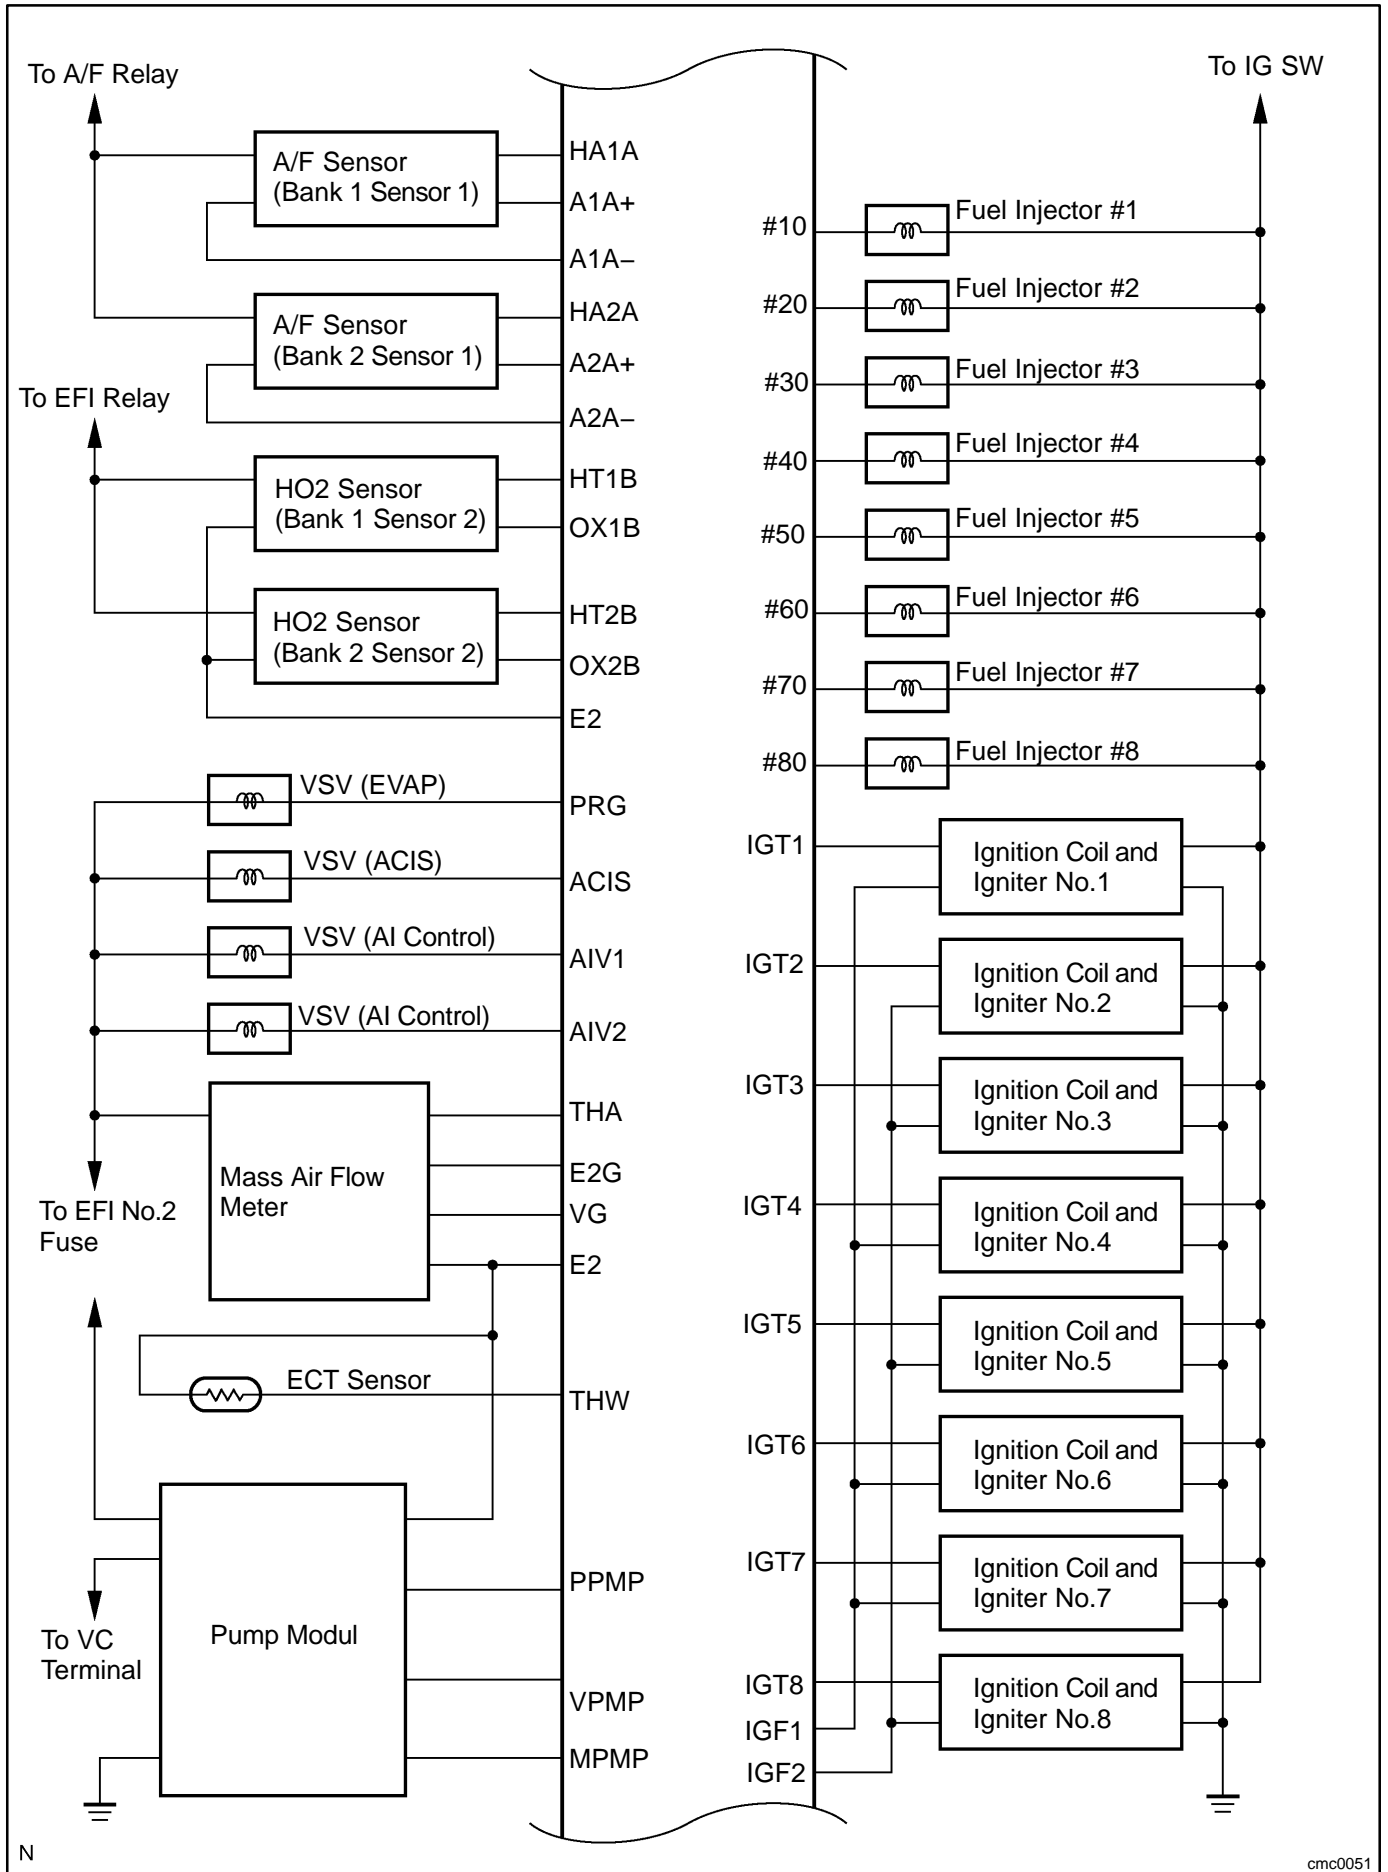

Term	Definition
Monitor description	Description of what the ECM monitors and how it detects malfunctions (monitoring purpose and its details).
Related DTCs	A group of diagnostic trouble codes that are output by the ECM based on the same malfunction detection logic.
Typical enabling condition	Preconditions that allow the ECM to detect malfunctions. With all preconditions satisfied, the ECM sets the DTC when the monitored value(s) exceeds the malfunction threshold(s).
Sequence of operation	The priority order that is applied to monitoring, if multiple sensors and components are used to detect the malfunction. When a sensor is being monitored, the next sensor or component will not be monitored until the sensor monitoring is finished.
Required sensor/components	The sensors and components that are used by the ECM to detect malfunctions.
Frequency of operation	The number of times that the ECM checks for malfunctions per driving cycle. "Once per driving cycle" means that the ECM detects the malfunction only one time during a single driving cycle. "Continuous" means that the ECM detects malfunction every time an enabling condition is met.
Duration	The minimum time that the ECM must sense a continuous deviation in the monitored value(s) before setting a DTC. This timing begins after the "typical enabling conditions" are met.
Malfunction thresholds	Beyond this value, the ECM will conclude that there is a malfunction and set a DTC.
MIL operation	MIL illumination timing after a defect is detected. "Immediately" means that the ECM illuminates MIL the instant the ECM determines that there is a malfunction. "2 driving cycle" means that the ECM illuminates MIL if the same malfunction is detected again in the 2nd driving cycle.

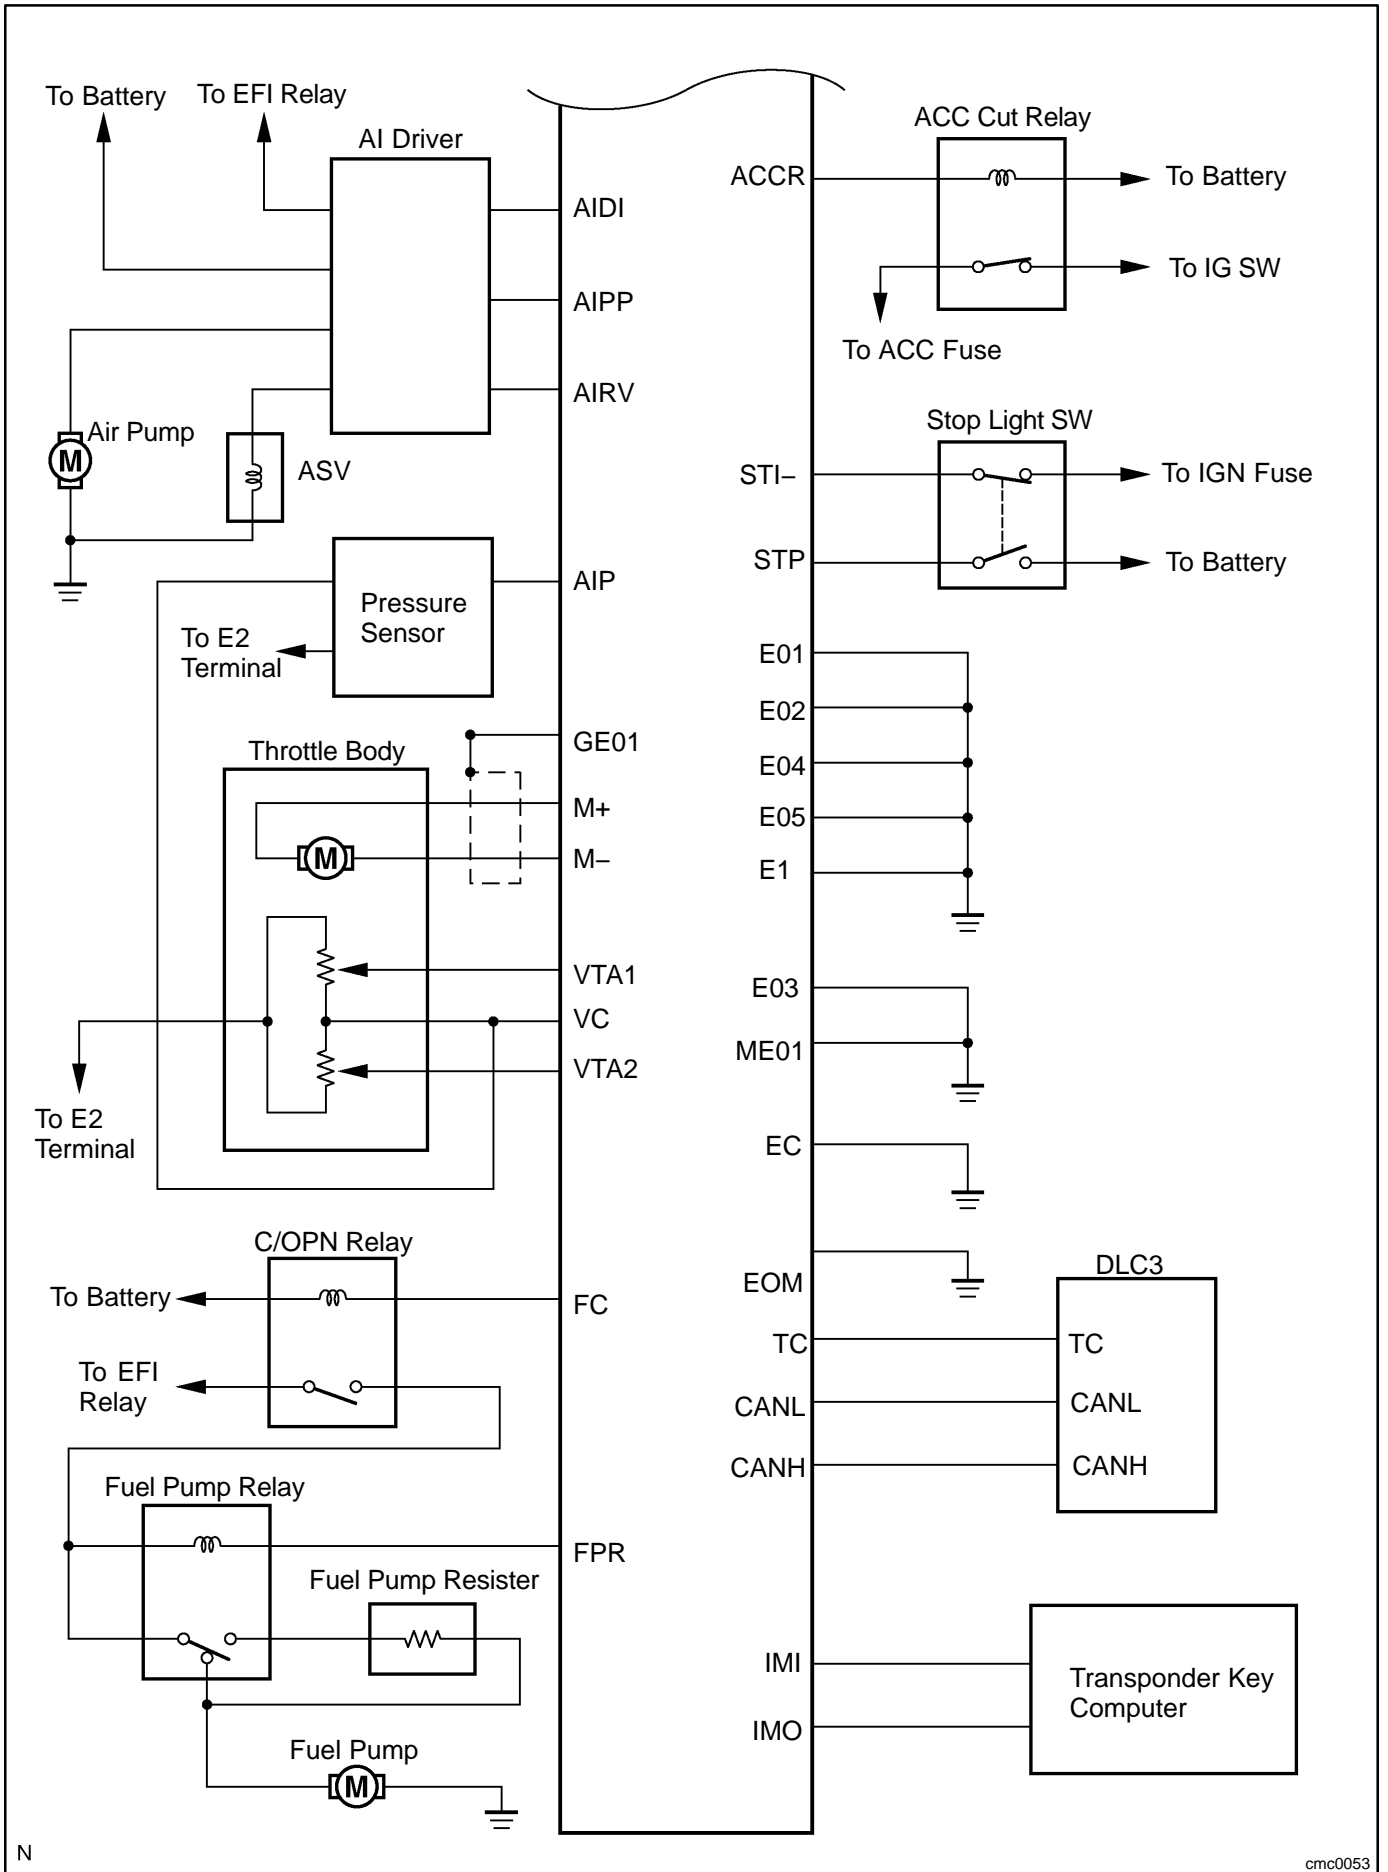

LOCATION

SYSTEM DIAGRAM

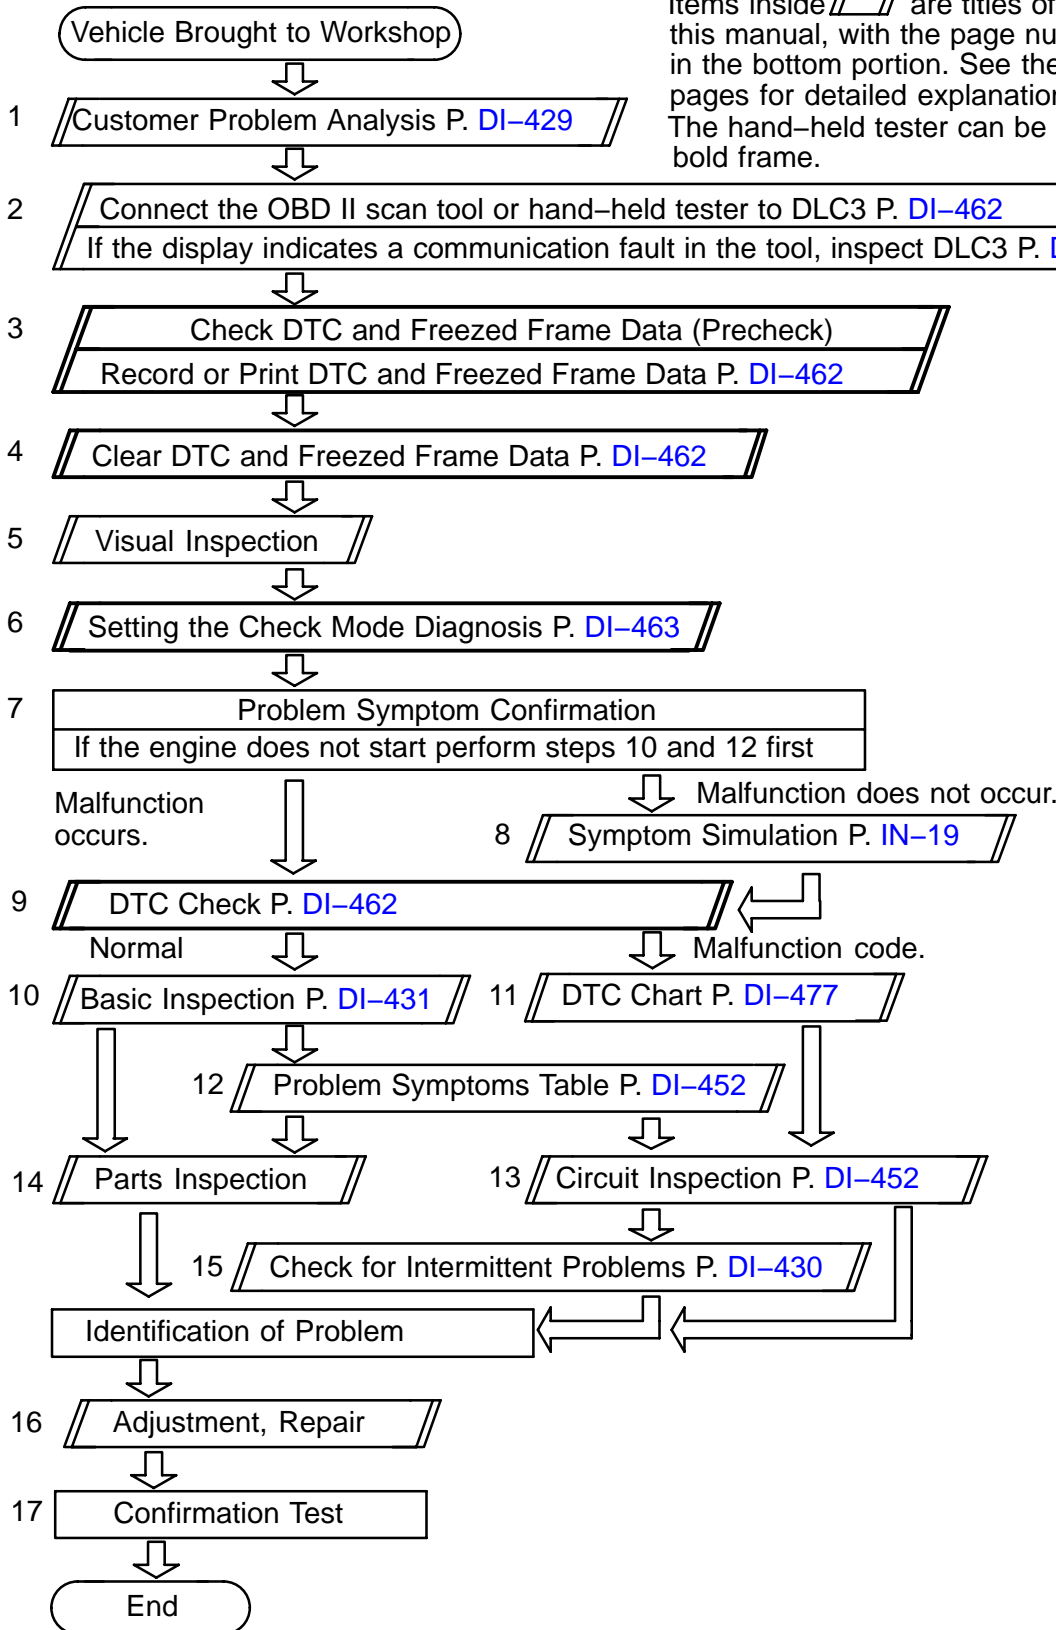

HOW TO PROCEED WITH TROUBLESHOOTING

Troubleshoot in accordance with the procedure on the following page.

Items inside **//** are titles of pages in this manual, with the page number in the bottom portion. See the indicated pages for detailed explanations. The hand-held tester can be used at **//**.

CHECK FOR INTERMITTENT PROBLEMS

HINT:

Hand-held tester only:

Inspect the vehicle's ECM using check mode. Intermittent problems are easier to detect with a hand-held tester when the ECM is in check mode. In check mode, the ECM uses 1trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

- (a) Clear DTCs (see page [DI-462](#)).
- (b) Switch the ECM from normal mode to check mode using a hand-held tester (see page [DI-463](#)).
- (c) Perform a simulation test (see page [IN-19](#)).
- (d) Check and wiggle the harness(es), connector(s) and terminal(s) (see page [IN-30](#)).

BASIC INSPECTION

When the malfunction is not confirmed in the DTC check, troubleshooting should be carried out in all the possible circuits considered as causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location causing the problem can be found quickly and efficiently. Therefore, using this check is essential in the engine troubleshooting.

1	Is battery voltage 11 V or more when engine stopped?
----------	---

NO	Charge or replace battery.
-----------	-----------------------------------

YES

2	Is engine cranked?
----------	---------------------------

NO	Proceed to page ST-18 and continue to troubleshoot.
-----------	--

YES

3	Does engine start?
----------	---------------------------

NO	Go to step 6.
-----------	----------------------

YES

4 Check air filter.**PREPARATION:**

Remove the air filter.

CHECK:

Visual check that the air filter is not excessively dirty or oily.

NG**Repair or replace air filter.****OK****5 Check idle speed (See page [EM-11](#)).****NG****Proceed to problem symptoms table on page [DI-452](#).****OK****6 Check fuel pressure (See page [SF-7](#)).****NG****Proceed to page [SF-7](#) and continue to trouble-shoot.****OK****7 Check for spark (See page [IG-1](#)).****NG****Proceed to page [IG-1](#) and continue to trouble-shoot.****OK****Proceed to problem symptoms table on page [DI-452](#).**

REGISTRATION

NOTICE:

The Vehicle Identification Number (VIN) must be input into the replacement ECM.

HINT:

The VIN is in the form of a 17–digit alphanumeric vehicle identification number. A hand–held tester is required to register the VIN.

1. DESCRIPTION

This registration section consists of three parts, Input Instructions, Read VIN and Write VIN.

- (a) Input Instructions: Explains the general VIN input instructions using a hand–held tester.
- (b) Read VIN: Explains the VIN reading process in a flowchart. This process allows the VIN stored in the ECM to be read, in order to confirm that the two VINs, provided with the vehicle and stored in the vehicle's ECM, are the same.
- (c) Write VIN: Explains the VIN writing process in a flowchart. This process allows the VIN to be input into the ECM. If the ECM is changed, or the VIN and VIN do not match, the VIN can be registered, or overwritten in the ECM by following this procedure.

2. INPUT INSTRUCTIONS

- (a) Hand–held tester
The arrow buttons (UP, DOWN, RIGHT and LEFT) and numerical buttons (0 to 9) are used, in order to input the VIN.
- (b) Cursor Operation
To move the cursor around the tester screen, press the RIGHT and LEFT buttons.
- (c) Alphabetical Character Input
 - (1) Press the UP and DOWN buttons to select the desired alphabetical character.
 - (2) After selection, the cursor should move.
- (d) Numeric Character Input
 - (1) Press the numerical button corresponding to the number that you want to input.
 - (2) Select or input the correct character using the UP/DOWN buttons, or the numerical buttons.

HINT:

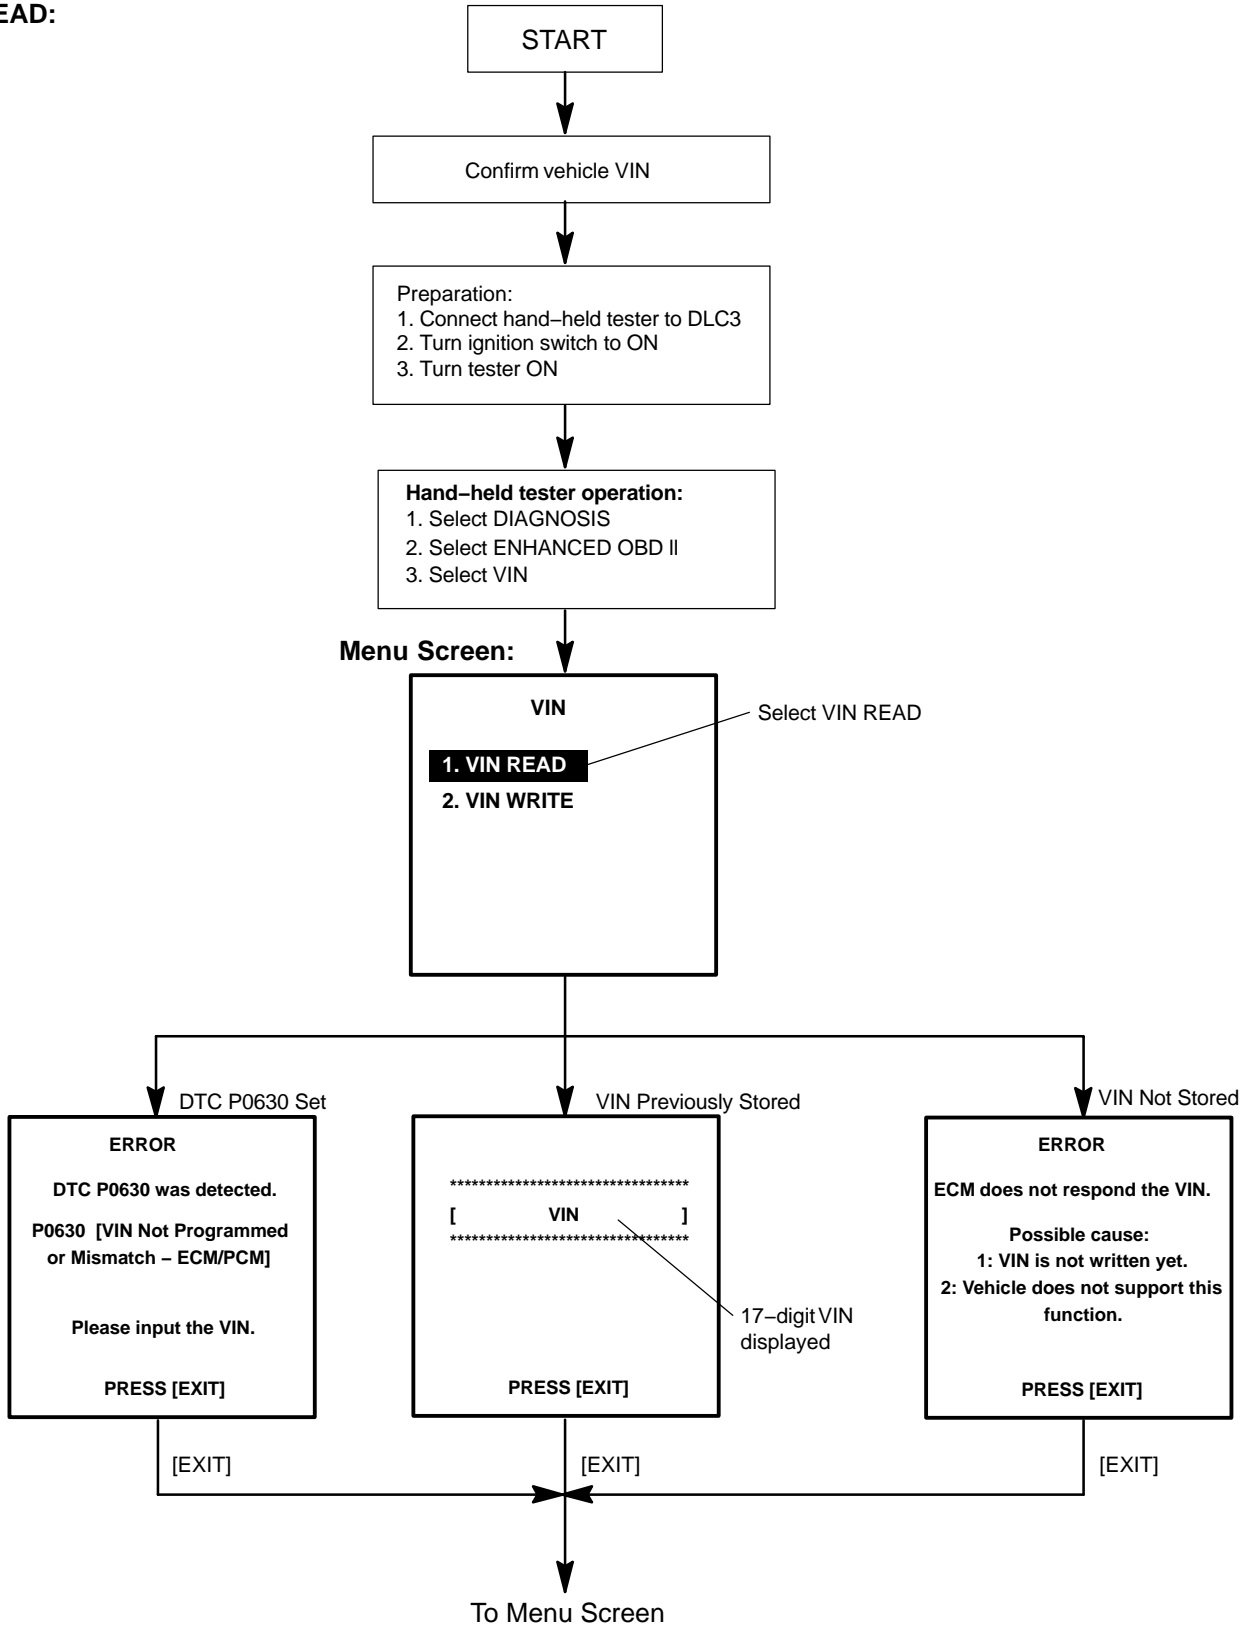

Numerical characters can be selected by using the UP and DOWN buttons.

- (e) Correction
 - (1) After input, the cursor should move.
 - (2) When correcting the input character(s), put the cursor onto the character using the RIGHT or LEFT buttons.
- (f) Finishing Input Operation
 - (1) Make sure that the input VIN matches the vehicle VIN after input.
 - (2) Press the ENTER button on the tester.

3. READ VIN (Vehicle Identification Number)

(a) Read VIN using a hand-held tester.

READ:

4. WRITE VIN

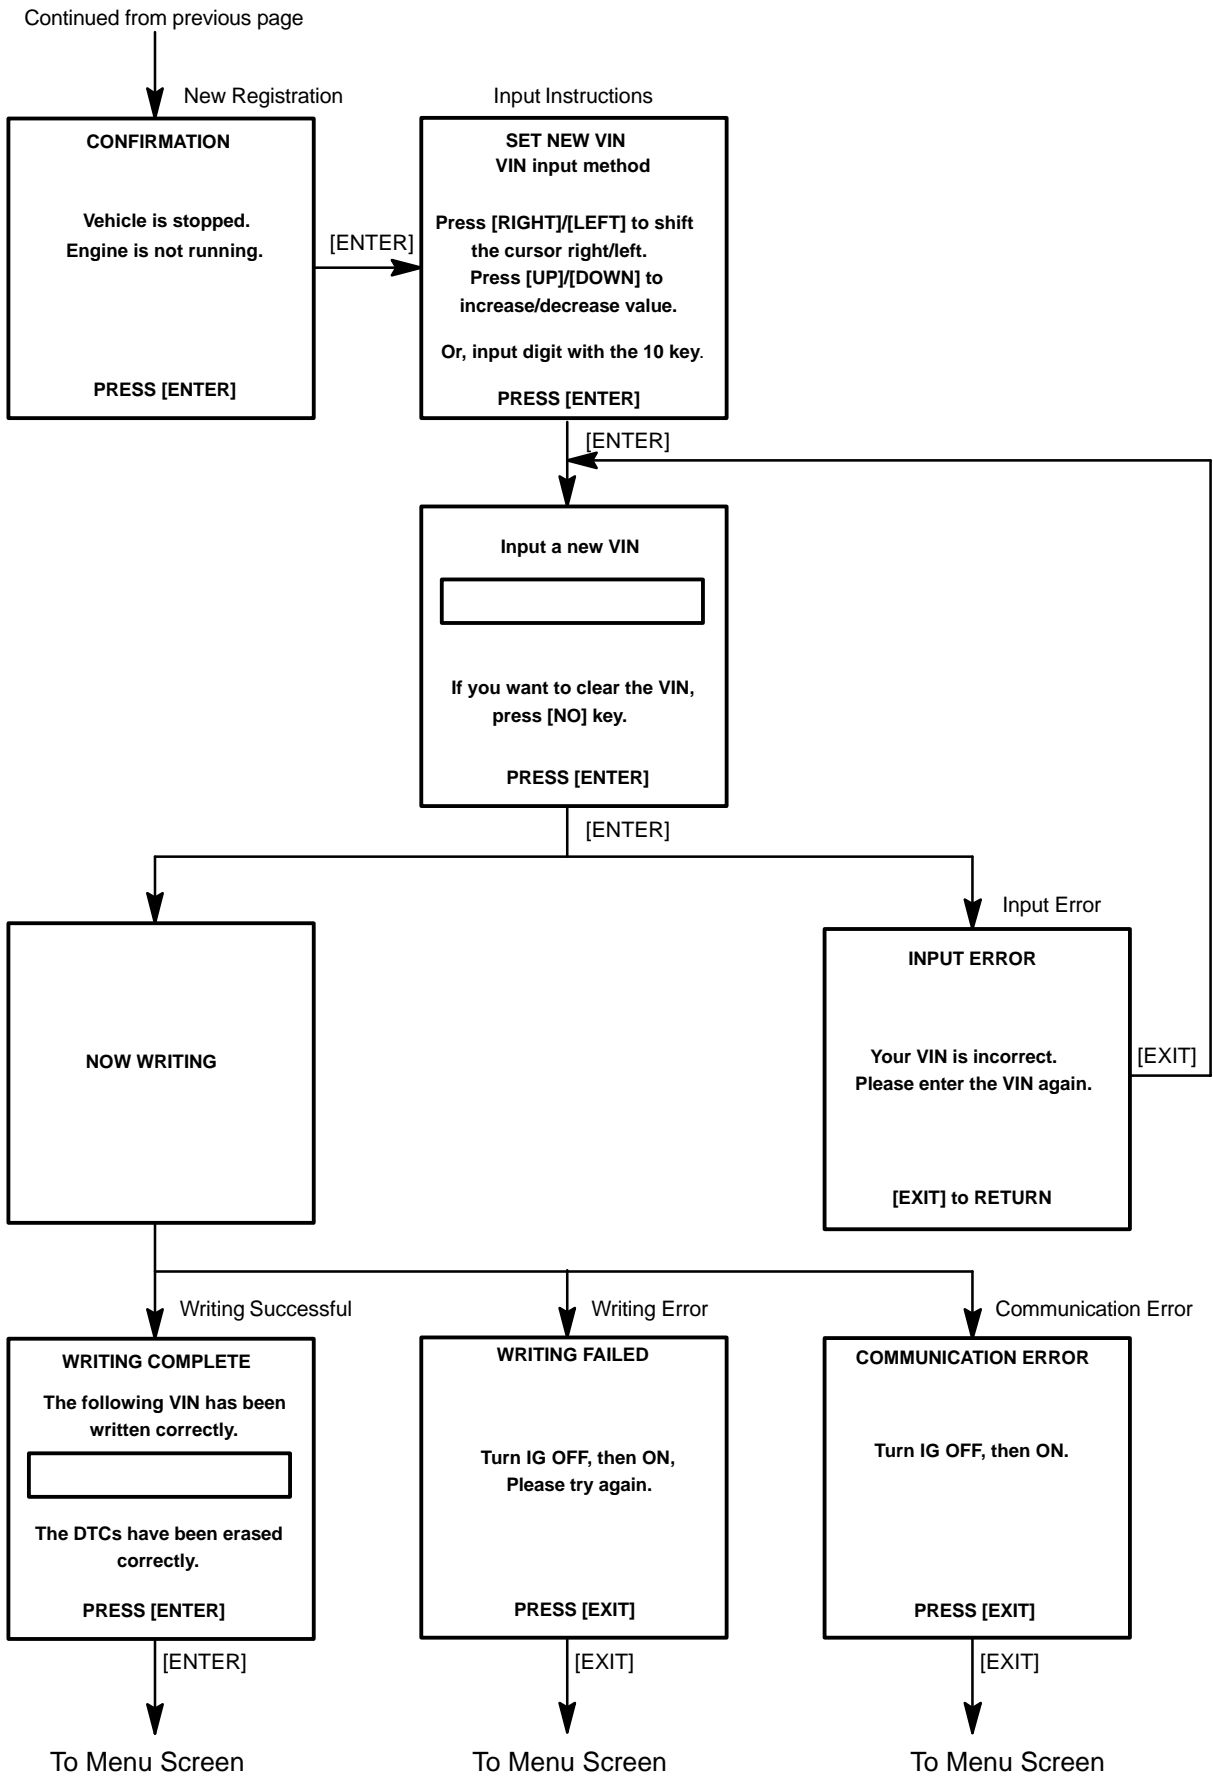

(a) Write VIN using the hand-held tester.

Write:

Menu Screen:

LIST OF DISABLE A MONITOR

HINT:

This table indicates ECM monitoring status for the items in the upper columns if the DTCs in each line on the left are being set.

As for the "X" mark, when the DTC on the left is stored, detection of the DTC in the upper column is not performed.

Monitor detected malfunction	Fault code		Component/system		Monitor disablement (X - disabled)

O2S TEST RESULT

INTRODUCTION

The O2S TEST RESULT refers to the results of the engine control module (ECM) when it monitors the oxygen sensor (O2S), and it can be read using the hand-held tester or the generic OBD II scan tool. Based on this, you can find the O2S's conditions.

The ECM monitors the O2S in the various items. You can read the monitor result (TEST DATA) of each monitor item using the O2S TEST RESULT. However, the output value of the TEST DATA is the latest "snapshot" value that is taken after monitoring and therefore it is not dynamic.

In this repair manual, the description of the O2S TEST RESULT (for O2S related DTCs) are written in a table.

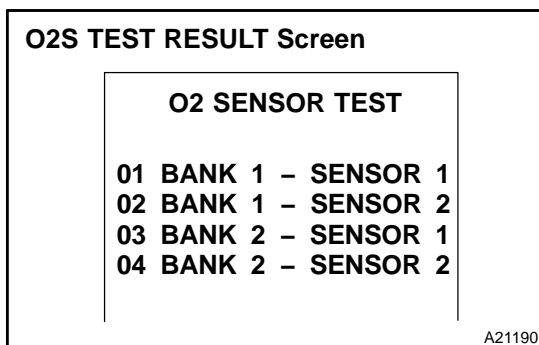

This table consists of 5 items:

- (1) TEST ID (a code applied to each TEST DATA)
- (2) Description of TEST DATA
- (3) Conversion Factor (When Conversion Factor has a value written in the table, multiply the TEST DATA value appearing on the scan tool by the Conversion Factor value. The result will be the required value.)
- (4) Unit
- (5) Standard Value

If the TEST DATA value appearing on the scan tool is out of the standard value, the O2S is malfunctioning. If it is within the standard value, the O2S is functioning normally. However, if the value is on the borderline of the standard value, the O2S may malfunction very soon.

HOW TO READ O2S TEST RESULT USING HAND-HELD TESTER

- (a) Connect the hand-held tester to the DLC3.

- (b) On the tester screen, select the following menus: DIAGNOSIS / CARB OBDII / O2S TEST RESULT. A list of the O2S equipped on the vehicle will be displayed.

- (c) Select the desired O2S and press ENTER. The following screen will appear.
- (d) Press HELP and * simultaneously. More information will appear.
- (e) Example:
 - (1) The hand-held tester displays "17" as a value of the "TIME \$81" (see the illustration on the left).
 - (2) Find the Conversion Factor value of "TIME \$81" in the O2S TEST RESULT chart below. 0.3906 is specified for \$81 in this chart.
 - (3) Multiply "17" in step (1) by 0.3906 (Conversion Factor) in the step (2).
 $17 \times 0.3906 = 6.6 \%$
 - (4) If the answer is within the standard value, the "TIME \$81" can be confirmed to be normal.

O2S TEST RESULT Chart

TEST ID	Description of TEST DATA	Conversion Factor	Unit	Standard Value
\$81	Percentage of monitoring time when the HO2S voltage is less than 0.05V	Multiply 0.3906	%	Within 60 %

CHECKING MONITOR STATUS

1. OUTLINE

The monitor results and the test values can be checked with the OBD II scan tool.

The engine control module (ECM) monitors the emissions-related components as the thermostat, catalyst converter and evaporative emissions (EVAP), and determines whether they are functioning normally or not. When finished and monitoring, the ECM stores the monitor results and the test values.

The monitor result indicates whether the component is functioning normally or not. The test value is the value that was used to determine the monitor result. If the test value is outside the test limit (malfunction criterion), the ECM determines the component is malfunctioning. Some emissions-related components have multiple test values to determine monitor result. If one of these test values is outside test limit, the ECM determines the component is determine monitor result. If one of these test values is outside test limit, the ECM determines the components is malfunctioning.

2. DESCRIPTION

The test value and test limit information are described as shown in the following table. This information is included under "MONITOR RESULT" in the emissions-related DTC sections.

Thermostat:

MID	TID	Scaling	Test Result	Minimum Test Limit	Maximum Test Limit
\$E1	\$E8	Multiply by 0.1 [°C]	ECT sensor output when estimated ECT reached to malfunction criteria	Malfunction criteria	Maximum test limit

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

3. PROCEDURE (USING HAND-HELD TESTER)

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch and hand-held tester ON.
- Clear DTCs.
- Allow the vehicle to drive, in accordance with the applicable drive pattern described in the READINESS MONITOR DRIVE PATTERN section (see page [DI-446](#)).
- Check the monitor result. Select the hand-held tester menus: DIAGNOSIS/ENHANCED OBDII/MONITOR INFO/MONITOR STATUS. The monitor result appears after the component name.
 - AVAIL indicates the component has not been monitored yet.
 - COMPL indicates the component is functioning normally.
 - INCMPL indicates the component is malfunctioning.
- Check the test value(s). Select the hand-held tester menus: DIAGNOSIS/ENHANCED OBDII/MONITOR INFO/TEST RESULT.
- Select the component and press ENTER. If the monitor result has been COMPL or INCMPL, the accuracy test value appears.
- Compare the test value with the test limits, MIN and MAX.
 - If the test value is outside of the test limit, the component is malfunctioning.
 - If the test value is on the borderline of the test limit, a malfunction is concealed in the component.

HINT:

The monitor result might on rare occasions be COMPL even if the malfunction indicator lamp (MIL) is illuminated. This indicates the system malfunctioned on a previous driving cycle. This might be caused by an intermittent problem.

READINESS MONITOR DRIVE PATTERN

1. PURPOSE OF THE READINESS TESTS

- The On-Board Diagnostic (OBD II) system is designed to monitor the performance of emission-related components and report any detected abnormalities in the form of Diagnostic Trouble Codes (DTCs). Since the various components need to be monitored during different driving conditions, the OBD II system is designed to run separate monitoring programs called Readiness Monitors. Many state Inspection and Maintenance (I/M) programs require that vehicles complete their Readiness Monitors prior to beginning an emission test.
- The current status of the Readiness Monitors can be seen by using the hand-held tester with version 9.0 software (or newer), or a generic OBD II Scan tool.
- To view the Readiness Monitor status using the hand-held tester, select "Monitor Status" from the Enhanced OBD II Menu.
- A status of "complete" indicates that the necessary conditions have been met to run the performance tests for the related Readiness Monitor.
- The Readiness Monitor will be reset to "incomplete" if:
 - ECM has lost power (battery or fuse).
 - DTCs have been cleared.
 - The conditions for running the Readiness Monitor have not been met.
- In the event that any Readiness Monitor shows "incomplete," follow the appropriate Readiness Monitor Drive Pattern to activate the monitor and change the readiness status to "complete."

CAUTION:

Strictly observe the posted speed limits, traffic laws, and road conditions when performing these drive patterns.

NOTICE:

These drive patterns represent the fastest method to satisfy all necessary conditions which allow the specific readiness monitor to complete.

In the event that the drive pattern must be interrupted (possibly due to traffic conditions or other factors) the drive pattern can be resumed, and in most cases, the readiness monitor will still set to "complete".

To ensure rapid completion of readiness monitors, avoid sudden changes in vehicle load and speed (driving up and down hills and/or sudden acceleration).

Contents:

TITLE	STEP(s)
CATALYST MONITOR	2
EVAP MONITOR	3, 4
AIR-FUEL RATIO (A/F) AND OXYGEN SENSOR (O ₂ S) MONITOR	5
OXYGEN SENOSR HEATER MONITOR	6

2. CATALYST MONITOR (ACTIVE AIR-FUEL RATIO CONTROL TYPE)

(a) Preconditions

The monitor will not run unless:

- The MIL is OFF

(b) Drive Pattern

- (1) Connect a hand-held tester or OBD II scan tool to the DLC3.
- (2) Turn the ignition switch to ON.
- (3) Turn the tester or scan tool ON.
- (4) Clear DTCs (where set) (see page [DI-462](#)).
- (5) Start the engine and warm it up.
- (6) Drive the vehicle at between 40 mph and 70 mph (64 km/h and 113 km/h) for at least 10 minutes.

(c) Monitor Status

- (1) Check the Readiness Monitor status displayed on the tester or scan tool.
- (2) If the status does not switch to COMPL (complete), extend the driving time.

3. EVAP MONITOR (VACUUM PRESSURE MONITOR)

NOTICE:

A cold soak must be performed prior to conducting the drive pattern to complete the Internal Pressure Readiness Monitor.

(a) Cold Soak Preconditions

The monitor will not run unless:

- MIL is OFF
- Fuel level is approximately 1/2 to 3/4
- Altitude is 7,800 feet (2,400 m) or less

(b) Cold Soak Procedure

Let the vehicle cold soak for 8 hours or until the difference between IAT and ECT becomes less than 7°C (13°F)

HINT:

Examples:

- Scenario 1

ECT = 24°C (75°F)

IAT = 16°C (60°F)

Difference between ECT and IAT is 8°C (15°F)

→ The monitor will not run because difference between ECT and IAT is greater than 7°C (13°F)

- Scenario 2

ECT = 21°C (70°F)

IAT = 20°C (68°F)

Difference between ECT and IAT is 1°C (2°F)

→ The monitor will run because difference between ECT and IAT is less than 7°C (13°F)

4. EVAP MONITOR (VACUUM PRESSURE MONITOR) (CONTINUED)

(a) Preconditions

The monitor will not run unless:

- MIL is OFF
- Fuel level is approximately 1/2 to 3/4
- Altitude is 7,800 feet (2,400 m) or less
- Engine Coolant Temperature (ECT) is between 4.4°C and 35°C (40°F and 95°F)
- Intake Air Temperature (IAT) is between 4.4°C and 35°C (40°F and 95°F)
- Cold Soak Procedure has been completed
- Before starting the engine, the difference between ECT and IAT must be less than 7°C (13°F)

HINT:

Examples:

- Scenario 1
ECT = 24°C (75°F)
IAT = 16°C (60°F)
Difference between ECT and IAT is 8°C (15°F)
→ The monitor will not run because difference between ECT and IAT is higher than 7°C (13°F)
- Scenario 2
ECT = 21°C (70°F)
IAT = 20°C (68°F)
Difference between ECT and IAT is 1°C (2°F)
→ The monitor will run because difference between ECT and IAT is less than 7°C (13°F)

The readiness test can be completed in cold ambient conditions (less than 40°F / 4.4°C) and/or at high altitudes (more than 7,800 feet / 2,400 m) if the drive pattern is repeated a second time after cycling the ignition off.

(b) Drive Pattern

- (1) Connect the OBD II scan tool to DLC3 to check monitor status and preconditions (refer to (a)).
- (2) Release pressure in fuel tank by removing the fuel tank cap and then reinstall it.
- (3) Start the engine and allow it to idle until ECT becomes 75°C (167°F) or higher.
- (4) Run the engine at 3,000 rpm for approximately 10 seconds.
- (5) Allow the engine to idle with the A/C ON (to create slight load) for 15 to 50 minutes.

NOTICE:

If the vehicle is not equipped with A/C, put a slight load on the engine by doing the following :

- **Securely set the parking brake.**
- **Block the drive wheels with wheel chocks.**
- **Allow the vehicle to idle in drive for 15 to 50 minutes.**

5. AIR-FUEL RATIO (A/F) AND OXYGEN SENSOR (HO2) MONITOR (ACTIVE AIR-FUEL RATIO CONTROL TYPE)

(a) Preconditions

The monitor will not run unless:

- 2 minutes or more have elapsed since the engine was started.
- The Engine Coolant Temperature (ECT) is 75°C (167°F) or higher.
- Air-fuel ratio feedback control is performed.
- Fuel-cut control is performed for 8 seconds or more.

(b) Drive Pattern

- (1) Connect the hand-held tester to DLC3.
- (2) Turn the ignition switch to ON.
- (3) Clear DTCs (see page [DI-462](#)).
- (4) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
- (5) Drive the vehicle at 40 mph (64 km/h) or more for at least 10 minutes.
- (6) Change the transmission to 2nd gear.
- (7) Accelerate the vehicle to 30 mph (48 km/h) or more by depressing the accelerator pedal for at least 10 seconds.
- (8) Soon after performing step (8) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
- (9) Stop the vehicle and allow the engine to idle for 10 seconds or more.
- (10) Allow the vehicle to decelerate until the vehicle speed declines to less than 6 mph (10 km/h).
- (11) Repeat steps from (8) through (10) above at least 3 times in one driving cycle.

(c) Monitor Status

- (1) Check the Readiness Monitor status displayed on the tester.
- (2) If the status does not switch to COMPL (complete), make sure that the preconditions have been met, and then perform steps from (5) through (11) in Drive Pattern above.

6. OXYGEN SENSOR HEATER MONITOR

A18915

(a) Preconditions

The monitor will not run unless:

- MIL is OFF

(b) Drive Pattern

- (1) Connect the OBD II scan tool to the DLC3 to check monitor status and preconditions (refer to (a)).
- (2) Start the engine and allow it to idle for 500 seconds or more.
- (3) Drive the vehicle at 25 mph (40 km/h) or more for at least 2 minutes.
- (4) Check the status of the readiness monitor on the scan tool display. If readiness status did not switch to complete, ensure the preconditions are met, turn the ignition off and then repeat steps (2) and (3).

PROBLEM SYMPTOMS TABLE

Symptom	Suspect Area	See page
Engine does not crank (Does not start)	1. Starter 2. Starter relay 3. Park/neutral position switch	ST-1 ST-20 DI-1159
No initial combustion (Does not start)	1. ECM power source circuit 2. Fuel pump control circuit 3. ECM	DI-918 DI-937 IN-30
No complete combustion (Does not start)	Fuel pump control circuit	DI-937
Engine cranks normally but difficult to start	1. Starter signal circuit 2. Fuel pump control circuit 3. Compression	DI-723 DI-937 EM-3
Difficult to start with cold engine	1. Starter signal circuit 2. Fuel pump control circuit	DI-723 DI-937
Difficult to start with hot engine	1. Starter signal circuit 2. Fuel pump control circuit	DI-723 DI-937
High engine idle speed (Poor idling)	1. A/C switch circuit 2. ECM power source circuit	- DI-918
Low engine idle speed (Poor idling)	1. A/C switch circuit 2. Fuel pump control circuit	- DI-937
Rough idling (Poor idling)	1. Compression 2. Fuel pump control circuit	EM-3 DI-937
Hunting (Poor idling)	1. ECM power source circuit 2. Fuel pump control circuit	DI-918 DI-937
Hesitation/Poor acceleration (Poor driveability)	1. Fuel pump control circuit 2. A/T faulty	DI-937 -
Surging (Poor driveability)	Fuel pump control circuit	DI-937
Engine stalls soon after starting	Fuel pump control circuit	DI-937
Engine stalls during A/C operation	1. A/C switch circuit 2. ECM	- IN-30

TERMINALS OF ECM

Each ECM terminals' standard voltage is shown in the table below. In the table, first follow the information under "Condition".

Look under "Symbols (Terminals No.)" for the terminals to be inspected.

The standard voltage between the terminals is shown under "STD Voltage".

Use the illustration above as a reference for the ECM terminals.

Symbols (Terminals No.)	Wiring Color	Condition	STD Voltage
BATT (E3-3) - E1 (E5-1)	B-R - BR*2 B-Y - BR*3	Always	9 to 14 V
+BM (E3-7) - E1 (E5-1)	G-Y - BR*2 W-G - BR*3		
IGSW (E3-9) - E1 (E5-1)	B-O - BR	IG switch ON	9 to 14 V
+B (E3-1) - E1 (E5-1)	W-L - BR*2 B-R - BR*3		
+B2 (E3-2) - E1 (E5-1)	W-L - BR*2 B-R - BR*3		
MREL (E3-8) - E1 (E5-1)	GR-G - BR*2 B-W - BR*3	IG switch ON	9 to 14 V
VC (E7-23) - E2 (E7-28)	G-B - B-W	IG switch ON	4.5 to 5.5 V
VG (E7-30) - E2G (E7-29)	R-Y - B-Y	Idling, P or N position, A/C switch OFF	0.5 to 3.0 V
THA (E7-22) - E2 (E7-28)	Y-G - B-W	Idling, Intake air temp. 20°C (68°F)	0.5 to 3.4 V
THW (E7-21) - E2 (E7-28)	G - B-W	Idling, Engine coolant temp. 80°C (176°F)	0.2 to 1.0 V
VTA1 (E7-20) - E2 (E7-28)	GR - B-W	IG switch ON, Accelerator pedal released	0.5 to 1.2 V
		IG switch ON, Accelerator pedal depressed	3.2 to 4.8 V
VTA2 (E7-19) - E2 (E7-28)	P-L - B-W	IG switch ON, Accelerator pedal released	2.0 to 3.1 V
		IG switch ON, Accelerator pedal depressed	4.7 to 5.1 V
VPA (E3-18) - E2 (E7-28)	R-G - B-W	IG switch ON, Accelerator pedal released	0.3 to 0.9 V
		IG switch ON, Accelerator pedal depressed	3.2 to 4.8 V
VPA2 (E3-19) - E2 (E7-28)	L - B-W	IG switch ON, Accelerator pedal released	1.8 to 2.7 V
		IG switch ON, Accelerator pedal depressed	4.7 to 5.1 V
VCPA (E3-26) - EPA (E3-20)	P-G - V-R*2 P-G - V*3	IG switch ON	4.5 to 5.5 V

VCP2 (E3-27) - EPA2 (E3-21)	G-R - LG-R	IG switch ON	4.5 to 5.5 V
#10 (E5-2) - E01 (E7-7) #20 (E5-3) - E01 (E7-7) #30 (E5-4) - E01 (E7-7) #40 (E5-5) - E01 (E7-7) #50 (E5-6) - E01 (E7-7) #60 (E5-7) - E01 (E7-7) #70 (E7-3) - E01 (E7-7) #80 (E7-2) - E01 (E7-7)	R - W-B W - W-B G - W-B R-B - W-B L - W-B Y - W-B L-R - W-B R-W - W-B	IG switch ON Idling	9 to 14 V Pulse generation (See waveform 1)
KNK1 (E6-29) - EKNK (E6-28)	G - R	Maintain engine speed at 4,000 rpm after warming up	Pulse generation (See waveform 2)
KNK2 (E6-21) - EKN2 (E6-20)	W - B		
OC1+ (E5-17) - OC1- (E5-16)	G-B - L-Y	Accelerate slowly after engine warmed-up	Pulse generation (See waveform 3)

VV1+ (E5-25) - VV1- (E5-24)	G - L	Idling	Pulse generation (See waveform 4)
VV2+ (E5-18) - VV2- (E5-28)	W - B	Idling	Pulse generation (See waveform 4)
G2+ (E5-19) - G2- (E5-29)	Y - L	Idling	Pulse generation (See waveform 5)
NE+ (E5-21) - NE- (E5-20)	G - L	Idling	Pulse generation (See waveform 5)
PRG (E7-34) - E1 (E5-1)	W-G - BR	IG switch ON	9 to 14 V
SPD (E4-8) - E1 (E5-1)	G-O - BR	IG switch ON, Rotate driving wheel slowly	Pulse generation (See waveform 6)
M+ (E7-5) - E1 (E5-1)	R - BR	Idling	Pulse generation (See waveform 7)
M- (E7-4) - E1 (E5-1)	W - BR	Idling	Pulse generation (See waveform 8)
FPR (E5-30) - E1 (E5-1)	R-G - BR	IG switch ON	0 to 3.0 V
FC (E3-10) - E1 (E5-1)	Y - BR	IG switch ON	9 to 14 V
IGT1 (E7-8) - E1 (E5-1) IGT2 (E7-15) - E1 (E5-1) IGT3 (E7-11) - E1 (E5-1) IGT4 (E7-10) - E1 (E5-1) IGT5 (E7-13) - E1 (E5-1) IGT6 (E7-12) - E1 (E5-1) IGT7 (E7-14) - E1 (E5-1) IGT8 (E7-9) - E1 (E5-1)	L-Y - BR LG-B - BR L - BR G-R - BR W-R - BR V - BR P - BR LG - BR	Idling	Pulse generation (See waveform 9)
IGF1 (E7-24) - E1 (E5-1) IGF2 (E7-25) - E1 (E5-1)	L-B - BR L-W - BR	IG switch ON Idling	4.5 to 5.5 V Pulse generation (See waveform 9)
A1A+ (E6-22) - E1 (E5-1)	G - BR	Always (Ignition switch ON)	3.3 V*1
A1A- (E6-30) - E1 (E5-1)	L - BR	Always (Ignition switch ON)	3.0 V*1
A2A+ (E6-23) - E1 (E5-1)	V - BR	Always (Ignition switch ON)	3.3 V*1
A2A- (E6-31) - E1 (E5-1)	P - BR	Always (Ignition switch ON)	3.0 V*1
HT1B (E7-1) - E1 (E5-1) HT2B (E6-5) - E1 (E5-1)	R-L - BR Y-B - BR	Idling IG switch ON	Below 3.0 V 9 to 14 V
OX1B (E7-18) - E2 (E7-28)	B - B-W	Idling	Pulse generation (See waveform 10)

DIAGNOSTICS - ENGINE (2UZ-FE)

OX2B (E6-33) - E2 (E7-28)	W - B-W	Idling	Pulse generation (See waveform 10)
STP (E3-15) - E1 (E5-1)	G-W - BR*2 W-R - BR*3	Brake pedal is depressed	7.5 to 14 V
		Brake pedal is released	Below 1.5 V
ST1- (E3-16) - E1 (E5-1)	B - BR*2 G - BR*3	Brake pedal is depressed	Below 1.5 V
		Brake pedal is released	7.5 to 14 V
STA (E5-11) - E1 (E5-1)	P - BR	Shift lever position P or N, Ignition switch START	6.0 V or more
STSW (E5-12) - E1 (E5-1)	R-L - BR	Shift lever position P or N, ignition switch START	6.0 V or more
NSW (E6-8) - E1 (E5-1)	L-R - BR	IG switch ON, Other shift position in P, N	9 to 14 V
		IG switch ON, Shift position in P, N	0 to 3.0 V
W (E4-30) - E1 (E5-1)	V-G - BR	Idling	9 to 14 V
		IG switch ON	Below 3.0 V
TACH (E4-1) - E1 (E5-1)	L-W - BR*2 B - BR*3	Idling	Pulse generation (See waveform 11)
ACIS (E7-33) - E1 (E5-1)	G-W - BR	IG switch ON	9 to 14 V
VPMP (E3-5) - E1 (E5-1)	L-B - BR	Ignition switch ON	9 V to 14 V
MPMP (E3-6) - E1 (E5-1)	R-W - BR	• Vacuum pump OFF	0 V to 3 V
		• Vacuum pump ON	9 V to 14 V
PPMP (E3-22) - E1 (E5-1)	L-W - BR	Ignition switch ON	3 V to 3.6 V
AIV1 (E7-27) - E1 (E5-1)	B-L - BR	Ignition switch ON	9 to 14 V
AIV2 (E7-26) - E1 (E5-1)	G-Y - BR	Ignition switch ON	9 to 14 V
AIRV (E3-4) - E1 (E5-1)	G-B - BR	Ignition switch ON	9 to 14 V
AIRP (E3-25) - E1 (E5-1)	P - BR	Ignition switch ON	9 to 14 V
AIP (E7-32) - E1 (E5-1)	W-L - BR	Ignition switch ON	3 V to 3.6 V

*1: The ECM terminal voltage is constant regardless of the output voltage from the sensor.

*2: Access Cab, Standard Cab

*3: Double Cab

WAVEFORM 1

Fuel injector

ECM Terminal Names	Between #10 (to 40) and E01
Tester Ranges	20 V/DIV, 20 msec./DIV
Conditions	Idling

HINT:

The wavelength becomes shorter as the engine rpm increases.

WAVEFORM 2

Knock sensor

ECM Terminal Name	Between KNK1 and EKNK Between KNK2 and EKN2
Tester Range	1 V/DIV, 1 msec./DIV
Condition	Maintain engine RPM at 2,000 rpm after engine warmed-up

HINT:

- The wavelength becomes shorter as engine rpm increases.
- The waveforms and amplitudes displayed differ slightly depending on the vehicle.

WAVEFORM 3

VVT OCV

ECM Terminal Name	Between OC1+ and OC1- Between OC2+ and OC2-
Tester Range	0.2 V/DIV, 200 msec./DIV
Condition	Accelerate slowly after engine warmed-up

HINT:

In the DATA LIST, the items VVT OCV DUTY B1 and B2 show the duty ratio of voltage flowing to the OCV (see illustration on left).

VVT OCV DUTY B1, B2 = $A/B \times 100$ (%)

WAVEFORM 4

- (a) VVT sensor bank 1
- (b) VVT sensor bank 2
- (c) Crankshaft position sensor

ECM Terminal Name	(a) Between VV1+ and VV1- (b) Between VV2+ and VV2- (c) Between NE+ and NE-
Tester Range	2 V/DIV, 20 msec./DIV
Condition	Idle after engine warmed-up

HINT:

The wavelength becomes shorter as the engine rpm increases.

WAVEFORM 5

- (a) Camshaft position sensor
- (b) Crankshaft position sensor

ECM Terminal Name	(a) Between G2+ and G2- (b) Between NE+ and NE-
Tester Range	5 V/DIV, 20 msec./DIV
Condition	Idle after engine warmed-up

HINT:

The wavelength becomes shorter as the engine rpm increases.

WAVEFORM 6

Vehicle speed signal

ECM Terminal Name	Between SP2+ and SP2-
Tester Range	5 V/DIV, 10 msec./DIV
Condition	Driving by 40 km/h (25 mph)

HINT:

The wavelength becomes shorter as vehicle speed increases.

WAVEFORM 7

Throttle actuator positive terminal

ECM Terminal Name	Between M+ and ME01
Tester Range	5 V/DIV, 1 msec./DIV
Condition	Idle after engine warmed-up

HINT:

The duty ratio varies depending on the throttle opening operation.

WAVEFORM 8

Throttle actuator negative terminal

ECM Terminal Name	Between M- and ME01
Tester Range	5 V/DIV, 1 msec./DIV
Condition	Idle after engine warmed-up

HINT:

The duty ratio varies depending on the throttle opening operation.

WAVEFORM 9

- (a) Igniter IGT signal (from ECM to igniter)
- (b) Igniter IGF signal (from igniter to ECM)

ECM Terminal Name	(a) Between IGT1 (to IGT8) and E1 (b) Between IGF1 (IGF2) and E1
Tester Range	2 V/DIV, 20 msec./DIV
Condition	Idling

HINT:

The wavelength becomes shorter as vehicle speed increases.

**WAVEFORM 10**

Heated oxygen sensor

ECM Terminal Names	Between OX1B and E2
Tester Ranges	0.2 V/DIV, 200 msec./DIV
Conditions	Engine speed maintained 2,500 rpm for 2 minutes after warming up sensor

HINT:

In the DATA LIST, item O2S B1S2 shows the ECM input values from the heated oxygen sensor.

**WAVEFORM 11**

Engine speed signal

ECM Terminal Names	Between TACH and E1
Tester Ranges	5 V/DIV, 10 msec./DIV
Conditions	Idling

HINT:

The wavelength becomes shorter as vehicle speed increases.

DIAGNOSIS SYSTEM

1. Description

- When troubleshooting On-Board Diagnostic (OBD II) vehicles, the vehicle must be connected to the hand-held tester. Various data output from the vehicle's ECM can then be read.
- OBD II regulations require that the vehicle's on-board computer illuminates the Malfunction Indicator Light (MIL) on the instrument panel when the computer detects a malfunction in: 1) the emission control system/components, or 2) the powertrain control components (which affect vehicle emissions), or 3) the computer. In addition, the applicable Diagnostic Trouble Codes (DTCs) prescribed by SAE J2012 are recorded in the ECM memory (See page [DI-477](#)).

If the malfunction does not reoccur in 3 consecutive trips, the MIL goes off automatically but the DTCs remain recorded in the ECM memory.

To check the DTC, connect the hand-held tester or OBD II scan tool to the Data Link Connector 3 (DLC3) of the vehicle. The hand-held tester or OBD II scan tool also enables you to erase the DTC and check the freeze frame data and various forms of engine data (See the instruction manual for the hand-held tester). The DTC includes SAE controlled codes and manufacturer controlled codes. SAE controlled codes must be set according to the SAE, while manufacturer controlled codes can be set by a manufacturer with certain restrictions (See the DTC chart on page [DI-477](#)).

2. NORMAL MODE AND CHECK MODE

The diagnosis system operates in "normal mode" during normal vehicle use. In "normal mode", 2 trip detection logic* is used to ensure accurate detection of malfunctions. A "check mode" is also available to technicians as an option. In "check mode", 1 trip detection logic is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent malfunctions (See page [DI-430](#)).

3. 2-TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory. This is known as 1st trip detection. If the ignition switch is turned OFF and then ON again, and the same malfunction is detected again, the MIL will illuminate. This is known as 2nd trip detection.

- Freeze frame data:
The freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

Priorities for troubleshooting:

When multiple DTCs occur, find out the order in which the DTCs should be inspected by checking the component's DTC chart. If no instructions are written in the DTC chart, check DTCs in the following order of priority:

- DTCs other than fuel trim malfunction DTCs (P0171, P0172, P0174 and P0175) and misfire DTCs (P0300 to P0308).
- Fuel trim malfunction DTCs (P0171, P0172, P0174 and P0175).
- Misfire DTCs (P0300 to P0308).

4. CHECK DLC3

The vehicle's ECM uses the ISO 9141–2 for communication protocol. The terminal arrangement of the DLC3 complies with SAE J1962 and matches the ISO 9141–2 format.

Symbol	Terminal Description	Condition	Specified Condition
SIL (7) – SG (5)	Bus "+" line	During transmission	Pulse generation
CG (4) – Body ground	Chassis ground	Always	Below 1 Ω
SG (5) – Body ground	Signal ground	Always	Below 1 Ω
BAT (16) – Body ground	Battery positive	Always	11 to 14 V
CANH (6) – CANL (14)	HIGH–level CAN bus line	Ignition switch OFF	54 to 69 Ω
CANH (6) – Battery positive	HIGH–level CAN bus line	Ignition switch OFF	1 M Ω or higher
CANH (6) – CG (4)	HIGH–level CAN bus line	Ignition switch OFF	1 k Ω or higher
CANL (14) – Battery positive	LOW–level CAN bus line	Ignition switch OFF	1 M Ω or higher
CANL (6) – CG (4)	LOW–level CAN bus line	Ignition switch OFF	1 k Ω or higher

HINT:

Connect the cable of the hand–held tester to the DLC3, turn the ignition switch ON and attempt to use the hand–held tester. If the screen displays UNABLE TO CONNECT TO VEHICLE, a problem exists in the vehicle side or the tester side.

- If the communication is normal when the tool is connected to another vehicle, inspect the DLC3 on the original vehicle.

- If the communication is still impossible when the tool is connected to another vehicle, the problem is probably in the tool itself, so consult the Service Department listed in the tool's instruction manual.

5. INSPECT BATTERY VOLTAGE

Battery Voltage: 11 to 14 V

If voltage is below 11 V, recharge the battery before proceeding.

6. CHECK MIL

- (a) The MIL comes on when the ignition switch is turned ON and the engine is not running.

HINT:

If the MIL is not illuminated, troubleshoot the MIL circuit (See page [DI-940](#)).

- (b) When the engine is started, the MIL should not illuminate. If the lamp remains on, the diagnosis system has detected a malfunction or abnormality in the system.

7. ALL READINESS

For this vehicle, using the hand-held tester allows readiness codes corresponding to all DTCs to be read. When diagnosis (normal or malfunctioning) has been complete, readiness codes are set. Enter the following menus: ENHANCED OBD II / MONITOR STATUS on the hand-held tester.

DTC CHECK / CLEAR

1. CHECK DTC

DTCs which are stored in the ECM can be displayed with the hand-held tester.

These scan tools can display pending DTCs and current DTCs. Some DTCs are not stored if the ECM does not detect a malfunction during consecutive driving. However, the detected malfunction during once driving is stored as pending DTC.

- (a) Connect the hand-held tester to the CAN VIM. Then connect the CAN VIM to the Data Link Connector 3 (DLC3).
- (b) Turn the ignition switch to ON.
- (c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES (or PENDING CODE).
- (d) Confirm the DTCs and freeze frame data and then write them down.
- (e) See page [DI-477](#) to confirm the details of the DTCs.

NOTICE:

When simulating a symptom with the hand-held tester to check the DTCs, use the normal mode. For DTC chart subject to "2 trip detection logic", perform either of the following actions.

Turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again. When the problem has been simulated twice, the MIL illuminates and the DTCs are recorded in the ECM.

2. CLEAR DTC

- (a) Connect the hand-held tester to the CAN VIM. Then connect the CAN VIM to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CLEAR CODES and press YES.

CHECK MODE PROCEDURE

HINT:

Hand-held tester only:

Check mode has a higher sensitivity to detect malfunctions and can detect malfunctions that normal mode cannot detect. Check mode can also detect all the malfunctions that normal mode can detect.

1. CHECK MODE PROCEDURE

- (a) Make sure that the items below are true.
 - (1) Battery positive voltage 11 V or more
 - (2) Throttle valve fully closed
 - (3) Transmission in the P or N position
 - (4) A/C switched OFF
- (b) Turn the ignition switch OFF.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch ON.
- (e) Change the ECM to check mode with the hand-held tester. Enter the following menus: DIAGNOSIS / ENHANCED OBD II / CHECK MODE. Make sure the MIL flashes as shown in the illustration.

NOTICE:

All DTCs and freeze frame data recorded will be erased if:

- 1) the hand-held tester is used to change the ECM from normal mode to check mode or vice-versa; or
- 2) during check mode, the ignition switch is turned from ON to ACC or OFF.

- (f) Start the engine. The MIL should turn off after the engine starts.
- (g) Simulate the conditions of the malfunction described by the customer.
- (h) After simulating the malfunction conditions, use the hand-held tester diagnosis selector to check the DTC, freeze frame data and other data.
- (i) After checking the DTC, inspect the applicable circuit.

2. CLEAR DTC (Using the hand-held tester)

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Erase DTCs and freeze frame data with the OBD II scan tool (complying with SAE J1978) or the hand-held tester. For the hand-held tester: 1) enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CLEAR CODES; and 2) press YES. For the OBD II scan tool, see its instruction manual.

3. CLEAR DTC (Not using the hand-held tester)

- (a) Remove the EFI No. 1 and ETCS fuses from the engine room J/B for more than 60 seconds, or disconnect the battery terminal for more than 60 seconds.

After disconnecting the battery terminal, perform the "INITIALIZE" procedure.

FAIL-SAFE CHART

If any of the following code is recorded, the ECM enters fail-safe mode.

DTC No.	Fail-Safe Operation	Fail-Safe Deactivation Conditions
P0031 P0032 P0037 P0038 P0051 P0052 P0057 P0058	The heater circuit in which an abnormality is detected is turned off	Ignition switch OFF
P0100 P0102 P0103	Ignition timing is calculated from engine speed and throttle angle	"Pass" condition detected
P0110 P0112 P0113	Intake air temperature is fixed at 20°C (68°F)	"Pass" condition detected
P0115 P0117 P0118	Engine coolant temperature is fixed at 80°C (176°F)	"Pass" condition detected
P0120 P0121 P0122 P0123 P0220 P0222 P0223 P0606 P0607 P0657 P2102 P2103 P2111 P2112 P2118 P2119 P2135	If the Electronic Throttle Control System (ETCS) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly. If the accelerator pedal is depressed quickly, the vehicle may speed up and slow down erratically.	"Pass" condition is detected and then the ignition switch is turned OFF.
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	Fuel cut	"Pass" condition detected
P2120 P2121 P2122 P2123 P2125 P2127 P2128 P2138	The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the remaining circuit is used to calculate the accelerator pedal opening to allow the vehicle to continue driving. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal to be fully closed. In this case, the throttle valve will remain closed as if the engine is idling.	"Pass" condition is detected and the ignition switch is turned OFF.

P2440 and P1441 and/or P1444	Restrict the throttle opening angle: $G_a \leq 30$ g/s	
P1441 and P1444	Restrict the throttle opening angle: $G_a \leq 50$ g/s	
P1441 P1444	Restrict the throttle opening angle: $G_a \leq 100$ g/s	
P2430 P2431 P2432 P2433	Restrict the throttle opening angle: $G_a \leq 50$ g/s	

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

By reading the DATA LIST displayed on a hand-held tester, you can check values, including those of the switches, sensors, and actuators, without removing any parts. Reading the DATA LIST as the first step of troubleshooting is one method of shortening diagnostic time.

NOTICE:

In the table below, the values listed under Normal Conditions are for reference only. Do not depend solely on these values when determining whether or not a part is faulty.

- Warm up the engine.
- Turn the ignition switch to OFF.
- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON.
- Turn the tester ON.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST.
- Check the values by referring to the table below.

Hand-Held Tester Display	Measurement Item:Range (Display)	Normal Condition *1	Diagnostic Note
INJECTOR	Injection period of the No. 1 cylinder: Min.: 0 ms, Max.: 32.64 ms	2.3 to 3.8 ms: Idling	—
IGN ADVANCE	Ignition timing advance for No. 1 cylinder/ Min.: -64 deg., Max.: 63.5 deg.	BTDC 4 to 17°: Idling	—
CALC LOAD	Calculated load by ECM: Min.: 0 %, Max.: 100 %	• 11 to 21 %: Idling • 12 to 22 %: Running without load (2,500 rpm)	—
VEHICLE LOAD	Vehicle load: Min.: 0 %, Max.: 25700 %	Actual vehicle load	—
MAF	Air flow rate from MAF meter: Min.: 0 g/s, Max.: 655 g/s	2.0 to 3.9 g/s: Idling	If the value approximately 0.0 g/s: • Mass air flow meter power source circuit open • VG circuit open or short If the value 160.0 g/s or more: • E2G circuit open
ENGINE SPD	Engine speed: Min.: 0 rpm, Max.: 16,383 rpm	600 ± 50 rpm: Idling	—
VEHICLE SPD	Vehicle speed: Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	Speed indicated on speedometer
COOLANT TEMP	Engine coolant temperature: Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F): After warming up	• If the value -40°C (-40°F): sensor circuit open • If the value 140°C (284°F): sensor circuit shorted
INTAKE AIR	Intake air temperature: Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	• If the value -40°C (-40°F): sensor circuit open • If the value 140°C (284°F): sensor circuit shorted
SECONDARY AIR	Second air system status: ON or OFF	ON: Secondary air system operation	—
AIR-FUEL RATIO	Air-fuel ratio: Min.: 0, Max.: 1.999	0.8 to 1.2: During idling	—
EVAP VAPOR PRES	EVAP vapor pressure: Min.: -8192 Pa, Max.: 8191 Pa	0 Pa: Fuel tank cap removed	—

PURGE DENSITY	Learning value of purge density/ Min.: -50, Max.: 350	Idling: -40 to 0 %	Service data
PURGE FLOW	Purge flow: Min.: 0 %, Max.: 102.4 %	0 to 100 %: Idling	—
EVAP PURGE VSV	EVAP (Purge) VSV control duty: Min.: 0 %, Max.: 100 %	0 to 100 %: During idling	Order signal from ECM
VAPOR PRESS	Vapor pressure: Min.: -4.125 kPa, Max.: 2.125 kPa	0 kPa: Fuel tank cap removed	Pressure inside fuel tank monitored by the vapor pressure sensor
KNOCK CRRT VAL	Correction learning value of knocking: Min.: -64 CA, Max.: 1,984 CA	0 to 22 °CA: Driving, 44 mph (70 km/h)	Service data
KNOCK FB VAL	Feedback value of knocking: Min.: -64 CA, Max.: 1,984 CA	-22 to 0 °CA Driving, 44 mph (70 km/h)	Service data
ACCEL POS #1	Absolute Accelerator Pedal Position (APP) No. 1: Min.: 0 %, Max.: 100 %	10 to 22 %: accelerator pedal is released 54 to 86 %: accelerator pedal is fully depressed	—
ACCEL POS #2	Absolute APP No. 2: Min.: 0 %, Max.: 100 %	12 to 42 %: accelerator pedal is released 66 to 98 %: The accelerator pedal is fully depressed	—
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 4.98 V	—	ETCS freeze data
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 4.98 V	—	ETCS freeze data
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: accelerator pedal is released. 2.6 to 4.5 V: or pedal is fully depressed.	—
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: accelerator pedal is released. 3.4 to 5.3 V: accelerator pedal is fully depressed.	—
ACCEL IDL POS	Whether or not accelerator pedal position sensor detecting idle: ON or OFF	ON: Idling	—
THRTL LEARN VAL	Throttle valve fully closed (learned value):	0.4 to 0.8 V	—
ACCEL SSR #1 AD	Accelerator fully closed value No.1 (AD): Min.: 0, Max.: 4.98 V	—	ETCS service data
ACCEL LRN VAL#1	Accelerator fully closed learning value No.1: Min.: 0, Max.: 124.512	—	ETCS service data
ACCEL LRN VAL#2	Accelerator fully closed learning value No.2: Min.: 0, Max.: 124.512	—	ETCS service data
FAIL #1	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	—
FAIL #2	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	—

DIAGNOSTICS – ENGINE (2UZ-FE)

ST1	Starter signal: ON or OFF	ON: Cranking	—
SYSGUARD JUDGE	System guard: ON or OFF	—	ETCS service data
OPN MALFUNCTION	Open side malfunction: ON or OFF	—	ETCS service data
THROTTLE POS	Absolute throttle position sensor: Min.: 0 %, Max.: 100 %	• 10 to 24 %: Throttle fully closed • 64 to 96 %: Throttle fully open	Read the value with intrusive operation (active test)
THROTTL IDL POS	Whether or not throttle position sensor detecting idle: ON or OFF	ON: Idling	—
THRTL REQ POS	Throttle requirement position: Min.: 0 V, Max.: 5 V	0.5 to 1.0 V: Idling	—
THROTTLE POS	Throttle sensor positioning: Min.: 0 %, Max.: 100 %	10 to 18 %: Idling	Calculated value based on VTA1
THROTTLE POS #2	Throttle sensor positioning #2: Min.: 0 %, Max.: 100 %	—	Calculated value based on VTA2
THROTTLE POS #1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 4.9 V	—	ETCS freeze data
THROTTLE POS #2	Throttle position sensor No.2 output voltage: Min.: 0 V, Max.: 4.9 V	—	ETCS freeze data
THROTTLE POS #1	Throttle position No. 1: Min.: 0 V, Max.: 5 V	• 0.5 to 1.2 V: Throttle fully closed • 3.2 to 4.8 V: Throttle fully opened	—
THROTTLE POS #2	Throttle position No. 2: Min.: 0 V, Max.: 5 V	• 2.0 to 2.9 V: Throttle fully closed • 4.6 to 5.5 V: Throttle fully open	Read the value with intrusive operation (active test)
THRTL COMND VAL	Throttle position command value: Min.: 0 V, Max.: 4.98 V	0.5 to 4.8 V	ETCS service data
THROTTLE SSR #1	Throttle sensor opener position No. 1: Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	ETCS service data
THROTTLE SSR #2	Throttle sensor opener position No. 2: Min.: 0 V, Max.: 4.98 V	2.2 to 2.6 V	ETCS service data
THRTL SSR #1 AD	Throttle sensor opener position No.1 (AD): Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	ETCS service data
THROTTLE MOT	Whether or not throttle motor control permitted: ON or OFF	ON: Idling	Read the value with the power switch ON (Do not start engine)
THROTTLE MOT	Throttle motor current: Min.: 0 A, Max.: 80 A	0 to 3.0 A: Idling	—
THROTTLE MOT	Throttle motor: Min.: 0 %, Max.: 100 %	0.5 to 40 %: Idling	—
THROTTLE MOT	Throttle motor current: Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	—
THROTL OPN DUTY	Throttle motor opening duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	When accelerator pedal depressed, duty ratio increased
THROTL CLS DUTY	Throttle motor closed duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	When accelerator pedal released quickly, duty ratio increased
THRTL MOT (OPN)	Throttle motor duty ratio (open): Min.: 0 %, Max.: 100 %	—	ETCS service data

THRTL MOT (CLS)	Throttle motor duty ratio (close): Min.: 0 %, Max.: 100 %	—	ETCS service data
O2S B1 S2	Heated oxygen sensor output voltage for bank 1 sensor 2: Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving 44 mph (70 km/h)	Performing the INJ VOL or A/F CONTROL function of the ACTIVE TEST enables the technician to check voltage output of the sensor
O2S B2 S2	Heated oxygen sensor output voltage for bank 2 sensor 2: Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving 44 mph (70 km/h)	Performing the INJ VOL or A/F CONTROL function of the ACTIVE TEST enables the technician to check voltage output of the sensor
AFS B1 S1	A/F sensor output voltage for bank 1 sensor 1: Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the INJ VOL or A/F CONTROL function of the ACTIVE TEST enables the technician to check voltage output of the sensor
AFS B2 S1	A/F sensor output voltage for bank 2 sensor 1: Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the INJ VOL or A/F CONTROL function of the ACTIVE TEST enables the technician to check voltage output of the sensor
TOTAL FT #1	Total fuel trim of bank 1 Average value for fuel trim system of bank 1: Min.: -0.5, Max.: 1,496	-0.2 to 0.2: Idling	—
TOTAL FT #2	Total fuel trim of bank 2 Average value for fuel trim system of bank 2: Min.: -0.5, Max.: 1,496	-0.2 to 0.2: Idling	—
SHORT FT #1	Short-term fuel trim of bank 1: Min.: -100 %, Max.: 99.2%	0 ± 20 %	This item the short-term fuel compensation used to maintain the air-fuel ratio at stoichiometric air-fuel ratio
SHORT FT #2	Short-term fuel trim of bank 2: Min.: -100 %, Max.: 99.2%	0 ± 20 %	This item the short-term fuel compensation used to maintain the air-fuel ratio at stoichiometric air-fuel ratio
LONG FT #1	Long-term fuel trim of bank 1: Min.: -100 %, Max.: 99.2 %	0 ± 20 %	This item the overall fuel compensation carried out in long-term to compensate a continual deviation of the short-term fuel trim from the central value
LONG FT #2	Long-term fuel trim of bank 2: Min.: -100 %, Max.: 99.2 %	0 ± 20 %	This item the overall fuel compensation carried out in long-term to compensate a continual deviation of the short-term fuel trim from the central value
FUEL SYS #1	Fuel system status (Bank1): OL or CL or OL DRIVE or OL FAULT or CL FAULT	CL: Idling after warming up	<ul style="list-style-type: none"> • OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using heated oxygen sensor as feedback for fuel control. • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but heated oxygen sensor, which used for fuel control malfunctioning

DIAGNOSTICS – ENGINE (2UZ-FE)

FUEL SYS #2	Fuel system status (Bank 2): OL or CL or OL DRIVE or OL FAULT or CL FAULT	CL: Idling after warming up	<ul style="list-style-type: none"> • OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using heated oxygen sensor as feedback for fuel control. • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but heated oxygen sensor, which used for fuel control malfunctioning
O2FT B1 S2	Short-term fuel trim associated with the bank 1 sensor 2: Min.: -100 %, Max.: 99.2 %	0 ± 20 %	Same as SHORT FT #1
O2FT B2 S2	Short-term fuel trim associated with the bank 2 sensor 2: Min.: -100 %, Max.: 99.2 %	0 ± 20 %	Same as SHORT FT #1
AF FT B1 S1	Short-term fuel trim associated with the bank 1 sensor 1: Min.: 0, Max.: 1.999	<ul style="list-style-type: none"> • Value less than 1 (0.000 to 0.999) = Lean • Stoichiometric air-fuel ratio=1 • Value greater than 1 (1.001 to 1.999) = RICH 	—
AF FT B2 S1	Short-term fuel trim associated with the bank 2 sensor 1: Min.: 0, Max.: 1.999	<ul style="list-style-type: none"> • Value less than 1 (0.000 to 0.999) = Lean • Stoichiometric air-fuel ratio=1 • Value greater than 1 (1.001 to 1.999) = RICH 	—
CAT TEMP B1S1	Catalyst temperature (Bank 1, Sensor 1): Min.: -40, Max.: 6,513.5 °C	—	—
CAT TEMP B2S1	Catalyst temperature (Bank 2, Sensor 1): Min.: -40, Max.: 6,513.5 °C	—	—
CAT TEMP B1S2	Catalyst temperature (Bank 1, Sensor 2): Min.: -40, Max.: 6,513.5 °C	—	—
CAT TEMP B2S2	Catalyst temperature (Bank 2, Sensor 2): Min.: -40, Max.: 6,513.5 °C	—	—
INI COOL TEMP	Initial engine coolant temperature: Min.: -40°C, Max.: 140°C	Close to ambient air temperature	Service data
INI INTAKE TEMP	Initial intake air temperature: Min.: -40°C, Max.: 140°C	Close to ambient air temperature	Service data
INJ VOL	Injection volume (cylinder 1): Min.: 0 ml, Max.: 2.048 ml	0 to 0.5 ml	Quantity of fuel injection volume for 10 times
STARTER SIG	Starter signal: ON or OFF	ON: Cranking	—
PS SW	Power steering signal: ON or OFF	ON: Power steering operation	—
PS SIGNAL	Power steering signal: ON or OFF	ON: When steering wheel first turned after ignition switch turned to ON	This signal status usually ON until ignition switch turned to OFF
CTP SW	Closed throttle position switch: ON or OFF	<ul style="list-style-type: none"> • ON: Throttle fully closed • OFF: Throttle open 	—

A/C SIG	A/C signal: ON or OFF	ON: A/C ON	—
ELECT LOAD SIG	Electrical load signal: ON or OFF	ON: Headlights or defogger is turned ON	—
STOP LIGHT SW	Stop lamp switch: ON or OFF	ON: brake pedal is depressed.	—
+BM	Whether or not electric throttle control system power inputted: ON or OFF	ON: Idling	—
+BM VOLTAGE	+BM voltage: Min.: 0, Max.: 19.92	10 to 15 V: Idling	ETCS service data
BATTERY VOLTAGE	Battery voltage: Min.: 0 V, Max.: 65.535 V	9 to 14 V: Idling	—
ACTUATOR POWER	Actuator power supply: ON or OFF	ON: Idling	ETCS service data
ATM PRESSURE	Atmospheric pressure: Min.: 0 kPa, Max.: 150 kPa	Equivalent to atmospheric pres- sure (absolute pressure)	—
SECOND AIR VSV	Secondary air injection system status	ON: Secondary air injection sys- tem operation	—
ACT VSV	A/C cut status for Active Test: ON or OFF	—	Active Test support data
EVAP (Purge) VSV	VSV status for EVAP control: ON or OFF	—	Active Test support data
FUEL PUMP / SPD	Fuel pump/speed status: ON or OFF	—	Active Test support data
VVT CTRL B1	VVT control status (Bank 1): ON or OFF	—	Active Test support data
VVT CTRL B2	VVT control status (Bank 2): ON or OFF	—	Active Test support data
VACUUM PUMP	Key-off EVAP system pump sta- tus: ON or OFF	—	Active Test support data
EVAP VENT VAL	Key-off EVAP system vent valve status: ON or OFF	—	Active Test support data
TC/TE1	TC and TE1 terminal of DLC3: ON or OFF	—	—
VVTL AIM ANGL #1	VVT aim angle (bank 1): Min.: 0 %, Max.: 100 %	0 %: Idling	VVT duty signal value during intru- sive operation
VVTL AIM ANGL #2	VVT aim angle (bank 2): Min.: 0 %, Max.: 100 %	0 %: Idling	VVT duty signal value during intru- sive operation
VVT CHNG ANGL #1	VVT change angle (Bank 1): Min.: 0°FR, Max.: 60°FR	0 to 5 °FR: Idling	Displacement angle during intru- sive operation
VVT CHNG ANGL #2	VVT change angle (Bank 2): Min.: 0°FR, Max.: 60°FR	0 to 5 °FR: Idling	Displacement angle during intru- sive operation
VVT OCV DUTY B1	VVT OCV operation duty (Bank 1): Min.: 0 %, Max.: 100 %	0 %: Idling	Requested duty value for intrusive operation
VVT OCV DUTY B2	VVT OCV operation duty (Bank 2): Min.: 0 %, Max.: 100 %	0 %: Idling	Requested duty value for intrusive operation
FC IDL	Fuel cut idle: ON or OFF	ON: Fuel cut operation	FC IDL = "ON" when throttle valve fully closed and engine speed over 2,800 rpm

DIAGNOSTICS – ENGINE (2UZ-FE)

FC TAU	Fuel cut TAU: Fuel cut during very light load: ON or OFF	ON: Fuel cut operating	The fuel cut being performed under very light load to prevent the engine combustion from becoming incomplete
IGNITION	Ignition counter: Min.: 0, Max.: 800	0 to 800	—
CYL #1, #2, #3, #4, #5, #6, #7, #8	Misfire ratio of the cylinder 1 to 8: Min.: 0, Max.: 255	0 %	This item displayed in only idling
CYL ALL	All cylinders misfire rate: Min.: 0, Max.: 255	0 to 35	—
MISFIRE RPM	Engine RPM for first misfire range: Min.: 0 rpm, Max.: 6,375 rpm	0 rpm: Misfire 0	—
MISFIRE LOAD	Engine load for first misfire range: Min.: 0 g/rev, Max.: 3.98 g/rev	0 g/rev: Misfire 0	—
MISFIRE MARGIN	Misfire monitoring: Min.: -100 %, Max.: 99.22 %	-100 to 99.2 %	Misfire detecting margin
#CODES	#Codes: Min.: 0, Max.: 255	—	Number of detected DTCs
CHECK MODE	Check mode: 0: ON, 1: OFF	ON: Check mode ON	See page DI-463
SPD TEST	Check mode result for vehicle speed sensor: 0: COMPL, 1: INCOMPL	—	—
AS TEST	Check mode result for secondary air injection system: 0: COMPL, 1: INCOMPL	—	—
MISFIRE TEST	Check mode result for misfire monitor: 0: COMPL, 1: INCOMPL	—	—
OXS1 TEST	Check mode result for HO2 sensor (Bank 1): 0: COMPL, 1: INCOMPL	—	—
OXS2 TEST	Check mode result for HO2 sensor (Bank 2): 0: COMPL, 1: INCOMPL	—	—
A/F SSR TEST B1	Check mode result for air-fuel ratio sensor (Bank 1): 0: COMPL, 1: INCOMPL	—	—
A/F SSR TEST B2	Check mode result for air-fuel ratio sensor (Bank 2): 0: COMPL, 1: INCOMPL	—	—
MIL	MIL status: ON or OFF	ON: MIL ON	—
MIL ON RUN DIST	MIL ON Run Distance: Min.: 0 second, Max.: 65,535 seconds	Distance after DTC detected	—
MIL ON RUN TIME	Running time from MIL ON: Min.: 0 minute, Max.: 65,535 minutes	Equivalent to running time after MIL was ON	—
ENG RUN TIME	Engine run time: Min.: 0 second, Max.: 65,535 seconds	Time after engine start	Service data
TIME DTC CLEAR	Time after DTC cleared: Min.: 0 minute, Max.: 65,535 minutes	Equivalent to time after DTCs were erased	—

DIST DTC CLEAR	Distance after DTC cleared: Min.: 0 km/h, Max.: 65535 km/h	Equivalent to drive distance after DTCs were erased	—
WU CYC DTC CLEAR	Warm-up cycle after DTC cleared: Min.: 0, Max.: 255	—	Number of warm-up cycles after DTC cleared
MODEL CODE	Model code:	—	Identifying the model code: UCK30 (2WD), UCK40 (4WD)
ENGINE TYPE	Engine type:	—	Identifying the engine type: 2UZFE
CYLINDER NUMBER	Cylinder number: Min.: 0, Max.: 255	—	Identifying the cylinder number: 8
TRANSMISSION	Transmission type:	—	Identifying the transmission type: ECT(5AT)
DESTINATION	Destination	—	Identifying the destination: A (America)
MODEL YEAR	Model year: Min.: 0, Max.: 255	—	Identifying the model year: 200#
SYSTEM	System identification	—	Identifying the engine system: GASLIN (gasoline engine)
AI STATUS	AI operation prohibit: OK or NG	OK	

*1: If no idling conditions are specified, the transmission gear selector lever should be in the N or P position, and the A/C switch and all accessory switches should be OFF.

2. ACTIVE TEST

HINT:

Performing an ACTIVE TEST enables components including the relays, VSV (Vacuum Switching Valve), and actuators, to be operated without removing any parts. The ACTIVE TEST can be performed with a hand-held tester. Performing an ACTIVE TEST as the first step of troubleshooting is one method of shortening diagnostic time.

DATA LIST can be displayed during ACTIVE TESTS.

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Turn the tester ON.
- (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST.
- (e) Perform the ACTIVE TEST by referring to the table below.

Hand-held Tester Displays	Test Details	Control Ranges	Diagnostic Notes
INJ VOL	Change injection volume	Between -12 % and 25 %	<ul style="list-style-type: none"> • All injectors tested at the same time • Perform test at less than 3,000 rpm • Injection volume can be changed in 1 % graduations within control range
A/F CONTROL	Change injection volume	Lower by 12.5 % or increase by 25 %	<ul style="list-style-type: none"> • Perform test at less than 3,000 rpm • A/F CONTROL enables checking and graphing of A/F (Air Fuel Ratio) sensor and Heated Oxygen (HO2) sensor voltage outputs • To conduct test, select following menu items: ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press YES and ENTER followed by F4
EVAP VSV (ALONE)	Activate EVAP VSV control	ON/OFF	–
VVT CTRL B1	Turn on and off OCV (Oil Control Valve)	ON/OFF	<ul style="list-style-type: none"> • Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV off
VVT CTRL B2	Turn on and off OCV (Oil Control Valve)	ON/OFF	<ul style="list-style-type: none"> • Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV off
A/C CUT SIG	Control A/C cut signal	ON/OFF	–
FUEL PUMP/SPD	Activate fuel pump (C/OPN Relay)	ON/OFF	–
TC/TE1	Turn on and off TC and TE1 connection	ON/OFF	<ul style="list-style-type: none"> • ON: TC and TE1 connected • OFF: TC and TE1 disconnected
FC IDL PROHBT	Prohibit idling fuel cut control	ON/OFF	–
ETCS OPEN SLOW	Throttle actuator	ON: throttle valve opens slowly	<p>This test is possible when the following conditions are met:</p> <ul style="list-style-type: none"> • Ignition switch ON • Engine does not start • Fully depressing accelerator pedal (APP: 58 degrees or more)
ETCS CLOSE SLOW	Throttle actuator	ON: throttle valve closes slowly	Same as above
ETCS OPEN FAST	Throttle actuator	ON: throttle valve opens fast	Same as above
ETCS CLOSE FAST	Throttle actuator	ON: throttle valve closes fast	Same as above

FUEL CUT #1	Cylinder #1 injector fuel cut	ON/OFF	This test is possible during vehicle stopping and engine idling.
FUEL CUT #2	Cylinder #2 injector fuel cut	ON/OFF	Same as above
FUEL CUT #3	Cylinder #3 injector fuel cut	ON/OFF	Same as above
FUEL CUT #4	Cylinder #4 injector fuel cut	ON/OFF	Same as above
FUEL CUT #5	Cylinder #5 injector fuel cut	ON/OFF	Same as above
FUEL CUT #6	Cylinder #6 injector fuel cut	ON/OFF	Same as above
FUEL CUT #7	Cylinder #7 injector fuel cut	ON/OFF	Same as above
FUEL CUT #8	Cylinder #8 injector fuel cut	ON/OFF	Same as above
VENT VALVE (ALONE)	Activate vent valve (built into pump module)	ON/OFF	–
VCUUM PUMP	Activate vacuum pump (built into pump module)	ON/OFF	–

3. SYSTEM CHECK

HINT:

Performing a SYSTEM CHECK enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs are set, and can detect potential malfunctions in the system. The SYSTEM CHECK can be performed with a hand-held tester.

- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON.
- Turn the tester ON.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK.
- Perform the SYSTEM CHECK by referring to the table below.

Hand-held Tester Displays	Test Details	Recommended Fuel Temperatures	Diagnostic Notes
EVAP SYS CHECK (AUTO OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor automatically	35°C (95°F) or less	<ul style="list-style-type: none"> If no DTCs in PENDING CODE after performing this test, system functioning normally Refer to EVAP Inspection Procedure on page DI-884
EVAP SYS CHECK (MANUAL OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor manually	35°C (95°F) or less	<ul style="list-style-type: none"> Used to detect malfunctioning parts Refer to EVAP Inspection Procedure on page DI-884
AI INJ CHECK (AUTO OPERATION)	Perform 6 steps in order to operate air injection system automatically	–	<ul style="list-style-type: none"> If no DTCs in PENDING CODE after performing this test, system functioning normally
AI INJ CHECK (MANUAL OPERATION)	Perform 8 operations in order to operate air injection system monitor manually	–	<ul style="list-style-type: none"> Used to detect malfunctioning parts

DIAGNOSTIC TROUBLE CODE CHART

HINT:

Parameters listed in the chart may not be exactly the same as your reading due to the type of instrument or other factors.

If a malfunction code is displayed during the DTC check in the check mode, check the circuit for the listed in the table below. For details of each code, refer to the "See page" under the respective "DTC No." in the DTC chart.

DTC No. (See page)	Detection Item	Trouble Area	MIL*1	Memory
P0010 (DI-492)	Camshaft Position "A" Actuator Circuit (Bank 1)	<ul style="list-style-type: none"> • Open or short in OCV circuit • OCV • ECM 	○	○

CIRCUIT INSPECTION

DTC	P0010	Camshaft Position "A" Actuator circuit (Bank 1)
------------	--------------	--

DTC	P0020	Camshaft Position "A" Actuator circuit (Bank 2)
------------	--------------	--

CIRCUIT DESCRIPTION

The Variable Valve Timing (VVT) system includes the ECM, the Oil Control Valve (OCV) and the VVT controller. The ECM sends a target "duty-cycle" control signal to the OCV. This control signal, applied to the OCV, regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed based on engine operation conditions such as intake air volume, throttle position and engine coolant temperature. The ECM controls the OCV, based on the signals output from the sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative position between the camshaft and the crankshaft is optimized, and the engine torque improves, fuel economy improves, and exhaust emissions decrease under overall driving conditions. Also, the ECM detects the actual valve timing using signals from the camshaft position sensor and the crankshaft position sensor, and performs feedback control. This is how target valve timing is verified by the ECM.

DTC No.	DTC Detecting Condition	Trouble Area
P0010 P0020	Open or short in OCV circuit	<ul style="list-style-type: none"> • Open or short in OCV circuit • OCV • ECM

MONITOR DESCRIPTION

After the ECM sends the "target" duty-cycle signal to the OCV (Oil Control Valve), the ECM monitors the OCV current to establish an "actual" duty-cycle. When the actual duty-cycle ratio varies from the target duty-cycle, the ECM sets a DTC.

MONITOR STRATEGY

Related DTCs	P0010	VVT oil control valve bank 1 range check
	P0020	VVT oil control valve bank 2 range check
Required sensors/components	OCV	
Frequency of operation	Continuous	
Duration	1 sec.	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC not present	See page DI-437	
All of the following conditions are met	-	
Starter	OFF	
Ignition switch	ON	
Time after ignition switch OFF to ON	0.5 seconds	-

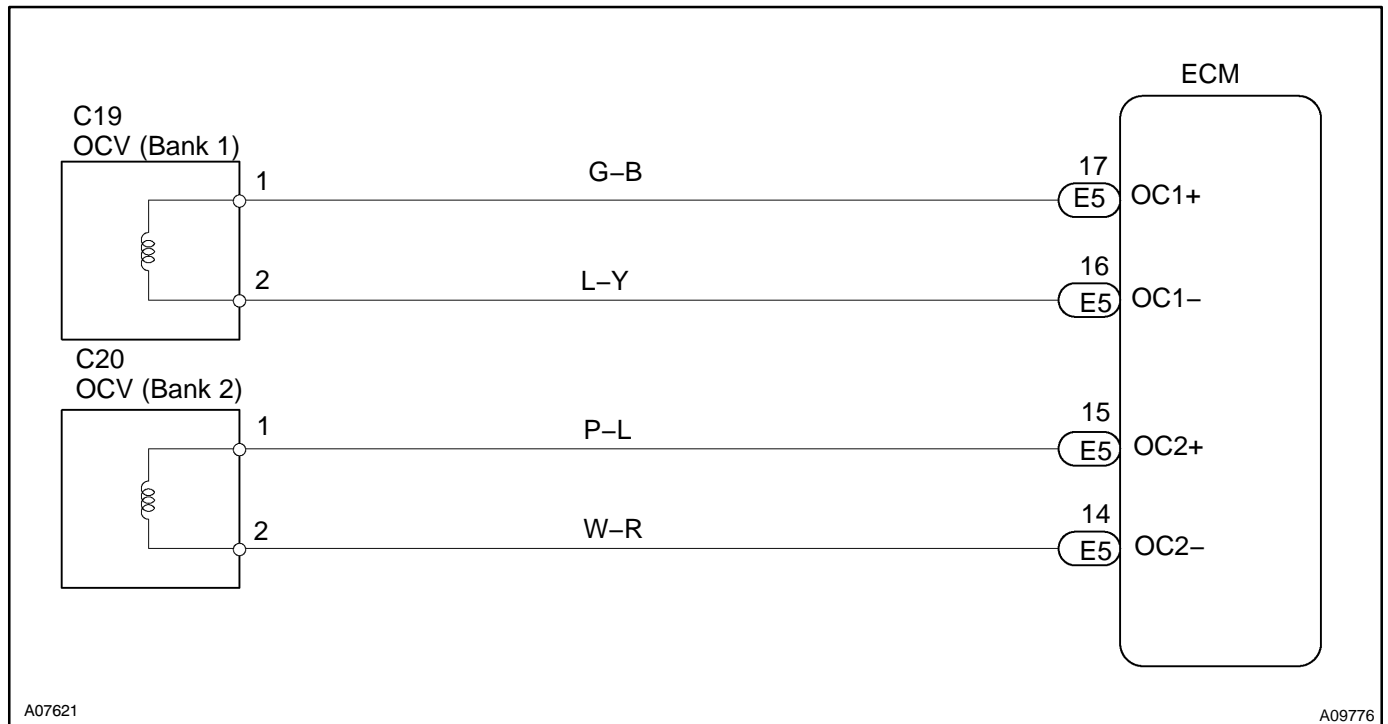

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
One of the following conditions is met:	Condition A, B or C
A. All of the following conditions are met:	Condition (a), (b) , and (c)
(a) Battery voltage	11 V or more, and less than 13 V
(b) Target duty ratio	Less than 70 %
(c) Output signal duty ratio	100 % or more
B. All of the following conditions are met:	Condition (a), (b) , and (c)
(a) Battery voltage	13 V or more
(b) Target duty ratio	Less than 80 %
(c) Output signal duty ratio	100 % or more
C. Both of the following conditions are met:	Condition (a) and (b)
(a) Current cut status	Not cut
(b) Output signal duty ratio	3% or less

COMPONENT OPERATING RANGE

Parameter	Standard Value
OCV current	3 to 100 %

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If DTC P0010 displayed, check left bank OCV circuit.
- If DTC P0020 displayed, check right bank OCV circuit.
- Read freeze frame data using hand-held tester. Because freeze frame records the engine conditions when the malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1	Check OCV circuit.
----------	---------------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and warm it up.
- (c) Turn the ignition switch to ON and turn the hand-held tester ON.

CHECK:

- (a) Select the item: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1 or VVT CTRL B2.
- (b) Using the hand-held tester, operate the OCV and check the engine speed.

OK:

Standard:

Tester Operation	Specified Condition
OCV is OFF	Normal engine speed
OCV is ON	Rough idle or engine stall

OK	Check for intermittent problems (See page DI-430).
-----------	---

NG

2	Check operation of OCV.
----------	--------------------------------

PREPARATION:

- (a) Start the engine and warmed it up.
- (b) Disconnect the OCV connector.
- (c) Apply battery positive voltage between the terminals of the OCV.

CHECK:

Check the engine speed.

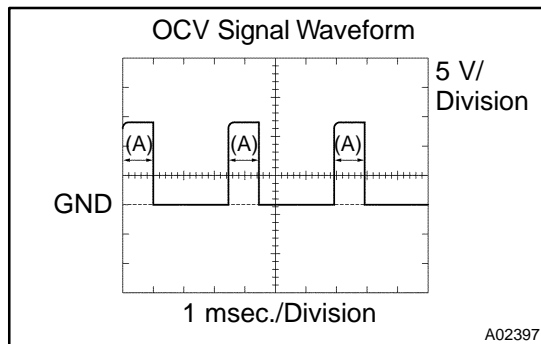

OK:

Rough idle or engine stalled.

NG	Replace OCV.
-----------	---------------------

OK

3 Check voltage between terminals OC1+ and OC1-, OC2+ and OC2- of ECM connector.

**CHECK:**

- Inspection using the oscilloscope.
- During idling, check the waveform between the specified terminals of the E5 ECM connector.

HINT:

The waveform frequency (A) is lengthened as the engine speed becomes higher.

OK:**Standard:**

The correct waveform is as shown.

**NG**

Replace ECM (See page [SF-82](#)).

OK

4 Check for open and short in harness and connector between OCV and ECM.

PREPARATION:

- (a) Disconnect the C19 or C20 OCV connector.
- (b) Disconnect the E5 ECM connector.

CHECK:

- (a) Check for resistance between the wire harness side connectors.

OK:

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
OCV (C19-1) - OC1+ (E5-17)	Below 1 Ω
OCV (C19-2) - OC1- (E5-16)	Below 1 Ω
OCV (C20-1) - OC2+ (E5-15)	Below 1 Ω
OCV (C20-2) - OC2- (E5-14)	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
OCV (C19-1) or OC1+ (E5-17) - E1 (E5-1)	10 kΩ or higher
OCV (C19-2) or OC1- (E5-16) - E1 (E5-1)	10 kΩ or higher
OCV (C20-1) or OC2+ (E5-15) - E1 (E5-1)	10 kΩ or higher
OCV (C20-2) or OC2- (E5-14) - E1 (E5-1)	10 kΩ or higher

NG **Repair or replace harness or connector.**

OK

Check for intermittent problems (See page DI-430).

DTC	P0011	Camshaft Position "A" –Timing Over-Actuator or System Performance (Bank 1)
------------	--------------	---

DTC	P0012	Camshaft Position "A" –Timing Over-Retarded (Bank 1)
------------	--------------	---

DTC	P0021	Camshaft Position "A" –Timing Over-Actuator or System Performance (Bank 2)
------------	--------------	---

DTC	P0022	Camshaft Position "A" –Timing Over-Retarded (Bank 2)
------------	--------------	---

DTC No.	DTC Detecting Condition	Trouble Area
P0011 P0021	Advanced cam timing: After engine is warmed up and engine speed is at 400 to 4,000 rpm, condition (a) continues. (1 trip detection logic) (a) Valve timing does not change from current valve timing	<ul style="list-style-type: none"> • Valve timing • OCV • VVT controller assembly • ECM
P0012 P0022	Retarded cam timing: After engine is warmed up and engine speed is at 400 to 4,000 rpm, condition (a) continues. (2 trip detection logic) (a) Valve timing does not change from current valve timing	

MONITOR DESCRIPTION

The ECM optimizes the valve timing using the VVT (Variable Valve Timing) system to control the intake valve camshaft. The VVT system includes the ECM, the OCV (Oil Control Valve) and the VVT controller. The ECM sends a target "duty-cycle" control signal to the OCV. This control signal, applied to the OCV, regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake valve camshaft.

Example:

A DTC will set if: 1) the difference between the target and actual valve timing is more than 5 degrees of the crankshaft angle (CA) and the condition continues for more than 4.5 sec.; or 2) the OCV is forcibly activated 63 times or more.

Advanced cam DTCs are subject to "1 trip" detection logic.

Retarded cam DTCs are subject to "2 trip" detection logic.

INSPECTION PROCEDURE

HINT:

- Bank 1 refers to bank that includes cylinder No. 1.
- Bank 2 refers to bank that does not include cylinder No. 1.
- If DTC P0011, P0012 is displayed, check the bank 1 VVT system.
- If DTC P0021, P0022 is displayed, check the bank 2 VVT system.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1	Check operation of OCV.
----------	--------------------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and warm it up.
- (c) Turn the ignition switch to ON and turn the hand-held tester ON.

CHECK:

- (a) Select the item: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1 or VVT CTRL B2.
- (b) Using the hand-held tester, operate the OCV and check the engine speed.

OK:**Standard:**

Tester Operation	Specified Condition
OCV is OFF	Normal engine speed
OCV is ON	Rough idle or engine stall

OK**VVT system is OK.***

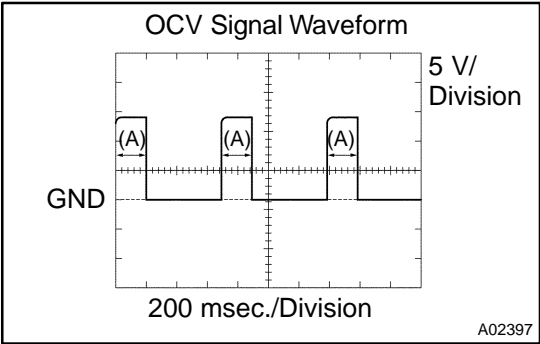

*: DTC P0011, P0012, P0021 or P0022 is also output when a foreign object is detected in some parts of the system in the engine oil, and then the system returns to normal in a short time. As ECM is controlled to eject a foreign object, there is no problem on the VVT. There is also no problem on the VVT as the oil filter should catch the foreign object in the engine oil.

NG

2	Check valve timing (See page EM-9).
----------	--

NG**Adjust valve timing.****OK**

3 Check voltage between terminals OCV+ and OCV- of ECM connector.

- CHECK:**
- (a) Inspection using the oscilloscope.
 - (b) During idling, check the waveform between the specified terminals of the E5 ECM connector.

HINT:
The waveform frequency (A) is lengthened as the engine speed becomes higher.

OK:
Standard:
The correct waveform is as shown.

NG → Replace ECM (See page [SF-82](#)).

OK

4 Check OCV.

- PREPARATION:**
- (a) Remove the V-bank cover.
 - (b) Remove the air cleaner inlet and intake air connector.
 - (c) Disconnect the oil control valve connector.

CHECK:

- (a) Using an Ohmmeter, measure the resistance between the terminals.

Resistance: 6.9 – 7.9 Ω at 20°C (68°F)

NG → Replace OCV, and then go to step 6.

OK

5 Check VVT controller assembly.

PREPARATION:

- (a) Remove the timing belt (See page [EM-16](#)).
- (b) Remove the cylinder head cover.
- (c) Remove the OCV (See page [SF-48](#)).
- (d) Drain the oil in the VVT controller assembly (See page [EM-46](#)).

CHECK:

Check whether the oil in VVT controller assembly is drained or not.

OK:

Standard:

The oil in VVT controller assembly is drained.

NG

Replace VVT controller assembly, and then go to step 6.

OK

6 Check oil control valve filter.

PREPARATION:

- (a) Remove the cylinder head cover.
- (b) Remove the camshaft bearing cap and OCV filter.

CHECK:

Check that the filter is not clogged.

OK:

The filter is not clogged.

NG

Repair or replace.

OK

7	Check whether or not DTC P0010, P0012, P0021 or P0022 is stored.
----------	---

PREPARATION:

- (a) Clear DTCs (see page [DI-462](#)).
- (b) Perform simulation test.

CHECK:

Check whether or not DTC P0011, P0012, P0021 or P0022 is stored (See page [DI-462](#)).

OK:

Standard: DTC P0011, P0012, P0021 or P0022 is not stored.

*: DTC P0011, P0012, P0021 or P0022 is also output when a foreign object is detected in some parts of the system in the engine oil, and then the system returns to normal in a short time. As ECM is controlled to eject a foreign object, there is no problem on the VVT. There is also no problem on the VVT as the oil filter should catch the foreign object in the engine oil.

DTC	P0016	Crankshaft Position – Camshaft Position Correlation (Bank 1 Sensor A)
------------	--------------	--

DTC	P0018	Crankshaft Position – Camshaft Position Correlation (Bank 2 Sensor A)
------------	--------------	--

CIRCUIT DESCRIPTION

VVT sensor (VVL or VVR signal) consist of a signal plate and pickup coil.

The VVL or VVR signal plate has 1 tooth on its outer circumference and is mounted on the intake camshafts. When the camshafts rotate, the protrusion on the signal plate and the air gap on the pickup coil change, causing fluctuations in the magnetic field and generating an electromotive force in the pickup coil.

The actual camshaft angle is detected by the VVT sensor and it provides feedback to the ECM to control the intake valve timing in response to during condition.

DTC No.	DTC Detecting Condition	Trouble Area
P0016 P0018	No VVT sensor signal to ECM during cranking at 4 sec. or more	<ul style="list-style-type: none"> • Open or short in VVT sensor circuit • VVT sensor • ECM
	No VVT sensor signal to ECM with 5 sec. or more engine speed 600 rpm or more	
	While the crankshaft rotates twice, VVT sensor signal will be input to ECM 5 times	

MONITOR DESCRIPTION

The ECM optimizes the valve timing using the VVT (Variable Valve Timing) system to control the intake valve camshaft. The VVT system includes the ECM, the OCV (Oil Control Valve) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal, applied to the OCV, regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake valve camshaft. The ECM calibrates the valve timing of the VVT system by setting the camshaft to the maximum retard angle when the engine is idle. The ECM closes the OCV to retard the cam. The ECM stores this value as VVT learning value (When the difference between the target valve timing and the actual valve timing is 5 degrees or less, the ECM stores this in its memory.).

If the learning value meets both of the following conditions ((a) and (b)), the ECM interprets this as a defect in the VVT system and sets a DTC.

- (a) VVT learning value is less than 20° CA (Crankshaft Angle) or more than 39° CA.
- (b) Above condition continues for more than 18 sec.

MONITOR STRATEGY

HINT:

Although each DTC title (DTC description) says "oxygen sensor", these DTCs are related to the "A/F sensor".

CIRCUIT DESCRIPTION

Refer to DTC P2195 on page [DI-806](#).

HINT:

The ECM provides a pulse width modulated control circuit to adjust current through the heater. The A/F sensor heater circuit uses a relay on the B+ side of the circuit.

DTC No.	DTC Detection Condition	Trouble Area
P0031 P0051	Heated current is 0.8 A or less when heater operates (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in heater circuit of A/F sensor • A/F sensor heater
P0032 P0052	When the heater operates, heated current exceeds 19.7 A (1 trip detection logic)	<ul style="list-style-type: none"> • A/F sensor heater relay • ECM

HINT:

- Bank 1 refers to the bank that includes cylinder No.1.
- Bank 2 refers to the bank that does not include cylinder No.1.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR DESCRIPTION

The ECM uses the Air–Fuel Ratio sensor (A/F sensor) information to regulate the air–fuel ratio close to the stoichiometric ratio. This maximizes the catalytic converter’s ability to purify exhaust gases. The sensor detects oxygen levels in the exhaust gas and sends this signal to the ECM.

The inner surface of the sensor element is exposed to outside air. The outer surface of the sensor element is exposed to exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element. The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations of the exhaust and the outside air. The platinum coating amplifies the voltage generation. When heated, the sensor becomes very efficient. If the temperature of the exhaust is low, the sensor will not generate useful voltage signals without supplemental heating. The ECM regulates the supplemental heating using a duty–cycle approach to regulate the average current in the heater element. If the heater current is out of the normal range, the sensor’s output signals will be inaccurate and the ECM can not regulate the air–fuel ratio properly.

When the heater current is out of the normal operating range, the ECM interprets this as a malfunction and sets a DTC.

MONITOR STRATEGY

INSPECTION PROCEDURE

HINT:

Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Check resistance of air-fuel ratio (A/F) sensor heater.
----------	--

PREPARATION:

Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Standard:

Tester Connection	Specified Condition
HT (1) - +B (2)	1.8 Ω to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

NG	Replace air-fuel ratio (A/F) sensor.
-----------	---

2 Check A/F relay.**PREPARATION:**

Remove the A/F relay from the engine room R/B No.2.

CHECK:

Inspect the A/F relay.

OK:**Standard:**

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 K Ω or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG**Replace A/F relay.****OK****3 Check voltage between terminals HA1A, HA2A of ECM connectors and body ground.****PREPARATION:**

Turn the ignition switch ON.

CHECK:

Measure the voltage between terminals of the ECM connectors and body ground.

HINT:

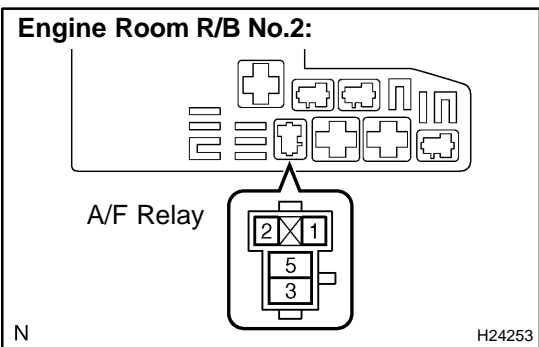

- Connect terminal HA1A to the bank 1 sensor 1.
- Connect terminal HA2A to the bank 2 sensor 1.

OK:**Standard:**

Tester Connection	Specified Condition
HA1A (E6-2) - Body ground	9 V to 14 V
HA2A (E6-1) - Body ground	9 V to 14 V

OK**Replace ECM (See page SF-82).****NG**

4 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the A10 or A30 A/F sensor connector.
- (c) Disconnect the E6 ECM connector.

CHECK:

Check the resistance.

OK:

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the A10 or A30 A/F sensor connector.
- (c) Remove A/F relay from engine room R/B No.2.

CHECK:

Check the resistance.

OK:

Standard (Check for open):

Tester Connections	Specified Conditions
+B (A10-2) - A/F relay (3) +B (A30-2) - A/F relay (3)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
+B (A10-2) or A/F relay (3) - Body ground +B (A30-2) or A/F relay (3) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Check for intermittent problems (See page DI-430).

DTC	P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)
------------	--------------	---

DTC	P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)
------------	--------------	--

DTC	P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)
------------	--------------	---

DTC	P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)
------------	--------------	--

CIRCUIT DESCRIPTION

To obtain a high purification rate for the CO, HC and NOx components of the exhaust gas, a three-way catalytic converter is used, but for the most efficient use of the three-way catalytic converter, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio.

The heated oxygen sensor has the characteristic which its output voltage changes suddenly in the vicinity of the stoichiometric air-fuel ratio. This characteristic is used to detect the oxygen concentration in the exhaust gas and provide the ECM with feedback to control the air-fuel ratio.

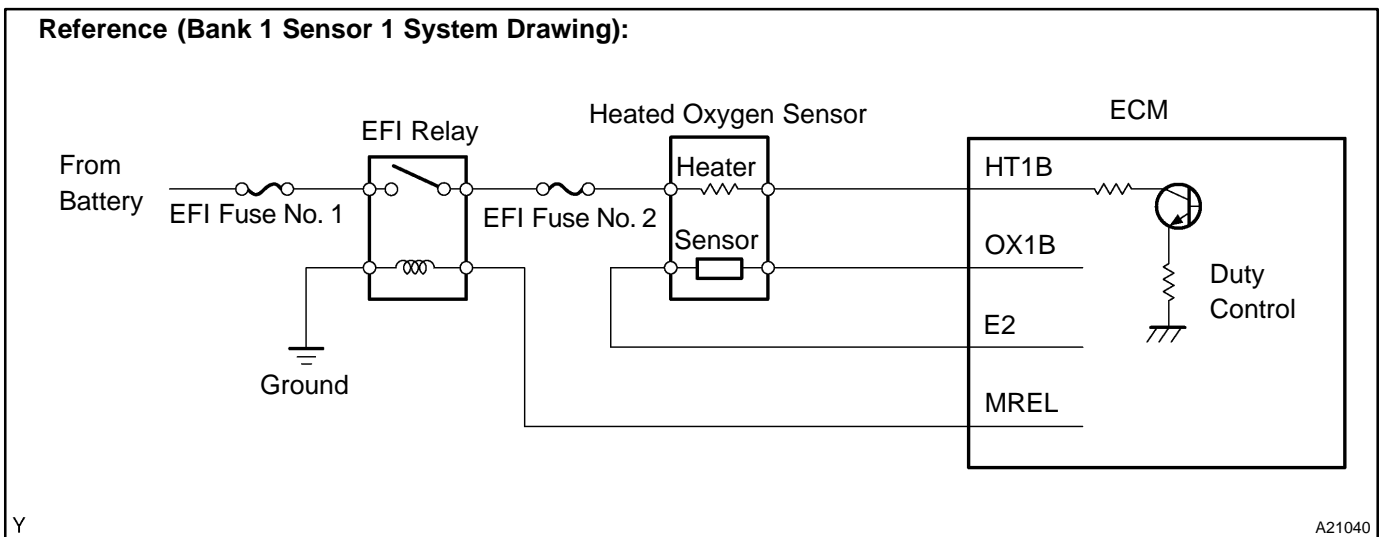

When the air-fuel ratio becomes LEAN, the oxygen concentration in the exhaust increases and the heated oxygen sensor informs the ECM of the LEAN condition (low voltage, i.e. less than 0.45 V).

When the air-fuel ratio is RICHER than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas is reduced and the heated oxygen sensor informs the ECM of the RICH condition (high voltage, i.e. more than 0.45 V). The ECM judges by the voltage output from the heated oxygen sensor whether the air-fuel ratio is RICH or LEAN and controls the injection time accordingly. However, if malfunction of the heated oxygen sensor causes output of abnormal voltage, this disables the ECM for performing an accurate air-fuel ratio control. The heated oxygen sensors include a heater which heats the zirconia element. The heater is controlled by the ECM. When the intake air volume is low (the temperature of the exhaust gas is low) current flows to the heater to heat the sensor for accurate oxygen concentration detection.

HINT:

The ECM provides a pulse width modulated control circuit to adjust current through the heater. The heated oxygen sensor heater circuit uses a relay on the B+ side of the circuit.

Y

A21040

DTC No.	DTC Detecting Condition	Trouble Area
P0037 P0057	Heater current is 0.25 A or less when the heater operates with more than 10.5 V positive battery voltage	<ul style="list-style-type: none"> • Open in heater circuit of heated oxygen sensor • Heated oxygen sensor heater • EFI relay • ECM
P0038 P0058	When heater operates, heater current exceeds 2.0 A	<ul style="list-style-type: none"> • Short in heater circuit of heated oxygen sensor • Heated oxygen sensor heater • EFI relay • ECM

HINT:

- Bank 1 refers to bank that includes cylinder No. 1.
- Bank 2 refers to bank that does not includes cylinder No. 1.
- Sensor 1 refers to the sensor closer to the engine assembly.
- Sensor 2 refers to the sensor farther away from the engine assembly.

MONITOR DESCRIPTION

The sensing portion of the heated oxygen sensor has a zirconia element which is used to detect oxygen concentration in the exhaust. If the zirconia element is at the proper temperature and difference of the oxygen concentration between the inside and outside surface of sensor is large, the zirconia element will generate voltage signals. In order to increase the oxygen concentration detecting capacity in the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor. When current in the sensor is out of the standard operating range, the ECM interprets this as a fault in the heated oxygen sensor and sets a DTC.

Example:

The ECM will set a high current DTC if the current in the sensor is more than 2.0 A when the heater is OFF. Similarly, the ECM will set a low current DTC if the current is less than 0.3 A when the heater is ON.

MONITOR STRATEGY

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

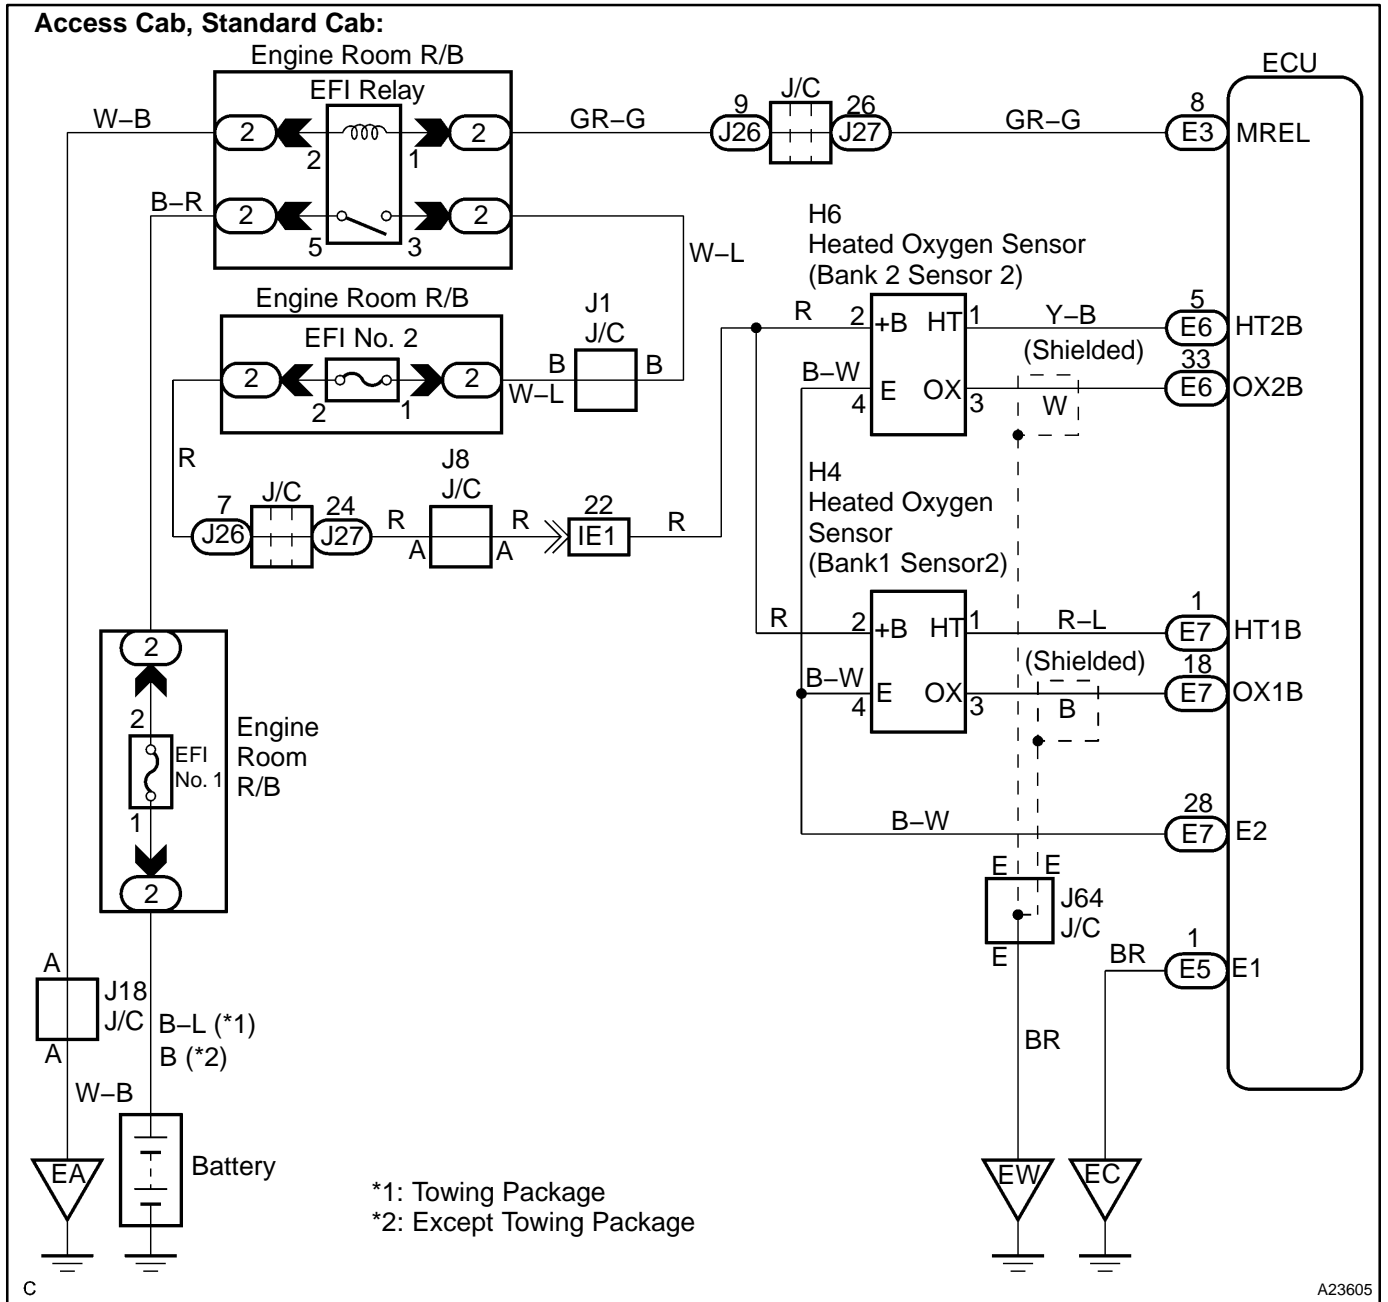

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (see page [DI-446](#)).

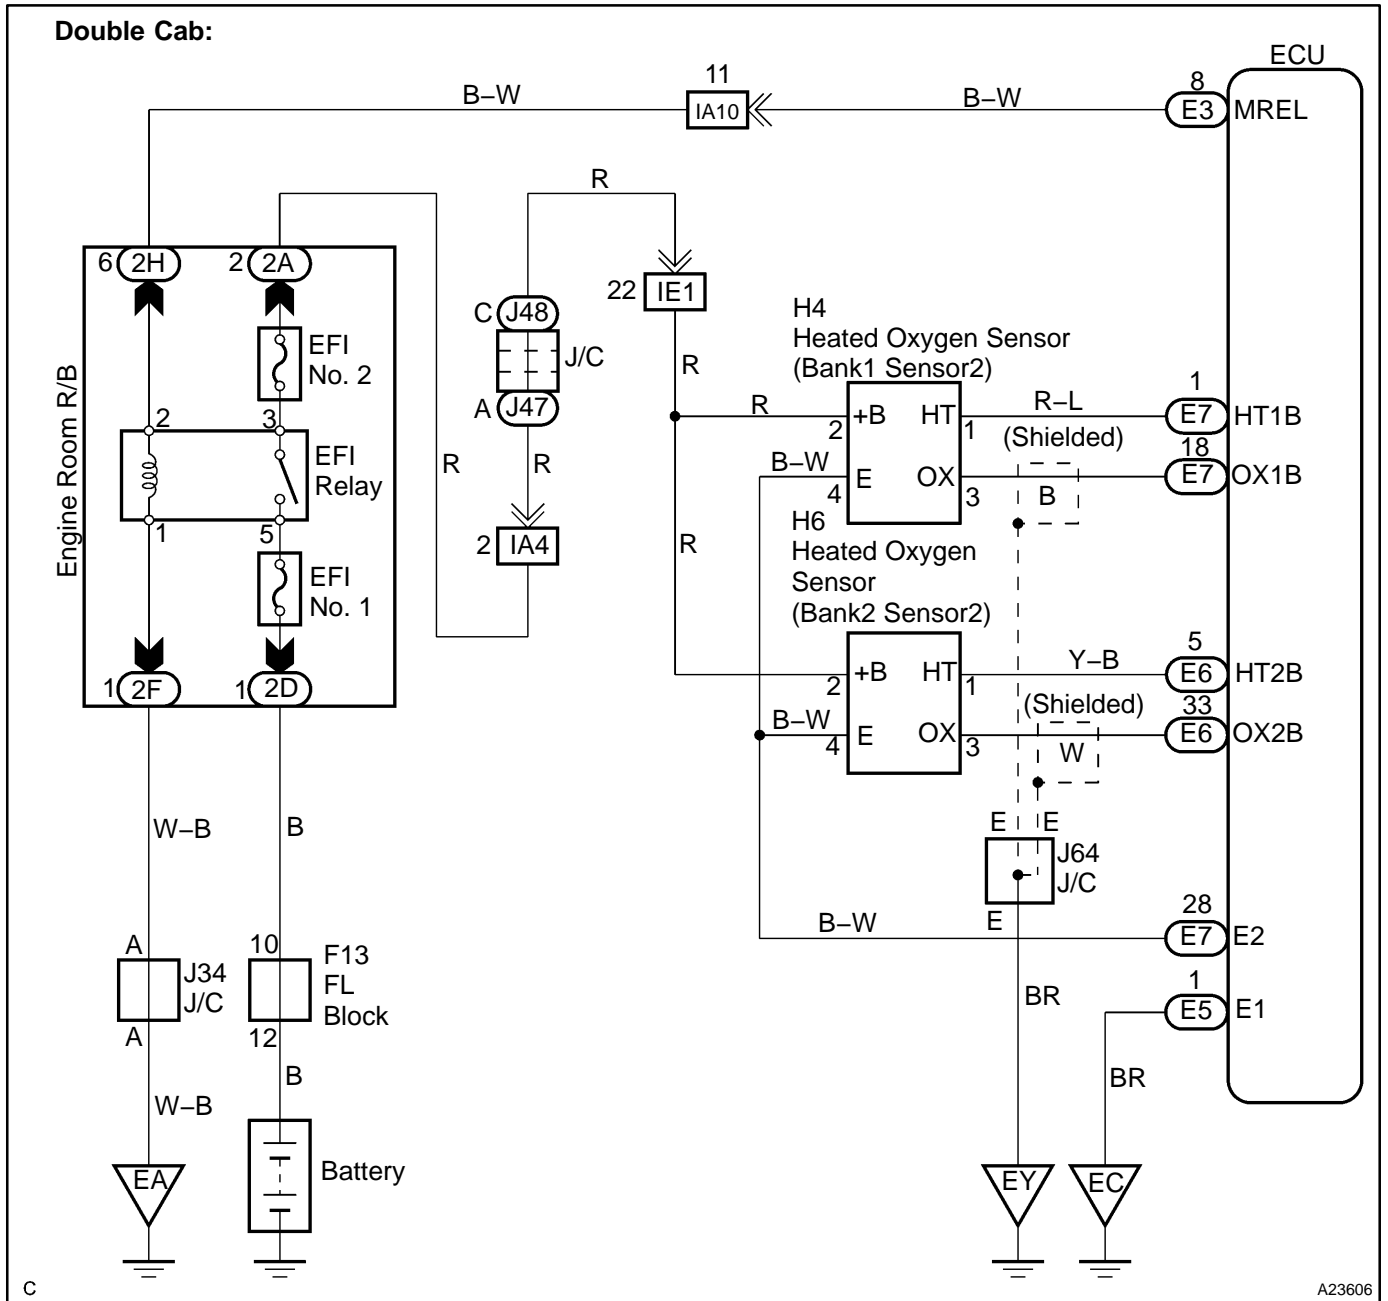

- TID (Test Identification Data) is assigned to each emissions-related component.
- TLT (Test Limit Type):
If TLT is 0, the component is malfunctioning when the test value is higher than the test limit.
If TLT is 1, the component is malfunctioning when the test value is lower than the test limit.
- CID (Component Identification Data) is assigned to each test value.
- Unit Conversion is used to calculate the test value indicated on generic OBD II scan tools.

TID \$04: HO2S heater

TLT	CID	Unit Conversion	Description of Test Data	Description of Test Limit
1	\$02	Multiply by 0.000076 (A)	Maximum HO2S heater current (Bank 1 Sensor 2)	Malfunction threshold for HO2S heater
1	\$20	Multiply by 0.000076 (A)	Maximum HO2S heater current (Bank 2 Sensor 2)	Malfunction threshold for HO2S heater

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using hand-held tester. Because freeze frame records the engine conditions when the malfunction is detected. When troubleshooting, it is useful to determine whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. when a malfunction occurred.

1 Check resistance of heated oxygen sensor heater.

PREPARATION:

Disconnect the H4 or H6 heated oxygen sensor connector.

CHECK:

Measure resistance between terminals of the heated oxygen sensor.

OK:

Standard:

Tester Connection	Specified Condition
HT (H4-1) - +B (H4-2)	11 to 16 Ω (20°C)
HT (H6-1) - +B (H6-2)	11 to 16 Ω (20°C)

NG Replace heated oxygen sensor.

OK

2 Check EFI relay.

PREPARATION:

Remove the EFI relay from the engine room J/B.

CHECK:

Inspect the EFI relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 KΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace EFI relay.

OK

3 Check voltage between terminals HT1B, HT2B of ECM connectors and body ground.

PREPARATION:

Turn the ignition switch ON.

CHECK:

Measure the voltage between terminals of the ECM connectors and body ground.

HINT:

- Connect terminal HT1B to the bank 1 sensor 2.
- Connect terminal HT2B to the bank 2 sensor 2.

OK:

Standard:

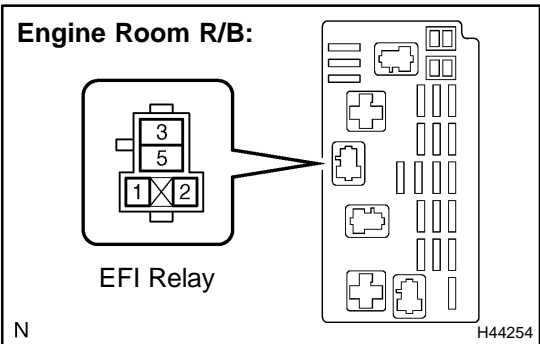

Tester Connection	Specified Condition
HT1B (E7-1) – Body ground	9 to 14 V
HT2B (E6-5) – Body ground	9 to 14 V

OK

Replace ECM (See page [SF-82](#)).

NG

4 Check for open and short in harness and connector between ECM and heated oxygen sensor, heated oxygen sensor - EFI relay.

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the H4 or H6 oxygen sensor connector.
- (c) Disconnect the E6 and E7 ECM connector.

CHECK:

Check the resistance.

OK:

Standard (Check for open):

Tester Connections	Specified Conditions
HT (H4-1) - HT1B (E7-1)	Below 1 Ω
HT (H6-1) - HT2B (E6-5)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (H4-1) or HT1B (E7-1) - Body ground	10 kΩ or higher
HT (H6-1) or HT2B (E6-5) - Body ground	10 kΩ or higher

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the H4 or H6 oxygen sensor connector.
- (c) Remove EFI relay from engine room R/B.

CHECK:

Check the resistance.

OK:

Standard (Check for open):

Tester Connections	Specified Conditions
+B (H4-2) - EFI relay (3)	Below 1 Ω
+B (H6-2) - EFI relay (3)	

Standard (Check for short):

Tester Connections	Specified Conditions
+B (H4-2) or EFI relay (3) - Body ground	10 kΩ or higher
+B (H6-2) or EFI relay (3) - Body ground

DTC	P0100	Mass or Volume Air Flow Circuit
------------	--------------	--

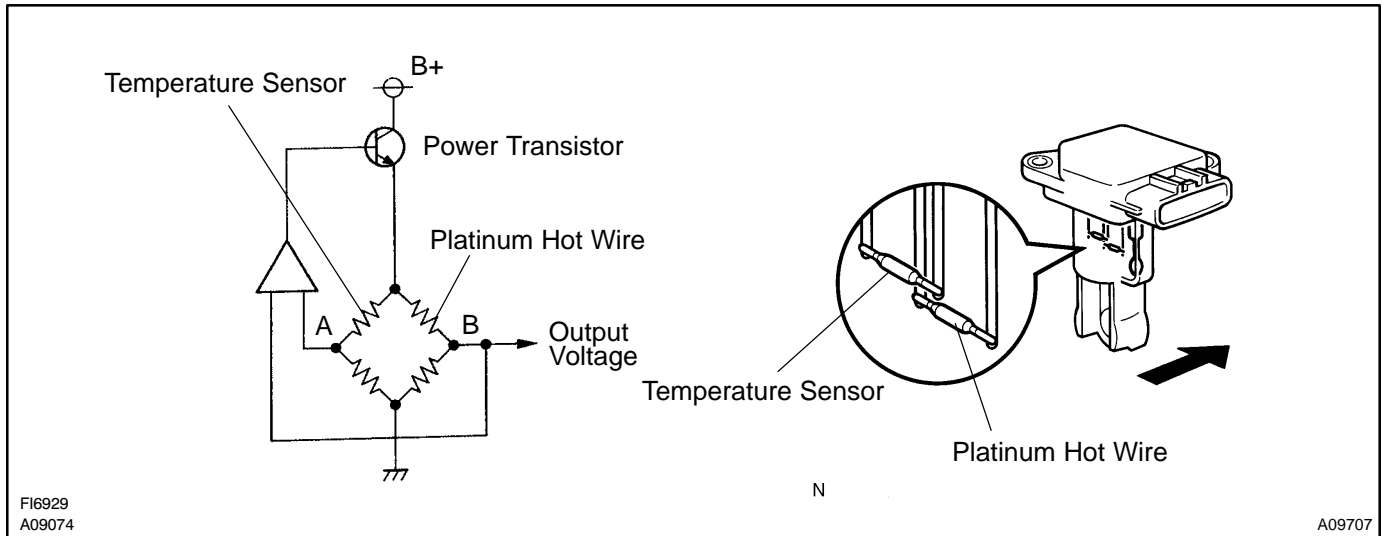

DTC	P0102	Mass or Volume Air Flow Circuit Low Input
------------	--------------	--

DTC	P0103	Mass or Volume Air Flow Circuit High Input
------------	--------------	---

CIRCUIT DESCRIPTION

The Mass Air Flow (MAF) meter measures the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and provide a proper air fuel ratio. Inside the MAF meter, there is a heated platinum wire exposed to the flow of intake air.

By applying a specific current to the wire, the ECM heats this wire to a given temperature. The flow of incoming air cools the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the airflow through the sensor. The ECM interprets this voltage as the intake air amount. The circuit is constructed so that the platinum hot wire and temperature sensor provide a bridge circuit, with the power transistor controlled so that the potential of A and B remains equal to maintain the set temperature.

A09074

A09077

DTC No.	DTC Detection Condition	Trouble Area
P0100	Open or short in mass air flow meter circuit for more than 3 sec.	<ul style="list-style-type: none"> • Open or short in mass air flow meter circuit • Mass air flow meter • ECM
P0102	Open or short in mass air flow meter circuit for more than 3 sec.	
P0103	Open in mass air flow meter circuit for more than 3 sec. (EVG circuit) Short in mass air flow meter circuit for more than 3 sec. (+B circuit)	

HINT:

After confirming DTC P0100, P0102 or P0103, use the hand-held tester or the OBD II scan tool to confirm the MAF ratio from the ALL menu (to reach the ALL menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL).

Mass Air Flow Value (gm/sec.)	Malfunction
Approx. 0.0	<ul style="list-style-type: none"> • Mass air flow meter power source circuit open • VG circuit open or short
271.0 or more	<ul style="list-style-type: none"> • EVG circuit open

MONITOR DESCRIPTION

If there is a defect in the MAF (Mass Air Flow) meter or an open or short circuit, the voltage level will deviate outside the normal operating range. The ECM interprets this deviation as a defect in the MAF meter and sets a DTC.

Example:

When the MAF meter voltage output is less than 0.2 V, or more than 4.9 V, and if either the condition continues for more than 3 sec.

MONITOR STRATEGY

Related DTCs	P0100	Mass air flow meter circuit range check (Fluttering)

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read value of mass air flow rate.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) Start the engine.
- (d) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / MAF.

CHECK:

Read the mass air flow rate on the hand-held tester.

RESULT:

Air Flow Rate (gm/s)	Proceed to
0.0	A
271.0 or more	B
Between 1 and 270.0 (*1)	C

*1: The value must change when the throttle valve is opened or closed.

2 Check voltage of mass air flow meter power source.

PREPARATION:

- (a) Disconnect the M1 mass air flow meter connector.
- (b) Turn the ignition switch ON.

CHECK:

Measure voltage between terminal 1 of the mass air flow meter connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
+B (M1-1) - Body ground	9 to 14 V

NG Go to step 5.

OK

3 Check voltage between terminal VG of ECM connector and body ground.

PREPARATION:

Start the engine.

CHECK:

Measure the voltage between the specified terminal of the E7 ECM connector.

HINT:

The shift position should be P or N and the A/C switch should be turned OFF.

OK:

Standard:

Tester Connection	Condition	Specified Condition
VG (E7-30) - E2G (E7-29)	Engine is idling	0.5 to 3.0 V

OK Replace ECM (See page [SF-82](#)).

NG

4 Check for open and short in harness and connector between mass air flow meter and ECM.

Wire Harness Side:

Mass Air Flow Meter Connector

Y

A21226

E7 ECM Connector

N

B17412

PREPARATION:

- Disconnect the M1 mass air flow meter connector.
- Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VG (M1-3) - VG (E7-30)	Below 1 Ω
E2G (M1-2) - E2G (E7-29)	Below 1 Ω
VG (M1-3) or VG (E7-30) - Body ground	10 k Ω or higher

NG

Repair or replace harness or connector.

OK

Replace mass air flow meter.

5 Check for open and short in harness and connector between mass air flow meter and EFI relay.

PREPARATION:

Remove the EFI No. 2 fuse from the engine room J/B.

CHECK:

Check the resistance in the EFI No. 2 fuse.

OK:

Standard:
Below 1 Ω

PREPARATION:

- (a) Install the EFI No. 2 fuse.
- (b) Disconnect the M1 mass air flow meter connector.
- (c) Remove the EFI relay from the engine room J/B.

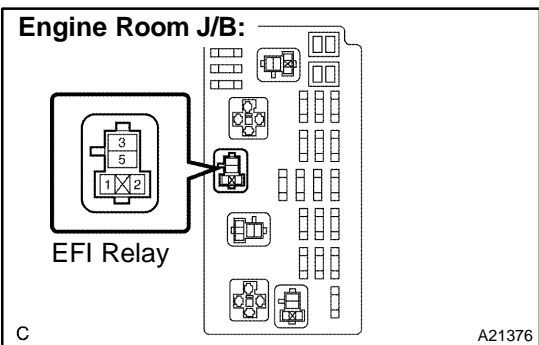

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
+B (M1-1) – Engine Room J/B (EFI relay terminal 1)	Below 1 Ω
+B (M1-1) or Engine room J/B (EFI relay terminal 1) – Body ground	10 kΩ or higher

NG → **Repair or replace harness or connector.**

OK

Check ECM power source circuit (See page DI-918).

6 Check continuity between terminal E2G of ECM connector and body ground.

CHECK:

Check the resistance between terminal of the E7 ECM connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
E2G (E7-29) - Body ground	Below 1 Ω

NG Replace ECM (See page [SF-82](#)).

OK

7 Check for open in harness and connector between mass air flow meter and ECM.

PREPARATION:

- (a) Disconnect the M1 mass air flow meter connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VG (M1-3) - VG (E7-30)	Below 1 Ω
E2G (M1-2) - E2G (E7-29)	Below 1 Ω
VG (M1-3) or VG (E7-30) - Body ground	10 kΩ or higher
E2G (M1-2) or E2G (E7-29) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace mass air flow meter.

DTC	P0101	Mass or Volume Air Flow Circuit Range/ Performance Problem
------------	--------------	---

CIRCUIT DESCRIPTION

Refer to DTC P0100, P0102 and P0103 on page [DI-522](#).

DTC No.	DTC Detecting Condition	Trouble Area
P0101	After engine is warmed up, conditions (a), (b), (c) and (d) continue for more than 10 seconds: (2 trip detection logic) (a) Throttle valve fully closed (b) Voltage output of the mass air flow meter is more than 2.2 V. (c) Engine coolant temperature is more than 70 °C (158 °F). (d) Engine speed is less than 2,000 rpm.	• Mass air flow meter
	Conditions (a), (b) and (c) continue for more than 10 seconds at engine speed: (2 trip detection logic) (a) Engine speed is more than 300 rpm. (b) Voltage output of the mass air flow meter is less than 1.0 V.	

MONITOR DESCRIPTION

The MAF (Mass Air Flow) meter helps the ECM calculate the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and provide a proper air fuel ratio. Inside the MAF meter, there is a heated platinum wire exposed to the flow of intake air. By applying a specific current to the wire, the ECM heats this wire to a given temperature. The flow of incoming air cools the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the air flow through the MAF meter. The ECM interprets this voltage as the intake air amount. If there is a defect in the MAF meter or an open or short circuit, the voltage level will deviate outside the normal operating range. The ECM interprets this deviation as a defect in the MAF meter and sets a DTC.

Example:

If the voltage is more than 2.2 V at idle or less than 1.0 V at idle OFF, the ECM interprets this as a defect in the MAF meter and sets a DTC.

MONITOR STRATEGY

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Are there any other codes (besides DTC P0101) being output?
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS/ENHANCED OBD II/DTC INFO/CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
"P0101" and other DTCs	A
Only P0101	B

HINT:

If any other codes besides P0101 are output, perform the troubleshooting for those codes first.

Go to relevant DTC chart (See page [DI-477](#)).

DTC	P0110	Intake Air Temperature Circuit
------------	--------------	---------------------------------------

DTC	P0112	Intake Air Temperature Circuit Low Input
------------	--------------	---

DTC	P0113	Intake Air Temperature Circuit High Input
------------	--------------	--

CIRCUIT DESCRIPTION

The intake air temperature (IAT) sensor, mounted on the mass air flow (MAF) meter, monitors the intake air temperature. The IAT sensor has a thermistor that varies its resistance depending on the temperature of the intake air. When the air temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. The resistance varies as voltage changes to the ECM terminal.

(See Fig. 1).

The intake air temperature sensor is connected to the ECM (See below). The 5 V power source voltage in the ECM is applied to the intake air temperature sensor from terminal THA (THAR) via resistor R.

That is, the resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes in accordance with changes in the intake air temperature, the voltage at terminal THA (THAR) also changes. Based on this signal, the ECM increases the fuel injection volume to improve the driveability during cold engine operation.

DTC No.	Proceed to	DTC Detection Condition	Trouble Area
P0110	Step 1	Open or short in intake air temperature sensor circuit for 0.5 sec.	<ul style="list-style-type: none"> • Open or short in intake air temperature sensor circuit • Intake air temperature sensor (built in mass air flow meter) • ECM
P0112	Step 4	Short in intake air temperature sensor circuit for 0.5 sec.	
P0113	Step 2	Open in intake air temperature sensor circuit for 0.5 sec.	

HINT:

After confirming DTC "P0110, P0112 or P0113", use the hand-held tester to confirm the intake air temperature in the "DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL".

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or more	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the intake air temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the IAT (Intake Air Temperature) sensor and sets a DTC.

Example:

When the sensor voltage output is equal to -40°C (-40°F), or more than 140°C (284°F).

MONITOR STRATEGY

Related DTCs	P0110	Intake air temperature sensor range check (Fluttering)

The typical enabling condition is not available	-

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
P0110:	
Intake air temperature sensor voltage (Intake air temperature)	Less than 0.18 V or more than 4.91 V (More than 140°C (284°F), or less than -40°C (-40°F))
P0112:	
Intake air temperature sensor voltage (Intake air temperature)	Less than 0.18 V (More than 140°C (284°F))
P0113:	
Intake air temperature sensor voltage (Intake air temperature)	More than 4.91 V (Less than -40°C (-40°F))

COMPONENT OPERATING RANGE

Parameter	Standard Value
Intake air temperature sensor voltage	0.18 V (140°C (284°F)) to 4.91 V (-40°C (-40°F))

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read value of intake air temperature.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Same as actual intake air temperature.

RESULT:

Displayed Temperature	Proceed to
-40°C (-40°F)	A
140°C (284°F) or more	B
OK (Same as present temperature)	C

HINT:

- If there is an open circuit, the hand-held tester indicates -40°C (-40°F).
- If there is a short circuit, the hand-held tester indicates 140°C (284°F) or more.

2 Check for open in harness or ECM.

PREPARATION:

- Disconnect the M1 mass air flow meter connector.
- Connect terminals 4 and 5 of the mass air flow meter wire harness side connector.
- Turn the ignition switch ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: Temperature value: 140°C (284°F) or more

OK

Confirm good connection at sensor. If OK, replace mass air flow meter.

NG

3 Check for open in harness or ECM.

PREPARATION:

- Connect terminals THA and E2 of the E7 ECM connector.

HINT:

Before checking, do a visual and contact pressure check for the ECM connector.

- Turn the ignition switch ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: Temperature value: 140°C (284°F) or more

OK

Repair or replace harness or connector.

NG

Confirm good connection at ECM. If OK, replace ECM (See page SF-82).

4 Check for short in harness and ECM.

PREPARATION:

- (a) Disconnect the M1 mass air flow meter connector.
- (b) Turn the ignition switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

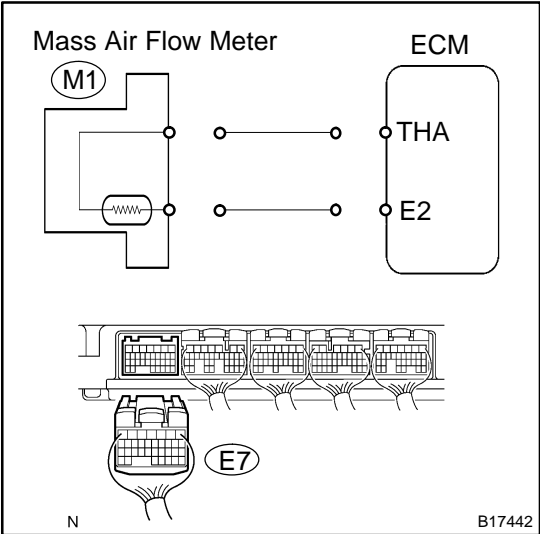

OK:

Standard: Temperature value: -40°C (-40°F)

OK → Replace mass air flow meter.

NG

5 Check for short in harness or ECM.

PREPARATION:

- (a) Disconnect the E7 ECM connector.
- (b) Turn the ignition switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: Temperature value: -40°C (-40°F)

OK → Repair or replace harness or connector.

NG

Replace ECM (See page SF-82).

DTC	P0115	Engine Coolant Temperature Circuit
------------	--------------	---

DTC	P0117	Engine Coolant Temperature Circuit Low Input
------------	--------------	---

DTC	P0118	Engine Coolant Temperature Circuit High Input
------------	--------------	--

CIRCUIT DESCRIPTION

A thermistor is built in the Engine Coolant Temperature (ECT) sensor and changes the voltage value according to the engine coolant temperature.

The structure of the sensor and connection to the ECM is the same as the Intake Air Temperature (IAT) sensor.

HINT:

If the ECM detects the DTC "P0115, P0117 or P0118", it operates the fail-safe function in which the ECT is assumed to be 80°C (176°F).

DTC No.	Proceed to	DTC Detection Condition	Trouble Area
P0115	Step 1	Open or short in engine coolant temperature sensor circuit for 0.5 sec.	<ul style="list-style-type: none"> • Open or short in engine coolant temperature sensor circuit • Engine coolant temperature sensor • ECM
P0117	Step 4	Short in engine coolant temperature sensor circuit for 0.5 sec.	
P0118	Step 2	Open in engine coolant temperature sensor circuit for 0.5 sec.	

HINT:

After confirming DTC "P0115, P0117 or P0118", use the OBD II scan tool or the hand-held tester to confirm the engine coolant temperature from the DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL.

Displayed Temperature	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or more	Short circuit

MONITOR DESCRIPTION

The ECT (Engine Coolant Temperature) sensor is used to monitor the engine coolant temperature. The ECT sensor has a thermistor that varies its voltage depending on the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the voltage drops. The voltage varies as output voltage from the sensor changes.

The ECM monitors the sensor voltage and uses this value to calculate the engine coolant temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and sets a DTC.

Example:

When the ECM calculates that the ECT is less than -40°C (-40°F), or more than 140°C (284°F), and if either the condition continues for 0.5 sec. or more, the ECM will set a DTC.

MONITOR STRATEGY

COMPONENT OPERATING RANGE

Parameter	Standard Value
Engine coolant temperature sensor voltage	0.14 V (140°C (284°F)) to 4.91 V (-40°C (-40°F))

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If DTCs related to different system that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read value of engine coolant temperature.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

Read the temperature value on the the hand-held tester.

OK:

Same value as actual engine coolant temperature.

RESULT:

Displayed Temperature	Proceed to
-40°C (-40°F)	A
140°C (284°F) or more	B
OK (Same as present temperature)	C

HINT:

- If there is an open circuit, hand-held tester indicates -40°C (-40°F).
- If there is a short circuit, hand-held tester indicates 140°C (284°F) or more.

2 Check for open in harness or ECM.

PREPARATION:

- Disconnect the E2 engine coolant temperature (ECT) sensor connector.
- Connect terminals 1 and 2 of the engine coolant temperature sensor wire harness side connector.
- Turn the ignition switch ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: Temperature value: 140°C (284°F) or more

OK

Confirm good connection at sensor. If OK, replace engine coolant temperature sensor.

NG

3 Check for open in harness or ECM.

PREPARATION:

- Disconnect the E2 engine coolant temperature sensor connector.
 - Connect terminals THW and E2 of the E7 ECM connector.
- HINT:
Before checking, do a visual and contact pressure checks for the ECM connector.
- Turn the ignition switch ON.
 - When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

Read the temperature value on the OBD II scan tool or the hand-held tester.

OK:

Standard: Temperature value: 140°C (284°F) or more

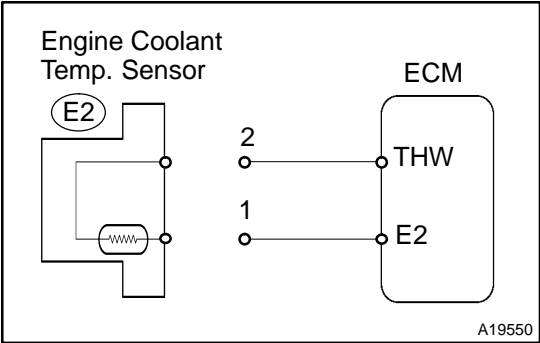

OK

Repair or replace harness or connector.

NG

Confirm good connection at ECM. If OK, replace ECM (See page SF-82).

4 Check for short in harness and ECM.

PREPARATION:

- (a) Disconnect the E2 engine coolant temperature sensor connector.
- (b) Turn the ignition switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: Temperature value: -40°C (-40°F)

OK → Replace engine coolant temperature sensor.

NG

5 Check for short in harness or ECM.

PREPARATION:

- (a) Disconnect the E7 ECM connector.
- (b) Turn the ignition switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

Read the temperature value on the hand-held tester.

OK:

Standard: Temperature value: -40°C (-40°F)

OK → Repair or replace harness or connector.

NG

Replace ECM (See page SF-82).

DTC	P0116	Engine Coolant Temperature Circuit Range/ Performance Problem
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to DTC P0115 on page [DI-540](#).

DTC No.	DTC Detecting Condition	Trouble Area
P0116	If the engine coolant temperature was 35°C (95°F) or more but less than 60°C (140°F) when the engine is started, and if conditions (a) and (b) are met: (a) Vehicle has accelerated and decelerated. (b) Engine coolant temperature remains within 3°C (5.4°F) of the initial engine coolant temperature (2 trip detection logic)	• Engine coolant temperature sensor
	If the engine coolant temperature is more than 60°C (140°F) when the engine is started, and if conditions (a) and (b) are met: (a) Vehicle has accelerated and decelerated. (b) If the engine coolant temperature sensor records a temperature variation below 1°C (1.8°F) successively 6 times (6 trip detection logic)	

MONITOR DESCRIPTION

The ECT (Engine Coolant Temperature) sensor is used to monitor the engine coolant temperature. The ECT sensor has a thermistor that varies its resistance depending on the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. The variations in resistance are reflected in the voltage output from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the engine coolant temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and sets a DTC.

Examples:

- (1) Upon starting the engine, the ECT is between 35°C (95°F) and 60°C (140°F). If after driving for 250 sec., the ECT still remains within 3°C (5.4°F) of the starting temperature, a DTC will be set (2 trip detection logic).
- (2) Upon starting the engine, the ECT is over 60°C (140°F). If after driving for 250 sec., the ECT still remains within 1°C (1.8°F) of the starting temperature, a DTC will be set (6 trip detection logic).

MONITOR STRATEGY

Frequency of operation	Continuous	
Duration	250 sec.	
MIL operation	2 driving cycles (When temperature is fixed between 35°C (95°F) and 60°C (140°F)) 6 driving cycles (When temperature is fixed at 60°C (140°F) or more)	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-437	
Case 1 (When temperature is fixed between 35°C (95°F) and 60°C (140°F)):		
Cumulative idle off period	250 sec.	–
Speed increase 18.6 mph (30 km/h) or more	10 times	–
Engine coolant temperature	35°C (95°F)	60°C (140°F)
Intake air temperature	–6.7°C (20°F)	–
Intake air temperature sensor circuit fail	Not detected	
Case 2 (When temperature is fixed at 60°C (140°F) or more):		
Engine coolant temperature at engine start	60°C (140°F)	–
Intake air temperature	–6.7°C (20°F)	–
Stop and go*1	Once or more	
Steady driving and stop*2	Once or more	
Engine running time after engine start	0.3 seconds or more	

*1: The vehicle is stopped for 20 seconds or more and accelerated to more than 43.5 mph (70 km/h) within 40 seconds.

*2: Following these steps: 1) the vehicle is driven at 40.4 mph (65 km/h) or more for 30 seconds or more and the vehicle speed reaches 43.5 mph (70 km/h); 2) the vehicle is decelerated from 40.4 mph (65 km/h) to 1.86 mph (3 km/h) or less within 35 seconds; and 3) the vehicle is stopped for 10 seconds.

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Case1 (When temperature is fixed between 35°C (95°F) and 60°C (140°F)):	
Change of engine coolant temperature value	Less than 3°C (5.4°F)
Case2 (When temperature is fixed at 60°C (140°F) or more):	
Change of engine coolant temperature value	1°C (1.8°F) or less

COMPONENT OPERATING RANGE

Standard Value
Engine coolant temperature changes with the actual engine coolant temperature.

INSPECTION PROCEDURE

HINT:

- If DTC P0115, P0116, P0117, P0118 and P0125 are output simultaneously, ECT sensor circuit may be open or shorted. Perform the troubleshooting of DTC P0115, P0117 or P0118 first.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

Replace engine coolant temperature sensor.

DTC	P0120	Throttle/Pedal Position Sensor/Switch "A" Circuit
DTC	P0122	Throttle/Pedal Position Sensor/Switch "A" Circuit Low Input
DTC	P0123	Throttle/Pedal Position Sensor/Switch "A" Circuit High Input
DTC	P0220	Throttle/Pedal Position Sensor/Switch "B" Circuit
DTC	P0222	Throttle/Pedal Position Sensor/Switch "B" Circuit Low Input
DTC	P0223	Throttle/Pedal Position Sensor/Switch "B" Circuit High Input
DTC	P2135	Throttle/Pedal Position Sensor/Switch "A"/"B" Voltage Correction

HINT:

This is the purpose for the "throttle position sensor".

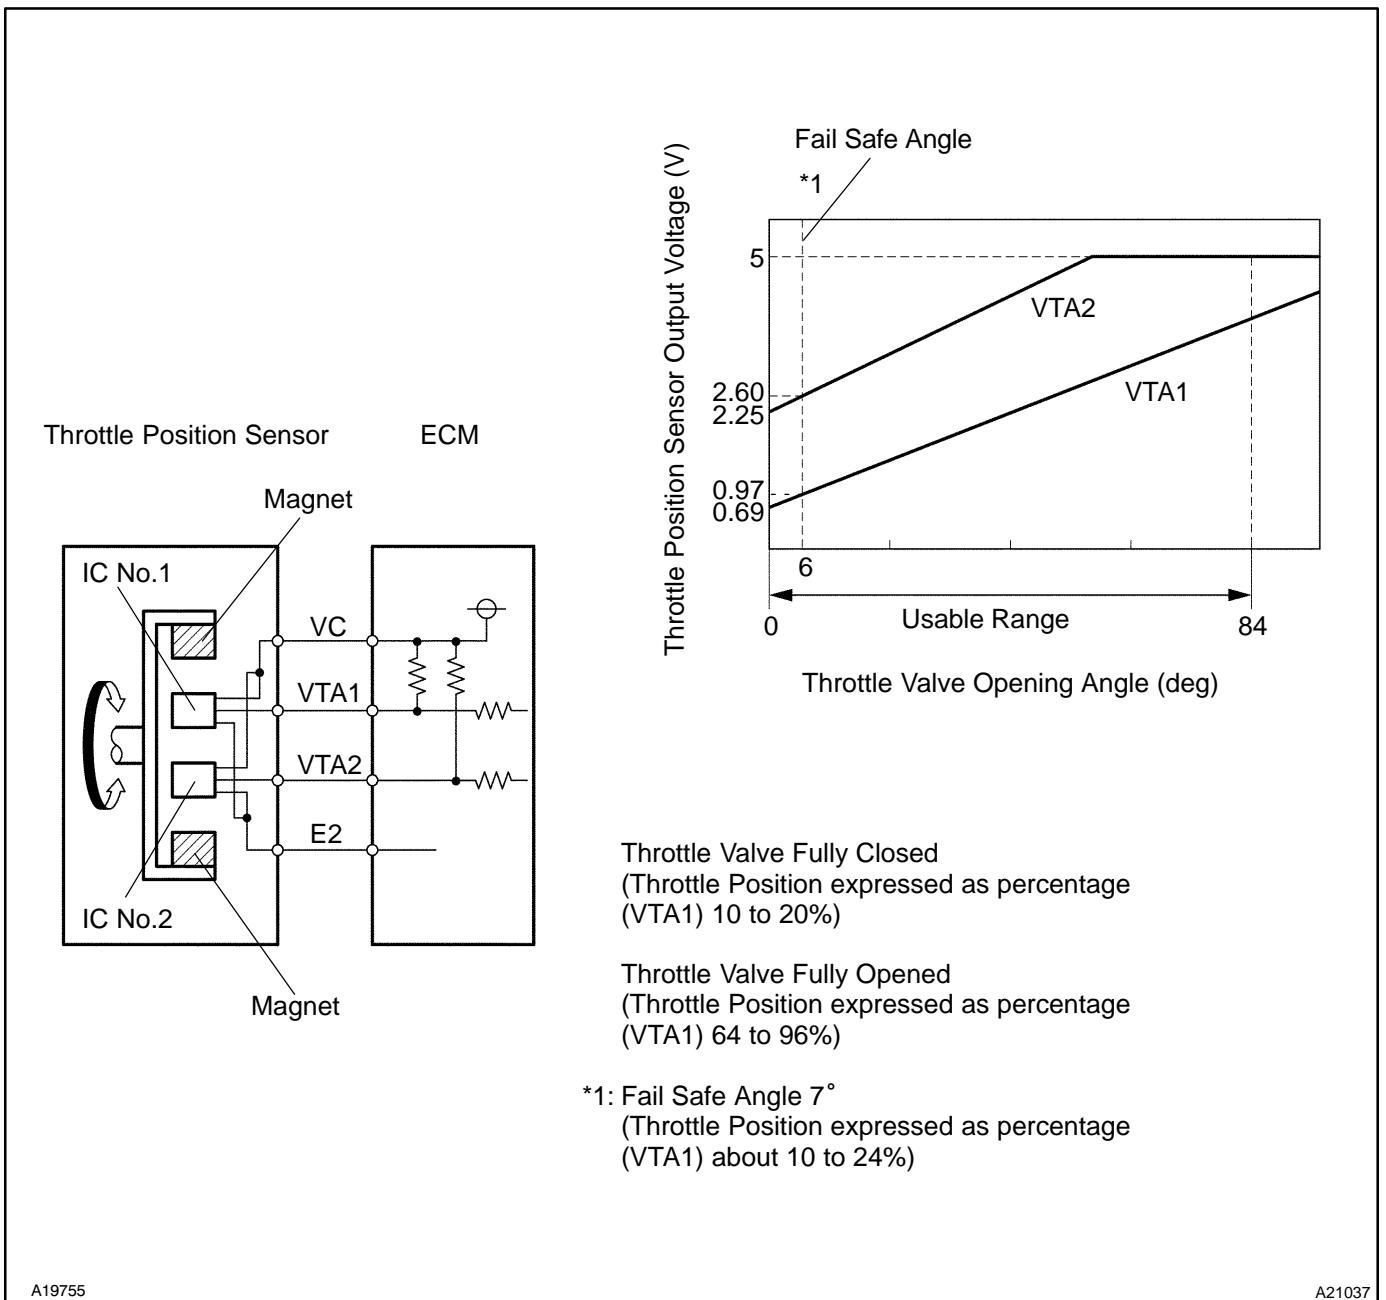

CIRCUIT DESCRIPTION

HINT:

- This Electrical Throttle Control System (ETCS) does not use a throttle cable.
- This throttle position sensor is a non-contact type.

The throttle position sensor is mounted on the throttle body. It detects the opening angle of the throttle valve. This sensor is electronically controlled and uses Hall-effect elements, so that accurate control and reliability can be obtained. The throttle position sensor has 2 sensor elements / signal outputs: VTA1 and VTA2. VTA1 used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. Voltage applied to VTA1 and VTA2 change between 0 V and 5 V in proportion to the opening angle of the throttle valve. There are several checks that the ECM performs to confirm proper operation of the throttle position sensor and VTA1.

The ECM judges the current opening angle of the throttle valve from these signals input from terminals VTA1 and VTA2, and the ECM controls the throttle motor to make the throttle valve angle properly in response to driver inputs.

DTC No.	DTC Detection Condition	Trouble Area
	Condition (a) of DTC P0120, P0122, P0123, P0220, P0222 or P0223 continues for 2 sec. (Open or short in the throttle control motor and sensor circuit)	
P0120	Detection conditions for DTCs P0122 and P0123 are not satisfied but condition (a) is satisfied (a) VTA1 is "0.2 V or less" or VTA1 is "4.535 V or more"	<ul style="list-style-type: none"> • Open or short in throttle control motor and sensor circuit • Throttle control motor and sensor • ECM
P0122	(a) VTA1 is 0.2 V or less	<ul style="list-style-type: none"> • Short in throttle control motor and sensor circuit • Throttle control motor and sensor • Short in VTA1 circuit • Open in VC circuit • ECM

P2135	Condition (a) continues for 0.5 sec. or more, or condition (b) continues for 0.4 sec. or more: (a) Difference between VTA1 and VTA2 is 0.02 V or less (b) VTA1 is "0.2 V or less" and VTA2 is "1.75 V or less"	<ul style="list-style-type: none"> • VTA1 and VTA2 circuit are short-circuited • Throttle control motor and sensor • ECM

HINT:

- After confirming DTCs, use the hand-held tester or the OBD II scan tool to confirm the throttle valve opening percentage and closed throttle position switch condition.
- THROTTLE POS means the VTA1 signal and the THROTTLE POS #2 means the VTA2 signal.

Reference (Normal condition):

Tester display	Accelerator pedal fully released	Accelerator pedal fully depressed
THROTTLE POS	10 to 24%	66 to 98%
THROTTLE POS #2	2.1 to 3.1 V	4.5 to 5.5 V

MONITOR DESCRIPTION

The ECM uses throttle position sensor to monitor the throttle valve opening angle.

- (a) There is an expected specific voltage difference between VTA1 and VTA2 for each throttle opening angle.
- If the difference between VTA1 and VTA2 is incorrect the ECM interprets this as a fault and will set a DTC.
- (b) VTA1 and VTA2 each have a specific voltage operating range.
- If VTA1 or VTA2 is out of the normal operating range the ECM interprets this as a fault and will set a DTC.
- (c) VTA1 and VTA2 should never be close to the same voltage levels.
- If VTA1 is within the range of ± 0.02 V of VTA2 the ECM interprets this as a short circuit in the throttle position sensor system and will set a DTC.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
P0120:	
VTA1 voltage	0.2 V or less, or 4.535 V or more
P0122:	
VTA1 voltage	0.2 V or less
P0123:	
VTA1 voltage	4.535 V or more
P0220:	
VTA2 voltage	1.75 V or less, or 4.8 V or more
P0222:	
VTA2 voltage	1.75 V or less
P0223:	
Both of the following conditions are met:	Condition 1 and 2
1. VTA1 voltage	0.2 to 2.02 V
2. VTA2 voltage	4.8 V or more
P2135:	
Different between VTA1 and VTA2 voltage	0.02 V or less
Both of the following conditions are met:	Condition 1 and 2
1. VTA1 voltage	0.2 V or less
2. VTA2 voltage	1.75 V or less

COMPONENT OPERATING RANGE

Parameter	Standard Value
Throttle position sensor VTA1 voltage	0.6 to 3.96 V
Throttle position sensor VTA2 voltage	2.25 to 5.0 V

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If DTCs related to different system that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read the voltage for throttle position sensor data.
----------	--

PREPARATION:

(a) Enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / THROTTLE POS and THROTTLE POS #2.

CHECK:

Read voltage value displayed on the hand-held tester.

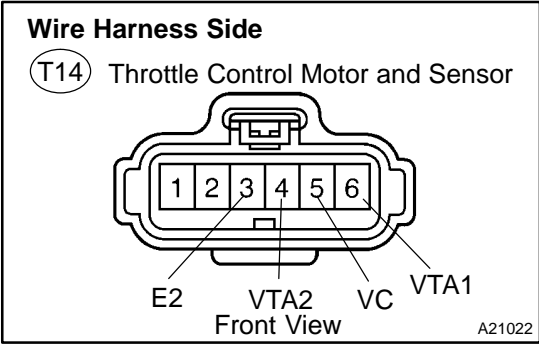

OK:**RESULT:**

Throttle position expressed as percentage and voltage				Trouble area	Proceed to
Accelerator pedal released		Accelerator pedal depressed			
THROTTLE POS (VTA1)	THROTTLE POS #2 (VTA2)	THROTTLE POS (VTA1)	THROTTLE POS #2 (VTA2)		
0 %	0 to 0.2 V	0 %	0 to 0.2 V	VC circuit open	A
100 %	4.5 to 5.5 V	100 %	4.5 to 5.5 V	E2 circuit open	
0 % or 100 %	2.1 to 3.1 V (Fail safe)	0 % or 100 %	2.1 to 3.1 V (Fail safe)	VTA1 circuit open or ground short	
about 16 % (Fail safe)	0 to 0.2 or 4.5 to 5.5 V	about 16 % (Fail safe)	0 to 0.2 or 4.5 to 5.5 V	VTA2 circuit open or ground short	
10 to 24 %	2.15 to 3.05 V	64 to 96 % (Does not fail safe)	4.5 to 5.5 V (Does not fail safe)	Throttle position sensor circuit is normal	

B	Go to step 5.
----------	----------------------

2 Check for open and short in harness and connector between ECM and throttle position sensor.

PREPARATION:

- (a) Disconnect the T14 throttle control motor and sensor connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VC (T14-5) – VC (E7-23)	Below 1 Ω
VTA1 (T14-6) – VTA1 (E7-20)	Below 1 Ω
VTA2 (T14-4) – VTA2 (E7-19)	Below 1 Ω
E2 (T14-3) – E2 (E7-28)	Below 1 Ω
VC (T14-5) or VC (E7-23) – Body ground	10 kΩ or higher
VTA1 (T14-6) or VTA1 (E7-20) – Body ground	10 kΩ or higher
VTA2 (T14-4) or VTA2 (E7-19) – Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

3 Check voltage between terminals VC and E2 of ECM connector.

PREPARATION:

- (a) Disconnect the T14 throttle control motor and sensor connector.
- (b) Turn the ignition switch ON.

CHECK:

Measure the voltage between the specified terminals of the E7 ECM connector.

OK:

Standard:

Tester Connection	Specified Condition
VC (E7-23) - E2 (E7-28)	4.5 to 5.5 V

NG → Replace ECM (See page [SF-82](#)).

OK

4 Replace throttle body (See page [SF-43](#)).

Go

5 Check if DTC output recur.

PREPARATION:

- (a) Clear DTCs (see page [DI-462](#)).
- (b) Start the engine.
- (c) Run the engine at idle for 15 seconds or more.

CHECK:

Read the DTC.

RESULT:

Display (DTC Output)	Proceed to
"P0120, P0122, P0123, P0220, P0222, P0223 and/or P2135" are output again	A
No DTC output	B

B → System is OK.

A

Replace ECM (See page [SF-82](#)).

DTC	P0121	Throttle Pedal Position Sensor/Switch "A" Circuit Range/Performance Problem
------------	--------------	--

HINT:

This is the purpose of the "throttle position sensor".

CIRCUIT DESCRIPTION

Refer to DTC P0120 on page [DI-548](#).

DTC No.	DTC Detecting Condition	Trouble Area
P0121	Condition (a) continues for 2.0 sec.: (a) Difference between VTA1 and VTA2 deviates from the threshold	Throttle control motor and sensor

MONITOR DESCRIPTION

The ECM uses throttle position sensor to monitor the throttle valve opening angle.

This sensor includes two signals, VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. There are several checks that the ECM performs confirm proper operation of the throttle position sensor and VTA1.

There is a specific voltage difference expected between VTA1 and VTA2 for each throttle opening angle. If the voltage output difference of the VTA1 and VTA2 deviates from the normal operating range, the ECM interprets this as a malfunction of the throttle position sensor. The ECM will turn on the MIL and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

Related DTCs	P0121	Throttle position sensor rationality

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Different between VTA1 and VTA2 $ VTA1 - (VTA2 \times 0.8 \text{ to } 1.2) ^*$ * Corrected by learning value	Less than 0.8 V, or more than 1.6 V

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

Replace throttle control motor and sensor (See page [SF-43](#)).

DTC	P0125	Insufficient Coolant Temperature for Closed Loop Fuel Control
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to DTC P0115 on page [DI-540](#).

DTC No.	DTC Detection Condition	Trouble Area
P0125	If THW or THA is less than -19.45°C (-3°F) at engine start and 20 min. or more after starting engine, engine coolant temp. sensor value is 20°C (68°F) or less (2 trip detection logic)	<ul style="list-style-type: none"> • Cooling system • Engine coolant temperature sensor • Thermostat
	If THW and THA is between -19.45°C (-3°F) and -8.34°C (17°F) at engine start, 129 sec. or more after starting engine and engine coolant temp. sensor value is 20°C (68°F) or less (2 trip detection logic)	
	If THW and THA greater than -8.34°C (17°F) at engine start and 77 sec. or more after starting engine, engine coolant temp. sensor value is 20°C (68°F) or less (2 trip detection logic)	

MONITOR DESCRIPTION

The ECT (Engine Coolant Temperature) sensor is used to monitor the temperature of the engine coolant. The resistance of the sensor varies with the actual coolant temperature. The ECM applies a voltage to the sensor and the varying resistance of the sensor cause the signal voltage to vary. The ECM monitors the ECT signal voltage after engine start-up. If, after sufficient time has passed, the sensor still reports that the engine is not warmed up enough for closed-loop fuel control after sufficient time has passed, the ECM interprets this as a fault in the sensor or cooling system and sets a DTC.

Example:

The engine coolant temperature was 0°C (32°F) at engine start. After 5 min. running time, the ECT sensor still indicates that the engine is not warmed up enough to begin air fuel ratio feedback control of the air-fuel ratio. The ECM interprets this as a fault in the sensor or cooling system and will set a DTC.

MONITOR STRATEGY

Related DTCs	P0125	Insufficient coolant temperature for closed loop fuel control
Required sensors/components	Main sensors/components	Engine coolant temperature sensor, Cooling system, Thermostat
	Related sensors/components	Mass air flow meter
Frequency of operation	Continuous

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Time until "engine coolant temperature" detection temperature reaches feedback start temperature	
When the temperature at the time of engine starting is -8.34°C (17°F) or more	Engine coolant temperature is less than "closed-loop enable temperature" when 77 sec. or more after engine start
When the temperature at the time of engine starting is -19.45 to -8.34°C (-3 to 17°F)	Engine coolant temperature is less than "closed-loop enable temperature" when 129 sec. or more after engine start
When the temperature at the time of engine starting is -19.45°C (-3°F) or less	Engine coolant temperature is less than "closed-loop enable temperature" when 20 min. or more after engine start

INSPECTION PROCEDURE

HINT:

- If DTC P0115, P0116, P0117, P0118 and P0125 are output simultaneously, engine coolant temperature sensor circuit may be open or short. Perform the troubleshooting of DTC P0115, P0117 or P0118 first.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Are there any other codes (besides DTC P0125) being output?
----------	--

PREPARATION:

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch ON and push the hand-held tester main switch ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTCs using the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
P0125	A
"P0125" and other DTCs	B

HINT:

If any other codes besides "P0125" are output, perform the troubleshooting for those DTCs first.

B
Go to relevant DTC chart (See page [DI-477](#)).

A

2 Inspect thermostat (See page CO-11).**CHECK:**

Check the valve opening temperature of the thermostat.

OK:

Valve opening temperature is 80 to 84°C (176 to 183°F)

HINT:

Also check that the valve is completely closed under opening temperature as above.

NG**Replace thermostat (See page CO-12).****OK****3 Check cooling system.****CHECK:**

Check that there is detect in the cooling system which causes overcool, such as abnormal radiator fan operation, modified cooling system and so on.

NG**Repair or replace cooling system.****OK****Replace engine coolant temperature sensor.**

DTC	P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)
------------	--------------	---

HINT:

This is the purpose of "thermostat" malfunction detection.

CIRCUIT DESCRIPTION

If the engine coolant temperature does not reach 75°C (167°F) despite sufficient warm-up time has elapsed.

DTC No.	DTC Detection condition	Trouble Area
P0128	Condition (a), (b) and (c) are met: (a) Cold start (b) After sufficient warm-up time has elapsed (c) Engine coolant temperature greater than 75°C (167°F)	<ul style="list-style-type: none"> • Thermostat • Cooling system • Engine coolant temperature sensor • ECM

MONITOR DESCRIPTION

The ECM estimates the coolant temperature based on starting temperature, engine loads, and engine speeds. The ECM then compares the estimated temperature with the actual ECT (Engine Coolant Temperature). When the estimated coolant temperature reaches 75°C (167°F), the ECM checks the actual ECT. If the actual ECT is less than 75°C (167°F), the ECM will interpret this as a fault in the thermostat or engine cooling system and set a DTC.

MONITOR STRATEGY

Related DTCs	P0128	Thermostat
Required sensors/components	Main sensors/components	Engine coolant temperature sensor, Engine cooling system, Thermostat
	Related sensors/components	Intake air temperature sensor, Vehicle speed sensor

(b) ECT at engine start	–10 to 56°C (14 to 133°F)	
(c) IAT at engine start	–10 to 56°C (14 to 133°F)	
2. All of the following conditions are met	Condition (d), (e) and (f)	
(d) ECT at engine start – IAT at engine start	7°C (44.6°F)	–
(e) ECT at engine start	–	56°C (133°F)
(f) IAT at engine start	–10°C (14°F)	–
Accumulated time that vehicle speed is 80 mph (128 km/h) or more	–	20 sec.

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Duration that both of following conditions 1 and 2 are met	5 sec. or more
1. Estimated engine coolant temperature	75°C (167°F) or more
2. Engine coolant temperature sensor output	Less than 75°C (167°F)

COMPONENT OPERATING RANGE

Parameter	Standard Value
Engine coolant temperature sensor output value after warm up	75°C (167°F) or more

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Are there any other codes (besides DTC P0128) being output?
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
P0128	A
P0128 and other DTCs	B

HINT:

If any other codes besides P0128 are output, perform the troubleshooting for those DTCs first.

B

Check for intermittent problems (See page DI-430).

A

2	Check cooling system.
----------	------------------------------

CHECK:

- (a) Check for defects in the cooling system that might cause the system to be too cold, such as abnormal radiator fan operation or a modified cooling system.
- (b) Check the valve opening temperature of the thermostat.

OK:

Valve opening temperature is 80 to 84°C (176 to 183°F)

HINT:

Also check that the valve is completely closed under opening temperature as above.

NG

Repair or replace cooling system.

OK

3	Check thermostat (See page CO-12).
----------	---

CHECK:

Check the valve lift.

OK:

Valve lift: 10 mm (0.39 in.) or more at 95°C (203°F)

NG	Replace thermostat.
-----------	----------------------------

Replace ECM (See page SF-82).
--

DTC	P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)
------------	--------------	--

DTC	P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)
------------	--------------	--

DTC	P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)
------------	--------------	---

DTC	P0156	Oxygen Sensor Circuit Malfunction (Bank 2 Sensor 2)
------------	--------------	--

DTC	P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)
------------	--------------	--

DTC	P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)
------------	--------------	---

HINT:

Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.

CIRCUIT DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. less than 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. more than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

MONITOR DESCRIPTION

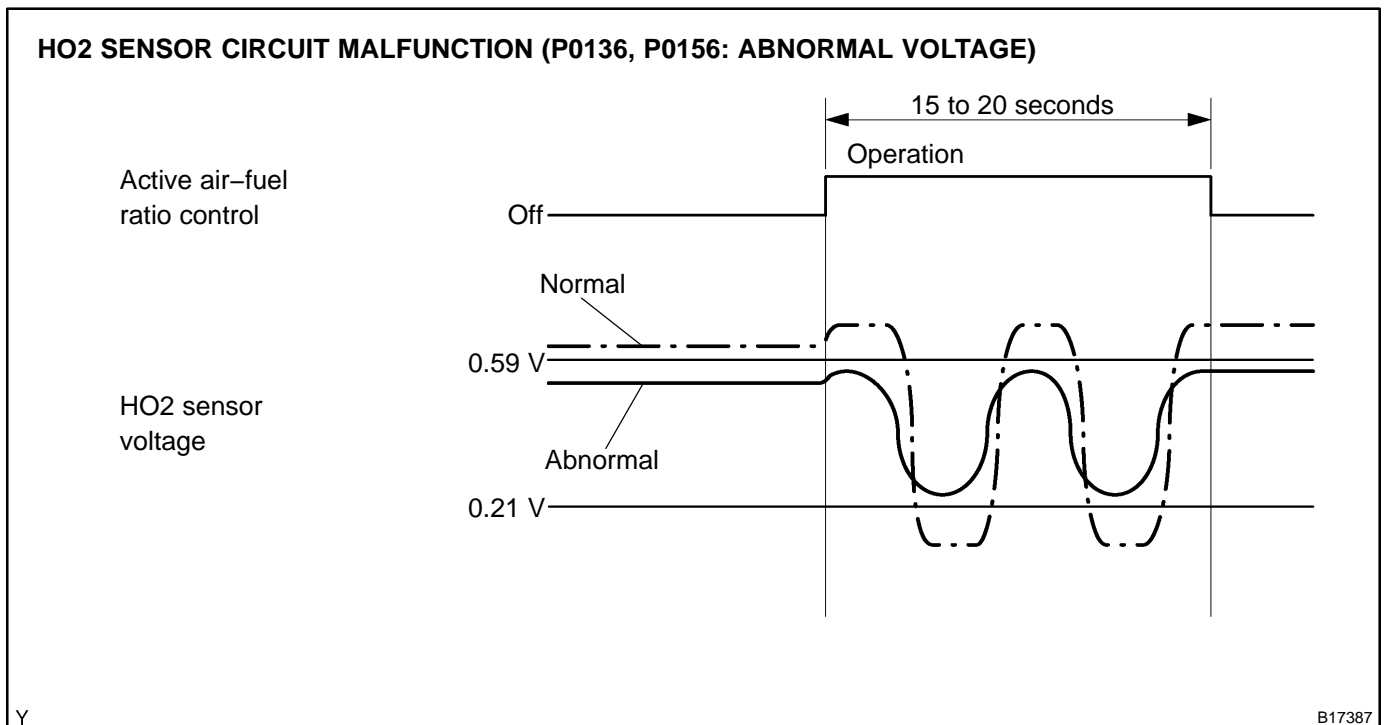

Active Air-Fuel Ratio Control

The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO₂) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, one of the following DTCs is set: DTC P0136, P0156 (abnormal voltage output), P0137, P0157 (open circuit) and P0138, P0158 (short circuit).

Abnormal Voltage Output of HO₂ Sensor (DTC P0136, P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO₂ sensor voltage does not decrease to less than 0.21 V and does not increase to more than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and sets DTC P0136.

Open or Short in the Heated Oxygen (HO2) Sensor Circuit (DTC P0137, P0157, P0138 or P0158)

During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean.

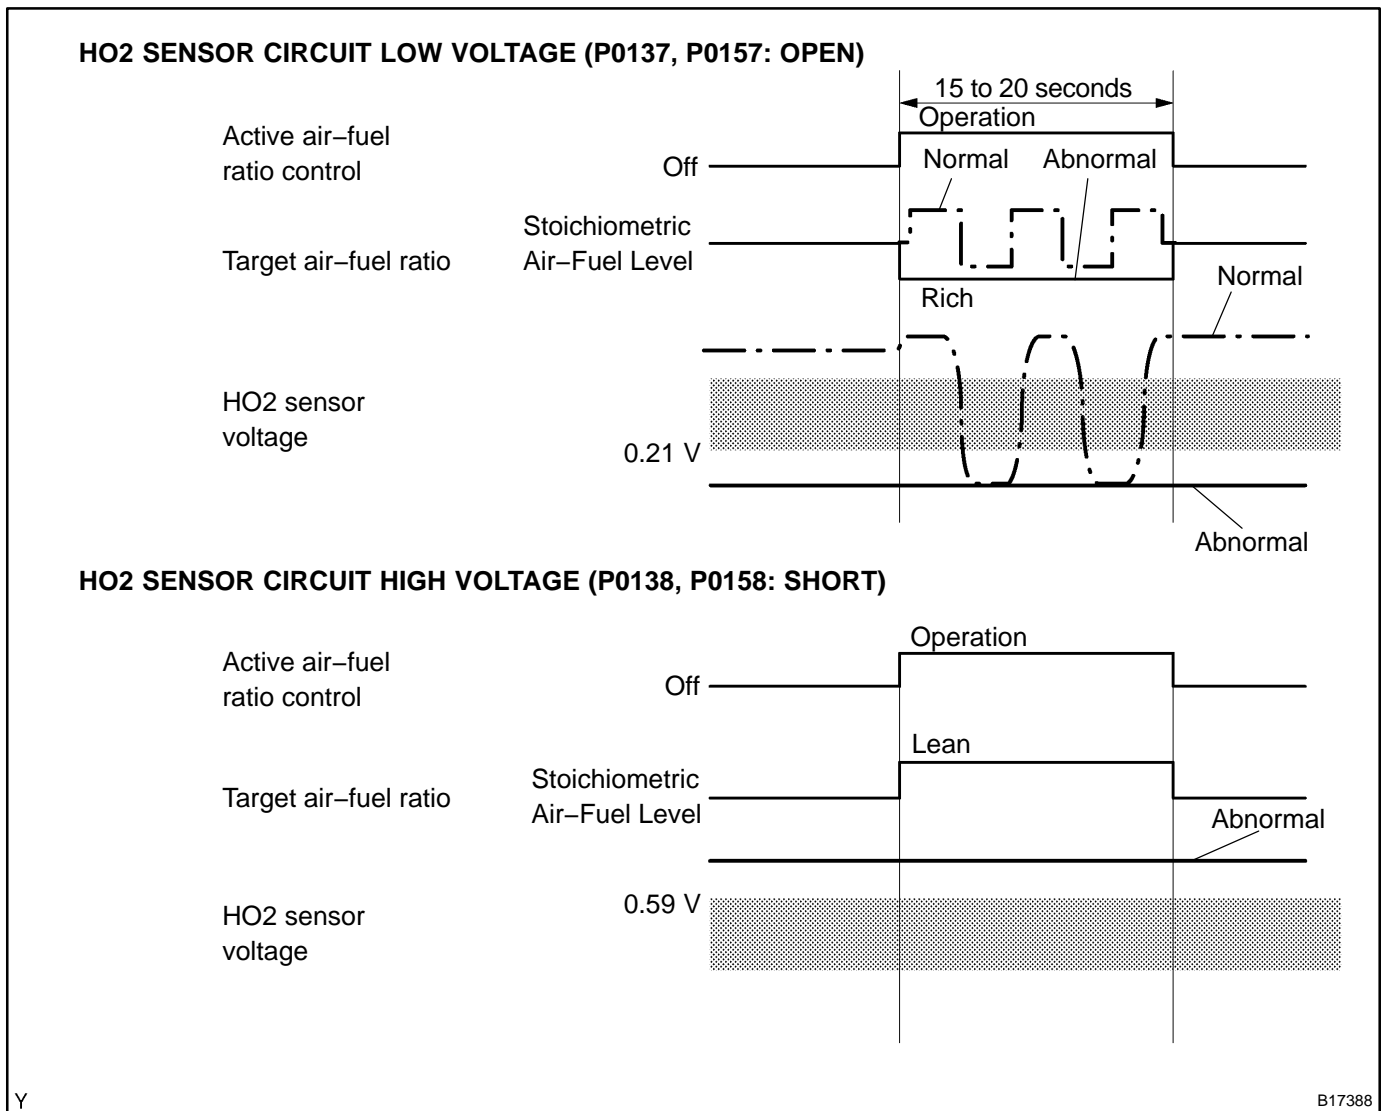

If the HO2 sensor has an open or short, or the voltage output of the sensor noticeably decreases, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and sets DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or more (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and sets DTC P0138 or P0158.

HINT:

DTC P0138 or P0158 is also set if the HO2 sensor voltage output is more than 1.2 V for 30 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated, based on the calculated OSC value (see page DI-672).

High or Low Impedance of Heated Oxygen (HO2) Sensor (DTC P0136, P0156, P0137 or P0157)

Interrelation between temperature of the element and impedance:

During normal air–fuel ratio feedback control, there are small variations in the exhaust gas oxygen concentration. In order to continuously monitor the slight variation of the HO2 sensor signal while the engine is running, the impedance* of the sensor is measured by the ECM. The ECM determines that there is a malfunction in the sensor when the measured impedance deviates from the standard range.

*: The effective resistance in an alternating current electrical circuit.

HINT:

- The impedance can not be measured using an ohmmeter.
- DTC P0136 or P0156 indicates the deterioration of the HO2 sensor. The ECM sets the DTC by calculating the impedance of the sensor when the typical enabling conditions are satisfied (1 driving cycle).
- DTC P0137 or P0157 indicates an open circuit in the HO2 sensor (1 driving cycle). The ECM sets this DTC when the impedance of the sensor exceeds the threshold 348.1 MΩ.

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Heated oxygen sensor output voltage (Output voltage):	
Either of the following conditions is met:	Condition 1 or 2
1. All of the following conditions are met:	Condition (a), (b) and (c)
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2S voltage	0.21 to 0.59 V
(c) OSC (Oxygen Storage Capacity of catalyst)	3 g or more
2. All of the following conditions are met:	Condition (d), (e) and (f)
(d) Commanded air-fuel ratio	14.9 or more
(e) Rear HO2S voltage	0.21 to 0.59 V
(f) OSC (Oxygen Storage Capacity of catalyst)	3 g or more
Heated oxygen sensor output voltage (Low voltage):	
All of the following conditions are met:	Condition 1, 2 and 3
1. Commanded air-fuel ratio	14.3 or less
2. Rear HO2S voltage	Less than 0.21 V
3. OSC (Oxygen Storage Capacity of catalyst)	3 g or more
Heated oxygen sensor output voltage (High voltage):	
All of the following conditions are met:	Condition 1, 2 and 3
1. Commanded air-fuel ratio	14.9 or more
2. Rear HO2S voltage	More than 0.59 V
3. OSC (Oxygen Storage Capacity of catalyst)	3 g or more

Heated oxygen sensor impedance (Low):	
Duration of following condition	30 sec. or more
Heated oxygen sensor impedance	Less than 5 Ω
Heated oxygen sensor impedance (High):	
Duration of following condition	90 sec. or more
Heated oxygen sensor impedance	15 k Ω or more
Heated oxygen sensor output voltage (Extremely high):	
Duration of following condition	10 sec. or more
Heated oxygen sensor voltage	1.2 V or more

COMPONENT OPERATING RANGE

Parameter	Standard Value
Heated oxygen sensor voltage	Varies between 0.1 to 0.9 V

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (see page [DI-446](#)).

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.

HO2S bank 1 sensor 2

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$02	\$07	Multiply by 0.001 (V)	Minimum sensor voltage	Minimum test limit	Maximum test limit
\$02	\$08	Multiply by 0.001 (V)	Maximum sensor voltage	Minimum test limit	Maximum test limit
\$02	\$8F	Multiply by 0.001 (g)	Maximum oxygen storage capacity	0	Maximum test limit

HO2S bank 2 sensor 2

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$06	\$07	Multiply by 0.001 (V)	Minimum sensor voltage	Minimum test limit	Maximum test limit
\$06	\$08	Multiply by 0.001 (V)	Maximum sensor voltage	Minimum test limit	Maximum test limit
\$06	\$8F	Multiply by 0.001 (g)	Maximum oxygen storage capacity	0	Maximum test limit

WIRING DIAGRAM

Refer to DTC P2195 on page [DI-806](#).

CONFIRMATION DRIVING PATTERN

HINT:

- This confirmation driving pattern is used in steps 5, 8 and 11 of the following diagnostic troubleshooting procedure when using either a hand-held tester.
- Performing this confirmation pattern will activate the Heated Oxygen (HO2) sensor monitor. (The catalyst monitor is performed simultaneously.) This is very useful for verifying the completion of a repair.

READINESS TESTS	
MISFIRE MON	AVAIL
FUEL SYS MON	AVAIL
COMP MON	AVAIL
CAT EVAL	INCMPL
HTD CAT EVAL	N/A
EVAP EVAL	INCMPL
2nd AIR EVAL	N/A
A/C EVAL	N/A
O2S EVAL	INCMPL
O2S HTR EVAL	INCMPL
EGR EVAL	N/A

A76855 A23660

- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON.
- Turn the tester or scan tool ON.
- Clear DTCs (where set) (see page DI-462).
- If using a hand-held tester, select the following menu items: DIAGNOSIS / CARB OBD II / READINESS TESTS.
- Check that O2S EVAL is INCMPL (incomplete).
- Start the engine and warm it up.
- Drive the vehicle at between 40 mph and 70 mph (64 km/h and 113 km/h) for at least 10 minutes.
- Note the state of the Readiness Tests items. Those items will change to COMPL (complete) as O2S EVAL monitor operates.
- On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.

HINT:

If O2S EVAL does not change to COMPL, and any pending DTCs fail to set, extend the driving time.

INSPECTION PROCEDURE

HINT:

Hand-held tester only:

Narrowing down the trouble area is possible by performing ACTIVE TEST of the following "A/F CONTROL" (Heated oxygen sensor or another can be distinguished).

(a) Perform ACTIVE TEST by hand-held tester (A/F CONTROL).

HINT:

"A/F CONTROL" is the ACTIVE TEST which changes the injection volume to -12.5 % or +25 %.

- (1) Connect the hand-held tester to the DLC3 on the vehicle.
- (2) Turn the ignition switch ON.
- (3) Warm up the engine with the engine speed at 2,500 rpm for approximately 90 seconds.
- (4) Select the menu "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL".
- (5) Perform "A/F CONTROL" with the engine in an idle condition (press the right or left button).

RESULT:

Heated oxygen sensor reacts in accordance with increase and decrease of injection volume

+25 % → rich output: More than 0.5 V

-12.5 % → lean output: Less than 0.4 V

NOTICE:

There is a few seconds delay in the sensor 1 (front sensor) output. And there is approximately 20 seconds delay in the sensor 2 (rear sensor).

The following A/F CONTROL procedure enables the technician to check and graph the voltage output of the heated oxygen sensors.

For displaying the graph indication, first enter "ACTIVE TEST / A/F CONTROL / USER DATA," then select "A/F B1,2S1 and O2S B1,2S2" by pressing "YES" button, and push "ENTER" button before pressing "F4" button.

	Output voltage of A/F sensor (sensor 1: front sensor)	Output voltage of heated oxygen sensor (sensor 2: rear sensor)	Mainly suspected trouble area
Case 1	Injection volume +25 %  -12.5 % Output voltage More than 0.5 V  OK Less than 0.4 V	Injection volume +25 %  -12.5 % Output voltage More than 0.5 V  OK Less than 0.4 V	—
Case 2	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage More than 0.5 V  OK Less than 0.4 V	Sensor 1: front sensor (sensor 1, heater, sensor 1 circuit)
Case 3	Injection volume +25 %  -12.5 % Output voltage More than 0.5 V  OK Less than 0.4 V	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Sensor 2: rear sensor (sensor 2, heater, sensor 2 circuit)
Case 4	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Extremely rich or lean actual air-fuel ratio (Injector, fuel pressure, gas leakage in exhaust system, etc.)

HINT:

- If different DTCs that are related to different system are output simultaneously while terminal E2 is used as a ground terminal, terminal E2 may be open.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. when a malfunction occurred.

1	Read output DTC.
----------	-------------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
P0138, P0158	A
P0137, P0157	B
P0136, P0156	C

HINT:

If any other codes besides P0136 are output, perform the troubleshooting for those DTCs first.

2	Check output voltage of heated oxygen sensor.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) After warming up the engine, run the engine at 2,500 rpm for 3 minutes.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / O2S B1S2 or B2S2.
- (d) Allow the engine to idle.

CHECK:

Read the Heated Oxygen (HO2) sensor output voltage while idling.

RESULT:

HO2 Sensor Output Voltages	Proceed To
More than 1.2 V	A
Less than 1.0 V	B

3 Check for short in harness and connector between terminal OX1B and HT1B, OX2B and HT2B of ECM.

PREPARATION:

- (a) Turn the ignition switch to OFF and wait for 5 minutes.
- (b) Disconnect the E6 and E7 ECM connector.

CHECK:

- (a) Check the resistance.

OK:

Standard:

Tester Connections	Specified Conditions
HT1B (E7-1) - OX1B (E7-18)	10 kΩ or higher
HT2B (E6-5) - OX2B (E6-33)	10 kΩ or higher

OK → Replace ECM (See page SF-82).

NG

4 Check resistance of heated oxygen sensor heater.

PREPARATION:

Disconnect the heated oxygen sensor connector.

CHECK:

Measure resistance between terminals of the heated oxygen sensor.

OK:

Standard:

Tester Connection	Specified Condition
HT (1) - +B (2)	11 to 16 Ω at 20°C (68°F)
+B (2) - OX (3)	10 kΩ or higher

NG → Replace heated oxygen sensor.

OK

Repair or replace harness or connector.

5 Perform confirmation driving pattern.

NEXT

6	Check whether DTC output recurs (DTC P0138, P0158)
----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
 (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P0138 or P0158	A
No output	B

B → **Check for intermittent problems (See page DI-430).**

A

Replace heated oxygen sensor.

7	Check output voltage of heated oxygen sensor.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
 (b) Turn the ignition switch to ON and turn the tester ON.
 (c) Start the engine.
 (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / O2S B1S2.
 (e) After warming up the engine, run the engine at an engine speed of 2,500 rpm for 3 minutes.

CHECK:

- (a) Read the output voltage of the HO2 sensor when the engine rpm is suddenly increased.

HINT:

Quickly accelerate the engine to 4,000 rpm 3 times using the accelerator pedal.

Standard: Fluctuates between 0.4 V or less and 0.5 V or more.

NG → **Go to step 14.**

OK

8	Perform confirmation driving pattern.
----------	--

NEXT

9	Check whether DTC output recurs (DTC P0136, P0156)
----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P0136 or P0156	A
No output	B

B → **Check for intermittent problems (See page DI-430).**

A

10	Replace heated oxygen sensor.
-----------	--------------------------------------

NEXT

11	Perform confirmation driving pattern.
-----------	--

NEXT

12	Check whether DTC output recurs (DTC P0136, P0156)
-----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P0136 or P0156	A
No output	B

B → **Repair completed.**

A

13	Perform active test (injection volume).
-----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and turn the tester ON.
- (c) Warm up the engine.
- (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INJ VOL.

CHECK:

- (a) Change the fuel injection volume using the tester, monitoring the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- Change the fuel injection volume within the range of -12 % and +12 %. The injection volume can be changed in 1 % graduations within the range.
- The A/F sensor is displayed as AFS B1S1 (AFS B2S1), and the HO2 sensor is displayed as O2S B1S2 (O2S B2S2), on hand-held testers.

RESULT:

Tester Display (Sensor)	Voltage Variations	Proceed To
AFS B1S1 (AFS B2S1) (A/F)	Alternates between more and less than 3.3 V	OK
AFS B1S1 (AFS B2S1) (A/F)	Remains at more than 3.3 V	NG
AFS B1S1 (AFS B2S1) (A/F)	Remains at less than 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or more than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	Replace air-fuel ratio (A/F) sensor.
-----------	---

OK

Check and repair extremely rich or lean actual air fuel ratio (injector, fuel pressure, gas leakages from exhaust system, etc.)

14 Check for exhaust gas leakage.

CHECK:

Check for exhaust gas leakage from the exhaust manifold and pipe.

OK: No exhaust gas leakage.

NG Repair or replace exhaust gas leakage point.

OK

15 Inspect heated oxygen sensor.

PREPARATION:

Disconnect the HO2 sensor connector.

CHECK:

Measure the resistance between the terminals of the HO2 sensor connector.

OK:

Standard:

Tester Connections	Specified Conditions
HT (2) - +B (1)	11 to 16 Ω at 20°C (68°F)
HT (2) - E (3)	10 kΩ or higher

NG Replace heated oxygen sensor.

OK

16 Check EFI relay.
**PREPARATION:**

Remove the EFI relay from the engine room J/B.

CHECK:

Inspect the EFI relay.

OK:**Standard:**

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 K Ω or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG**Replace EFI relay.****OK**

17 Check for open and short in harness and connector between ECM and heated oxygen sensor.

Wire Harness Side:

Bank 1 Sensor 2, Bank 2 Sensor 2 A23543

PREPARATION:

- (a) Disconnect the heated oxygen sensor connector.
- (b) Disconnect the E6 and E7 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

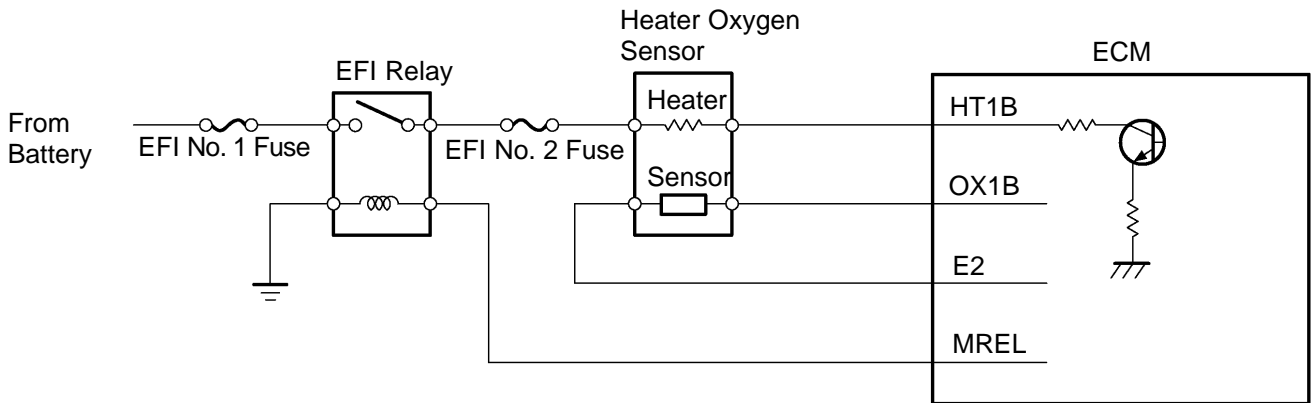

Standard:

Tester Connection	Specified Condition
OX (H4-3) - OX1B (E7-18)	Below 1 Ω
HT (H4-1) - HT1B (E7-1)	Below 1 Ω
OX (H6-3) - OX2B (E6-33)	Below 1 Ω
HT (H6-1) - HT2B (E6-5)	Below 1 Ω
OX (H4-3) or OX1B (E7-18) - Body ground	10 kΩ or higher
HT (H4-1) or HT1B (E7-1) - Body ground	10 kΩ or higher
OX (H6-3) or OX2B (E6-33) - Body ground	10 kΩ or higher
HT (H6-1) or HT2B (E6-5) - Body ground	10 kΩ or higher

CIRCUIT DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and long-term fuel trims.

The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.

Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.

If both the short-term and long-term fuel trims are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.

DIAGNOSTICS – ENGINE (2UZ-FE)

DTC No.	DTC Detecting Condition	Trouble Area
P0171 P0174	When air–fuel ratio feedback is stable after warming up the engine, fuel trim is considered to be in error on LEAN side (2 trip detection logic)	<ul style="list-style-type: none"> • Air induction system • Injector blockage • Mass air flow meter • Engine coolant temperature sensor • Fuel pressure • Gas leakage in exhaust system • Open or short in heated oxygen sensor (bank 1, 2 sensor 1) circuit • Heated oxygen sensor (bank 1, 2 sensor 1) • Heated oxygen sensor heater (bank 1, 2 sensor 1) • EFI relay • PCV piping • ECM
P0172 P0175	When air–fuel ratio feedback is stable after warming up the engine, fuel trim is considered to be in error on RICH side (2 trip detection logic)	<ul style="list-style-type: none"> • Injector leak, blockage • Mass air flow meter • Engine coolant temperature sensor • Ignition system • Fuel pressure • Gas leakage in exhaust system • Open or short in heated oxygen sensor (bank 1, 2 sensor 1) circuit • Heated oxygen sensor (bank 1, 2 sensor 1) • ECM

HINT:

- When DTC P0171 or P0174 is recorded, the actual air–fuel ratio is on the LEAN side. When DTC P0172 or P0175 is recorded, the actual air–fuel ratio is on the RICH side.
- If the vehicle runs out of fuel, the air–fuel ratio is LEAN and DTC P0171 or P0174 may be recorded. The MIL then comes on.
- If the total of the short–term fuel trim value and long–term fuel trim value is within $\pm 35\%$ (engine coolant temperature is more than $75\text{ }^{\circ}\text{C}$ (167°F)), the system is functioning normally.

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction thresholds, the ECM interprets this a fault in the fuel system and sets a DTC.

Example:

The average fuel trim leaning value is more than +35 % or less than -35 %, the ECM interprets this as a fuel system malfunction.

INSPECTION PROCEDURE

HINT:

Hand-held tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- (1) Connect a hand-held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 (AFS B2S1) and OS2 B1S2 (OS2 B2S2)) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

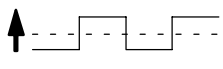

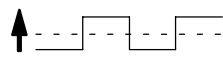

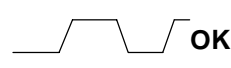

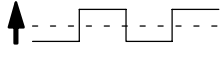

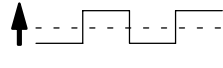

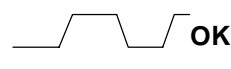

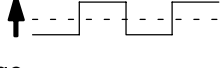

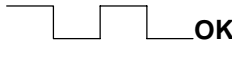

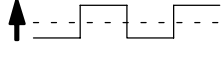

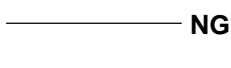

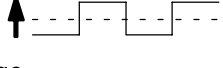

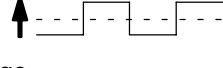

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 % ↑  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0 V	Injection volume +25 % ↑  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	—
2	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 % ↑  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 % ↑  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0V	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 % ↑  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

HINT:

- Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1	Check any other DTCs output (in addition to DTC P0171, P0172, P0174 or P0175).
----------	---

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- (a) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P0171, P0172, P0174 or P0175	A
P0171, P0172, P0174 or P0175 and other DTCs	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B	Go to relevant DTC chart (See page DI-477).
----------	--

A

2	Check connection of PCV piping.
----------	--

OK:

PCV hose is connected correctly and is not damaged.

NG	Repair or replace PCV piping.
-----------	--------------------------------------

OK

3	Check air induction system (See page SF-1).
----------	--

CHECK:

Check the air induction system for vacuum leaks.

NG

Repair or replace air induction system.

OK

4	Perform active test (A/F control).
----------	---

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and turn the tester ON.
- (c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (f) Monitor the voltage outputs of A/F and HO2 sensors (AFS B1S1 (AFS B2S1) and O2S B1S2 (O2S B2S2)) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO2)	-12.5 %	Lean	Less than 0.4

Result:

Status AFS B1S1 (AFS B2S1)	Status O2S B1S2 (O2S B2S2)	A/F Condition and A/F Sensor Condition	Misfires	Suspected Trouble Areas	Proceed To
Lean/Rich	Lean/Rich	Normal	—	—	C
Lean	Lean	Actual air-fuel ratio lean	May occur	<ul style="list-style-type: none"> • PCV valve and hose • PCV hose connections • Injector blockage • Gas leakage from exhaust system • Air induction system • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor 	A

DIAGNOSTICS - ENGINE (2UZ-FE)

Rich	Rich	Actual air-fuel ratio rich	—	<ul style="list-style-type: none"> • Injector leakage or blockage • Gas leakage from exhaust system • Ignition system • Fuel pressure • MAF meter • ECT sensor 	A
Lean	Lean/Rich	A/F sensor malfunction	—	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	—	• A/F sensor	B

Lean: During A/F CONTROL, the A/F sensor output voltage (AFS) is consistently more than 3.35 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.

Rich: During A/F CONTROL, the AFS is consistently less than 3.0 V, and the O2S is consistently more than 0.55 V.

5	Read value of engine coolant temperature.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / COOLANT TEMP.

CHECK:

- (a) Read the COOLANT TEMP twice, when the engine is cold and also when warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 75°C and 95°C (167°F and 203°F)

6	Read value of mass air flow meter.
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / MAF and COOLANT TEMP.
- (d) Allow the engine to idle until the COOLANT TEMP reaches 75°C (167°F) or more.

CHECK:

- (a) Read the MAF with the engine in an idling condition and at an engine speed of 2,500 rpm.

Standard:

MAF while engine idling: Between 1.4 gm/s and 2.3 gm/s (shift position: N, A/C: OFF).

MAF at engine speed of 2,500 rpm: Between 5.4 gm/s and 7.9 gm/s (shift position: N, A/C: OFF).

NG

Replace mass air flow meter.

OK

7	Check fuel pressure (See page SF-7).
----------	---

CHECK:

Check the fuel pressure (high or low pressure).

NGCheck and replace fuel pump, pressure regulator, fuel pipe line and filter (See page [SF-1](#)).**OK**

8	Check exhaust system for gas leakage.
----------	--

OK:

No exhaust gas leakage.

NG

Repair or replace exhaust gas leakage point.

OK

9 Check for spark and ignition (See page IG-1).

HINT:

If the spark plugs or ignition system malfunction, engine misfire may occur. The misfire counter can be read with the hand-held tester. Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL#1 (to CYL#8).

NG → **Repair or replace ignition system.**

OK

10 Check injector injection (See page SF-29).

HINT:

If the injectors malfunction, engine misfires may occur. The misfire counter can be read with the hand-held tester. Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL#1 (to CYL#8).

NG → **Replace injector.**

OK

11 Check resistance of air-fuel ratio (A/F) sensor heater.

PREPARATION:
Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:
Measure resistance between the terminals of the A/F sensor connector.

OK:
Standard:

Tester Connection	Specified Condition
HT (1) - +B (2)	1.8 to 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

NG → **Replace air-fuel ratio (A/F) sensor.**

OK

12 Check A/F relay.

PREPARATION:

Remove the A/F relay from the engine room J/B.

CHECK:

Inspect the A/F relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 K Ω or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace A/F relay.

OK

13 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

OK:

Standard:

Tester Connections	Specified Conditions
+B (2) - Body ground	9 to 14 V

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E6 ECM connector.

CHECK:

- (a) Check the resistance.

OK:

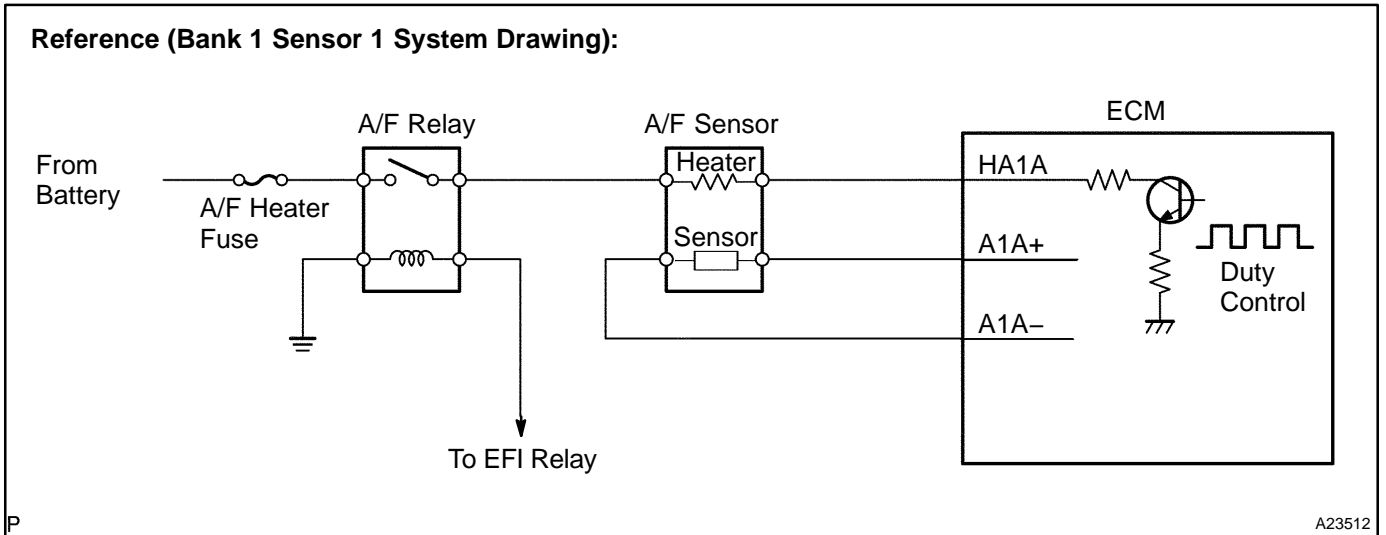

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω
AF+ (A10-3) - A1A+ (E6-22) AF+ (A30-3) - A2A+ (E6-23)	Below 1 Ω
AF- (A10-4) - A1A- (E6-30) AF- (A30-4) - A2A- (E6-31)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher
AF+ (A10-3) or A1A+ (E6-22) - Body ground AF+ (A30-3) or A2A+ (E6-23) - Body ground	10 kΩ or higher
AF- (A10-4) or A1A- (E6-30) - Body ground AF- (A30-4) or A2A- (E6-31) - Body ground	10 kΩ or higher

Reference (Bank 1 Sensor 1 System Drawing):

P

A23512

NG Replace or replace harness or connector.

OK

14 Replace air fuel ratio sensor.

NEXT

15 Perform confirmation driving pattern.

B17397

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Clear DTCs (see page [DI-462](#)).
- (d) Switch the ECM from normal mode to check mode using the tester (see page [DI-463](#)).
- (e) Start the engine and warm it up with all the accessories switched OFF.
- (f) Drive the vehicle at between 38 mph and 75 mph (60 km/h and 120 km/h) and at an engine speed of between 1,400 rpm and 3,200 rpm for 3 to 5 minutes.

HINT:

If the system is still malfunctioning, the MIL will be illuminated during step (e).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16 Check whether DTC output recurs (DTC P0171, P0172, P0174 or P0175)

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P0171, P0172, P0174 or P0175	A
No output	B

B Go to step 5.

DTC No.	DTC Detecting Condition	Trouble Area
P0230	Open or short in fuel pump relay circuit	<ul style="list-style-type: none">• Open or short in fuel pump relay circuit• Fuel pump relay• Circuit opening relay• Fuel pump• ECM

WIRING DIAGRAM

HINT:

This diagnostic chart is based on premise that engine is started. If the engine is not started, proceed to problem symptoms table on [DI-452](#).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 Check voltage between terminal FPR and E1 of ECM.

CHECK:

Measure the voltage between terminals of E5 and E5 ECM connectors.

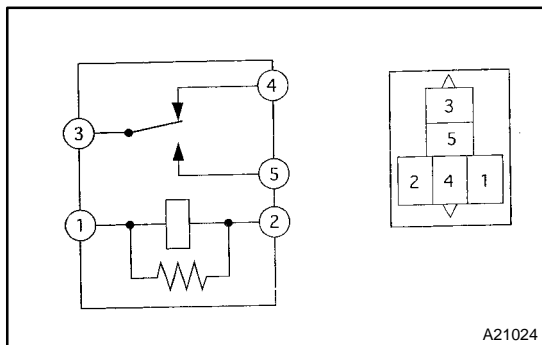

OK:

Tester Connection	Condition	Specified Condition
FPR (E5-30) - E1 (E5-1)	STA signal ON	9 to 14 V
FPR (E5-30) - E1 (E5-1)	STA signal OFF	0 to 3 V

OK Replace ECM (See page SF-82).

NG

2 Check fuel pump relay.

PREPARATION:

Remove the fuel pump relay from the engine room R/B.

CHECK:

Inspect the fuel pump relay.

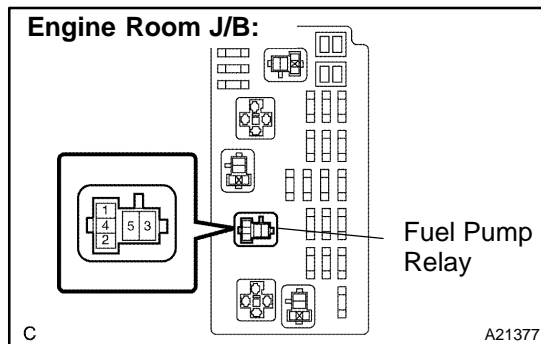

OK:

Terminal No.	Condition	Specified Condition
3 - 4	Apply B+ between terminals 1 and 2	No Continuity
3 - 4	Usually	Continuity
3 - 5	Usually	No Continuity
3 - 5	Apply B+ between terminals 1 and 2	Continuity

NG Replace fuel pump relay.

OK

3 Check for open and short in harness and connector between fuel pump relay and ECM.

PREPARATION:

- Remove the fuel pump relay from the engine room J/B.
- Disconnect the E5 ECM connector.

CHECK:

Measure the resistance between wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Engine Room J/B (Fuel pump relay terminal 1) - FPR (E5-30)	Below 1 Ω
Engine Room J/B (Fuel pump relay terminal 1) or FPR (E5-30) - Body ground	10 k Ω or higher

NG

Repair or replace harness or connector.

OK

Replace ECM (See page SF-82).

DTC	P0300	Random/Multiple Cylinder Misfire Detected
DTC	P0301	Cylinder 1 Misfire Detected
DTC	P0302	Cylinder 2 Misfire Detected
DTC	P0303	Cylinder 3 Misfire Detected
DTC	P0304	Cylinder 4 Misfire Detected
DTC	P0305	Cylinder 5 Misfire Detected
DTC	P0306	Cylinder 6 Misfire Detected
DTC	P0307	Cylinder 7 Misfire Detected
DTC	P0308	Cylinder 8 Misfire Detected

CIRCUIT DESCRIPTION

When a misfire occurs in the engine, hydrocarbons (HC) enter the exhaust in high concentrations. If this HC concentration is high enough, there could be an increase in exhaust emission levels. High concentrations of HC can also cause the temperature of the catalyst to increase, possibly damaging the catalyst. To prevent this increase in emissions and limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the catalyst reaches a point of thermal degradation, the ECM will blink the MIL. For monitoring misfire, the ECM uses both the camshaft position sensor and the crankshaft position sensor. The camshaft position sensor is used to identify misfiring cylinders and the crankshaft position sensor is used to measure variations in the crankshaft rotation speed. The misfire counter increments when crankshaft rotation speed variations exceed threshold values.

If the misfiring rate exceeds the threshold value, which could cause emissions deterioration, the ECM illuminates the MIL.

DTC No.	DTC Detecting Condition	Trouble Area
P0300	Misfiring of random cylinders is detected	<ul style="list-style-type: none"> • Open or short in engine wire • Connector connection • Vacuum hose connection
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of each cylinder is detected	<ul style="list-style-type: none"> • Ignition system • Injector • Fuel pressure • Mass air flow meter • Engine coolant temperature sensor • Compression pressure • Valve clearance • Valve timing • PCV piping • ECM

HINT:

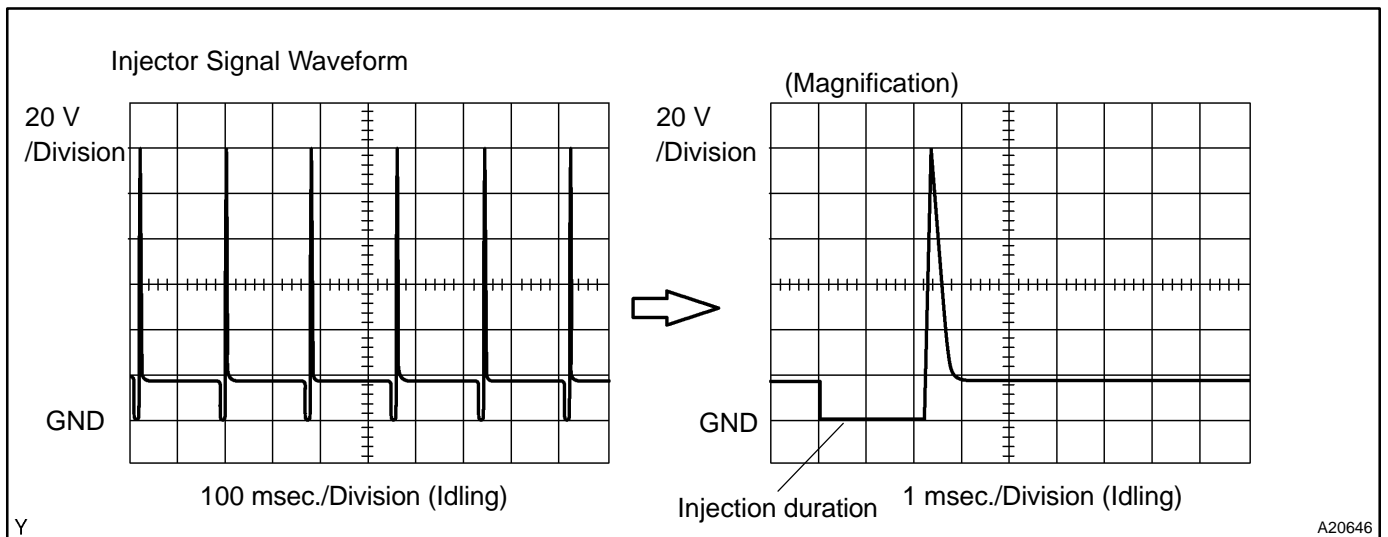

When several codes for a misfiring cylinder are recorded repeatedly but no random misfire code is recorded, it indicates that the misfires have been detected and recorded at different times.

Reference: Inspection using the oscilloscope.

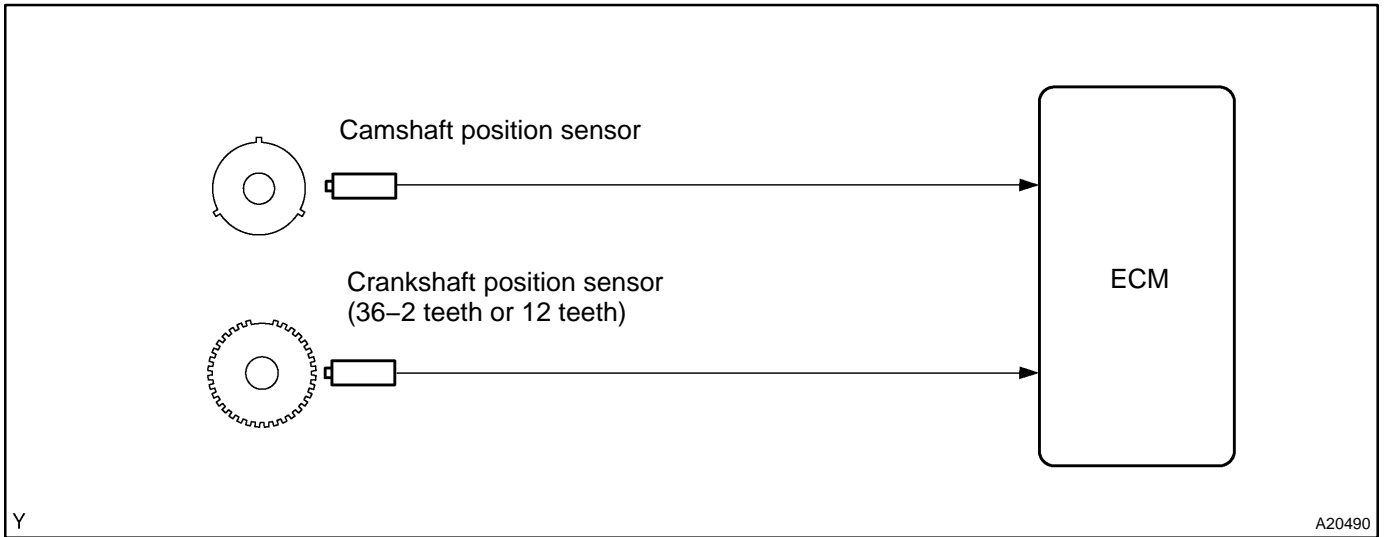

With the engine idling, check the waveform between terminals #1 to #8 and E01 of the ECM connectors.

HINT:

The correct waveform is as shown in the illustration.

MONITOR DESCRIPTION

The ECM illuminates the MIL (2 trip detection logic) if:

The ECM will illuminate the MIL when the percentage of misfire exceeds the specified limit per 1,000 engine revolutions. One occurrence of excessive misfire during engine start will set the MIL. Four occurrences are required to set the MIL 1,000 revolutions after engine start.

The ECM blinks the MIL (the MIL blinks immediately) if:

- Within 200 engine revolutions at a high rpm, the threshold for "percentage of misfire causing catalyst damage" is reached 1 time.
- Within 200 engine revolutions at a normal rpm, the threshold for "percentage of misfire causing catalyst damage" is reached 3 time.

Multiple cylinders misfire	Detected

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (refer to "Confirmation Monitor").

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

Misfire monitor – All cylinders

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$A1	\$0B	Multiply by 1 (time)	Exponential Weighted Moving Average misfire counts for last 10 driving cycles – total	0	65535

\$A9	\$0C	Multiply by 1 (time)	Misfire counts for last and current driv- ing cycles – total	0	65535

WIRING DIAGRAM

Refer to DTC P0351 on page [DI-642](#) for the wiring diagram of the ignition system.

CONFIRMATION DRIVING PATTERN

- (a) Connect the hand-held tester to the DLC3.
- (b) Record DTC and the freeze frame data.
- (c) Use the hand-held tester to set the check mode (See page [DI-463](#)).
- (d) Read the value on the misfire counter for each cylinder when idling. If the value is displayed on the misfire counter, skip the following procedure of confirmation driving.
- (e) Drive the vehicle several times with the engine speed, load and surrounding range shown as ENGINE SPD, CALC LOAD in the freeze frame data or MISFIRE RPM, MISFIRE LOAD in the DATA LIST.

If you have no hand-held tester, turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again.

HINT:

In order to memorize the DTC of misfire, it is necessary to drive around MISFIRE RPM, MISFIRE LOAD in the DATA LIST for the following period of time. Take care not to turn the ignition switch OFF. Turning the ignition switch OFF switches the diagnosis system from check mode to normal mode, and all DTCs, etc., are erased.

Engine Speed	Time
Idling	3 minutes 30 seconds or more
1,000 rpm	3 minutes or more
2,000 rpm	1 minute 30 seconds or more
3,000 rpm	1 minute or more

- (f) Check if there is misfire, and the DTC and the freeze frame data. Record the DTC's, freeze frame data and misfire counter data.
- (g) Turn the ignition switch OFF and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- If DTCs besides misfire DTCs are memorized simultaneously, troubleshoot the non-misfire DTCs first.
- If the misfire does not occur when the vehicle is brought to the workshop, the misfire can be confirmed by reproducing the condition of the freeze frame data. Also, after finishing the repair, confirm that there is no misfire (See confirmation driving pattern).
- On 6 or 8 cylinder engines, misfiring cylinder identification is disabled at high engine speed and only a general misfire fault code P0300 is stored instead of a cylinder specific misfire fault code (P0301 to P0308).

If the misfire starts in a high engine speed area or the misfire occurs only in a high engine speed area, only code P0300 may be stored.

When only a general misfire fault code like P0300 is stored:

- Erase the general misfire fault code using the hand-held tester
- Start the engine and drive the confirmation pattern.
- Read the value of the misfire ratio for each cylinder. Or read the DTC.
- Repair the cylinder that has a high misfire ratio. Or repair the cylinder indicated by the DTC.
- After finishing repairs, drive the confirmation pattern again and confirm that no misfire occurs.
- When either of SHORT FT #1, LONG FT #1, SHORT FT #2 or LONG FT #2 in the freeze frame data is over the range of $\pm 20\%$, there is a possibility that the air-fuel ratio is becoming RICH (-20% or less) or LEAN ($+20\%$ or more).
- When COOLANT TEMP in the freeze frame data is less than 80°C (176°F), there is a possibility of misfire only during engine warm-up.
- If the misfire cannot be reproduced, the following reasons may apply: 1) the vehicle has low fuel, 2) improper fuel is being used, or 3) the ignition plug is contaminated.
- Be sure to check the value on the misfire counter after the repair.

1	Are there any other codes (besides DTC P0300, P0301, P0302, P0303, P0304 P0305, P0306, P0307 or P0308) being output?
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTCs using hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
"P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308"	A
"P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308" and other DTCs	B

HINT:

If any other codes besides "P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308" are output, perform the troubleshooting for those DTCs.

2	Check wire harness, connector and vacuum hose in engine room.
----------	--

CHECK:

- (a) Check the connection conditions of the wire harness and connector.
- (b) Check for the disconnection, piping and brake of the vacuum hose.

3	Check connection of PCV piping.
----------	--

OK:

PCV hose is connected correctly and is not damaged.

NG	Repair or replace PCV piping.
-----------	--------------------------------------

OK

4	Connect hand-held tester, and read the number of misfire.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) Start the engine.
- (d) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / CYL#1 to CYL#8.

CHECK:

Read the number of misfire on the hand-held tester.

HINT:

When a misfire is not reproduced, be sure to branch below based on the stored DTC.

RESULT:

High Misfire Rate Cylinder	Proceed to
1 or 2 cylinders	A
More than 3 cylinders	B

B	Go to step 15.
----------	-----------------------

A

5 Check spark plug and spark of misfiring cylinder.
**PREPARATION:**

- Remove the ignition coil assembly.
- Remove the spark plug.

CHECK:

- Check the electrode for carbon deposits.
- Check the spark plug type (See page IG-1).
- Check electrode gap.

OK:

No large carbon deposit present.

Not wet with gasoline or oil.

Electrode gap: 0.8 mm (0.031 in.)

NOTICE:

If adjusting the gap of a new spark plug, bend only "the base / ground" electrode. Do not touch the tip. Never attempt to adjust the gap of a used plug.

PREPARATION:

- Install the spark plug to the ignition coil assembly.
- Disconnect the injector connector.
- Ground spark plug.

CHECK:

Check if spark occurs while engine is being cranked.

CAUTION:

Always disconnect each injector connector.

NOTICE:

Do not crank the engine for more than 2 seconds.

OK:

Spark occurs across electrode gap.

OK

Go to step 8.

NG

6	Change normal spark plug and check spark of misfiring cylinder.
----------	--

**PREPARATION:**

- (a) Change to the normal spark plug.
 - (1) Remove the spark plug that may be faulty from the ignition coil assembly.
 - (2) Install another spark plug to the ignition coil assembly.
- (b) Disconnect the injector connector.
- (c) Ground the spark plug.

CHECK:

Check if spark occurs while the engine is being cranked.

CAUTION:

Always disconnect each injector connector.

NOTICE:

Do not crank the engine for more than 2 seconds.

OK:

Spark jumps across electrode gap.

OK	Replace spark plug.
-----------	----------------------------

NG

7

Check for open and short in harness and connector between ignition coil and ECM.**Wire Harness Side:**

Ignition Coil Connector

Y

A21025

Check the harness and connector between the ignition coil and the ECM (IGF terminal) connectors:

PREPARATION:

- Disconnect the I3, I4, I5, I6, I7, I8, I9 or I10 ignition coil connector.
- Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:**Standard:**

N

B17412

Tester Connection	Specified Condition
Ignition coil (I3-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I4-2) - IGF2 (E7-25)	Below 1 Ω
Ignition coil (I5-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I6-2) - IGF2 (E7-25)	Below 1 Ω
Ignition coil (I7-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I8-2) - IGF2 (E7-25)	Below 1 Ω
Ignition coil (I9-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I10-2) - IGF2 (E7-25)	Below 1 Ω
Ignition coil (I3-2) or IGF1 (E7-24) - Body ground	10 k Ω or higher
Ignition coil (I4-2) or IGF2 (E7-25) - Body ground	10 k Ω or higher
Ignition coil (I5-2) or IGF1 (E7-24) - Body ground	10 k Ω or higher
Ignition coil (I6-2) or IGF2 (E7-25) - Body ground	10 k Ω or higher
Ignition coil (I7-2) or IGF1 (E7-24) - Body ground	10 k Ω or higher
Ignition coil (I8-2) or IGF2 (E7-25) - Body ground	10 k Ω or higher
Ignition coil (I9-2) or IGF1 (E7-24) - Body ground	10 k Ω or higher
Ignition coil (I10-2) or IGF2 (E7-25) - Body ground	10 k Ω or higher

Check the harness and connector between the ignition coil and the ECM (IGT terminal) connectors:

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7, I8, I9 or I10 ignition coil connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Ignition coil (I3-3) - IGT1 (E7-8)	Below 1 Ω
Ignition coil (I4-3) - IGT2 (E7-15)	Below 1 Ω
Ignition coil (I5-3) - IGT3 (E7-11)	Below 1 Ω
Ignition coil (I6-3) - IGT4 (E7-10)	Below 1 Ω
Ignition coil (I7-3) - IGT5 (E7-13)	Below 1 Ω
Ignition coil (I8-3) - IGT6 (E7-12)	Below 1 Ω
Ignition coil (I9-3) - IGT7 (E7-14)	Below 1 Ω
Ignition coil (I10-3) - IGT8 (E7-9)	Below 1 Ω
Ignition coil (I3-3) or IGT1 (E7-8) - Body ground	10 kΩ or higher
Ignition coil (I4-3) or IGT2 (E7-15) - Body ground	10 kΩ or higher
Ignition coil (I5-3) or IGT3 (E7-11) - Body ground	10 kΩ or higher
Ignition coil (I6-3) or IGT4 (E7-10) - Body ground	10 kΩ or higher
Ignition coil (I7-3) or IGT5 (E7-13) - Body ground	10 kΩ or higher
Ignition coil (I8-3) or IGT6 (E7-12) - Body ground	10 kΩ or higher
Ignition coil (I9-3) or IGT7 (E7-14) - Body ground	10 kΩ or higher
Ignition coil (I10-3) or IGT8 (E7-9) - Body ground	10 kΩ or higher

OK Replace ignition coil with igniter, then confirm that there is no misfire.

NG

Repair or replace harness or connector.

8 Check ECM terminal of misfiring cylinder.

PREPARATION:

Turn the ignition switch ON.

CHECK:

Measure the voltage between the terminals of the E5 and E7 ECM connectors.

OK:

Standard:

Tester Connection	Specified Condition
#10 (E5-2) – E01 (E7-7)	9 to 14 V
#20 (E5-3) – E01 (E7-7)	9 to 14 V
#30 (E5-4) – E01 (E7-7)	9 to 14 V
#40 (E5-5) – E01 (E7-7)	9 to 14 V
#50 (E5-6) – E01 (E7-7)	9 to 14 V
#60 (E5-7) – E01 (E7-7)	9 to 14 V
#70 (E7-3) – E01 (E7-7)	9 to 14 V
#80 (E7-2) – E01 (E7-7)	9 to 14 V

OK

Go to step 11.

NG

9 Check injector resistance of misfiring cylinder (See page [SF-24](#)).

NG

Replace injector.

OK

10 Check for open and short in harness and connector between ignition SW and injector, injector and ECM of misfiring cylinder.

PREPARATION:

- (a) Disconnect the I14, I15, I16, I17, I18, I19, I20 or I21 injector connector.
- (b) Disconnect the E5 or E7 ECM connector.

CHECK:

Measure the resistance of the wire harness side connectors between the ECM and injector.

OK:

Standard:

Tester Connection	Specified Condition
Injector (I14-2) - #10 (E5-2)	Below 1 Ω
Injector (I15-2) - #20 (E5-3)	Below 1 Ω
Injector (I16-2) - #30 (E5-4)	Below 1 Ω
Injector (I17-2) - #40 (E5-5)	Below 1 Ω
Injector (I18-2) - #50 (E5-6)	Below 1 Ω
Injector (I19-2) - #60 (E5-7)	Below 1 Ω
Injector (I20-2) - #70 (E7-3)	Below 1 Ω
Injector (I21-2) - #80 (E7-2)	Below 1 Ω
Injector (I14-2) or #10 (E5-2) - Body ground	10 kΩ or higher
Injector (I15-2) or #20 (E5-3) - Body ground	10 kΩ or higher
Injector (I16-2) or #30 (E5-4) - Body ground	10 kΩ or higher
Injector (I17-2) or #40 (E5-5) - Body ground	10 kΩ or higher
Injector (I18-2) or #50 (E5-6) - Body ground	10 kΩ or higher
Injector (I19-2) or #60 (E5-7) - Body ground	10 kΩ or higher
Injector (I20-2) or #70 (E7-3) - Body ground	10 kΩ or higher
Injector (I21-2) or #80 (E7-2) - Body ground	10 kΩ or higher

PREPARATION:

- (a) Disconnect the I14, I15, I16, I17, I18, I19, I20 or I21 injector connector.
- (b) Disconnect the I23 ignition switch connector.

CHECK:

Measure the resistance the wire harness side connectors between the injector and ignition switch.

OK:

Standard:

Tester Connection	Specified Condition
Injector (I14-1) – IG2 (I23-6)	Below 1 Ω
Injector (I15-1) – IG2 (I23-6)	Below 1 Ω
Injector (I16-1) – IG2 (I23-6)	Below 1 Ω
Injector (I17-1) – IG2 (I23-6)	Below 1 Ω
Injector (I18-1) – IG2 (I23-6)	Below 1 Ω
Injector (I19-1) – IG2 (I23-6)	Below 1 Ω
Injector (I20-1) – IG2 (I23-6)	Below 1 Ω
Injector (I21-1) – IG2 (I23-6)	Below 1 Ω
Injector (I14-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Injector (I15-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Injector (I16-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Injector (I17-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Injector (I18-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Injector (I19-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Injector (I20-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Injector (I21-1) or IG2 (I23-6) – Body ground	10 kΩ or higher

NG → **Repair or replace harness or connector.**

OK

11 Check injector injection of misfiring cylinder (See page [SF-29](#)).

NG → **Replace injector.**

OK

12 Check compression pressure of misfiring cylinder (See page [EM-3](#)).

NG Repair or replace.

OK

13 Check valve clearance of misfiring cylinder (See page [EM-4](#)).

NG Adjust valve clearance.

OK

14 Switch step by number of misfire cylinder (Refer to the result of step 4).

High misfire rate cylinder	Proceed to
1 or 2 cylinders	A
More than 3 cylinders	B

B Check for intermittent problems (See page [DI-430](#)).

A

15 Check valve timing (Check for looseness or a jumped tooth of timing belt) (See page [EM-9](#)).

NG Adjust valve timing (Repair or replace timing belt).

OK

16 Check fuel pressure (See page [SF-7](#)).

NG

Check and repair fuel pump, pressure regulator, fuel pipe line and filter (See page [SF-1](#)).

OK

17 Check intake air temperature and mass air flow rate.

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON.

CHECK:

Check the intake air temperature.

- (1) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / INTAKE AIR.
- (2) Read its value displayed on the hand-held tester.

OK:

Equivalent to ambient temperature

CHECK:

Check the air flow rate.

- (1) When using hand-held tester, enter the following menu: DIAGNOSIS/ENHANCED OBD II/DATA LIST/ALL/MAF.
- (2) Read its value displayed on the hand-held tester.

OK:

Condition	Air Flow Rate (gm/s)
Ignition switch ON (do not start engine)	0
Idling	4 to 6
Running without load (2,500 rpm)	13 to 20
Idling to quickly accelerating	Air flow rate fluctuates

NG

Replace mass air flow meter.

OK

18 Check engine coolant temperature sensor.

PREPARATION:

Remove the engine coolant temperature sensor.

CHECK:

Measure the resistance between the terminals of the engine coolant temperature sensor.

Resistance:

Tester Connection	Specified Condition
1 - 2	2.32 to 2.59 kΩ (20°C (68°F))
1 - 2	0.310 to 0.326 kΩ (80°C (176°F))

NOTICE:

In case of checking the engine coolant temperature sensor in the water, be careful not to allow water to go into the terminals. After checking, dry the sensor.

HINT:

Alternate procedure: Connect an ohmmeter to the installed engine coolant temperature sensor and read the resistance. Use an infrared thermometer to measure the engine temperature in the immediate vicinity of the sensor. Compare these values to the resistance/temperature graph. Change the engine temperature (by warming up or cooling down) and repeat the test.

NG Replace engine coolant temperature sensor.

OK

19 Switch step by number of misfire cylinder (Refer to the result of step 4).

High misfire rate cylinder	Proceed to
1 or 2 cylinders	A
More than 3 cylinders	B

B Go to step 5.

A

Check for intermittent problems (See page DI-430).

DTC	P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)
------------	--------------	---

DTC	P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)
------------	--------------	--

DTC	P0332	Knock Sensor 2 Circuit Low Input (Bank 2)
------------	--------------	--

DTC	P0333	Knock Sensor 2 Circuit High Input (Bank 2)
------------	--------------	---

CIRCUIT DESCRIPTION

A flat type knock sensor (non-resonant type) has the structure that can detect the vibration in a wider band of frequency from about 6 kHz to 15 kHz and has the following features.

Knock sensors are fitted on the right bank and left bank of the cylinder block to detect engine knocking. Each knock sensor contains a piezoelectric element which generates voltage when it becomes deformed. Generation of the voltage occurs when the cylinder block vibrates due to knocking. If engine knocking occurs, the ignition timing is retarded in order to suppress the knocking.

DTC No.	DTC Detection Condition	Trouble Area
P0327 P0332	Output voltage of the knock sensor 1 or 2 is 0.5 V or less (1 trip detection logic)	<ul style="list-style-type: none"> • Short in knock sensor 1 or 2 circuit • Knock sensor 1 or 2 • ECM
P0328 P0333	Output voltage of the knock sensor 1 or 2 is 4.5 V or more (1 trip detection logic)	<ul style="list-style-type: none"> • Open in knock sensor 1 or 2 circuit • Knock sensor 1 or 2 • ECM

Reference: Inspection using the oscilloscope.
The correct waveform is as shown.

Item	Details
Terminal	KNK1 - EKNK or KNK2 - EKN2
Equipment Settings	0.01 to 10 V/Division, 0.01 to 10 msec./Division
Condition	After warming up the engine, keep the engine speed at 4,000 rpm.

MONITOR DESCRIPTION

The knock sensor located on the cylinder block detects spark knock.

When spark knock occurs, the sensor pick-up vibrates in a specific frequency range. When the ECM detects the voltage in this frequency range, it retards the ignition timing to suppress the spark knock.

If there is a defect in the knock sensor or an open or short circuit, the voltage level will deviate outside the normal operating range. The ECM interprets this deviation as a defect in the knock sensor and sets a DTC.

Example:

When the knock sensor voltage output is less than 0.5 V, or more than 4.5 V, and if either the condition continues for more than 3 sec.

MONITOR STRATEGY

Related DTCs	P0327	Knock sensor (Bank 1) range check (Low voltage)
	P0328	Knock sensor (Bank 1) range check (High voltage)
	P0332	Knock sensor (Bank 2) range check (Low voltage)
	P0333	Knock sensor (Bank 2) range check (High voltage)
Required sensors/components	Main sensors/components	Knock sensor
	Related sensors/components	Crankshaft position sensor, Camshaft position sensor, Engine coolant temperature sensor, Mass air flow meter
Frequency of operation	Continuous	
Duration	1 sec.	
MIL operation	Immediate	
Sequence of operation	None	

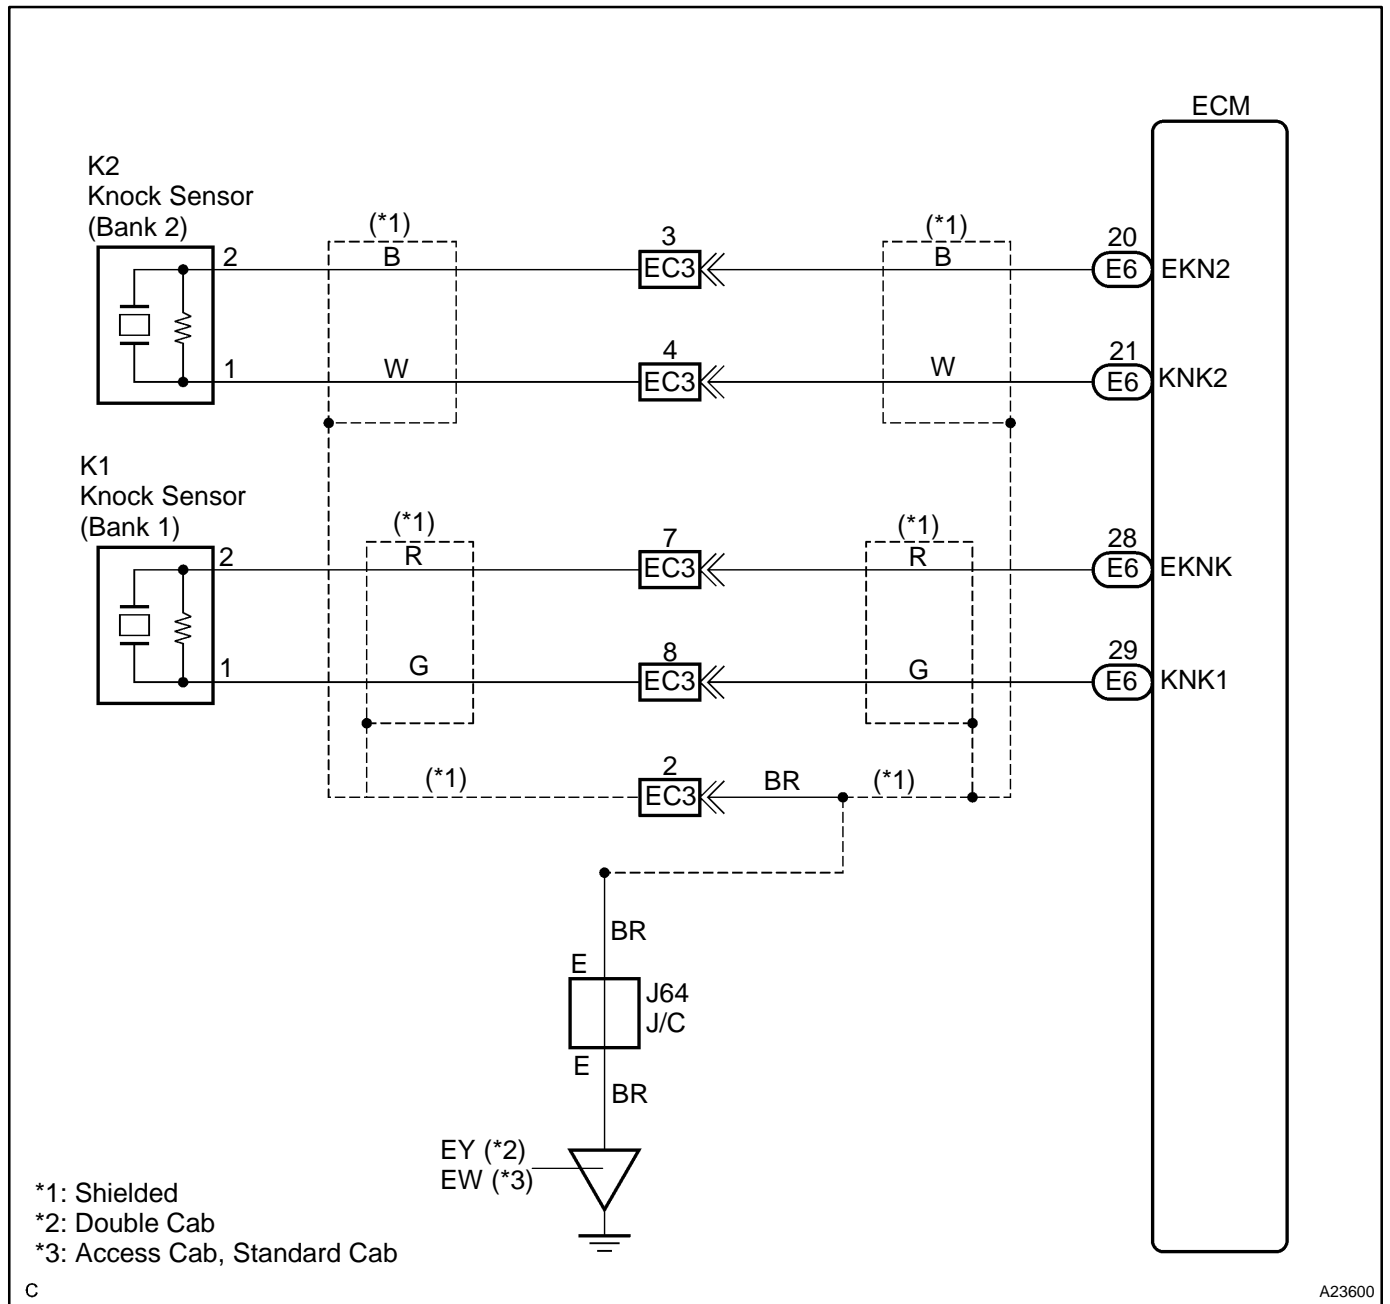

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-437	
Battery voltage	10.5 V	–
Time after engine start	5 sec.	–
Ignition switch	ON	
Starter	OFF	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Knock sensor range check (Low voltage) P0327, P0332:	
Knock sensor voltage	Less than 0.5 V
Knock sensor range check (High voltage) P0328, P0333:	
Knock sensor voltage	More than 4.5 V

WIRING DIAGRAM

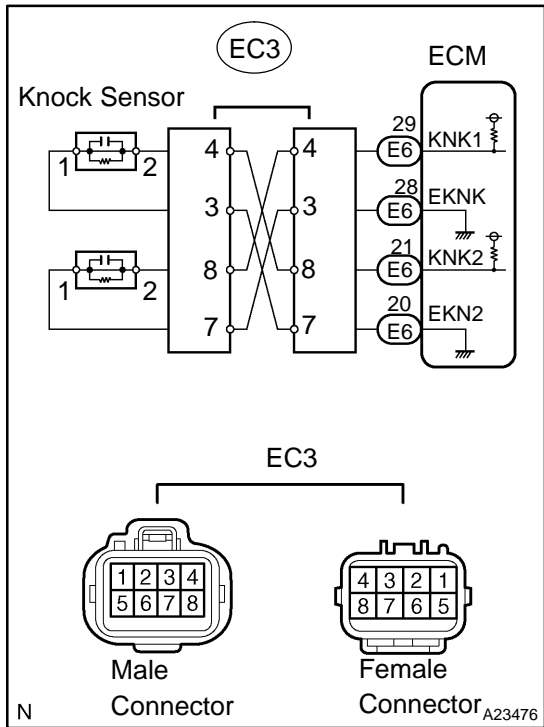

INSPECTION PROCEDURE

HINT:

- DTC P0325, P0327 and P0328 are for the bank 1 knock sensor circuit.
- DTC P0330, P0332 and P0333 are for the bank 2 knock sensor circuit.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 Connect hand-held tester, and check knock sensor circuit.

PREPARATION:

- (a) Disconnect the EC3 connector.
- (b) Using lead wires, connect the EC3 connectors as follows.

Male Connector – Female Connector
Terminal 4 – Terminal 8
Terminal 3 – Terminal 7
Terminal 8 – Terminal 4
Terminal 7 – Terminal 3

- (c) Warm up the engine.
- (d) Run the engine at 3,000 rpm for 10 seconds or more.

CHECK:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the hand-held tester ON.
- (c) Select the item: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (d) Read DTCs.

Result :

Display	Proceed to
DTCs same as when vehicle brought in P0325, P0327, P0328 → P0325, P0327, P0328 or P0330, P0332, P0333 → P0330, P0332, P0333	A
DTC different from when vehicle brought in P0325 → P0330 or P0330 → P0325	B
DTCs different from when vehicle brought in P0327, P0328 → P0332, P0333 or P0332, P0333 → P0327, P0328	C

- (e) Reconnect the EC3 connector.

B Go to step 4.

C Go to step 5.

A

- 2 Check for open and short in harness and connector between EC3 connector and ECM (See page [IN-30](#)).

NG

Repair or replace harness or connector.

OK

- 3 Measure voltage between terminals KNK1 and EKNK, KNK2 and EKN2 of ECM.

**PREPARATION:**

- Disconnect the E6 ECM connector.
- Turn the ignition switch to ON.

CHECK:

- Measure the voltage between the specified ECM terminals.

OK:**Standard:**

Tester Connection	Specified Condition
KNK1 (E6-29) – EKNK (E6-28)	4.5 to 5.5 V
KNK2 (E6-21) – EKN2 (E6-20)	4.5 to 5.5 V

- Reconnect the ECM connector.

NG

Replace ECM (See page [SF-82](#)).

OK

Check for intermittent problems
(See page [DI-430](#)).

- 4 Check knock sensor installation.

CHECK:

Check the knock sensor installation.

OK:

Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

NG

Tighten the sensor.

OK

Replace knock sensor (See page [SF-68](#)).**5 Check knock sensor.****Wire Harness Side:**

Male Connector

Front View

A23513

PREPARATION:

(a) Disconnect the EC3 connector.

CHECK:

(a) Check the resistance between the terminals of the EC3 male connector.

OK:**Standard:**

Tester Connection	Specified Condition
EC3 male connector 3 - 4	120 to 280 kΩ
EC3 male connector 7 - 8	120 to 280 kΩ

(b) Reconnect the EC3 connector.

OK

Check for intermittent problems
(See page [DI-430](#)).

NG

6 Check for open and short in harness and connector between EC3 connector and knock sensor (See page [IN-30](#)).**HINT:**

- If DTC P0327 or P0328 has changed to P0332 or P0333, check the knock sensor circuit on the right bank side.
- If DTC P0332 or P0333 has changed to P0327 or P0328, check the knock sensor circuit on the left bank side.

NG

Repair or replace harness or connector.

OK

Replace knock sensor.

DTC	P0335	Crankshaft Position Sensor "A" Circuit
------------	--------------	---

DTC	P0339	Crankshaft Position Sensor "A" Circuit Intermittent
------------	--------------	--

CIRCUIT DESCRIPTION

The crankshaft position sensor system consists of a crankshaft position sensor plate and a pick-up coil. The sensor plate has 32 teeth and is installed on the crankshaft. The pick-up coil is made of an iron core and magnet. The sensor plate rotates and as each tooth passes through the pick-up coil, a pulse signal is created. The pick-up coil generates 32 signals for each engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine RPM. Using these calculations, the fuel injection time and ignition timing are controlled.

DTC No.	DTC Detecting Condition	Trouble Area
P0335	No crankshaft position sensor signal to ECM during cranking (2 trip detection logic)	<ul style="list-style-type: none"> • Open or short in crankshaft position sensor circuit • Crankshaft position sensor • Signal plate • ECM
	No crankshaft position sensor signal to ECM with engine speed 450 rpm or more (1 trip detection logic)	
P0339	In condition (a), (b) and (c), when no crankshaft position sensor (NE) signal is input for 0.05 sec. or more. : (1 trip detection logic) (c) Engine revolution 1,000 rpm or more (d) STA signal is OFF (e) 3 sec. or more has lapsed after STA signal is switched from ON to OFF.	<ul style="list-style-type: none"> • Open or short in crankshaft position sensor circuit • Crankshaft position sensor • Signal plate • ECM

Reference: Inspection using the oscilloscope.

The correct waveform is as shown in the illustration.

Tester Connection	Specified Condition
VV1+ (E5-25) - VV1- (E5-24)	Correct waveform is as shown
VV2+ (E5-18) - VV2- (E5-28)	
NE+ (E5-21) - NE- (E5-20)	

MONITOR DESCRIPTION

If there are no signals from the crankshaft sensor even though the engine is revolving, the ECM interprets this as a malfunction of the sensor.

MONITOR STRATEGY

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- Read freeze frame data using the hand-held tester. Freeze frame records the engine conditions when a malfunction is detected. When troubleshooting it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio lean or rich, etc. at the time of the malfunction.
- READ VALUE ON HAND-HELD TESTER
 - (a) Connect the hand-held tester to the DLC3.
 - (b) Start the engine and push the hand-held tester tool main switch ON.
 - (c) When using hand-held tester, enter the following menu: "DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / ENGINE SPD".
- The engine speed can be confirmed in DATA LIST using the hand-held tester. If there are no NE signals from the crankshaft position sensor despite the engine revolving, the engine speed will be indicated as zero. If voltage output of the crankshaft position sensor is insufficient, the engine speed will be indicated as lower RPM (than the actual RPM).

1 Check resistance of crankshaft position sensor.

PREPARATION:

Disconnect the C2 crankshaft position sensor connector.

CHECK:

Measure the resistance between terminals 1 and 2.

OK:

Standard:

Tester Connection	Specified Condition
1 - 2	985 to 1,600 Ω at cold
1 - 2	1,265 to 1,890 Ω at hot

NOTICE:

” Cold” and ”Hot” shown above mean the temperature of the coils themselves. ”Cold” is from -10°C (14°F) to 50°C (122°F) and ”Hot” is from 50°C (122°F) to 100°C (212°F).

NG Replace crankshaft position sensor.

OK

2 Check for open and short in harness and connector between ECM and crankshaft position sensor.

PREPARATION:

- (a) Disconnect the C2 crankshaft position sensor connector.
- (b) Disconnect the E5 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Crankshaft position sensor (C2-1) - NE+ (E5-21)	Below 1 Ω
Crankshaft position sensor (C2-2) - NE- (E5-20)	Below 1 Ω
Crankshaft position sensor (C2-1) or NE+ (E5-21) - Body ground	10 kΩ or higher
Crankshaft position sensor (C2-2) or NE- (E5-20) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

3 Check sensor installation (crankshaft position sensor).

**CHECK:**

Check the crankshaft position sensor installation.

OK:

The crankshaft position sensor is installed properly.

NG

Tighten sensor installation bolt.

OK

4 Inspect teeth of sensor plate.

PREPARATION:

Remove the crankshaft angle sensor plate (See page [EM-98](#)).

CHECK:

Check the teeth of sensor plate.

NG

Replace sensor plate.

OK

Replace ECM (See page [SF-82](#)).

DTC	P0340	Camshaft Position Sensor "A" Circuit
DTC	P0341	Camshaft Position Sensor "A" Circuit Range/Performance
DTC	P0345	Camshaft Position Sensor "A" Circuit (Bank 2)
DTC	P0346	Camshaft Position Sensor "A" Circuit Range/Performance (Bank 2)

CIRCUIT DESCRIPTION

The camshaft position sensor consists of a magnet, an iron core and a pick-up coil. This sensor monitors a timing rotor located on the camshaft and is used by the ECM to detect the camshaft angle. The camshaft rotation synchronizes with the crankshaft rotation, and this sensor communicates the rotation of the camshaft timing rotor as a pulse signal to the ECM. Based on the signal, the ECM controls fuel injection time and ignition timing.

If there is no signal from the camshaft position sensor even though the engine is turning or the rotation of the camshaft and the crankshaft is not synchronized, the ECM interprets this as a malfunction in the sensor and sets a DTC.

DTC No.	DTC Detection Condition	Trouble Area
P0340 P0345	No camshaft position sensor signal to ECM during cranking (2 trip detection logic) No camshaft position sensor signal to ECM with engine speed 600 rpm or more (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in camshaft position sensor circuit • VVT sensor • Camshaft • Jumping teeth of timing belt • ECM
P0341 P0346	While crankshaft rotates twice, camshaft position sensor signal will be input to ECM 12 times or more (1 trip detection logic) • Hint: Under normal condition, the camshaft position signal is input into the ECM 3 times per 2 engine revolutions	

**Reference: Inspection using the oscilloscope.**

The correct waveform is as shown.

Tester Connection	Specified Condition
G2+ (E5-27) – G2- (E5-32)	Correct waveform is as shown
NE+ (E5-25) – NE- (E5-24)	

MONITOR DESCRIPTION

If there are no signals from the camshaft position sensor even though the engine is turning, or if the rotation of the camshaft and the crankshaft is not synchronized, the ECM interprets this as a malfunction of the sensor.

HINT:

- These DTCs indicate a malfunction related to primary circuit.
- If DTC P0351 is displayed, check No. 1 ignition coil with igniter circuit.
- If DTC P0352 is displayed, check No. 2 ignition coil with igniter circuit.
- If DTC P0353 is displayed, check No. 3 ignition coil with igniter circuit.
- If DTC P0354 is displayed, check No. 4 ignition coil with igniter circuit.
- If DTC P0355 is displayed, check No. 5 ignition coil with igniter circuit.
- If DTC P0356 is displayed, check No. 6 ignition coil with igniter circuit.
- If DTC P0357 is displayed, check No. 7 ignition coil with igniter circuit.
- If DTC P0358 is displayed, check No. 8 ignition coil with igniter circuit.

CIRCUIT DESCRIPTION

These DTCs indicate a malfunction related to primary circuit.

The DIS is a 1-cylinder ignition system which ignites one cylinder with one ignition coil. In the 1-cylinder ignition system, the one spark plug is connected to the end of the secondary winding. High voltage generated in the secondary winding is applied directly to the spark plug. The spark of the spark plug passes from the center electrode to the ground electrode.

The ECM determines the ignition timing and outputs the ignition signals (IGTs) for each cylinder. Using the IGT, the ECM turns on and off the power transistor inside the igniter and this switches on and off the current to the primary coil. When the current to the primary coil is cut off, high-voltage is generated in the secondary coil and this voltage is applied to the spark plugs to create sparks inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back the ignition confirmation signal (IGF) for each cylinder ignition to the ECM.

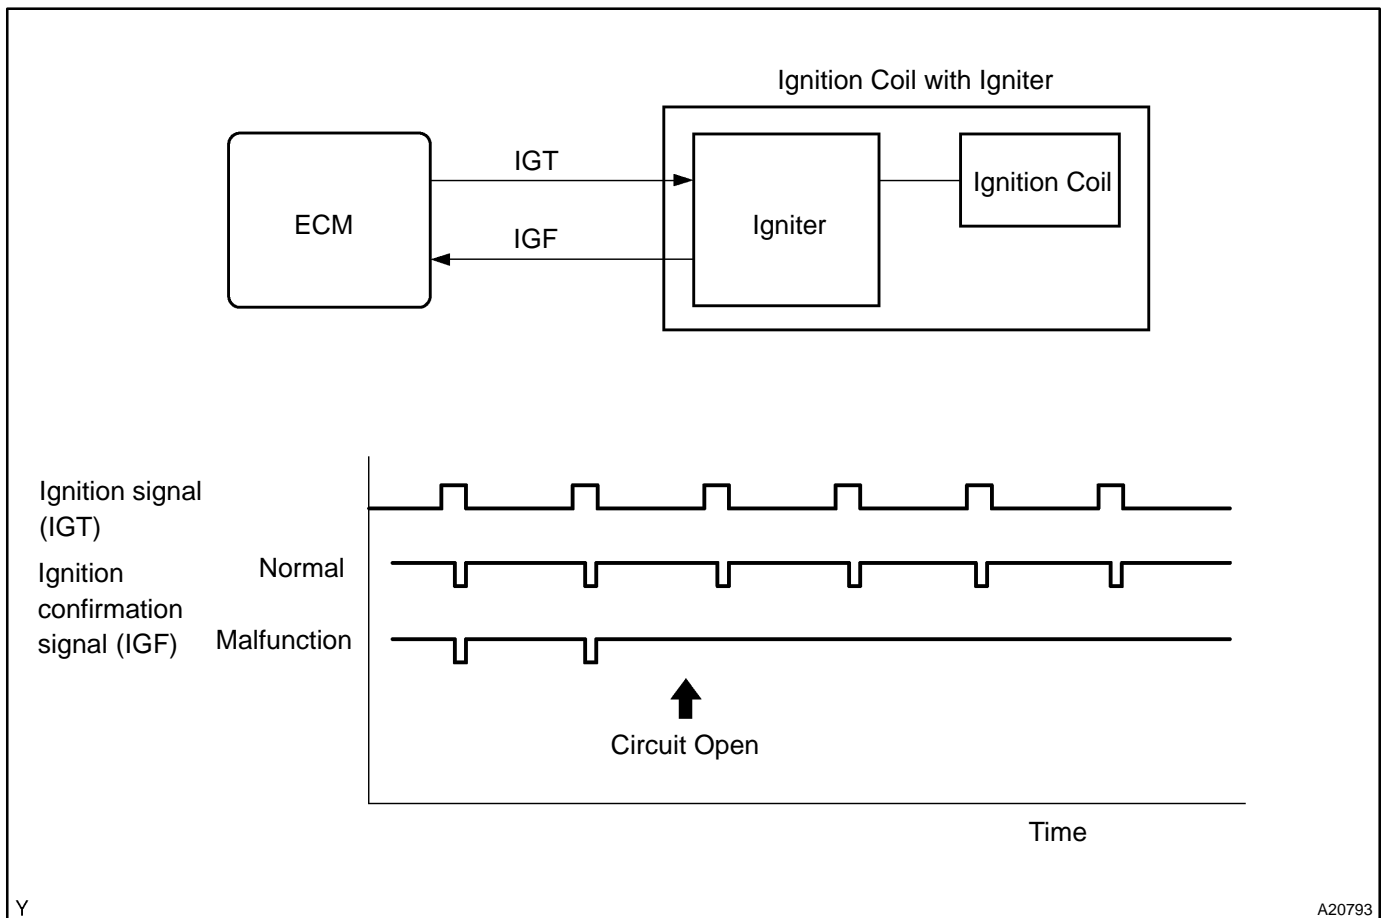

DTC No.	DTC Detecting Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal to ECM while engine is running	<ul style="list-style-type: none"> • Open or short in IGF1 or IGF2 and IGT1 to IGT8 circuit from ignition coil with igniter to ECM • No. 1 to No. 8 ignition coil with igniter (primary ignition) • Ignition system • ECM

Reference: Inspection using the oscilloscope.

During cranking or idling, check the waveform between terminals IG1 to IG8 and E1, and IGF1, IGF2 and E1 of the E5 and E7 ECM connectors.

MONITOR DESCRIPTION

If the ECM does not receive the IGF after sending the IGT it interprets this as a fault in the igniter and sets a DTC.

MONITOR STRATEGY

Related DTCs	P0351	No. 1 ignition coil with igniter circuit malfunction

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If DTCs P0351, P0354, P0356 and P0357 are output simultaneously, IGF1 circuit may be open or short.
- If DTCs P0352, P0353, P0355 and P0358 are output simultaneously, IGF2 circuit may be open or short.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check spark plug and spark (See page IG-1).
----------	--

2 Check for open and short in harness and connector in IGF signal circuits between ECM and ignition coil with igniter.

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7, I8, I9 or I10 ignition coil with igniter connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Ignition coil (I3-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I4-2) - IGF2 (E7-25)	Below 1 Ω
Ignition coil (I5-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I6-2) - IGF2 (E7-25)	Below 1 Ω
Ignition coil (I7-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I8-2) - IGF2 (E7-25)	Below 1 Ω
Ignition coil (I9-2) - IGF1 (E7-24)	Below 1 Ω
Ignition coil (I10-2) - IGF2 (E7-25)	Below 1 Ω
Ignition coil (I3-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher
Ignition coil (I4-2) or IGF2 (E7-25) - Body ground	10 kΩ or higher
Ignition coil (I5-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher
Ignition coil (I6-2) or IGF2 (E7-25) - Body ground	10 kΩ or higher
Ignition coil (I7-2) or IGF1 (E7-24) - Body ground	10 kΩ or higher
Ignition coil (I8-2) or IGF2 (E7-25) - Body ground	10 kΩ or higher

NG

Repair or replace harness or connector.

OK

5 Check voltage between terminals IGT1 – IGT8 and E1 of ECM connector.
**PREPARATION:**

Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminals the E7 and E5 ECM connectors when the engine is cranked.

OK:**Standard:**

Tester Connection	Specified Condition
IGT1 (E7-8) – E1 (E5-1)	More than 0.1 V or less than 4.5 V
IGT2 (E7-15) – E1 (E5-1)	More than 0.1 V or less than 4.5 V
IGT3 (E7-11) – E1 (E5-1)	More than 0.1 V or less than 4.5 V
IGT4 (E7-10) – E1 (E5-1)	More than 0.1 V or less than 4.5 V
IGT5 (E7-13) – E1 (E5-1)	More than 0.1 V or less than 4.5 V
IGT6 (E7-12) – E1 (E5-1)	More than 0.1 V or less than 4.5 V
IGT7 (E7-14) – E1 (E5-1)	More than 0.1 V or less than 4.5 V
IGT8 (E7-9) – E1 (E5-1)	More than 0.1 V or less than 4.5 V

NG

Replace ECM (See page SF-82).

OK

6 Disconnect ignition coil with igniter connector, and check voltage between terminals IGT1 - IGT8 and E1 of ECM connector.

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7, I8, I9 or I10 ignition coil with igniter connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminals the E5 and E7 ECM connectors when the engine is cranked.

OK:

Standard:

Tester Connection	Specified Condition
IGT1 (E7-8) - E1 (E5-1)	4.5 V or more
IGT2 (E7-15) - E1 (E5-1)	4.5 V or more
IGT3 (E7-11) - E1 (E5-1)	4.5 V or more
IGT4 (E7-10) - E1 (E5-1)	4.5 V or more
IGT5 (E7-13) - E1 (E5-1)	4.5 V or more
IGT6 (E7-12) - E1 (E5-1)	4.5 V or more
IGT7 (E7-14) - E1 (E5-1)	4.5 V or more
IGT8 (E7-9) - E1 (E5-1)	4.5 V or more

NG Replace ECM (See page [SF-82](#)).

OK

7 Check ignition coil with igniter power source circuit.

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7, I8, I9 or I10 ignition coil with igniter connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between the terminal of the wire harness side connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
I3-1 - Body ground	9 to 14 V
I4-1 - Body ground	
I5-1 - Body ground	
I6-1 - Body ground	
I7-1 - Body ground	
I8-1 - Body ground	
I9-1 - Body ground	
I10-1 - Body ground	

OK Repair ignition coil with igniter.

NG

8 Check for open and short in harness and connector between ignition switch and ignition coil with igniter.

PREPARATION:

- (a) Disconnect the I3, I4, I5, I6, I7, I8, I9 or I10 ignition coil with igniter connector.
- (b) Disconnect the I23 ignition switch connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Ignition coil (I3-1) – IG2 (I23-6)	Below 1 Ω
Ignition coil (I4-1) – IG2 (I23-6)	Below 1 Ω
Ignition coil (I5-1) – IG2 (I23-6)	Below 1 Ω
Ignition coil (I6-1) – IG2 (I23-6)	Below 1 Ω
Ignition coil (I7-1) – IG2 (I23-6)	Below 1 Ω
Ignition coil (I8-1) – IG2 (I23-6)	Below 1 Ω
Ignition coil (I9-1) – IG2 (I23-6)	Below 1 Ω
Ignition coil (I10-1) – IG2 (I23-6)	Below 1 Ω
Ignition coil (I3-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Ignition coil (I4-1) or IG2 (I23-6) – Body ground	10 kΩ or higher

Ignition coil (I9-1) or IG2 (I23-6) – Body ground	10 kΩ or higher
Ignition coil (I10-1) or IG2 (I23-6) – Body ground	10 kΩ or higher

NG **Repair or replace harness or connector.**

OK

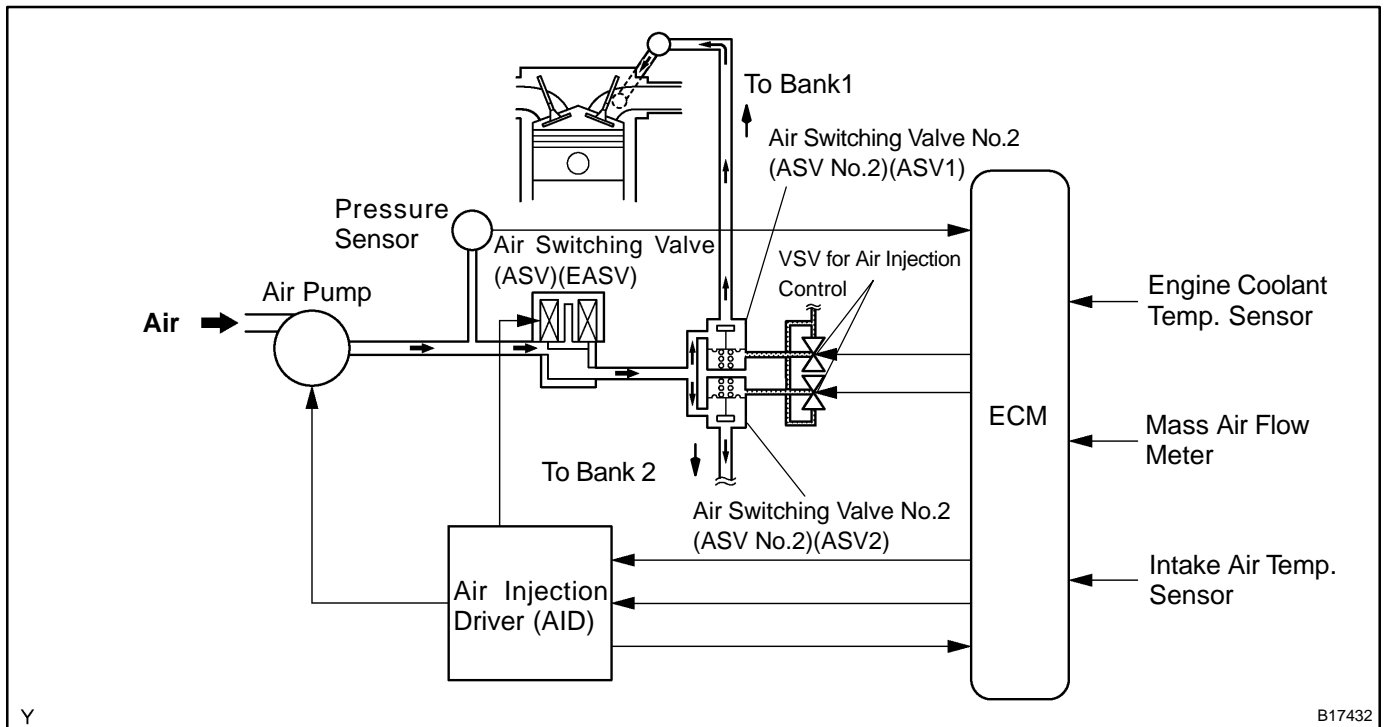

Replace ignition coil with igniter.

DTC	P0412	Secondary Air Injection System Air Switching Valve "A" Circuit
------------	--------------	---

CIRCUIT DESCRIPTION

The secondary air injection system pumps air to the exhaust port to accelerate the activation of the catalyst. The secondary air injection system consists of the ECM, air pump, Air Switching Valve (ASV) (EASV), Air Switching Valve No.2 (ASV No.2) (ASV1, 2), pressure sensor and air injection driver (AID). The Air Switching Valve (ASV)(EASV) is an electromagnetic type and Air Switching Valve No.2 (ASV No.2)(ASV1,2) is a vacuum type.

The secondary air injection system pumps pressurized air to the exhaust port by the air pump through the ASV and ASV No.2. The ASV assists the ASV No.2. The ASV No.2 also controls air supply. The ECM sends signals to the AID, and then the AID operates the air pump and ASV. The pressure sensor detects pressure and exhaust pulsation in the system when the system operates and when it does not operate, and sends the data to the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P0412	All of the following conditions are met when engine is idling just after cold start (1 trip detection logic): (a) Air injection system does not operate (Air pump OFF and all ASVs OFF) (b) Air injection driver diagnostic signal duty is 40%.	<ul style="list-style-type: none"> • Open in air switching valve drive circuit • Short between air switching valve circuit and +B circuit • Air injection driver • Air switching valve • ECM
P0412	All of the following conditions are met when engine is idling just after cold start (1 trip detection logic): (a) Air injection system operates (Air pump ON and all ASVs ON) (b) Air injection driver diagnostic signal duty is 40%.	<ul style="list-style-type: none"> • Short between air switching valve circuit and body ground • Air injection driver • Air switching valve • ECM

MONITOR DESCRIPTION

The air injection driver (AID) detects an open or short in the circuit according to the voltage of the air pump terminal (VP) and electromagnetic air switching valve terminal (VV), and sends a signal as diagnostic information to the ECM.

The AID outputs the air switching valve terminal malfunction signal to the ECM if: 1) VV terminal voltage is low despite the AID receiving the command signal from the ECM to drive the air switching valve terminal or 2) VV terminal voltage is high despite the AID not receiving the command signal from the ECM.

The ECM stores the DTC based on the diagnostic signal from the AID and illuminates the MIL.

Diagnostic signal duty ratio from air injection driver	31 to 48 %

COMPONENT OPERATING RANGE

Parameter	Standard Value
Diagnostic signal duty ratio from air injection driver	70 to 90% when secondary air injection system operating and 0% when secondary air injection system not operating

INSPECTION PROCEDURE

HINT:

The diagnostic information output from AID can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. It narrows a trouble area search to read the waveform on the oscilloscope when performing the AI system intrusive operation function provided in the SYSTEM CHECK.

- (1) Start the engine and warm it up.
- (2) Turn the ignition switch to OFF.
- (3) Connect a hand-held tester to the DLC3.

- (4) Connect an oscilloscope probe to the AIDI terminal of the ECM.
- (5) Start the engine and turn the tester ON.

- (6) On the tester, select the following menu items:
 DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / OPERATION 1 and 2.

HINT:

OPERATION 1: AP: OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE
 OPERATION 2: AP: ON, EASV:OPEN, ASV1:OPEN, ASV2:OPEN

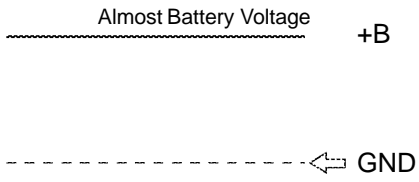

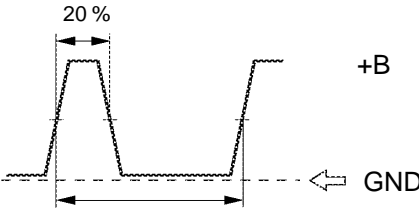

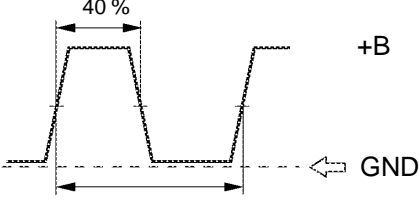

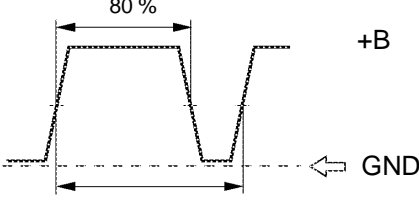

- (7) Monitor the voltage output of the AID (duty ratio signal).

Oscilloscope range:

Items	Contents
Terminals	CH1: AIDI - E1
Equipment Settings	5 V/Division, 20 to 40 ms/Division
Conditions	Idling

NOTICE:

- This AIR INJECTION CHECK only allows technicians to operate the AI system for 5 seconds. Furthermore, the check can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between checks.
 While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again.
- Performing the AIR INJ CHECK over and over again may cause the damage in the secondary air injection system. If necessary, put an interval of several minutes between tests to prevent overheating the system.

AID Diagnostic Signal Waveforms	ECM Commands	DTCs (ECM Output)	Suspected Trouble Areas
<p>100 % Duty ratio</p> 	<p>Any Air Injection (AI) System operation</p>	<p>P1613</p>	<ul style="list-style-type: none"> • Open in diagnostic signal circuit • Air Injection Control Driver (AID) • Open in AID+B circuit (AID power source) • Short between +B circuit and diagnostic signal circuit

HINT:

- Using the AIR INJ CHECK operation of the SYSTEM CHECK provided in the hand-held tester function, conditions for air-fuel ratio and pressure in the secondary air injection system passage can be checked while the secondary air injection system operating. It helps technicians to troubleshoot the system when it malfunctioning.
- Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Check voltage between terminal 1 of air switching valve connector and body ground.
----------	---

Wire Harness Side:

**PREPARATION:**

- Remove the intake manifold (see page EM-36).
- Disconnect the A31 air switching valve connector.
- Connect the hand-held tester to the DLC3.
- Turn the ignition switch ON and turn the tester ON.

CHECK:

- When the air switching valve is operated using the hand-held tester, measure voltage between terminal A31-1 of the air switching valve connector and body ground.
- Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/ AIR INJ CHECK/ MANUAL OPERATION/OPERATION 1 and 4

HINT:

OPERATION 1: AP:OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE

OPERATION 4: AP:OFF, EASV:OPEN, ASV1:CLOSE, ASV2:CLOSE

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:**Standard:**

Tester operation	Tester Connection	Specified Condition
Operation 4	A31-1 – Body ground	10 V or more
Operation 1	A31-1 – Body ground	Below 1.0 V

NG

Go to step 4.

OK

2 Check air switching valve.

PREPARATION:

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Disconnect the ASV connector.

CHECK:

Measure the resistance of the ASV.

OK:

Standard:

Tester Connections	Specified Conditions
ASV (B13-1) – ASV (B13-2)	4.5 to 5.5 Ω

NG → **Replace air switching valve.**

OK

3 Check for open in harness and connector between air switching valve and body ground.

PREPARATION:

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Disconnect the A31 air switching valve connector.

CHECK:

Check the resistance between the wire harness side connectors and body ground.

OK:

Standard:

Tester Connection	Specified Condition
A31-2 – Body ground	Below 1 Ω

NG → **Repair or replace harness or connector.**

OK

Check for intermittent problems (See page [DI-430](#)).

4 Check for open and short in harness and connector between air injection driver and air switching valve.

Wire Harness Side:

Air Injection Driver Connector

N

B17444

PREPARATION:

- Remove the intake manifold (see page [EM-36](#)).
- Disconnect the A32 air injection driver connector.
- Disconnect the A31 air switching valve connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VV (A32-6) - A31-1	Below 1 Ω
VV (A32-6) or A31-1 - Body ground	10 k Ω or higher

Wire Harness Side:

Air Switching Valve Connector

N

B17440

NG

Repair or replace harness or connector.

OK

Replace air injection driver.

DTC	P0418	Air Injection System Air Pump Malfunction
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to DTC P0412 on page [DI-656](#).

DTC No.	DTC Detection Condition	Trouble Area
P0418	All of the following conditions are met, when idling just after cold start. (1 trip detection logic): (a) Air injection system not operate (b) Air injection driver outputs air pump malfunction signal (20% duty signal)	<ul style="list-style-type: none"> • Open in air pump drive circuit • Short between air pump circuit and +B circuit • Air injection driver • ECM
P0418	All of the following conditions are met, when idling just after cold start. (1 trip detection logic): (a) Air injection system operates (b) Air injection driver outputs air pump malfunction signal (20% duty signal)	<ul style="list-style-type: none"> • Short between air pump circuit and body ground • Air injection driver • ECM

MONITOR DESCRIPTION

Air Injection Driver (AID) detects an open or short in the air pump and Air Switching Valve (ASV) circuit according to the terminal voltage and sends a signal as diagnostic information to the ECM.

When the air injection system operation is required while the engine is warming up, the ECM transmits command signals to the AID to drive the air pump and ASV.

The AID inputs the command signal from ECM if: 1) VP terminal voltage is low despite the AID inputting the command signal from the ECM to drive the ASV or 2) VP terminal voltage is high despite the AID not inputting the command signal from the ECM.

The ECM sets the DTC based on the diagnostic information from the AID.

MONITOR STRATEGY

HINT:

- Using the AIR INJ CHECK operation of the SYSTEM CHECK provided in the hand-held tester function, conditions for air-fuel ratio and pressure in the secondary air injection system passage can be checked while the secondary air injection system operating. It helps technicians to troubleshoot the system when it malfunctioning.
- Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 Check voltage between terminal 2 of air pump and body ground.

PREPARATION:

- Remove the intake manifold (see page EM-36).
- Disconnect the A35 air pump connector.
- Connect the hand-held tester to the DLC3.
- Turn the ignition switch ON and turn the tester ON.

CHECK:

- When the air pump is operated using the hand-held tester, measure voltage between terminal A35-2 of the air injection driver connector and body ground.
- Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/ AIR INJ CHECK/ MANUAL OPERATION/OPERATION 1 and 3

HINT:

OPERATION 1: AP:OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE

OPERATION 3: AP:ON, EASV:OPEN, ASV1:OPEN, ASV2:OPEN

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:

Standard:

Tester operation	Tester Connection	Specified Condition
Operation 3	A35-2 - Body ground	10 V or more
Operation 1	A35-2 - Body ground	Below 1.0 V

NG Go to step 4.

OK

2 Check air pump resistance.

PREPARATION:

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Disconnect the air pump connector.

CHECK:

Measure the resistance of the air pump.

OK:

Standard:

Tester Connections	Specified Conditions
A35-1 - A35-2	0.4 to 1.0 Ω

NG → Replace air pump assembly.

OK

3 Check for open in harness and connector between air pump and body ground.

PREPARATION:

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Disconnect the A35 air pump connector.

CHECK:

Check the resistance between the wire harness side connectors and body ground.

OK:

Standard:

Tester Connection	Specified Condition
A35-1 - Body ground	Below 1 Ω

NG → Repair or replace harness or connector.

OK

Check for intermittent problems (See page [DI-430](#)).

4 Check for open and short in harness and connector between air injection driver and air pump.

PREPARATION:

- (a) Remove the intake manifold (see page EM-36).
- (b) Disconnect the A33 air injection driver connector.
- (c) Disconnect the A35 air pump connector.

CHECK:

Check the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VP (A33-2) - A35-2	Below 1 Ω
VP (A33-2) or A35-2 - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace air injection driver.

DTC	P0420	Catalyst System Efficiency Below Threshold (Bank 1)
------------	--------------	--

DTC	P0430	Catalyst System Efficiency Below Threshold (Bank 2)
------------	--------------	--

MONITOR DESCRIPTION

The ECM uses the two sensors, mounted in front of and behind the Three-way Catalytic Converter (TWC), to monitor its efficiency.

The first sensor, the Air-Fuel Ratio (A/F) sensor (sensor 1), sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor (sensor 2), sends post-catalyst information to the ECM. The ECM compares the information transmitted by these two sensors to determine the efficiency of the TWC performance and its ability to store oxygen.

When the TWC is functioning properly, the variation in the oxygen concentration in the exhaust gas, after it has passed through the TWC, is small. In this condition, the voltage output of sensor 2 slowly alternates between the rich and lean signal voltages (shown in the illustration below). As the TWC performance efficiency deteriorates, its oxygen storage capacity decreases, and the variation in the oxygen concentration in the exhaust gas increases. As a result, the sensor voltage output fluctuates frequently.

While the catalyst monitor is running, the ECM measures the signal lengths of both sensors 1 and 2, and calculates the ratio of the signal lengths to determine the extent of the TWC deterioration. If the deterioration level exceeds the preset threshold, the ECM interprets this as the TWC malfunction. The ECM then illuminates the MIL and sets the DTC.

DTC No.	DTC Detecting Condition	Trouble Area
P0420 P0430	OSC value smaller than standard value under active air-fuel ratio control (2 trip detection logic)	<ul style="list-style-type: none"> • Gas leakage on exhaust system • A/F sensor (Bank 1, 2 sensor 1) • Heated oxygen sensor (bank 1, 2 sensor 2) • Three-way catalytic converter

HINT:

- Bank 1 refers to the bank that includes cylinder No.1.
- Bank 2 refers to the bank that does not include cylinder No.1.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.
- Sensor 2 refers to the sensor mounted behind the TWC and located far from the engine assembly.

MONITOR STRATEGY

Related DTCs	P0420	Bank 1 catalyst is deteriorated
	P0430	Bank 2 catalyst is deteriorated
Required sensors/components	Main sensors/components	Front and rear heated oxygen sensor
	Related sensors/components	Mass air flow meter, Engine coolant temperature sensor, Engine speed sensor, Intake air temperature sensor
Frequency of operation	Once per driving cycle	
Duration	30 sec.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-437	
Battery voltage	11 V	-
Intake air temperature	-10°C (14°F)	-
Engine coolant temperature	75°C (167°F)	-
Atmospheric pressure coefficient	0.75	-
Idle	OFF	
Engine RPM	-	3,200 rpm
A/F sensor	Activated	
Fuel system status	Closed loop	
Engine load	10 to 70 %	
All of the following conditions are met	Condition 1, 2 and 3	
1. MAF	6 to 75 g/sec	
2. Front catalyst temperature (estimated)	620 to 830°C (1,148 to 1,526°F)	
3. Rear catalyst temperature (estimated)	410 to 830°C (770 to 1,526°F)	
Rear HO2S monitor	Completed	
Shift position	4th	-

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Oxygen storage capacity (OSC) of catalyst	Less than 0.16 g

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (refer to "Confirmation Monitor").

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

Catalyst bank 1 – Active A/F control method

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$21	\$A9	Multiply by 0.0003 (no dimension)	Oxygen storage capacity of catalyst	Minimum test limit for catalyst	Maximum test limit for catalyst

Catalyst bank 2 – Active A/F control method

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$22	\$A9	Multiply by 0.0003 (no dimension)	Oxygen storage capacity of catalyst	Minimum test limit for catalyst	Maximum test limit for catalyst

WAVEFORMS OF AIR-FUEL RATIO (A/F) AND HEATED OXYGEN (HO2) SENSORS

HINT:

Perform the operation with the engine speeds and time durations described below prior to check the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

- Connect the hand-held tester to the DLC3.
- Start the engine and warm it up with all the accessories switched OFF, until the engine coolant temperature stabilizes.
- Run the engine at an engine speed of between 2,500 rpm and 3,000 rpm for at least 3 minutes.
- After confirming that the waveform of the heated oxygen sensor (bank 1, 2 sensor 1 (OX1A, OX2A)), oscillate around 0.5 V during feedback to the ECM, check the waveform of the heated oxygen sensor (bank 1, 2 sensor 2 (OX1B, OX2B)).

HINT:

- If either of the voltage outputs of the Air-Fuel Ratio (A/F) or Heated Oxygen (HO2) sensors does not fluctuate, or either of the sensors makes a noise, the sensor may be malfunctioning.
- If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following A/F CONTROL using a hand-held tester.
- If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).

**A/F CONTROL**

HINT:

Hand-held tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- (1) Connect a hand-held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and OS2 B1S2) displayed on the tester.

HINT:

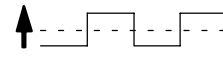

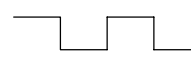

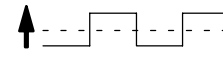

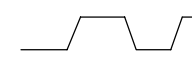

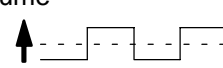

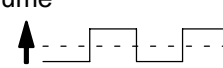

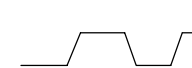

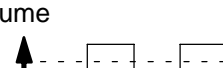

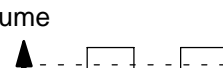

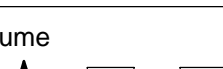

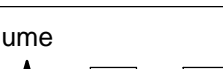

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 % ↑ -12.5 % ↓  Output voltage More than 3.35 V Less than 3.0 V  OK	Injection volume +25 % ↑ -12.5 % ↓  Output voltage More than 0.55 V Less than 0.4V  OK	—
2	Injection volume +25 % ↑ -12.5 % ↓  Output voltage Almost no reaction  NG	Injection volume +25 % ↑ -12.5 % ↓  Output voltage More than 0.55 V Less than 0.4V  OK	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 % ↑ -12.5 % ↓  Output voltage More than 3.35 V Less than 3.0V  OK	Injection volume +25 % ↑ -12.5 % ↓  Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 % ↑ -12.5 % ↓  Output voltage Almost no reaction  NG	Injection volume +25 % ↑ -12.5 % ↓  Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Are there any other codes (besides DTC P0420 or P0430) being output?
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
"P0420 and/or P0430"	A
"P0420 or P0430" and other DTCs	B

HINT:

If any other codes besides "P0420 and/or P0430" are output, perform the troubleshooting for those DTCs first.

B
Go to relevant DTC chart (See page [DI-477](#)).

A

2	Check A/F sensor (bank 1, 2 sensor 1).
----------	---

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and turn the tester ON.
- (c) Warm up the engine with the engine speed at 2,500 rpm for approximately 90 seconds.
- (d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 and O2S B1S2) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (HO2)	-12.5 %	Lean	Less than 0.4

RESULT:

Status A/F S1	Status O2S S2	A/F Condition and A/F and HO2 Sensors Condition	Misfires	Main Suspected Trouble Areas	Proceed To
Lean/Rich	Lean/Rich	Normal	–	<ul style="list-style-type: none"> • Three-way Catalytic Converter (TWC) • Gas leakage from exhaust system 	A
Lean	Lean/Rich	A/F sensor malfunction	–	<ul style="list-style-type: none"> • A/F sensor 	B
Rich	Lean/Rich	A/F sensor malfunction	–	<ul style="list-style-type: none"> • A/F sensor 	B
Lean/Rich	Lean	HO2 sensor malfunction	–	<ul style="list-style-type: none"> • HO2 sensor • Gas leakage from exhaust system 	C
Lean/Rich	Rich	HO2 sensor malfunction	–	<ul style="list-style-type: none"> • HO2 sensor • Gas leakage from exhaust system 	C
Lean	Lean	Actual air–fuel ratio lean	May occur	<ul style="list-style-type: none"> • Extremely rich or lean actual air–fuel ratio • Gas leakage from exhaust system 	A
Rich	Rich	Actual air–fuel ratio lean	–	<ul style="list-style-type: none"> • Extremely rich or lean actual air–fuel ratio • Gas leakage from exhaust system 	A

Lean: During A/F CONTROL, the A/F sensor output voltage (AFS) is consistently more than 3.35 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.

Rich: During A/F CONTROL, the AFS is consistently less than 3.0 V, and the O2S is consistently more than 0.55 V.

3	Check gas leakage on exhaust system.
----------	---

OK:

No exhaust gas leakage.

Replace front and rear three-way catalytic converter in the bank a malfunction is detected.

DTC	P0441	Evaporative Emission Control System Incorrect Purge Flow
------------	--------------	---

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0441	Purge VSV (Vacuum Switching Valve) stuck open	Vacuum pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak pressure standard is measured at the start and at the end of the leak check. If stabilized pressure higher than [second 0.02 inch leak pressure standard x 0.2], ECM determines that purge VSV stuck open	<ul style="list-style-type: none"> • Purge VSV • Connector/wire harness (Purge VSV – ECM) • ECM • Pump module • Leakage from EVAP system 	While ignition Switch OFF	2 trip
P0441	Purge VSV stuck closed	After EVAP leak check performed, purge VSV turned ON (open), and atmospheric air introduced into EVAP system. 0.02 inch leak pressure standard is measured at the start and at the end of the leak check. If pressure does not return to near atmospheric pressure, ECM determines that purge valve stuck closed	<ul style="list-style-type: none"> • Purge VSV • Connector/wire harness (Purge VSV – ECM) • ECM • Pump module • Leakage from EVAP system 	While ignition Switch OFF	2 trip
P0441	Purge flow	While engine running, following conditions successively met: <ul style="list-style-type: none"> • Negative pressure not created in EVAP system when purge VSV turned ON (open) • EVAP system pressure change less than 0.5 kPa (3.75 mmHg) when vent valve turned ON (closed) • Atmospheric pressure change before and after purge flow monitor less than 0.1 kPa (0.75 mmHg) 	<ul style="list-style-type: none"> • Purge VSV • Connector/wire harness (Purge VSV – ECM) • Leakage from EVAP line (Purge VSV – Intake manifold) • ECM 	While engine running	2 trip

CIRCUIT DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) Inspection Procedure (see page [DI-884](#)).

MONITOR DESCRIPTION

The two monitors, Key-Off and Purge Flow, are used to detect malfunctions relating to DTC P0441. The Key-Off monitor is initiated by the ECM internal timer, known as the soak timer, 5 hours* after the ignition switch is turned to OFF. The purge flow monitor runs while the engine is running.

1. KEY-OFF MONITOR

5 hours* after the ignition switch is turned OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

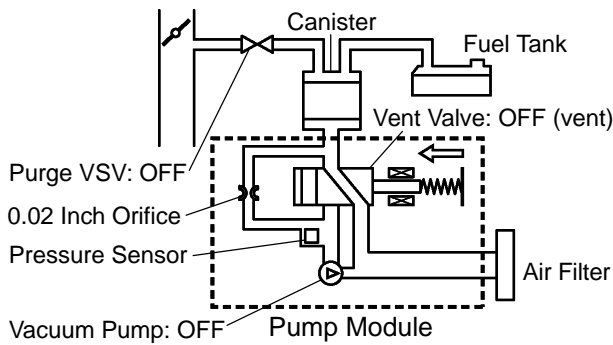

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure is not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	Leak check is performed after second 0.02 inch leak pressure standard is measured. If stabilized system pressure higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

Operation A: Atmospheric Pressure Measurement Operation B, E: 0.02 Inch Leak Pressure Measurement

Operation C: EVAP System Pressure Measurement

Operation D: Purge VSV monitor

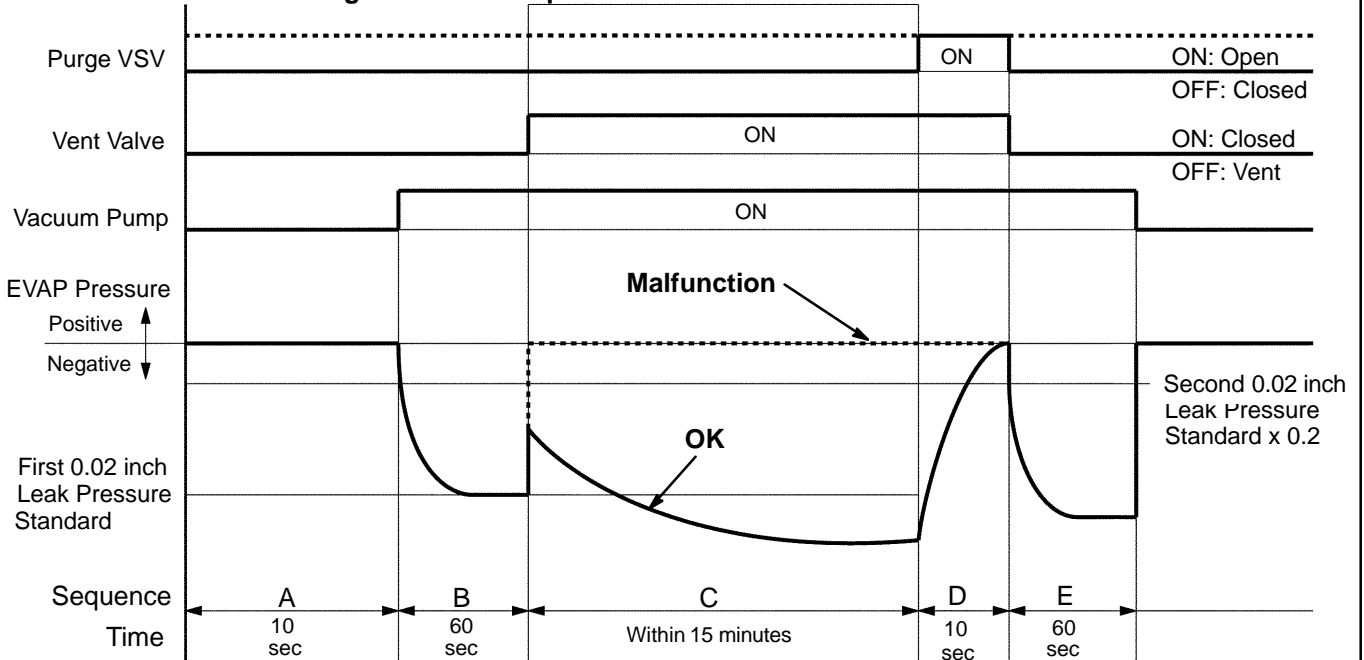

Y

A23480

(a) Purge VSV stuck open

In operation C, the vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The EVAP system pressure is then measured by the ECM using the pressure sensor. If the stabilized system pressure is higher than [second 0.02 inch leak pressure standard x 0.2], the ECM interprets this as the purge VSV (Vacuum Switching Valve) being stuck open. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

EVAP Pressure when Purge VSV Stuck Open:

C

A23483

(b) Purge VSV stuck closed

In operation D, the pressure sensor measures the EVAP system pressure. The pressure measurement for purge VSV monitor is begun when the purge VSV is turned ON (open) after the EVAP leak check. When the measured pressure indicates an increase of 0.3 kPa (2.25 mmHg) or more, the purge VSV is functioning normally. If the pressure does not increase, the ECM interprets this as the purge VSV being stuck closed. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

2. PURGE FLOW MONITOR

The purge flow monitor consists of the two step monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
The vent valve is turned ON (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:

In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

MONITOR STRATEGY

Related DTCs	P0441	Purge VSV stuck open
		Purge VSV stuck closed
		Purge flow
Required sensors/components	Purge VSV, Pump module	
Frequency of operation	Once per driving cycle	
Duration	Purge VSV stuck open and closed: Within 15 min. (varies with amount of fuel in tank) Purge flow: Within 10 min.	
MIL operation	2 driving cycle

HINT:

The pressure sensor is built into the pump module.

CIRCUIT DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) Inspection Procedure (see page [DI-884](#)).

MONITOR DESCRIPTION

- (a) DTC P0450: Pressure sensor voltage abnormal fluctuation.
If the pressure sensor voltage output rapidly fluctuates between less than 0.45 V and more than 4.9 V, the ECM interprets this as an open or short circuit malfunction in the pressure sensor or its circuit, and stops the EVAP (Evaporative Emission) system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
- (b) DTC P0451: Pressure sensor noising or stuck
If the pressure sensor voltage output fluctuates rapidly for 10 seconds, the ECM stops the EVAP system monitor. The ECM interprets this as noise from the pressure sensor, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC.
Alternatively, if the sensor voltage output does not change for 10 seconds, the ECM interprets this as the sensor being stuck, and stops the monitor. The ECM then illuminates the MIL and sets the DTC.
(Both the malfunctions are detected by 2 trip detection logic)
- (c) DTC P0452: Pressure sensor voltage low
If the pressure sensor voltage output is below 0.45 V, the ECM interprets this as an open or short circuit malfunction in the pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
- (d) DTC P0453: Pressure sensor voltage high
If the pressure sensor voltage output is 4.9 V or more, the ECM interprets this as an open or short circuit malfunction in the pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

EVAP pressure	Less than 42.11 kPa (315.90 mmHg), or more than 123.761 kPa (928.440 mmHg)
Pressure sensor low voltage:	
EVAP pressure	Less than 42.11 kPa (315.90 mmHg)
Pressure sensor high voltage:	
EVAP pressure	More than 123.761 kPa (928.440 mmHg)

INSPECTION PROCEDURE

NOTICE:

- When a vehicle is brought into the workshop, leave it as it is. Do not change the vehicle condition. For example, do not tighten the fuel tank cap.
- Do not disassemble the pump module.
- A hand-held tester is required to conduct the following diagnostic troubleshooting procedure.

1	Confirm DTC and EVAP pressure.
----------	---------------------------------------

PREPARATION:

- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON (do not start the engine).
- Turn the tester ON.

CHECK:

- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- Read DTCs.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / VAPOR PRESS.
- Read the EVAP (Evaporative Emission) pressure displayed on the tester.

RESULT:

Display (DTC Output)	Test Results	Suspected Trouble Areas	Proceed To
P0451	—	• Pressure sensor	C
P0452	Less than 45 kpa (430 mmHg)	• Wire harness/connector (ECM – pressure sensor) • Pressure sensor • Short in ECM circuit	A
P0453	More than 120 kPa (900 mmHg)	• Wire harness/connector (ECM – pressure sensor) • Pressure sensor • Open in ECM circuit	B

B → **Go to step 4.**

C → **Go to EVAP inspection procedure (See page [DI-884](#)).**

A

2 Measure resistance between terminal PPMP of ECM and body ground.

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between PPMP terminal of the ECM connector and the body ground.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
10 Ω or less	<ul style="list-style-type: none"> • Wire harness/connector (ECM – pressure sensor) • Short in pressure sensor circuit 	A
10 kΩ or more	<ul style="list-style-type: none"> • Wire harness/connector (ECM – pressure sensor) • Short in ECM circuit 	B

B Go to step 7.

A

3 Measure resistance between terminal PPMP of ECM and body ground.

PREPARATION:

- (a) Disconnect the L4 canister connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Check the resistance between PPMP terminal of the ECM connector and the body ground.

Result:

Test Results	Suspected Trouble Areas	Proceed To
10 kΩ or more	• Short in pressure sensor circuit	A
10 Ω or less	• Short in wire harness/connector (ECM – pressure sensor)	B

A → Go to step 5.

B → Go to step 6.

4 Measure voltage and resistance of pump module connector.

PREPARATION:

- (a) Disconnect the L4 canister connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage and resistance of the L4 connector.

OK:

Standard:

Tester Connections	Specified Conditions
L4-4 - Body ground	Between 4.5 V and 5.5 V
L4-3 - Body ground	Between 4.5 V and 5.5 V
L4-2 - Body ground	100 Ω or less

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Voltage and resistance within standard ranges	• Open in pressure sensor circuit	A
Voltage and resistance outside standard ranges	• Open in wire harness/connector (ECM - pressure sensor)	B

B Go to step 6.

A

5 Replace charcoal canister assembly.

NEXT Go to step 8.

6 Repair or replace wire harness and connectors.

HINT:

If the exhaust tail pipe has been removed, go to the next step before reinstalling it.

NEXT Go to step 8.

7	Replace ECM (See page SF-82).
----------	--

NEXT

8	Check whether DTC output recurs.
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Wait for at least 60 seconds.

CHECK:

- (a) On the tester, select the following menu items: DIAGNOSIS/ENHANCED OBD II/DTC INFO/PENDING CODES.

HINT:

If no pending DTC is displayed on the tester, the repair has been successfully completed.

NEXT

Completed

DTC	P0455	Evaporative Emission Control System Leak Detected (Gross Leak)
------------	--------------	---

DTC	P0456	Evaporative Emission Control System Leak Detected (Very Small Leak)
------------	--------------	--

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0455	EVAP gross leak	Vacuum pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak pressure standard is measured at the start and at the end of the leak check. If stabilized pressure higher than [second 0.02 inch leak pressure standard x 0.2], ECM determines that EVAP system has large leakage.	<ul style="list-style-type: none"> • Fuel tank cap (loose) • Leakage from EVAP line (Canister – Fuel tank) • Leakage from EVAP line (Purge VSV – Canister) • Pump module • Leakage from fuel tank • Leakage from canister 	While ignition switch OFF	2 trip
P0456	EVAP small leak	Vacuum pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. 0.02 inch leak pressure standard is measured at the start and at the end of the leak check. If stabilized pressure larger than second 0.02 inch leak pressure, ECM determines that EVAP system has small leakage.	Same above	While ignition switch OFF	2 trip

CIRCUIT DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) Inspection Procedure (see page [DI-884](#)).

MONITOR DESCRIPTION

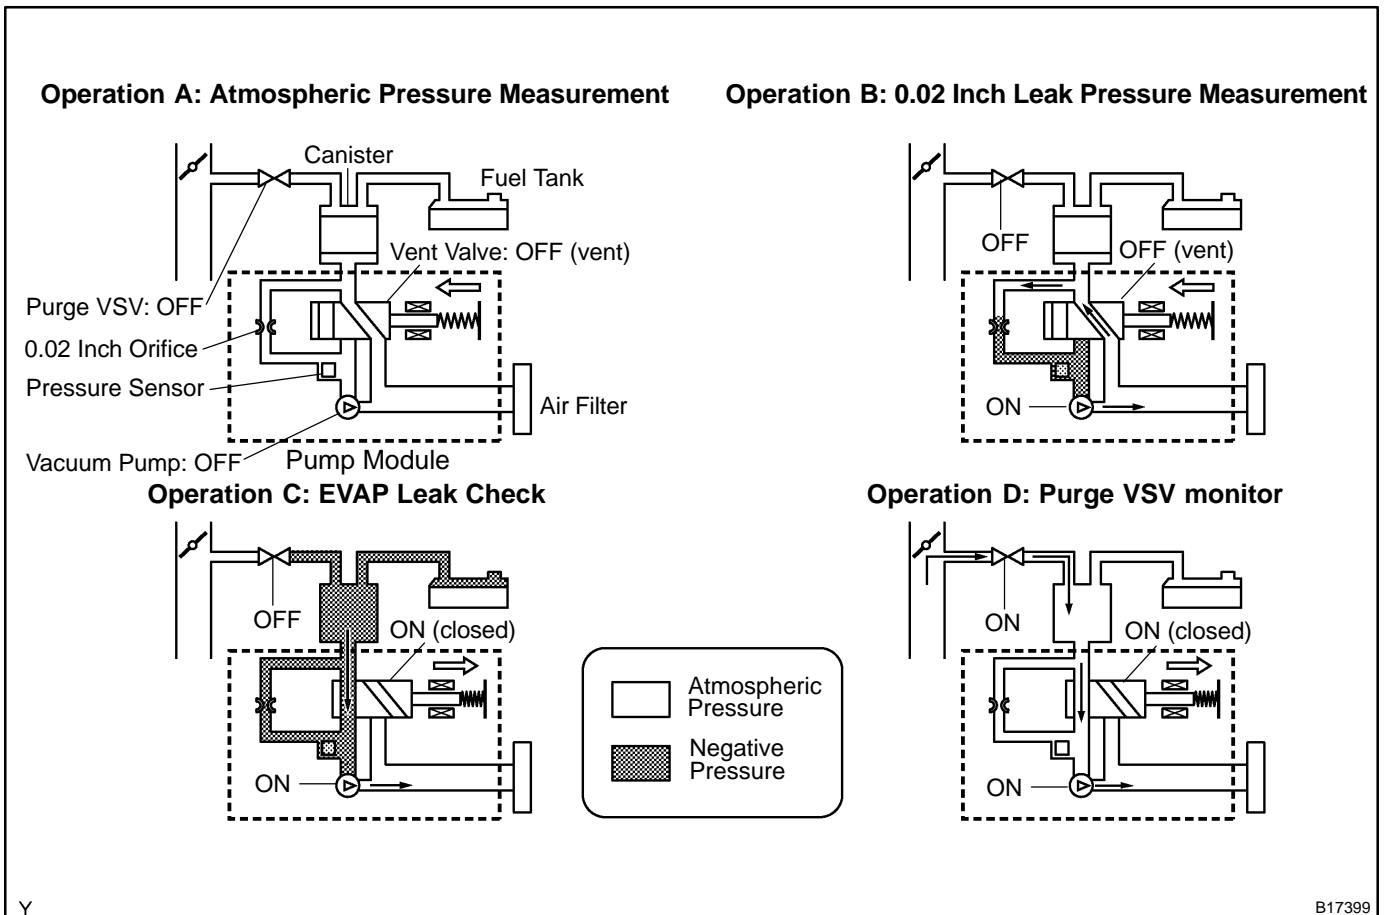

5 hours* after the ignition switch is turned OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure is not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	Leak check is performed after second 0.02 inch leak pressure standard is measured. If stabilized system pressure higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

(a) P0455: EVAP (Evaporative Emission) gross leak

In operation C, the vacuum pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than [second 0.02 inch leak pressure standard x 0.2] (near atmospheric pressure), the ECM determines that the EVAP system has a large leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

(b) P0456: EVAP very small leak

In operation C, the vacuum pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than second 0.02 inch leak pressure standard, the ECM determines that the EVAP system has a small leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

1. Duration that vehicle has been driven	5 min.	-
2. EVAP purge operation	Performed	
ECT	4.4 to 35°C (40 to 95°F)	
IAT	4.4 to 35°C (40 to 95°F)	
Key-off monitor sequence	1 to 8	
1. Atmospheric pressure	-	
Next sequence is run if the following condition is set	-	
Atmospheric pressure change	-	0.3 kPa (2.25 mmHg)
2. First reference pressure measurement	-	
Next sequence is run if the following conditions are set	Condition 1, 2 and 3	
1. EVAP pressure just after reference pressure measurement start	-	-1 kPa (-7.5 mmHg)
2. Reference pressure	-4.85 to -1.057 kPa (-36.38 to -7.93 mmHg)	
3. Reference pressure	Saturated within 60 seconds	
3. EVAP canister vent valve close stuck check	-	
Next sequence is run if the following condition is set	-	
EVAP pressure change after vent valve is ON	0.3 kPa (2.25 mmHg)	-
4. Vacuum introduction	-	
Next sequence is run if the following condition is set	-	
EVAP pressure	Saturated within 15 minutes	
5. EVAP canister purge valve close stuck check	-	
Next sequence is run if the following condition is set	-	
EVAP pressure change after purge valve is open	0.3 kPa (2.25 mmHg)	-

6. Second reference pressure measurement	–	
Next sequence is run if the following conditions are set	Condition 1, 2, 3 and 4	
1. EVAP pressure just after reference pressure	–	–1 kPa (–7.5 mmHg)
2. Reference pressure	–4.85 to –1.057 kPa (–36.38 to –7.93 mmHg)	
3. Reference pressure	Saturated within 60 seconds	
4. Difference between first reference pressure and second reference pressure	–	0.7 kPa (5.25 mmHg)
7. Leak check	–	
Next sequence is run if the following condition is set	–	
EVAP pressure when vacuum introduction is complete	–	Second reference pressure
8. Atmospheric pressure measurement	–	
EVAP monitor is complete if the following condition is set	–	
Atmospheric pressure difference between sequence 1 and 8	–	0.3 kPa (2.25 mmHg)

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Small leak (0.020 inch) malfunction detection:	
EVAP pressure when vacuum introduction is complete	Between reference pressure and reference pressure x 0.2
Gross leak detection:	
EVAP pressure when vacuum introduction is complete	Higher than reference pressure x 0.2

MONITOR RESULT (MODE 06 DATA)

Refer to page [DI-445](#) for detailed information.

INSPECTION PROCEDURE

Refer to the EVAP Inspection Procedure (see page [DI-884](#)).

DTC	P0500	Vehicle Speed Sensor "A"
------------	--------------	---------------------------------

DTC	P0503	Vehicle Speed Sensor "A" Intermittent/Erratic/High
------------	--------------	---

CIRCUIT DESCRIPTION

The No.1 vehicle speed sensor outputs a 4-pulse signal for every revolution of the rotor shaft, which is rotated by the transmission output shaft via the driven gear. After this signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter, it is then transmitted to the ECM. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC No.	Proceed to	DTC Detection Condition	Trouble Area
P0500	Step 1	No vehicle speed sensor signal to ECM under following conditions: (2 trip detection logic) • Vehicle is being driven	<ul style="list-style-type: none"> • Combination meter • Open or short in vehicle speed sensor circuit • Vehicle speed sensor • ECM
P0503	DI-430	Intermittent problem in the vehicle speed sensor circuit	

MONITOR DESCRIPTION

The ECM assumes that the vehicle is driven when the park/neutral position switch is OFF and it has been over 4 sec. since the actual vehicle speed was 5.59 mph (9 km/h) or more.

If there is no signal from the vehicle speed sensor when these conditions are satisfied, the ECM concludes that there is a fault in the vehicle speed sensor. The ECM will turn on the MIL and a DTC is set.

MONITOR STRATEGY

Related DTCs	P0500	Vehicle speed sensor "A" pulse input error
Required sensors/components	Main sensors	Vehicle speed sensor
	Related sensors	Park/Neutral position switch, Engine coolant temperature sensor, Combination meter
Frequency of operation	Continuous	
Duration	500 times	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

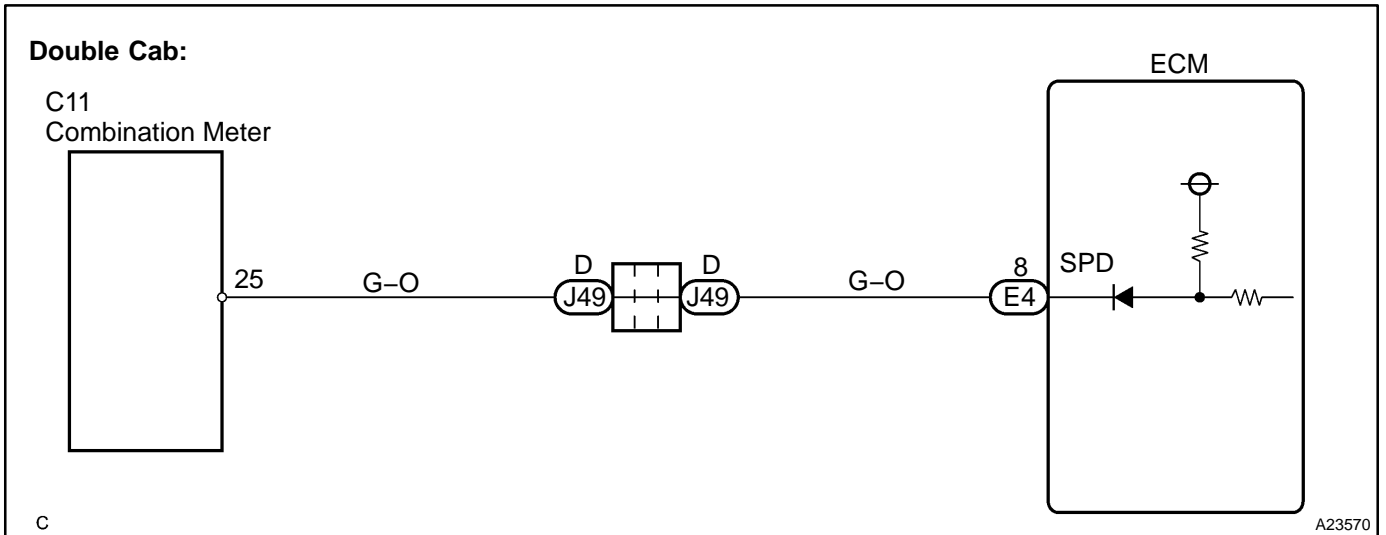

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-437	
Vehicle speed is 5.59 mph (9 km/h) or more	4 sec.	-
Park/neutral position switch	OFF	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Sensor signal	No pulse input

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check operation of speedometer.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (c) Start the engine.
- (d) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / VEHICLE SPD.

CHECK:

Read the mass air flow rate on the hand-held tester.

RESULT:

Vehicle speed	Proceed to
Vehicle speed remains 0 km/h (0 mph)	A
Vehicle speed is lower than actual speed	A
Vehicle speed is same as actual speed	B

B

Check for intermittent problems (See page DI-430).

A

2 Check voltage between terminal SPD and E1 of ECM connector.

PREPARATION:

- Shift the shift lever to neutral.
- Jack up the rear wheel on one side.
- Turn the ignition switch ON.

CHECK:

Measure the voltage between the specified terminal of the E4 and E5 ECM connector when the wheel is turned slowly.

OK:

Standard:

Tester Connection	Specified Condition
SPD (E4-8) - E1 (E5-1)	Generated intermittently

HINT:

The output voltage should fluctuate up and down similarly to the diagram on the left when the wheel is turned slowly.

OK

Replace ECM (See page [SF-82](#)).

NG

3 Check vehicle speed sensor.

Component Side Connector:

Vehicle Speed Sensor

I25536

PREPARATION:

- Disconnect the vehicle speed sensor connector.
- Connect the battery positive (+) lead to terminal 1 and the battery negative (-) lead to terminal 2.
- Connect the tester positive (+) lead to terminal 3 and the tester negative (-) lead to terminal 2.
- Shift the shift lever to N position.
- Rotate the shaft.

CHECK:

Check that there is voltage change between terminals 2 and 3.

OK:

Standard: 0 V to 10 V or more

NG

Replace vehicle speed sensor.

OK

4 Check sensor installation (Vehicle speed sensor).

CHECK:
Check the vehicle speed sensor installation.

OK:
The vehicle speed sensor is installed properly.

NG → Tighten sensor installation bolt.

OK

5 Check for open and short in harness and connector between combination meter and ECM.

PREPARATION:
(a) Disconnect the C11 combination meter connector.
(b) Disconnect the E4 ECM connector.

CHECK:
Check for resistance between the wire harness side connectors.

OK:

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
SPD (E4-8) - C11-23	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
SPD (E4-8) or C11-23 - Body ground	10 kΩ or higher

NG → Repair or replace harness or connector.

OK

Check combination meter circuit (See page [BE-86](#)).

DTC	P0504	Brake Switch "A"/"B" Correlation
------------	--------------	---

CIRCUIT DESCRIPTION

In addition to turning on the stop lamps, the stop lamp switch signals are used for a variety of engine, transmission, and suspension functions as well as being an input for diagnostic checks. It is important that the switch operates properly, therefore this switch is designed with two complementary signal outputs: STP and ST1-. The ECM analyzes these signal outputs to detect malfunctions in the stop lamp switch.

HINT:

Normal condition is as shown in the table.

Signal	Brake pedal released	In transition	Brake pedal depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

DTC No.	DTC Detection Condition	Trouble Area
P0504	Conditions (a), (b) and (c) continue for 0.5 sec. or more: (a) Ignition switch ON (b) Brake pedal released (c) STP signal is OFF when the ST1- signal is OFF	<ul style="list-style-type: none"> • Short in stop lamp switch signal circuit • Stop lamp fuse • Stop lamp switch • ECM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check operation of stop light.
----------	---------------------------------------

CHECK:

Check if the stop lights come on and go off normally when the brake pedal is operated and released.

NG	Check and repair stop light circuit.
-----------	---

OK

2	Check stop light switch (See page BE-70).
----------	--

NG	Replace stop light switch.
-----------	-----------------------------------

OK

3 Check STP signal and ST1- voltage.

PREPARATION:

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch ON.
- Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / STOP LIGHT SW".

CHECK:

Read the signal displayed on the hand-held tester.

OK:

Standard:

Brake Pedal	Specified Condition
Depressed	STP Signal ON
Released	STP Signal OFF

CHECK:

Measure the voltage between the specified terminals of the E3 and E5 ECM connectors.

OK:

Standard:

Tester Connection	Brake Pedal	Specified Condition
ST1- (E3-16) - E1 (E5-1)	Depressed	Below 1.5 V
ST1- (E3-16) - E1 (E5-1)	Released	7.5 to 14 V

OK

Check for intermittent problems
(See page [DI-430](#)).

NG

4 Check harness and connector between ECM and stop light switch.

PREPARATION:

- (a) Disconnect the S4 stop light switch connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Stop light switch (S4-1) - STP (E3-15)	Below 1 Ω
Stop light switch (S4-3) - ST1- (E3-16)	Below 1 Ω
Stop light switch (S4-1) or STP (E3-15) - Body ground	10 kΩ or higher
Stop light switch (S4-3) or ST1- (E3-16) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace ECM (See page [SF-82](#)).

DTC	P0505	Idle Air Control System
------------	--------------	--------------------------------

CIRCUIT DESCRIPTION

The idle speed is controlled by the ETCS (Electronic Throttle Control System).

The ETCS is composed of the throttle motor which operates the throttle valve, and the throttle position sensor, which detects the opening angle of the throttle valve.

The ECM controls the throttle motor to provide the proper throttle valve opening angle to obtain the target idle speed.

DTC No.	DTC Detection Condition	Trouble Area
P0501	Idle speed continues to vary greatly from target speed (2 trip detection logic)	<ul style="list-style-type: none"> • ETCS • Air induction system • PCV hose connection • ECM

MONITOR DESCRIPTION

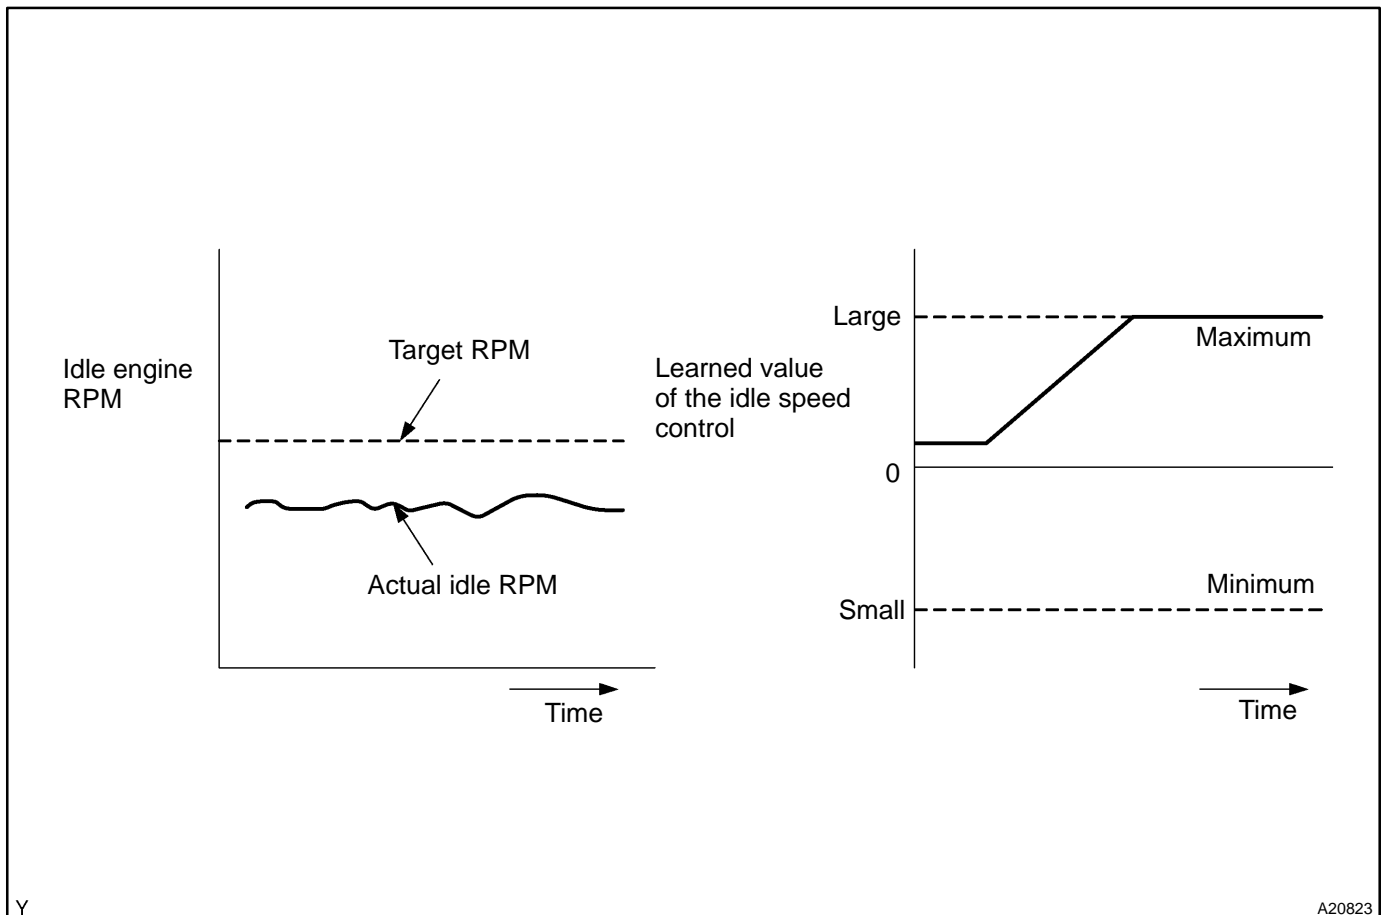

The ECM regulates the idle speed by opening and closing the throttle valve using the ETCS. The ECM concludes that the idle speed control ECM function is malfunctioning if: 1) the actual idle RPM varies more than the specified amount, or 2) a learning value of the idle speed control remains at the maximum or minimum five times or more during a driving cycle. The ECM will turn on the MIL and set a DTC.

Example:

If the actual idle RPM varies from the target idle RPM by more than 100 (*1) rpm five times during a driving cycle, the ECM will turn on the MIL and a DTC is set.

HINT:

*1: RPM threshold varies with engine load.

MONITOR STRATEGY

Related DTCs	P0505	Idle air control malfunction
Required sensors/components	Main sensors/components	Crankshaft position sensor
	Related sensors/components	Vehicle speed sensor, Engine coolant temperature sensor
Frequency of operation	Once per driving cycle	
Duration	10 min.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-437	
Engine	Running	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Either of the following conditions is met:	Condition 1 or 2
1. Frequency that both of the following conditions (a) and (b) are met:	5 times or more
(a) Engine RPM – target engine RPM	Less than –100 rpm or more than 150 rpm
(b) Vehicle condition	Stop after vehicle was driven by 6.25 mph (10 km/h) or more
2. Frequency that both of the following conditions (c) and (d) are met:	Once
(c) Engine RPM – target engine RPM	Less than –100 rpm or more than 150 rpm
(d) Intake air control flow rate learning value	2.48 L/sec. or less, or 11 L/sec. or more

INSPECTION PROCEDURE

HINT:

- When the throttle position is slightly opened (the accelerator pedal is slightly depressed) because a floor carpet is overlapped on the accelerator pedal, or if the accelerator pedal is not fully released, etc., DTC P0505 will possibly be detected.
- Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Are there any other codes (besides P0505) being output?
----------	--

PREPARATION:

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch ON and push the hand-held tester main switch ON.
- When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
P0505	A
"P0505" and other DTCs	B

HINT:

If any other codes besides P0505 are output, perform the troubleshooting for those DTCs first.

2	Check connection of PCV piping.
----------	--

3	Check air induction system (See page SF-1).
----------	--

CHECK:

Check for vacuum leaks in air induction system.

OK:

No leakage.

NG	Repair or replace air induction system.
-----------	--

OK

Check electric throttle control system (See page SF-41).

DTC	P050A	Cold Start Idle Air Control System Performance
------------	--------------	---

DESCRIPTION

The Electronic Throttle Control System (ETCS) controls the engine idling speed. The ETCS operates the throttle actuator to open and close the throttle valve, and adjusts the intake air amount to achieve the target idling speed.

In addition, the ECM retards the ignition timing and the ETCS increases the intake air amount to quickly increase the catalyst temperature at cold start.

DTC No.	DTC Detection Conditions	Trouble Areas
P050A	Accumulated intake air amount during 10 seconds of idling after cold start, less than threshold (2 trip detection logic)	<ul style="list-style-type: none"> • Throttle body assembly • Mass air flow meter • Air induction system • PCV hose connections • ECM

MONITOR DESCRIPTION

The ECM monitors the intake air amount during idling and the ignition timing.

When the engine coolant temperature is between -10°C and 50°C (14°F and 122°F), the ECM calculates the idling intake air amount for 10 seconds, beginning 3 seconds after the engine starts.

When the accumulated value is below the threshold, the ECM interprets this as a malfunction in the Idle Speed Control (ISC) system at cold start.

The ECM also monitors the ignition timing at cold start, and judges it to be incorrect when it is advanced to the same value for a warm engine for 5 seconds or more of the 10 second monitoring period.

Example:

P050A is detected when all conditions below are met (2 trip detection logic).

1. The engine coolant temperature is -10°C (14°F) or more when the engine starts.
2. The engine idles for 3 seconds after engine start.
3. The accumulated intake air amount is below the threshold.

If a malfunction is not repaired successfully, the ECM sets the DTC and illuminates the MIL 3 seconds after the engine is next started.

NOTICE:

When the negative battery terminal is disconnected during inspection or repairs, the ISC learning values are cleared. The ISC learning must be performed by warming up the engine and idling for 5 minutes with the engine coolant temperature at 75°C (167°F) or more because DTCs cannot be detected with the ISC learning values cleared.

MONITOR STRATEGY

Related DTCs	P050A	Idle speed control problem at cold
Required Sensors/Components (Main)	Mass air flow meter	
Required Sensors/Components (Related)	Engine Coolant Temperature (ECT) sensor, Throttle position sensor, Vehicle speed sensor	
Frequency of operation	Once per driving cycles	
Duration	10 seconds	
MIL Operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-437	
P050A:		
Battery voltage	8 V	–
Time after engine start	3 seconds	–
Starter	OFF	
ECT at engine start	-10°C (14°F)	–
ECT	-10°C (14°F)	50°C (122°F)
Engine idling time	3 seconds	–
Fuel-cut	OFF	
Vehicle speed	–	1.86 mph (3 km/h)
Time after shift position changed	1 second	–

TYPICAL MALFUNCTION THRESHOLDS

P050A:

Accumulated air flow amount	Varies with ECT (Example: Less than 102 g)
-----------------------------	--

INSPECTION PROCEDURE

HINT:

Read the freeze frame data using the intelligent tester. The freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, the freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Check any other DTCs output (In addition to DTC P050A).
----------	--

- (a) Connect the intelligent tester to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Turn the tester ON.
- (d) Select the following the menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- (e) Read the DTC.

RESULT:

Display (DTC Output)	Proceed to
P050A	A
P050A and other DTCs	B

HINT:

If any DTC other than P050A is output, troubleshoot those DTC first.

2	Read value using intelligent tester (Fuel trim).
----------	---

HINT:

Calculate the total fuel trim values to check the characteristic deviation of the mass air flow meter.

- (a) Connect the intelligent tester to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Turn the tester ON.
- (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / SHORT FT #1 and LONG FT #1.
- (e) Read the values displayed on the tester.
- (f) Add together the SHORT FT #1 and LONG FT #1 values to obtain the total FUEL TRIM.

OK:

Total of the SHORT FT #1 and LONG FT #1 values is between -20 % and 20 %.

OK	Go to step 8.
-----------	----------------------

NG

3	Check PCV hose connections.
----------	------------------------------------

OK:

PCV hose is connected correctly and is not damaged.

NG	Go to step 5.
-----------	----------------------

OK

4	Check air induction system.
----------	------------------------------------

- (a) Check the air induction system for vacuum leakage.

OK:

No leakage from the air induction system.

OK	Go to step 6.
-----------	----------------------

NG	Go to step 7.
-----------	----------------------

5	Repair or replace PCV hose.
----------	------------------------------------

NEXT**Go to step 11.**

6	Replace mass air flow meter.
----------	-------------------------------------

NEXT**Go to step 11.**

7	Repair or replace air induction system.
----------	--

NEXT**Go to step 11.**

8	Check throttle valve.
----------	------------------------------

(a) Check for deposits around the throttle valve.

OK:**No deposits around the throttle valve.****OK****Go to step 9.****NG****Go to step 10.**

9	Replace ECM.
----------	---------------------

NEXT**Go to step 11.**

10	Replace throttle body assembly.
-----------	--

NEXT

11

Check whether DTC output recurs (DTC P050A).**NOTICE:**

In this operation, the engine must be cold (the same level as the engine coolant temperature recorded in the freeze frame data).

- (a) Connect the intelligent tester to the DTC3.
- (b) Turn the ignition switch ON.
- (c) Turn the tester ON.
- (d) Clear DTCs (See page DI-462).
- (e) Switch the ECM from normal mode to check mode using the tester (See page DI-463).
- (f) Start the engine to idle for a minute.

OK:**Stable fast idling.**

- (g) Read DTCs.

OK:**No DTCs output.****NEXT****END**

DTC	P0560	System Voltage
------------	--------------	-----------------------

MONITOR DESCRIPTION

The battery supplies electricity to the ECM even when the ignition switch is OFF. This electricity allows the ECM to store data such as DTC history, freeze frame data, fuel trim values, and other data.

If the battery voltage falls below a minimum level, the ECM will conclude that there is a fault in the power supply circuit. The next time the engine starts, the ECM will turn on the MIL and a DTC will be set.

DTC No.	DTC Detecting Condition	Trouble Area
P0560	Open in back up power source circuit	<ul style="list-style-type: none"> • Open in back-up power source circuit • EFI fuse • ECM

HINT:

If DTC P0560 present, the ECM will not store another DTC.

MONITOR STRATEGY

Related DTCs	P0560	System voltage malfunction
Required sensors/components	ECM	
Frequency of operation	Continuous	
Duration	3 sec.	
MIL operation	Immediate (*1)	
Sequence of operation	None	

*1: The DTC is set immediate. The MIL will be illuminated after the engine starts in the next time.

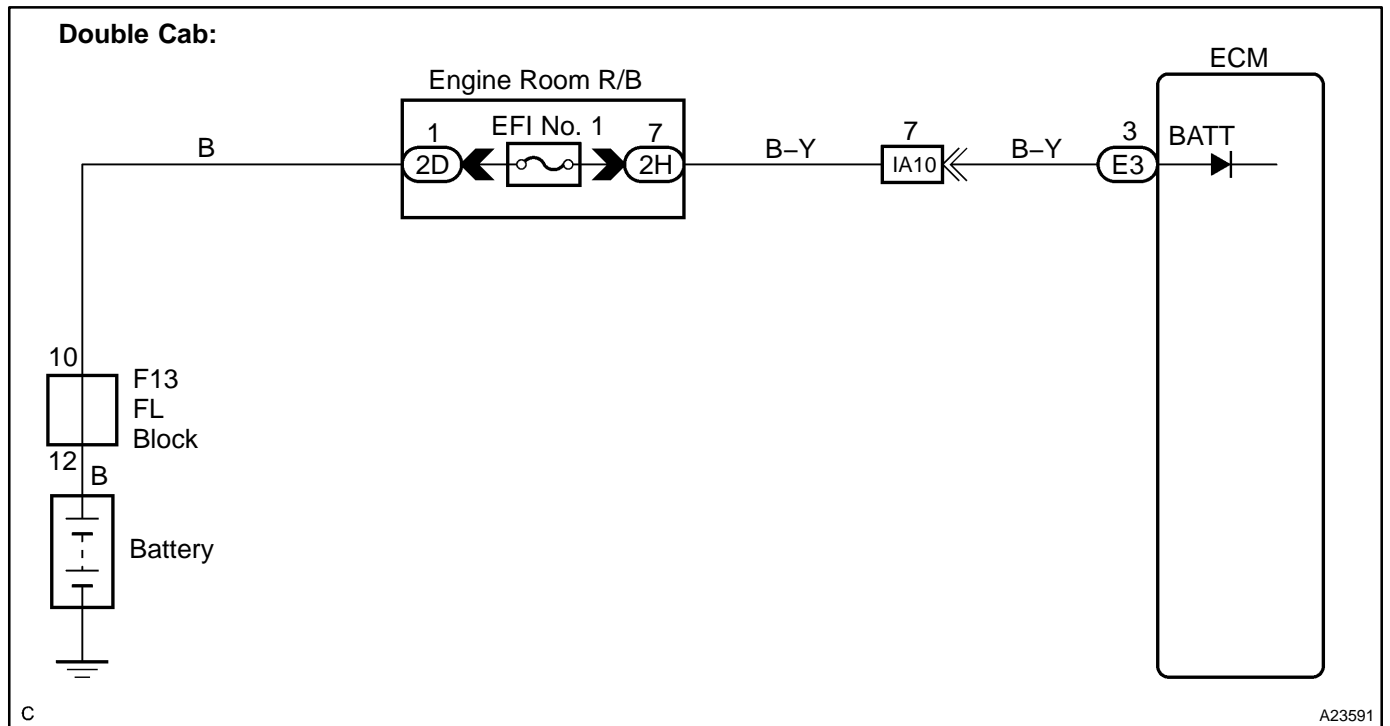

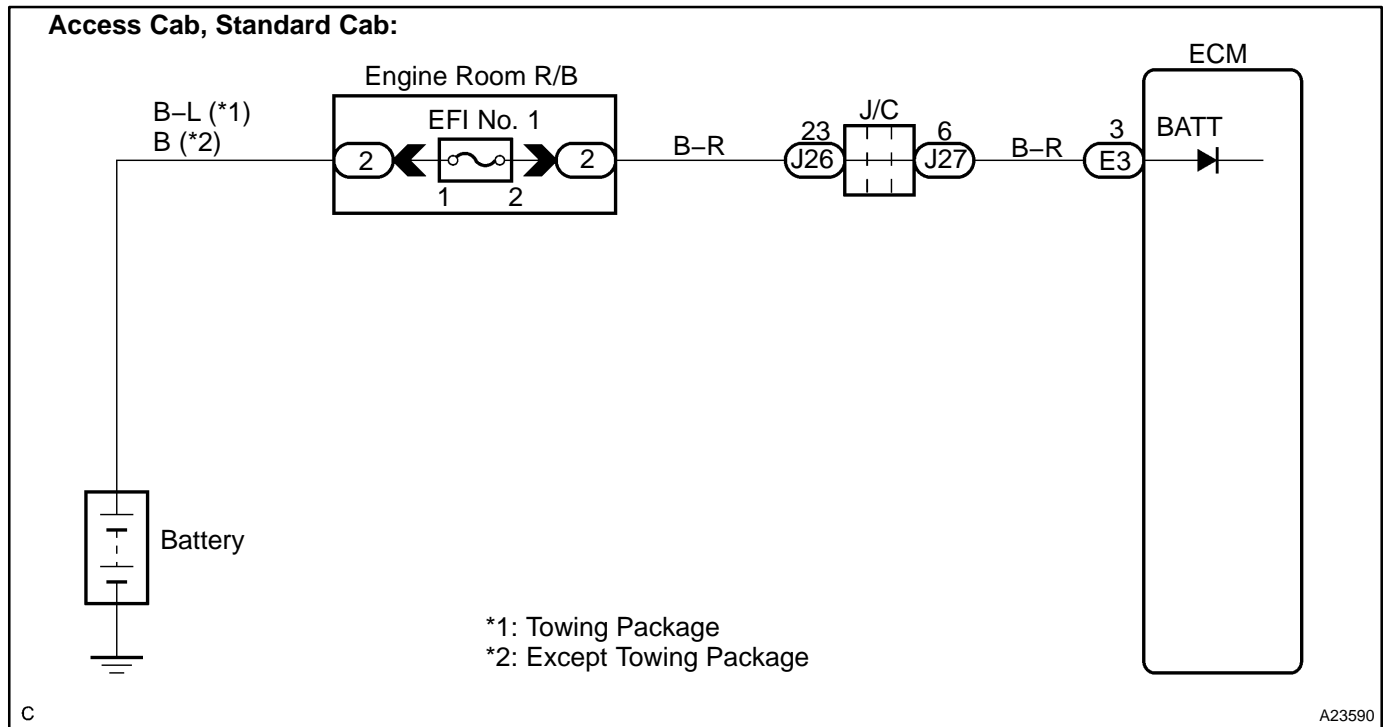

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-437	
Stand-by RAM	Initialized	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Battery voltage	Less than 3.5 V

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check battery voltage.
----------	-------------------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Select the item: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / BATTERY VOLTAGE.

CHECK:

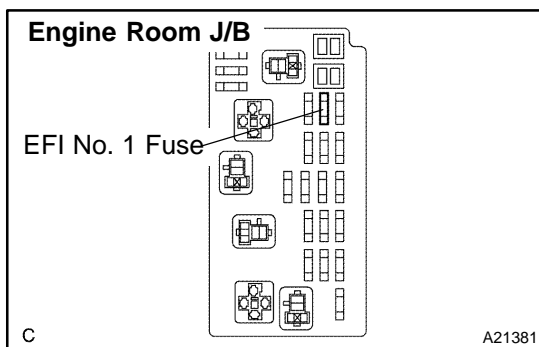

Read the battery voltage on the hand-held tester

RESULT:

Battery voltage	Proceed to
0 V	A
Except 0 V	B

2	Check EFI No. 1 fuse of engine room J/B.
----------	---

PREPARATION:

Remove the EFI No. 1 fuse from the engine room J/B.

CHECK:

Check the resistance of the EFI No. 1 fuse.

OK:

Standard: Below 1 Ω

3 Check voltage between terminal BATT and E1 of ECM connector.

CHECK:

Measure the voltage between terminals of the E5 and E3 ECM connector.

OK:

Standard:

Tester Connection	Specified Condition
BATT (E3-3) - E1 (E5-1)	9 to 14 V

OK Check for intermittent problems (See page [DI-430](#)).

NG

4 Check for open and short in harness and connector between ECM and EFI No. 1 fuse, EFI No. 1 fuse and battery.

PREPARATION:

- (a) Remove the EFI No. 1 fuse from the engine room J/B.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connector.

OK:

Standard:

Tester Connection	Specified Condition
Engine Room J/B (EFI No. 1 fuse terminal 2) - BATT (E3-3)	Below 1 Ω
Engine Room J/B (EFI No. 1 fuse terminal 2) or BATT (E3-3) - Body ground	10 k Ω or higher

NG Repair or replace harness or connector.

OK

5	Check the battery (See page CH-1).
---	---

NG	Replace battery.
----	------------------

OK

Check and replace engine room J/B.

DTC	P0604	Internal Control Module Random Access Memory (RAM) Error
------------	--------------	---

DTC	P0606	ECM/PCM Processor
------------	--------------	--------------------------

DTC	P0607	Control Module Performance
------------	--------------	-----------------------------------

DTC	P0657	Actuator Supply Voltage Circuit / Open
------------	--------------	---

MONITOR DESCRIPTION

The ECM continuously monitors its internal memory status, internal circuits, and output signals to the throttle actuator. This self-check insures that the ECM is functioning properly. If any malfunction is detected, the ECM will set the appropriate DTC and illuminate the MIL.

The ECM memory status is diagnosed by internal "mirroring" of the main CPU and the sub CPU to detect RAM (Random Access Memory) errors. The two CPUs also perform continuous mutual monitoring.

The ECM sets a DTC if: 1) outputs from the 2 CPUs are different and deviate from the standards, 2) the signals to the throttle actuator deviate from the standards, 3) a malfunction is found in the throttle actuator supply voltage, and 4) any other ECM malfunction is found.

DTC No.	DTC Detecting Condition	Trouble Area
P0604 P0606 P0607 P0657	ECM malfunction	• ECM

MONITOR STRATEGY

Related DTCs	P0604	Random access memory (RAM) error

The typical enabling condition is not available	-

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
P0604:	
RAM	RAM mirror check fail
P0606:	
Either of the following conditions is met	Condition 1 or 2
1. Difference between TP of main CPU and TP of sub CPU	0.3 V or more
2. Difference between APP of main CPU and APP of sub CPU	0.3 V or more
P0607:	
Either of the following conditions is met	Condition 1 or 2
1. All of the following conditions are met	Condition (a), (b) and (c)
(a) CPU reset	1 time or more
(b) Difference between TP and APP learned	0.4 V or more
(c) Electronic throttle actuator	OFF
2. CPU reset	2 times or more
P0657:	
ECTS power supply when ignition switch OFF to ON	7 V or more

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

Replace ECM (See page [SF-82](#)).

DTC	P0617	Starter Relay Circuit High
------------	--------------	-----------------------------------

MONITOR DESCRIPTION

While the engine is being cranked, the battery positive voltage is applied to terminal STA of the ECM. If the vehicle is being driven and the ECM detects the starter control signal (STA), the ECM concludes that the starter control circuit is malfunctioning. The ECM will turn on the MIL and a DTC is set.

DTC No.	DTC Detection Condition	Trouble Area
P0617	When all conditions (a), (b) and (c) are satisfied for 20 seconds with battery (+B) voltage 10.5 V or more (a) Vehicle speed \geq 12.4 mph (20 km/h) (b) Engine revolution \geq 1,000 rpm (c) STA signal ON	<ul style="list-style-type: none"> • Park/neutral position switch • Starter relay circuit • Ignition switch • ECM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and check STA signal.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON, and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / STARTER SIG.

CHECK:

Read the STA signal on the hand-held tester while the starter operates.

OK:

Standard:

Ignition Switch Position	ON	START
STARTER SIG	OFF	ON

OK →

Go to step 5.

NG

2	Check park/neutral position switch (See page DI-1159).
----------	---

NG →

**Replace park/neutral position switch.
Go to next step 5 after the replacement.**

OK

3	Check ignition switch (See page BE-37).
----------	--

NG →

**Replace ignition switch.
Go the next step 5 after the replacement.**

OK

4	Connect hand-held tester, and check STA signal.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON, and push the hand-held tester main switch ON.
- (c) On the hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / STARTER SIG.

CHECK:

Read the STA signal on the hand-held tester while the starter operates.

OK:**Standard:**

Ignition Switch Position	ON	START
STARTER SIG	OFF	ON

NG

Repair or replace harness or connector.

OK

5	Check DTC reoccur
----------	--------------------------

PREPARATION:

- (a) Connect the hand-held tester.
- (b) Turn the ignition switch ON and hand-held tester main switch ON.
- (c) Clear DTCs (see page [DI-462](#)).
- (d) Drive the vehicle more than 25 mph (40 km/h) for 20 seconds or more.

CHECK:

Check DTC reoccur.

RESULT:

Display (DTC Output)	Proceed to
P0617	A
No DTC output	B

A

Replace ECM (See page [SF-82](#)).

B

**Check for intermittent problems
(See page [DI-430](#)).**

DTC	P0630	VIN not Programmed or Mismatch ECM/PCM
------------	--------------	---

CIRCUIT DESCRIPTION

DTC P0630 is set when the Vehicle Identification Number (VIN) is not stored in the Engine Control Module (ECM) or the input VIN is not accurate. Input the VIN with the hand-held tester.

DTC No.	DTC Detecting Condition	Trouble Area
P0630	<ul style="list-style-type: none"> • VIN is not stored in ECM. • Input VIN in ECM is not accurate. 	ECM

MONITOR STRATEGY

DTC	P1340	Camshaft Position Sensor "A" (Bank 1 Sensor 1)
------------	--------------	---

DTC	P1341	Camshaft Position Sensor "A" (Bank 1 Sensor 1)
------------	--------------	---

CIRCUIT DESCRIPTION

Camshaft position sensor (G signal) consists of a magnet, iron core and pickup coil.

The camshaft drive gear (LH) has 3 teeth on its inner circumference. When the camshaft gear rotates, air gap changes between the protrusion on the gear and the pickup coil. The change affects the magnetic field and result in change in the resistance of the MRE element.

The crankshaft signal plate has 32 teeth and is mounted on the crankshaft. The crankshaft position sensor generates 32 signals at every engine revolution. The ECM detects the standard crankshaft angle based on the G signal and the actual crankshaft angle and the engine speed by the NE signal.

DTC No.	DTC Detecting Condition	Trouble Area
P1340	No camshaft position sensor signal to ECM during cranking (2 trip detection logic)	<ul style="list-style-type: none"> • Open or short in camshaft position sensor circuit • Camshaft position sensor • LH camshaft timing pulley • ECM
P1341	No camshaft position sensor signal to ECM with engine speed 600 rpm or more	

MONITOR DESCRIPTION

The camshaft position sensor (G signal) consists of a magnet and MRE element.

The camshaft drive gear has 5 teeth on its inner circumference. When the camshaft gear rotates, air gap changes between the protrusion on the gear and the pickup coil. The change affects the magnetic field and result in change in the resistance of the MRE element. The crankshaft angle sensor plate has 32 teeth and output 32 signals every engine revolution. The ECM detects the standard crankshaft angle based on the G signal and actual crankshaft angle and engine speed by NE signal.

MONITOR STRATEGY

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
P1340 Case 1 (No signal):	
Camshaft position sensor signal	No signal
P1340 Case 2 (Mis-aligned):	
Crankshaft/camshaft alignment is mis-aligned (judged by comparing the crankshaft position to the camshaft position)	
Camshaft position sensor signal: No input in appropriate timing.	
P1341:	
Crankshaft/Camshaft alignment	Mis-aligned
Camshaft position sensor count	12 or more / 720° CA (= Engine 2 revolutions)

COMPONENT OPERATING RANGE

Parameter	Standard Value
Camshaft position sensor signal input at every 720° CA	3

WIRING DIAGRAM

Refer to DTC P0335 on page [DI-632](#).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using hand-held tester. Because freeze frame records the engine conditions when the malfunction is detected. When troubleshooting, it is useful for determining whether the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, etc. at the time of the malfunction.

1 Check voltage of camshaft position sensor power source circuit.

Wire Harness Side:

Camshaft Position Sensor

N

B17445

PREPARATION:

- Disconnect the Camshaft position sensor connector.
- Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminal 3 of the camshaft position sensor connector and body ground.

OK:

Standard: 4.5 to 5.5 V

NG

Repair or replace harness or connector.

OK

2 Check camshaft position sensor signal.

2 V / DIV

Y

200 ms / DIV A23559

PREPARATION:

Start the engine.

CHECK:

Check the waveform between the G2+ (E5-19) and G2- (E5-29) of the ECM connector.

OK:

Standard: Correct waveform is as shown.

(E5) ECM Connector

N

B17414

OK

Replace ECM (See page SF-82).

NG

3 Check for open and short in harness and connector between ECM and camshaft position sensor.

PREPARATION:

- (a) Disconnect the Camshaft position sensor connector.
- (b) Disconnect the E5 ECM connector.

CHECK:

Measure the resistance between wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
Camshaft position sensor (C1-2) – G2+ (E5-19)	Below 1 Ω
Camshaft position sensor (C1-1) – G2- (E5-29)	Below 1 Ω
Camshaft position sensor (C1-2) or G2+ (E5-19) – Body ground	10 kΩ or higher
Camshaft position sensor (C1-1) or G2- (E5-29) – Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

4 Inspect sensor installation and signal plate tooth of LH camshaft timing pulley.

CHECK:

Check the camshaft position sensor installation.

OK:

The camshaft position sensor is installed properly.

NG Tighten sensor installation bolt.

OK

5	Inspect signal plate tooth of LH camshaft timing pulley.
----------	---

NG	Replace LH camshaft timing pulley.
-----------	---

OK

Replace camshaft position sensor.
--

DTC	P1440	Secondary Air Injection System Control Valve Circuit Bank 1
------------	--------------	--

DTC	P1443	Secondary Air Injection System Control Valve Circuit Bank 2
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to DTC P0412 on page [DI-656](#).

DTC No.	DTC Detection Condition	Trouble Area
P1440	AIV1 terminal voltage becomes less than half of the +B voltage while the VSV for air injection control is not operating. (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in VSV for air injection control circuit (Bank 1) • VSV power source • VSV for air injection control (Bank 1) • ECM
P1443	AIV2 terminal voltage becomes less than half of the +B voltage while the VSV for air injection control is not operating. (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in VSV for air injection control circuit (Bank 2) • VSV power source • VSV for air injection control (Bank 2) • ECM

MONITOR DESCRIPTION

The ECM detects an open or short in the circuit of the VSV for air injection control according to the AIV1 (AIV2) terminal voltage, stores the DTC, and then illuminates the MIL. When the AIV1 (AIV2) terminal voltage is less than half of the +B voltage while the VSV for air injection control is not operating, the ECM determines it as a malfunction.

MONITOR STRATEGY

Related DTCs	P1440	Secondary air injection system control valve circuit (Bank 1) range check
	P1443	Secondary air injection system control valve circuit (Bank 2) range check
Required sensors/components	VSV for air injection control	
Frequency of operation	Continuous	
Duration	0.5 sec.	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present	See page DI-437	
P1440:		
Engine	Running	
Air switching valve No. 2 (Bank 1)	Not operating	
P1443:		
Engine	Running	
Air switching valve No. 2 (Bank 2)	Not operating	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
P1440:	
Air switching valve No. 2 (Bank 1) output terminal level	Low
P1443:	
Air switching valve No. 2 (Bank 2) output terminal level	Low

WIRING DIAGRAM

Refer to DTC P0412 on page [DI-656](#).

INSPECTION PROCEDURE

1	Check VSV for air injection control power source.
----------	--

PREPARATION:

- (a) Disconnect the VSV for air injection control connector.
- (b) Turn the ignition switch ON.

CHECK:

Measure the voltage between the terminal 1 of VSV connector and body ground.

OK:

Standard: 9 V or more

NG

Check and replace harness and connector.

OK

2 Check for open and short circuit in harness and connector between ECM and VSV for air injection control

PREPARATION:

- (a) Disconnect the E7 ECM connector.
- (b) Disconnect the VSV for air injection control connector.

CHECK:

Measure the resistance between the VSV connector and ECM.

OK:

Standard:

Tester connection	Specified condition
E7-27 (AIV1) - V14-2	Below 1 Ω
E7-26 (AIV2) - V15-2	Below 1 Ω

CHECK:

Measure the resistance between the VSV connector and body ground.

OK:

Standard:

Tester connection	Specified condition
E7-27 (AIV1) or V14-2 and Body ground	10 KΩ or higher
E7-26 (AIV2) or V15-2 and Body ground	10 KΩ or higher

NG **Repair or replace harness or connector.**

OK

3 Check resistance of VSV for air injection control.

PREPARATION:

- Disconnect the connector from the VSV.
- Disconnect the 2 vacuum hoses from the VSV.

CHECK:

Measure the resistance between the VSV terminals.

OK:

Standard:

Tester Connection	Specified Condition
1 - 2	33 to 39 Ω at 20 °C (68 °F)
1 - Body ground	10 k Ω or higher
2 - Body ground	10 k Ω or higher

NG

Replace VSV for air injection control.

OK

Replace ECM. (See page [SF-82](#))

DTC	P1441	Secondary Air Injection System Switching Valve No.2 Stuck Open Bank 1
------------	--------------	--

DTC	P1444	Secondary Air Injection System Switching Valve No.2 Stuck Open Bank 2
------------	--------------	--

DTC	P2440	Secondary Air Injection System Switching Valve Stuck Open Bank 1
------------	--------------	---

CIRCUIT DESCRIPTION

Refer to DTC P0412 on page [DI-656](#).

DTC No.	DTC Detection Condition	Trouble Area
P1441	Air switching valve No.2 (bank 1) stuck open: The pressure sensor detects exhaust pulsation, when both of air switching valve No.2 OFF (and air switching valve ON). (2 trip detection logic)	<ul style="list-style-type: none"> • VSV for air injection control circuit (Bank 1) • Air switching valve No.2 (Bank 1) • VSV for air injection system (Bank 1) • ECM
P1444	Air switching valve No.2 (bank 2) stuck open: The pressure sensor detects exhaust pulsation, when both of air switching valve No.2 OFF (and air switching valve ON). (2 trip detection logic)	<ul style="list-style-type: none"> • VSV for air injection control circuit (Bank 2) • Air switching valve No.2 (Bank 2) • VSV for air injection system (Bank 2) • ECM
P2440	Air switching valve stuck open: The pressure sensor detects exhaust pulsation when the system is not operate (both of air switching valve No.2 OFF, and air switching valve OFF and air pump OFF). This DTC means open stuck of air switching valve and "air switching valve No.2 bank 1 or bank 2" (1 trip detection logic)	<ul style="list-style-type: none"> • Electromagnetic air switching valve • Air switching valve No.2 (Bank 1 and/or 2) • VSV for air injection system (Bank 1 and/or 2) • Air injection driver • Air injection driver circuit • ECM

MONITOR DESCRIPTION

The ECM detects pressure change with the pressure sensor to determine malfunctioning parts in the system, and stores the DTCs. The ECM measures pressure and/or exhaust pulsation of the system at 6 points, A to F, when the air injection system is in operation or when not in operation. When the pressure is high, the ECM determines that the pump operates. When exhaust pulsation is detected, the ECM determines that the ASV is open. The ECM determines malfunction parts based on the measured value, and stores the DTCs.

Points A and B:

ECM detects pressure changes (decrease), and determines that the ASV No.2 is open.

Points C and F:

ECM detects pressure and exhaust pulsation, and determines the pressure pattern of the system.

Point D:

ECM operate the system, as indicated by the dashed lines, to determine which of the ASV No.2 is malfunctioning only when pressure changes cannot be detected at point B.

Point E:

ECM detects exhaust pulsation to determine the condition of the system.

Pressure condition in Secondary Air Injection System

Pattern 1:

Air Pump	ON
Air Switching Valve and Air Switching Valve No.2	Open
Pressure	2.5 kPa or more
Pulsation detection	Exhaust gas pulsation detected

DIAGNOSTICS – ENGINE (2UZ-FE)

Pattern 2:

Air Pump	OFF
Air Switching Valve and Air Switching Valve No.2	Open
Pressure	Less than 2.5 kPa
Pulsation detection	Exhaust gas pulsation detected

Pattern 3:

Air Pump	ON
Air Switching Valve and Air Switching Valve No.2	Close
Pressure	2.5 kPa or more
Pulsation detection	Slight pulsation detected

Pattern 4:

Air Pump	OFF
Air Switching Valve and Air Switching Valve No.2	Close
Pressure	Less than 2.5 kPa
Pulsation detection	Not detected

Judgement and decision of failure mode:

Monitor						Judgement
C	F	A	B	D	E	DTCs where set
Pattern 1	Pattern 1	Pressure changed	Pressure changed	–	No pulsation detected	P2444, P1441 and P1443

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Thresholds for case 1	
Both of the following conditions are met:	Condition 1 or 2
1. One of the following conditions is met:	Condition (a), (b) or (c)
(a) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is generated
AIR pressure during monitor sequence 6	Less than 5 kPa (37.5 mmHg) and pulse is generated
(b) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is generated
AIR pressure during monitor sequence 6	5 kPa (37.5 mmHg) or more and pulse is generated
(c) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	Less than 1 kPa (7.5 mmHg) and pulse is generated
AIR pressure during monitor sequence 6	Less than 5 kPa (37.5 mmHg) and pulse is generated
2. One of the following conditions is met:	Condition (d), (e) or (f)
(d) All of the following conditions are met:	–
AIR pressure during monitor sequence 1	Change
AIR pressure during monitor sequence 2	Change
(e) AIR pressure during monitor sequence 1 (when AIR VSV bank 1 is open)	No change
(f) AIR pressure during monitor sequence 2 (when AIR VSV bank 1 is open)	No change
Thresholds for case 2	
Both of the following conditions are met:	Condition 1 or 2
1. One of the following conditions is met:	Condition (a), (b) or (c)
(a) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is generated
AIR pressure during monitor sequence 6	Less than 5 kPa (37.5 mmHg) and pulse is generated
(b) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is generated
AIR pressure during monitor sequence 6	5 kPa (37.5 mmHg) or more and pulse is generated
(c) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	Less than 1 kPa (7.5 mmHg) and pulse is generated
AIR pressure during monitor sequence 6	Less than 5 kPa (37.5 mmHg) and pulse is generated
2. One of the following conditions is met:	Condition (d), (e) or (f)
(d) All of the following conditions are met:	–
AIR pressure during monitor sequence 1	Change
AIR pressure during monitor sequence 2	Change

DIAGNOSTICS – ENGINE (2UZ-FE)

(e) AIR pressure during monitor sequence 1 (when AIR VSV bank 2 is open)	No change
(f) AIR pressure during monitor sequence 2 (when AIR VSV bank 1 is open)	No change
Thresholds for case 3	
AIR pressure	Pulse is generated
Thresholds for case 4	
Both of the following conditions are met:	–
AIR pressure during monitor sequence 3	Less than 1 kPa (7.5 mmHg) and pulse is generated
AIR pressure during monitor sequence 5	No pulse is generated
Thresholds for case 5	
AIR pressure change	Pulse is generated

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (refer to "Confirmation Monitor").

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic tools.

Secondary air injection (AIR) system

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$71	\$E1	Multiply by 0.01 (g/s)	Test value of AIR amount insufficient	Minimum test limit	Maximum test limit
\$71	\$E2	Multiply by 0.01 (kPa)	Test value of AIR pump stuck ON	Minimum test limit	Maximum test limit
\$71	\$E3	Multiply by 0.01 (kPa)	Test value of AIR pump stuck OFF	Minimum test limit	Maximum test limit
\$71	\$E4	Multiply by 0.01 (kPa)	Test value of AIR control valve ON	Minimum test limit	Maximum test limit
\$71	\$E5	Multiply by 0.01 (kPa)	Test value of AIR control valve OFF	Minimum test limit	Maximum test limit
\$71	\$E6	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR valve	Minimum test limit	Maximum test limit
\$71	\$E7	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR VSV bank 1	Minimum test limit	Maximum test limit
\$71	\$E8	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR VSV bank 2	Minimum test limit	Maximum test limit
\$71	\$E9	Multiply by 0.01 (kPa)	Test value of AIR pressure pulsation for AIR VSV when AIR pressure is low	Minimum test limit	Maximum test limit

WIRING DIAGRAM

Refer to DTC P0412 on page [DI-656](#).

INSPECTION PROCEDURE

1	Check any other DTCs output (In addition to secondary air injection system DTCs).
----------	--

PREPARATION:

- (a) Connect hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- (a) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
"P1441 and/or P1444" and P2440	A
P1441 and/or P1444	B
"P1441 and/or P1444 and/or P2440" and other DTCs	C

HINT:

If any DTCs other than P1441, P1444 or P2440 are output, troubleshoot those DTCs first.

2	Check air switching valve operation.
----------	---

PREPARATION:

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Remove the air switching valve.

CHECK:

Blow air into port A and check that air is not discharged from port B.

OK:

Not discharged

CHECK:

- (a) Apply battery positive across the terminals.
- (b) Blow air into port A and check that air is discharged from port B.

OK:

Discharged

NG Replace air switching valve and go to step 7.

OK

3 Check voltage between terminal 1 of air switching valve and body ground.

PREPARATION:

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Disconnect the A31 air switching valve connector.
- (c) Turn the ignition switch ON.

CHECK:

Measure the voltage between terminal 1 of the air switching valve connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
A31-1 - Body ground	Below 1.0 V

NG Go to step 4.

OK

Check for intermittent problems (See page [DI-430](#)) and go to step 7.

4 Check for open and short in harness and connector between air injection driver and air switching valve.

PREPARATION:

- (a) Remove the intake manifold (see page EM-36).
- (b) Disconnect the A32 air injection driver connector.
- (c) Disconnect the A31 air switching valve connector.
- (d) Disconnect the battery positive terminal cable.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VV (A32-6) - A31-1	Below 1 Ω
VV (A32-6) or A31-1 - Battery positive terminal cable	10 kΩ or higher

NG Repair or replace harness or connector.

OK

5 Check voltage between SIV terminal of air injection driver and body ground.

PREPARATION:

- (a) Disconnect the A32 air injection driver connector.
- (b) Turn the ignition switch ON.

CHECK:

Measure the voltage between terminal 3 (SIV) of the air injection driver connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
3 (SIV) - Body ground	10 V or more

NG Go to step 6.

OK

Replace air injection driver.

6 Check for open and short in harness and connector between air injection driver and ECM.

PREPARATION:

- (a) Disconnect the air injection driver connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
SIV (A32-3) – AIRV (E3-4)	Below 1 Ω
SIV (A32-3) or AIRV (E3-4) – Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace ECM (See page SF-82).

7	Check air switching valve No.2 operation.
----------	--

PREPARATION:

- (a) Start the engine and warm it up.
- (b) Turn the ignition switch to OFF.
- (c) Connect the hand-held tester to the DLC3.
- (d) Start the engine and push the hand-held tester main switch ON.

CHECK:

- (a) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/ AIR INJ CHECK/ MANUAL OPERATION/OPERATION 5 and 6

HINT:

OPERATION 5: AP:ON, EASV:OPEN, ASV1:OPEN, ASV2:CLOSE

OPERATION 6: AP:ON, EASV:OPEN, ASV1:CLOSE, ASV2:OPEN

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

- (b) Read values of the A/F BANK1 and BANK2 on the hand-held tester.

RESULT:

Air switching valve No.2 operation	Air-fuel ratio
Open	18 or more
Close	Approximately 14.5

HINT:

- When the ASV No.2 operates normally, the A/F value is 18 or more when the valve is open, and approximately 14.5 when the valve is closed.
- Perform the following procedures only on the bank of which the valve is not close.

8	Check VSV for air injection control operation.
----------	---

PREPARATION:

- (a) Turn the ignition switch OFF.
- (b) Disconnect the vacuum hose from the VSV for air injection control.
- (c) Connect the hand-held tester to the DLC3.
- (d) Start the engine and turn the tester ON.

CHECK:

- (a) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/ AIR INJ CHECK/MANUAL OPERATION/OPERATION 1
- (b) At this time, check that no negative pressure generates at port A of the VSV.

HINT:

OPERATION 1: AP: OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:

No negative pressure is generated.

NG	Go to step 10.
-----------	-----------------------

9 Check air switching valve No.2 operation.

**PREPARATION:**

Remove the air switching valve No.2.

CHECK:

Blow air into port B and check that air is not discharged from port C.

OK:

Not discharged from port C

**CHECK:**

Apply vacuum 30 kPa (225 mmHg) to port A, blow air into port B and check that air is discharged from port C.

OK:

Discharged from port C

NG

Replace air switching valve No.2.

OK

**Check for intermittent problems
(See page [DI-430](#)).**

10 Check VSV for air injection control.

PREPARATION:

Disconnect the connector from the VSV for air injection control.

CHECK:

Check that air does not flow from the port as shown in the illustration.

OK:

Does not flow from port A

CHECK:

Apply battery positive across the terminals, check that air flows from the ports.

OK:

Flows from port A

NG Replace VSV for air injection control.

OK

11 Check for open and short circuit in harness and connector between ECM and VSV for air injection system control
**PREPARATION:**

- Remove the intake manifold (see page [EM-36](#)).
- Disconnect the E7 ECM connector.
- Disconnect the VSV for air injection system control connector.

CHECK:

Measure the resistance between the VSV connector and ECM.

OK:**Standard:**

Tester connection	Specified condition
E7-27 (AIV1) – V14-2	Below 1 Ω
E7-26 (AIV2) – V15-2	Below 1 Ω

CHECK:

Measure the resistance between the VSV connector and body ground.

OK:**Standard:**

Tester connection	Specified condition
E7-27 (AIV1) or V14-2 and Body ground	10 K Ω or higher
E7-26 (AIV2) or V15-2 and Body ground	10 K Ω or higher

**NG****Repair or replace harness or connector.****OK**

Replace ECM (See page [SF-82](#)).

DTC	P1442	Secondary Air Injection System Switching Valve No.2 Stuck Close Bank 1
------------	--------------	---

DTC	P1445	Secondary Air Injection System Switching Valve No.2 Stuck Close Bank 2
------------	--------------	---

DTC	P2441	Secondary Air Injection System Switching Valve Stuck Close Bank 1
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to DTC P0412 on page [DI-656](#).

DTC No.	DTC Detection Condition	Trouble Area
P1442	Air switching valve No.2 (bank 1) stuck close: No pressure change (decrease) after the ECM sends an open air switching valve No.2 (bank 1) signal. (2 trip detection logic)	<ul style="list-style-type: none"> • VSV for air injection control circuit (Bank 1) • Vacuum hose (VSV for air injection control – air switching valve No.2) • Air injector pipe (Air switching valve No.2 – exhaust manifold) • Air switching valve No.2 (Bank 1) • VSV for air injection control (Bank 1) • ECM
P1445	Air switching valve No.2 (bank 2) stuck close: No pressure change (decrease) after the ECM sends an open air switching valve No.2 (bank 2) signal. (2 trip detection logic)	<ul style="list-style-type: none"> • VSV for air injection control circuit (Bank 2) • Vacuum hose (VSV for air injection control – air switching valve No.2) • Air injector pipe (Air switching valve No.2 – exhaust manifold) • Air switching valve No.2 (Bank 2) • VSV for air injection control (Bank 2) • ECM
P2441	Air switching valve stuck close: The pressure sensor does not detect exhaust pulsation when system operates. (All of air switching valve ON) This DTC means either of following conditions. (a) Electromagnetic air switching valve stuck closed. (b) Both of "air switching valve No.2 bank 1" and "air switching valve No.2 bank 2" stuck closed. (2 trip detection logic)	<ul style="list-style-type: none"> • Vacuum hoses (Throttle body – VSVs for air injection control) • Air switching valve • Air injector pipe (Air switching valve No.2 – exhaust manifold) • Air injection hose • Air switching valve No.2 (Bank 1 and/or 2) • VSV for air injection control (Bank 1 and/or 2) • Air injection driver • Air injection driver circuit • ECM

MONITOR DESCRIPTION

Refer to DTC P1441, P1444 and P2440 on page [DI-739](#).

MONITOR STRATEGY

Related DTCs	P1442	AIR VSV (Bank 1) is stuck close (case 1)
	P1444	AIR VSV (Bank 2) is stuck close (case 2)
	P2441	AIR valve stuck close (case 3)
Required sensors/components	AIR pressure sensor, AIR valve, AIR VSV (Bank 1), AIR VSV (Bank 2)	
Frequency of operation	Once per driving cycle	
Duration	Within 60 seconds	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-437	
Atmospheric pressure	45 kPa (338 mmHg)	–
Battery voltage	11.5 V	–
Sequence 1 to 6 are performed to monitor AIR	–	
Sequence 1	–	
AIR	In operation	
AIR pump	ON	
AIR valve (Electric type)	ON	
Either of the following conditions is met:	Condition 1 or 2	
1. Both of the following conditions are met:	Condition (a) and (b)	
(a) AIR valve (vacuum type) bank 1	ON	
(b) AIR valve (vacuum type) bank 2	OFF	
2. Both of the following conditions are met:	Condition (c) and (d)	
(c) AIR valve (vacuum type) bank 1	OFF	
(d) AIR valve (vacuum type) bank 2	ON	
Idle	ON	
Sequence 2	–	
AIR valve (Electric type)	ON	
AIR valve (vacuum type) bank 1	ON	
AIR valve (vacuum type) bank 2	ON	
Idle	ON	
Sequence 3	–	
AIR pump	ON	
AIR valve (Electric type)	ON	
AIR valve (vacuum type) bank 1	ON	
AIR valve (vacuum type) bank 2	ON	
Engine RPM	–	3750 rpm
Sequence 4 (This sequence is run when AIR pressure is no change at monitor)	–	
AIR	Not operating	
AIR pump	ON	

AIR valve (Electric type)	ON	
Either of the following conditions is met:	Condition 1 or 2	
1. Both of the following conditions are met:	Condition (a) and (b)	
(a) AIR valve (vacuum type) bank 1	ON	
(b) AIR valve (vacuum type) bank 2	OFF	
2. Both of the following conditions are met:	Condition (c) and (d)	
(c) AIR valve (vacuum type) bank 1	OFF	
(d) AIR valve (vacuum type) bank 2	ON	
Engine RPM	–	3750 rpm
Sequence 5	–	
AIR	Not operating	
AIR pump	OFF	
AIR valve (Electric type)	OFF	
AIR valve (vacuum type) bank 1	OFF	
AIR valve (vacuum type) bank 2	OFF	
Engine RPM	–	3750 rpm
Sequence 6	–	
AIR status	Not operating	
AIR pump	OFF	
AIR valve (Electric type)	ON	
AIR valve (vacuum type) bank 1	OFF	
AIR valve (vacuum type) bank 2	OFF	
Engine RPM	–	3750 rpm

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Thresholds for case 1	
Both of the following conditions are met:	Condition 1 or 2
1. One of the following conditions is met:	Condition (a), (b), (c) or (d)
(a) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is NOT generated
AIR pressure during monitor sequence 6	5 kPa (37.5 mmHg) or more and pulse is NOT generated
(b) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is NOT generated
AIR pressure during monitor sequence 6	Less than 5 kPa (37.5 mmHg) and pulse is NOT generated
(c) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	Less than 1 kPa (7.5 mmHg) or more and pulse is NOT generated
AIR pressure during monitor sequence 6	5 kPa (37.5 mmHg) or more and pulse is NOT generated
(d) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	Less than 1 kPa (7.5 mmHg) or more and pulse is NOT generated
AIR pressure during monitor sequence 6	Less than 5 kPa (37.5 mmHg) and pulse is NOT generated
2. One of the following conditions is met:	Condition (e), (f) or (g)
(e) AIR pressure during monitor sequence 1 (when AIR VSV bank 1 is open)	No change
(f) AIR pressure during monitor sequence 2 (when AIR VSV bank 1 is open)	No change

DIAGNOSTICS – ENGINE (2UZ-FE)

(g) AIR pressure during monitor sequence 4 (when AIR VSV bank 1 is open)	No pulse is generated
Thresholds for case 2	
Both of the following conditions are met:	Condition 1 or 2
1. One of the following conditions is met:	Condition (a), (b), (c) or (d)
(a) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is NOT generated
AIR pressure during monitor sequence 6	5 kPa (37.5 mmHg) or more and pulse is NOT generated
(b) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is NOT generated
AIR pressure during monitor sequence 6	Less than 5 kPa (37.5 mmHg) and pulse is NOT generated
(c) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	Less than 1 kPa (7.5 mmHg) or more and pulse is NOT generated
AIR pressure during monitor sequence 6	5 kPa (37.5 mmHg) or more and pulse is NOT generated
(d) All of the following conditions are met:	–
AIR pressure during monitor sequence 3	Less than 1 kPa (7.5 mmHg) or more and pulse is NOT generated
AIR pressure during monitor sequence 6	Less than 5 kPa (37.5 mmHg) or more and pulse is NOT generated
2. One of the following conditions is met:	Condition (e), (f) or (g)
(e) AIR pressure during monitor sequence 1 (when AIR VSV bank 2 is open)	No change
(f) AIR pressure during monitor sequence 2 (when AIR VSV bank 2 is open)	No change
Thresholds for case 3	
AIR pressure during monitor sequence 3	1 kPa (7.5 mmHg) or more and pulse is NOT generated
(g) AIR pressure during monitor sequence 4 (when AIR VSV bank 2 is open)	No pulse is generated

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (refer to "Confirmation Monitor").

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

Secondary air injection (AIR) system

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$71	\$E1	Multiply by 0.01 (g/s)	Test value of AIR amount insufficient	Minimum test limit	Maximum test limit
\$71	\$E2	Multiply by 0.01 (kPa)	Test value of AIR pump stuck ON	Minimum test limit	Maximum test limit
\$71	\$E3	Multiply by 0.01 (kPa)	Test value of AIR pump stuck OFF	Minimum test limit	Maximum test limit
\$71	\$E4	Multiply by 0.01 (kPa)	Test value of AIR control valve ON	Minimum test limit	Maximum test limit
\$71	\$E5	Multiply by 0.01 (kPa)	Test value of AIR control valve OFF	Minimum test limit	Maximum test limit
\$71	\$E6	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR valve	Minimum test limit	Maximum test limit
\$71	\$E7	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR VSV bank 1	Minimum test limit	Maximum test limit
\$71	\$E8	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR VSV bank 2	Minimum test limit	Maximum test limit
\$71	\$E9	Multiply by 0.01 (kPa)	Test value of AIR pressure pulsation for AIR VSV when AIR pressure is low	Minimum test limit	Maximum test limit

WIRING DIAGRAM

Refer to DTC P1441, P1444 and P2440 on page [DI-739](#).

INSPECTION PROCEDURE

1	Check any other DTCs output (In addition to secondary air injection system DTCs).
----------	--

PREPARATION:

- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON and turn the tester ON.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
"P1442 and/or P1445" and P2441	A
P1442 and/or P1445	B
"P1442 and/or P1445 and/or P2441" and other DTCs	C

HINT:

If any DTCs other than P1441 and/or P1444 and P2440 are output, troubleshoot those DTCs first.

- B** Go to step 6.
- C** Go to DTC chart (See page [DI-462](#)).

A

2 Check vacuum hose between throttle body and VSV for air injection control.

- CHECK:**
- (a) Check that the vacuum hoses between the throttle body and VSV for air injection control are securely connected.
- OK:**
The vacuum hoses are securely connected.
- CHECK:**
- (a) Inspect the vacuum hoses for blockages and damage.
- OK:**
The vacuum hoses no blockages and damages.

NG Repair or replace vacuum hoses.

OK

3 Check voltage between terminal 1 of air switching valve and body ground.

- PREPARATION:**
- (a) Remove the intake manifold (see page [EM-36](#)).
 - (b) Disconnect the A31 air switching valve connector.
 - (c) Connect the hand-held tester to the DLC3.
 - (d) Turn the ignition switch ON and turn the tester ON.
- CHECK:**
- (a) When the air switching valve is operated using the hand-held tester, measure voltage between terminal A31-1 of the air switching valve connector and body ground.
 - (b) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/AIR INJ CHECK/MANUAL OPERATION/OPERATION 1 and 4

HINT:
OPERATION 1: AP:OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE
OPERATION 4: AP:OFF, EASV:OPEN, ASV1:CLOSE, ASV2:CLOSE

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:**Standard:**

Tester operation	Tester Connection	Specified Condition
Operation 4	A31-1 – Body ground	10 V or more
Operation 1	A31-1 – Body ground	Below 1.0 V

NG**Go to step 12.****OK****4****Check all air injection pipes and hoses of air injection system.****CHECK:**

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Check all pipes and hoses of the air injection system.

OK:

All the air injection pipes and hoses are securely connected.

CHECK:

- (a) Check all pipes and hoses of the air injection system for blockage or damage.

OK:

The air injection system pipes and hoses have no blockage or damage.

NG**Repair or replace pipe or hose.****OK**

5 Check air switching valve operation.

PREPARATION:

- Remove the intake manifold (see page [EM-36](#)).
- Remove the air switching valve.

CHECK:

Blow air into port A and check that air is not discharged from port B.

OK:

Not discharged

CHECK:

- Apply battery positive across the terminals.
- Blow air into port A and check that air is discharged from port B.

OK:

Discharged

NG

Replace air switching valve and go to step 6.

OK

6	Check air switching valve No.2 operation.
----------	--

PREPARATION:

- (a) Start the engine and warm it up.
- (b) Turn the ignition switch to OFF.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to ON and push the hand-held tester main switch ON.

CHECK:

- (a) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/ AIR INJ CHECK/ MANUAL OPERATION/OPERATION 5 and 6

HINT:

OPERATION 5: AP:ON, EASV:OPEN, ASV1:OPEN, ASV2:CLOSE

OPERATION 6: AP:ON, EASV:OPEN, ASV1:CLOSE, ASV2:OPEN

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

- (b) Read value of the A/F BANK1 and BANK2 on the hand-held tester.

RESULT:

Air switching valve No.2 operation	Air-fuel ratio
Open	18 or more
Close	Approximately 14.5

HINT:

- When the ASV No.2 operates normally, the A/F value is 18 or more when the valve is open, and approximately 14.5 when the valve is closed.
- Perform the following procedures only on the bank of which the valve is not open.

7 Check VSV for air injection control operation.

PREPARATION:

- (a) Turn the ignition switch OFF.
- (b) Disconnect the vacuum hose from the VSV for air injection control.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to ON and turn the tester ON.

CHECK:

- (a) When the air switching valve is operated using the hand-held tester, check that negative pressure from the port A.
- (b) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/ AIR INJ CHECK/MANUAL OPERATION/OPERATION 2

HINT:

OPERATION 2: AP: ON, EASV:OPEN, ASV1:OPEN, ASV2:OPEN

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:

Negative pressure from port A

NG	Go to step 10.
-----------	-----------------------

8 Check vacuum hose between air switching valve(s) No.2 and VSV for air injection control.

CHECK:

- (a) Check that the vacuum hoses between the air switching valve(s) No.2 and VSV for air injection control are securely connected.

OK:

The vacuum hose(s) are securely connected.

CHECK:

- (a) Check the vacuum hoses for blockages and damage.

OK:

The vacuum hoses no blockages and damages.

NG

Repair or replace vacuum hose.

OK

9 Check air switching valve No.2 operation.

PREPARATION:

Remove the air switching valve No.2.

CHECK:

Blow air into port B and check that air is not discharged from the port C.

OK:

Not discharged from port C

CHECK:

Apply vacuum 30 kPa (225 mmHg) to port A, blow air into port B and check that air is discharged from the port C.

OK:

Discharged from port C

NG

Replace air switching valve No.2.

OK

10 Check air injection pipe between air switching valve No.2 and exhaust manifold.

CHECK:

- (a) Check that the air injection pipe between the air switching valve(s) No.2 and exhaust manifold are securely connected.

OK:

The air injection pipe is securely connected.

CHECK:

- (a) Check the air injection pipe for blockages and damage.

OK:

The air injection pipe no blockages and damages.

NG → **Repair or replace air injection pipe.**

OK

Check for intermittent problems (See page DI-430).

11 Check VSV for air injection control.

PREPARATION:

Disconnect the 2 vacuum hoses.

CHECK:

Check that air does not flow from the port A as shown in the illustration.

OK:

Not flow from port A

CHECK:

Apply battery positive across the terminals, check that air flows from the port A.

OK:

Flow from port A

NG → **Replace VSV for air injection control.**

OK

12 Check for open and short circuit in harness and connector between ECM and VSV for air injection system control

Wire Harness Side:

PREPARATION:

- Remove the intake manifold (see page EM-36).
- Disconnect the E7 ECM connector.
- Disconnect the VSV for air injection system control connector.

CHECK:

Measure the resistance between the VSV connector and ECM.

OK:

Standard:

Tester connection	Specified condition
E7-27 (AIV1) - V14-2	Below 1 Ω
E7-26 (AIV2) - V15-2	Below 1 Ω

CHECK:

Measure the resistance between the VSV connector and body ground.

OK:

Standard:

Tester connection	Specified condition
E7-27 (AIV1) or V14-2 and Body ground	10 K Ω or higher
E7-26 (AIV2) or V15-2 and Body ground	10 K Ω or higher

NG

Repair or replace harness or connector.

OK

13 Check for open and short in harness and connector between air injection driver and air switching valve.

Wire Harness Side:

Air Injection Driver Connector

N

B17444

PREPARATION:

- Remove the intake manifold (see page [EM-36](#)).
- Disconnect the A32 air injection driver connector.
- Disconnect the A31 air switching valve connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VV (A32-6) - A31-1	Below 1 Ω
VV (A32-6) or A31-1 - Body ground	10 k Ω or higher

Wire Harness Side:

N

B17440

NG

Repair or replace harness or connector and go to step 6.

OK

14 Check for open in harness and connector between air switching valve and body ground.

Wire Harness Side:

N

B17440

PREPARATION:

- Remove the intake manifold (see page [EM-36](#)).
- Disconnect the A31 air switching valve connector.

CHECK:

Measure the resistance between the wire harness side connectors and body ground.

OK:

Standard:

Tester Connection	Specified Condition
A31-2 - Body ground	Below 1 Ω

NG

Repair or replace harness or connector and go to step 6.

OK

15 Check for open and short in harness and connector between air injection driver and ECM.

Wire Harness Side:

Air Injection Driver Connector

N

B17444

PREPARATION:

- Disconnect the air injection driver connector.
- Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
SIV (A32-3) - AIRV (E3-4)	Below 1 Ω
SIV (A32-3) or AIRV (E3-4) - Body ground	10 k Ω or higher

N

B17417

NG

Repair or replace harness or connector and go to step 6.

OK

Replace ECM (See page SF-82).

DTC	P1613	Air Injection System Air Injection Driver
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to DTC P0412 on page [DI-656](#).

DTC No.	DTC Detection Condition	Trouble Area
P1613	Either of following condition (a) or (b) met: (a) All of following condition met (1 trip detection logic): <ul style="list-style-type: none"> • While either of air pump or air switching valve does not operate. • Air injection driver outputs normal signal (80% duty signal) (b) All of following condition met (1 trip detection logic): <ul style="list-style-type: none"> • Air injection driver outputs abnormal duty signal (duty signal excluding 0, 20, 40, 60, 80, 100%) 	<ul style="list-style-type: none"> • Air injection driver (AID) • Open in air injection driver ground circuit
P1613	All of following condition met (1 trip detection logic): (a) While air injection system operating (Air pump ON and all ASV ON) (b) Air injection driver outputs air pump malfunction signal (0% duty signal)	<ul style="list-style-type: none"> • Short in diagnostic information signal circuit (AID – ECM) • Open or short in air pump and air switching valve command signal circuit (AID – ECM) • Air injection driver (AID) • Open in air injection driver ground circuit • ECM
P1613	Air injection driver outputs abnormal duty signal (100% duty signal) (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in AID power source circuit • Open in diagnostic information signal circuit (AID – ECM) • Air injection driver (AID) • ECM

MONITOR DESCRIPTION

When the air injection system operation is required while the engine is warming up, the ECM transmits command signals to the Air Injection Driver (AID) to drive the air pump and air switching valve.

AID detects an open and short in the air pump and air switching valve circuit according to the terminal voltage and sends a signal as the diagnostic information to the ECM.

If the air injection system drive circuit or the AID itself has a malfunction, the AID sends a malfunction signal (duty signal) as a diagnostic information signal to the ECM (when the system is normal, a system normal signal is sent).

The ECM sets the DTC based on the diagnostic information from the AID.

Example:

- (1) The duty ratio of the diagnostic information signal output from AID is 0 or 100% (remains at 0 V or battery voltage).
- (2) The duty ratio output from AID is the ratio to output the impossible (excluding 0, 20, 40, 60, 80, 100%).
- (3) The AID outputs the normal signal (normal duty signal: 80%) while the system not operating.

MONITOR STRATEGY

Case 3:	
Diagnostic signal duty ratio from air injection driver	0 %
Case 4:	
Diagnostic signal duty ratio from air injection driver	100 %

COMPONENT OPERATING RANGE

Parameter	Standard Value
Diagnostic signal duty ratio from air injection driver	70 to 90% when secondary air injection system operating and 0% when secondary air injection system not operating

WIRING DIAGRAM

Refer to DTC P0412 on page [DI-656](#).

INSPECTION PROCEDURE

HINT:

The diagnostic information output from the AID can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. It narrows a trouble area search to read the waveform on the oscilloscope when performing the AI system intrusive operation function provided in the SYSTEM CHECK.

- (a) Start the engine and warm it up.
- (b) Turn the ignition switch to OFF.
- (c) Connect a hand-held tester to the DLC3.
- (d) Connect an oscilloscope probe to the AIDI terminal of the ECM.
- (e) Start the engine and turn the tester ON.
- (f) On the tester, select the following menu items:
DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ SYSTEM.
- (g) On the tester, select the following menu items:
DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / AIR INJ CHECK / MANUAL OPERATION / OPERATION 1 and 2.

HINT:
OPERATION 1: AP: OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:OFF
OPERATION 2: AP: ON, EASV:OPEN, ASV1:OPEN, ASV2:OPEN

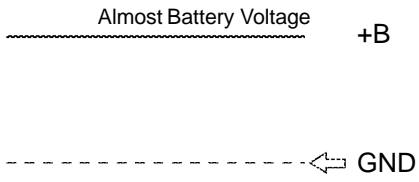

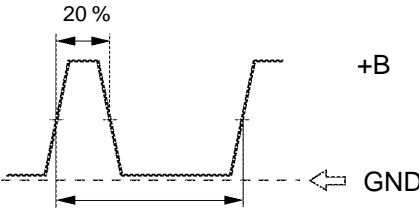

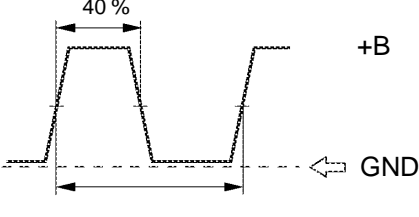

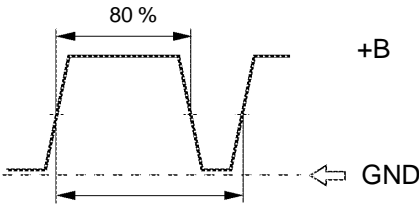

(1) Monitor the voltage output of the AID (duty ratio signal).

Oscilloscope range:

Items	Contents
Terminals	CH1: AIDI - E1
Equipment Settings	5 V/Division, 20 to 40 ms/Division
Conditions	Idling

NOTICE:

- This AIR INJECTION CHECK only allows technicians to operate the AI system for 5 seconds. Furthermore, the check can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between checks.
While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again.
- Performing the AIR INJ CHECK over and over again may cause the damage in the secondary air injection system. If necessary, put an interval of several minutes between tests to prevent overheating the system.

AID Diagnostic Signal Waveforms	ECM Commands	DTCs (ECM Output)	Suspected Trouble Areas

	<p>AI System: ON (Air pump ON, ASV ON)</p>	<p>—</p>	<p>Normal</p>
<p>Excluding above (excluding 0, 20, 40, 80, 100 % duty)</p>	<p>—</p>	<p>P1613</p>	<ul style="list-style-type: none"> • AID • Open in AID ground circuit

HINT:

- Using the AIR INJ CHECK operation of the SYSTEM CHECK provided in the hand-held tester function, conditions for air-fuel ratio and pressure in the secondary air injection system passage can be checked while the secondary air injection system operating. It helps technicians to troubleshoot the system when it malfunctioning.
- Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Check any other DTCs output (In addition to air injection system DTCs).
----------	--

PREPARATION:

- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON and turn the tester ON.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P1613	A
P1613 and other DTCs	B

HINT:

If any DTCs other than P1613 are output, troubleshoot those DTCs first.

2 Check voltage between AIDI terminal of ECM and body ground.

PREPARATION:

- (a) Start the engine and warm it up.
- (b) Turn the ignition switch to OFF.
- (c) Connect a hand-held tester to the DLC3.
- (d) Turn the ignition switch ON and turn the tester ON.
- (e) Start the engine.
- (f) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/AIR INJ CHECK/AUTOMATIC OPERATION

CHECK:

Measure voltage between terminal E3-13 (AIDI) of the ECM connector and body ground when the air injection system is ON and OFF.

RESULT:

Results	Suspected Trouble Areas	Proceed To
Fixed at Low (1.6 V or less) even when AI system ON (Air pump ON, ASV ON)	<ul style="list-style-type: none"> • Short between air pump or air switching valve command signal circuit and body ground • Open in air pump command signal circuit (between ECM and AID) • Open in ASV command signal circuit (between ECM and AID) • Open in AID ground circuit (between AID and body ground) • Diagnostic signal circuit ground short • AID • ECM 	A
Fixed at High (12 V or more) even when AI system OFF (Air pump OFF, ASV OFF)	<ul style="list-style-type: none"> • Open in diagnostic signal circuit (ECM - AID) • Short between +B circuit and diagnostic signal circuit (ECM - AID) • Open in AID power source circuit • AID • ECM 	B
Other than above: • Fluctuating (duty signal excluding 20, 40, 80%)	<ul style="list-style-type: none"> • AID • Open in AID ground circuit (between AID and body ground) 	C

B Go to step 5.

C Go to step 8.

A

3 Check voltage between AIRP, AIRV terminals of ECM and body ground.

PREPARATION:

Turn the ignition switch ON.

CHECK:

Measure voltage between terminal E3-25 (AIRP), E3-4 (AIRV) of the ECM connector and body ground.

OK:

Tester Connection	Specified Condition
E3-25 (AIRP) - Body ground	10 V or more
E3-4 (AIRV) - Body ground	10 V or more

NG Replace ECM (See page SF-82).

OK

4 Check for short in harness and connector between SIP terminal of air injection driver and SIRP of ECM.

PREPARATION:

- (a) Disconnect the A32 air injection driver connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
SIP (A32-4) or AIRP (E3-25) - Body ground	10 kΩ or higher
SIV (A32-3) or AIRV (E3-4) - Body ground	10 kΩ or higher
E (A32-1) - Body ground	Below 1 Ω

CHECK:

Measure the voltage between DI (A32-2) and E (A32-1) of the air injection driver wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
DI (A32-2) - E (A32-1)	9 V or more

NG Repair or replace harness or connector.

OK

Replace air injection driver.

5 Inspect air injection driver power source circuit.

PREPARATION:

- (a) Disconnect the A32 air injection driver connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between the terminal +B (A32-5) and E (A32-1) of the air injection driver connector.

OK:

Standard:

Tester Connection	Specified Condition
A32-5 (+B) - E (A32-1)	10 V or more

NG Repair or replace harness or connector.

OK

6 Check voltage between DI terminals of air injection driver and body ground.

PREPARATION:

- (a) Disconnect the A32 air injection driver connector.
- (b) Turn the ignition switch to ON.

CHECK:

Measure the voltage between the terminal A32-2 (DI) of the air injection driver connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
A32-2 (DI) - Body ground	10 V or more

NG Go to step 7.

OK

7 Check for short in harness and connector between DI terminal of air injection driver and AIDI terminal of ECM.

PREPARATION:

- (a) Disconnect the A32 air injection driver connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
DI (A32-2) - AIDI (E3-13)	Below 1 Ω
DI (A32-2) or AIDI (E3-13) - +B (A32-5)	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace ECM (See page [SF-82](#)).

8 Inspect air injection driver ground circuit.

PREPARATION:

Disconnect the A32 air injection driver connector.

CHECK:

Measure the resistance between the terminal E (A32-1) of the air injection driver connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
E (A32-1) - Body ground	10 V or more

NG Repair or replace harness or connector.

OK

9	Replace air injection driver.
----------	--------------------------------------

NEXT

10	Check whether DTC output recurs.
-----------	---

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Clear the DTCs (see page [DI-462](#)).
- (d) Start the engine.

CHECK:

- (a) Perform ACTIVE TEST to operate the air injection system.
Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/AIR INJ CHECK/AUTOMATIC OPERATION
- (b) After operating the secondary air injection system, confirm the pending codes of the secondary air injection system by selecting the following menu items: DIAGNOSIS/ENHANCED OBD II/DTC INFO/PENDING CODES.

OK:

DTC P1613 for the secondary air injection system is not output.

NG	Go to DTC chart (See page DI-462).
-----------	---

OK

END

DTC	P2102	Throttle Actuator Control Motor Circuit Low
------------	--------------	--

DTC	P2103	Throttle Actuator Control Motor Circuit High
------------	--------------	---

CIRCUIT DESCRIPTION

The throttle motor is operated by the ECM. It opens and closes the throttle valve.

The opening angle of the throttle valve is detected by the throttle position sensor which is mounted on the throttle body. The throttle position sensor provides feedback to the ECM. This feedback allows the ECM to control the throttle motor and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This Electrical Throttle Control System (ETCS) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds: (1 trip detection logic) (a) Throttle control motor output duty 80 % or more (b) Throttle control motor current less than 0.5 A or less	<ul style="list-style-type: none"> • Open in throttle control motor and sensor circuit • Throttle control motor and sensor • ECM
P2103	Either of the following condition is met (a) Hybrid IC diagnosis met: (b) Hybrid IC current limiter port fail	<ul style="list-style-type: none"> • Short in throttle control motor and sensor circuit • Throttle control motor and sensor • Throttle valve • Throttle body • ECM

MONITOR DESCRIPTION

The ECM monitors the current through the electronic throttle motor and detects malfunctions or open circuit in the throttle motor based on the voltage of the current. When the current deviates from the standard, the ECM concludes that there is a fault in the throttle motor.

Or, if the throttle valve is not functioning properly (for example, stuck ON), the ECM concludes that there is a fault, turns on the MIL and sets a DTC is set.

Example:

When the current is more than 10 A. Or the current is less than 0.5 A when the motor driving duty ratio is exceeding 80%. The ECM concludes that the current is out of range, turns on the MIL and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

WIRING DIAGRAM

Refer to DTC P0120 on page [DI-548](#).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 Check throttle control motor.

Component Side:

Throttle Control Motor and Sensor

A21034

PREPARATION:

Disconnect the throttle control motor and sensor connector.

CHECK:

Measure the resistance between terminals of the throttle control motor.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M- (T14-1)	0.3 to 100 Ω (20°C (68°F))

NG

Replace throttle body (See page [SF-44](#)).

OK

2 Check for open and short in harness and connector between throttle control motor and ECM.

PREPARATION:

- (a) Disconnect the T14 throttle control motor and sensor connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M+ (E7-5)	Below 1 Ω
M- (T14-1) - M- (E7-4)	Below 1 Ω
M+ (T14-2) or M+ (E7-5) - Body ground	10 kΩ or higher
M- (T14-1) or M- (E7-4) - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

3 Visually check throttle valve.

CHECK:

Check the area between the throttle valve and the housing for foreign objects. Also, check if the valve can open and close smoothly.

OK:

The throttle valve is not contaminated by foreign objects and can move smoothly.

NG Remove foreign object and clean throttle body.

OK

Replace ECM (See page SF-82).

DTC	P2111	Throttle Actuator Control System –Stuck Open
------------	--------------	---

DTC	P2112	Throttle Actuator Control System –Stuck Closed
------------	--------------	---

CIRCUIT DESCRIPTION

The throttle motor is operated by the ECM. It opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the throttle position sensor, which is mounted on the throttle body. The throttle position sensor provides feedback to the ECM to control the throttle motor and set the throttle valve angle in response to driver input.

HINT:

This Electrical Throttle Control System (ETCS) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2111	Throttle motor locked during ECM order to close. (1 trip detection logic)	<ul style="list-style-type: none"> • Throttle control motor and sensor circuit • Throttle control motor and sensor
P2112	Throttle motor locked during ECM order to open. (1 trip detection logic)	<ul style="list-style-type: none"> • Throttle body • Throttle valve

MONITOR DESCRIPTION

The ECM concludes that there is a malfunction of the ETCS (Electronic Throttle Control System) when the throttle valve remains at a fixed angle despite high drive current from the ECM. The ECM will turn on the MIL and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand–held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Check any other DTC output (in addition to DTC P2111 or P2112).
----------	--

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- (a) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P2111 and/or P2112	A
P2111 and/or P2112 and other DTCs	B

HINT:

If any DTCs other than P2111 and/or P2112 are output, troubleshoot those DTCs first.

2	Visually check throttle valve.
----------	---------------------------------------

PREPARATION:

Remove the intake air connector.

CHECK:

Check whether or not a foreign body is caught between the throttle valve and housing. Also, check if the valve can open and close smoothly.

OK: The throttle valve is not contaminated by foreign objects and can move smoothly.

3 Check throttle control motor.

Component Side:
Throttle Control Motor and Sensor

A21034

PREPARATION:

Disconnect the throttle control motor and sensor connector.

CHECK:

Measure the resistance between terminals of the throttle control motor.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M- (T14-1)	0.3 to 100 Ω (20° C (68° F))

NG

Replace throttle body (See page SF-44).

OK

4 Check for open and short in harness and connector between ECM and throttle control motor.

Wire Harness Side:
Throttle Control Motor and Sensor

A21022

PREPARATION:

- (a) Disconnect the T14 throttle control motor and sensor connector.
- (b) Disconnect the E7 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M+ (E7-5)	Below 1 Ω
M- (T14-1) - M- (E7-4)	Below 1 Ω
M+ (T14-2) or M+ (E7-5) - Body ground	10 kΩ or higher
M- (T14-1) or M- (E7-4) - Body ground	10 kΩ or higher

B17412

NG

Repair or replace harness or connector.

OK

Check for intermittent problems (See page DI-430).

DTC	P2118	Throttle Actuator Control Motor Current Range/Performance
------------	--------------	--

CIRCUIT DESCRIPTION

The Electronic Throttle Control System (ETCS) has a dedicated power supply circuit. The voltage (+BM) is monitored and when the voltage is low (less than 4V), the ECM concludes that the ETCS has a fault and current to the throttle control motor is cut.

When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the motor is cut. If repairs are made and the system has returned to normal, turn the ignition switch OFF. The ECM then allows current to flow to the motor and the motor can be restarted.

HINT:

This Electrical Throttle Control System (ETCS) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2118	Open in ETCS power source circuit (+BM)	<ul style="list-style-type: none"> • Open in ETCS power source circuit • ETCS fuse • ECM

MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the electronic throttle motor +BM. When the power supply voltage drops below the threshold, the ECM concludes that the power supply has an open circuit. The MIL is turned on and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

WIRING DIAGRAM

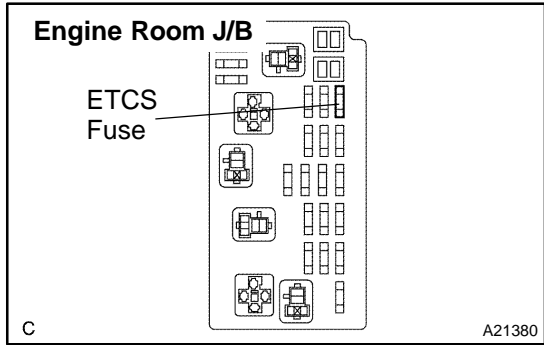

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 Check ETCS fuse.

PREPARATION:

Remove the ETCS fuse from the engine room J/B.

CHECK:

Check the resistance of the ETCS fuse.

OK:

Below 1 Ω

NG Check for short in all harness and components connected to ETCS fuse.

OK

2 Check voltage between terminal +BM and E1 of ECM connector.

CHECK:

Measure the voltage between the specified terminals of the E5 and E3 ECM connector.

OK:

Standard:

Tester Connection	Specified Condition
+BM (E3-7) - E1 (E5-1)	9 to 14 V

C Check for intermittent problems (See page DI-430).

NG

3 Check for open or short in harness or connector between battery and ETCS fuse, ETCS fuse and ECM.

PREPARATION:

- (a) Remove the ETCS fuse from the engine room J/B.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance of the wire harness side connector between the ETCS fuse and ECM.

OK:

Standard:

Tester Connection	Specified Condition
Engine Room J/B (ETCS fuse terminal) - +BM (E3-7)	Below 1 Ω
Engine Room J/B (ETCS fuse terminal) or +BM (E3-7) - Body ground	10 k Ω or higher

PREPARATION:

- (a) Remove the ETCS fuse from the engine room J/B.
- (b) Disconnect the battery positive terminal.

CHECK:

Measure the resistance of the wire harness side connector between the ETCS fuse and battery.

OK:

Standard:

Tester Connection	Specified Condition
Engine Room J/B (ETCS fuse terminal) - Battery positive terminal	Below 1 Ω
Engine Room J/B (ETCS fuse terminal) or Battery positive terminal - Body ground	10 k Ω or higher

NG **Repair or replace harness or connector.**

OK

Check engine room J/B.

DTC	P2119	Throttle Actuator Control Throttle Body Range Performance
------------	--------------	--

CIRCUIT DESCRIPTION

The Electric Throttle Control System (ETCS) is composed of a throttle motor that operates the throttle valve, a throttle position sensor that detects the opening angle of the throttle valve, an accelerator pedal position sensor that detects the accelerator pedal position, and the ECM that controls the ETCS system.

The ECM operates the throttle motor to position the throttle valve for proper response to driver inputs. The throttle position sensor, mounted on the throttle body, detects the opening angle of the throttle valve and provides this signal to the ECM so that the ECM can regulate the throttle motor.

DTC No.	DTC Detection Condition	Trouble Area
P2119	Throttle opening angle continues to vary greatly from target throttle opening angle (1 trip detection logic)	<ul style="list-style-type: none"> • Electric throttle control system • Throttle body

MONITOR DESCRIPTION

The ECM determines the "actual" throttle angle based on the throttle position sensor signal. The "actual" throttle position is compared to the "target" throttle position commanded by the ECM. If the difference of these two values exceeds a specified limit, the ECM interprets this as a fault in the ETCS (Electronic Throttle Control System). The ECM turns on the MIL and a DTC is set.

FAIL SAFE

If the ETCS (Electronic Throttle Control System) has a malfunction, the ECM cuts off current to the throttle control motor. The throttle control valve returns to a predetermined opening angle (approximately 16°) by the force of the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to enable the vehicle to continue at a minimum speed.

If the accelerator pedal is depressed firmly and slowly, the vehicle can be driven slowly.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 Are there any other codes (besides DTC P2119) being output?

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) When using hand-held tester, enter the following menu: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

Read the DTC using the hand-held tester.

RESULT:

Display (DTC Output)	Proceed to
P2119	A
"P2119" and other DTC	B

HINT:

If any other codes besides P2119 are output, perform the troubleshooting for those DTCs first.

B Go to DTC chart (See page [DI-462](#)).

A

2 Check throttle control motor.

Component Side:

Throttle Control Motor and Sensor

A21034

PREPARATION:

Disconnect the throttle control motor and sensor connector.

CHECK:

Measure the resistance between terminals of the throttle control motor.

OK:

Standard:

Tester Connection	Specified Condition
M+ (T14-2) - M- (T14-1)	0.3 to 100 Ω (20°C (68°F))

NG Replace throttle body (See page [SF-44](#)).

OK

3	Replace ECM and check DTC (Check if DTC outputs reoccur).
----------	--

PREPARATION:

- (a) Replace ECM.
- (b) Clear DTCs (see page [DI-462](#)).
- (c) Start and warm up the engine.
- (d) Run the engine at idle for 15 seconds or more.

CHECK:

Read the DTC using the hand-held tester (See page [DI-462](#)).

OK:

No DTC output.

OK

System is normal.

NG

Replace throttle body (See page [SF-44](#)).

DTC	P2120	Throttle/Pedal Position Sensor/Switch "D" Circuit
DTC	P2122	Throttle/Pedal Position Sensor/Switch "D" Circuit Low Input

DTC	P2125	Throttle/Pedal Position Sensor/Switch "E" Circuit
DTC	P2127	Throttle/Pedal Position Sensor/Switch "E" Circuit Low Input
DTC	P2128	Throttle/Pedal Position Sensor/Switch "E" Circuit High Input
DTC	P2138	Throttle/Pedal Position Sensor/Switch "D"/"E" Voltage Correlation

HINT:

This is the repair procedure for the "Accelerator Pedal Position (APP) sensor".

CIRCUIT DESCRIPTION

HINT:

- This electrical throttle control system does not use a throttle cable.
- This accelerator pedal position sensor is a non-contact type.

The accelerator pedal position sensor is mounted in the accelerator pedal to detect the angle of the accelerator pedal. This sensor is electronically controlled and uses Hall-effect elements.

In the accelerator pedal position sensor, the voltage applied to terminals VPA and VPA2 of the ECM changes between 0 V and 5 V in proportion to the angle of the accelerator pedal. The VPA is a signal to indicate the actual accelerator pedal angle and is used for the engine control. VPA2 is used to detect malfunctions of the sensor itself.

The ECM judges the current angle of the accelerator pedal from these signals input from terminals VPA and VPA2, and the ECM controls the throttle motor based on these signals.

DTC No.	DTC Detection Condition (Open or short in accelerator pedal position sensor circuit)	Main trouble Area
P2120	Condition (a) continues for 0.5 seconds or more: (a) $VPA \leq 0.4 \text{ V}$ or $VPA \geq 4.8 \text{ V}$	<ul style="list-style-type: none"> • Accelerator pedal position sensor • ECM
P2122	Condition (a) and (b) continues for 0.5 seconds or more: (a) $VPA \leq 0.4 \text{ V}$ (b) $VPA2 \geq 0.04 \text{ V}$	<ul style="list-style-type: none"> • Accelerator pedal position sensor • VCPA circuit open • VPA circuit open or ground short • ECM
P2123	Condition (a) continues for 2.0 seconds or more: (a) $VPA \geq 4.8 \text{ V}$	<ul style="list-style-type: none"> • Accelerator pedal position sensor • EPA circuit open • ECM
P2125	Condition (a) continues for 0.5 seconds or more: (a) $VPA2 \leq 1.2 \text{ V}$ or $VPA2 \geq 4.8 \text{ V}$ and $0.4 \text{ V} \leq VPA \leq 3.45 \text{ V}$	<ul style="list-style-type: none"> • Accelerator pedal position sensor • ECM
P2127	Condition (a) and (b) continues for 0.5 seconds or more: (a) $VPA2 \leq 1.2 \text{ V}$ (b) $VPA \geq 0.04 \text{ V}$	<ul style="list-style-type: none"> • Accelerator pedal position sensor • VCP2 circuit open • VPA2 circuit open or ground short • ECM
P2128	Condition (a) and (b) continues for 2.0 seconds or more: (a) $VPA2 \geq 4.8 \text{ V}$ (a) $0.4 \text{ V} \leq VPA \leq 3.45 \text{ V}$	<ul style="list-style-type: none"> • Accelerator pedal position sensor • EPA circuit open • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more: (a) $ VPA - VPA2 \leq 0.02 \text{ V}$ (b) $VPA \leq 0.4 \text{ V}$ and $VPA2 \leq 1.2 \text{ V}$	<ul style="list-style-type: none"> • VPA and VPA2 circuit are short circuited • Accelerator pedal position sensor • ECM

HINT:

After confirming DTC P2120, P2122, P2123, P2125, P2127, P2128 and P2138 use the OBD II scan tool or the hand-held tester to confirm the accelerator pedal opening percentage.

Trouble area	Accelerator pedal position expressed as voltage			
	Accelerator pedal completely released		Accelerator pedal fully depressed	
	ACCEL POS #1	ACCEL POS #2	ACCEL POS #1	ACCEL POS #2
VC circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
VPA circuit open or ground short	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.3 V
VPA2 circuit open or ground short	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
E2 circuit open	4.5 to 5.5 V	4.5 to 5.5 V	4.5 to 5.5 V	4.5 to 5.5 V

MONITOR DESCRIPTION

When VPA or VPA2 deviates from the standard, or the difference between the voltage outputs of the two sensors is less than threshold, the ECM concludes that there is a defect in the accelerator pedal position sensor. The ECM turns on the MIL and a DTC is set.

Example:

When the voltage output of the VPA is below 0.2 V or exceeds 4.8 V.

FAIL SAFE

The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the remaining circuit is used to calculate the accelerator pedal opening to allow the vehicle to continue driving.

If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal to be fully closed. In this case, the throttle valve will remain closed as if the engine is idling.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

P2138:	
Either of the following condition is met:	Condition 1 or 2
1. Difference between VPA1 and VPA2 voltage	0.02 V or less
2. Both of the following conditions are met:	(a) and (b)
(a) VPA1 voltage	0.4 V or less
(b) VPA2 voltage	1.2 V or less

COMPONENT OPERATING RANGE

Parameter	Standard Value
VPA voltage	More than 0.4 V and less than 4.8 V
VPA2 voltage	More than 1.2 V and Less than 4.8 V
Difference between VPA and VPA2 voltages	More than 0.02 V

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1 **Connect hand-held tester, and read the voltage for accelerator pedal position sensor data.**

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) Enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / ACCEL POS #1 and ACCEL POS #2.

CHECK:

Read the voltage for the accelerator pedal position sensor data.

OK:

Standard:

Accelerator pedal	ACCEL POS #1	ACCEL POS #2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.3 V

OK **Go to step 5.**

NG

2 Check for open and short in harness and connector in VCPA, VCP2, VPA, VPA2 EPA and EPA2 circuit between ECM and accelerator pedal position sensor.

Wire Harness Side:

Accelerator Pedal Position Sensor

PREPARATION:

- Disconnect the A20 accelerator pedal position sensor connector.
- Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VPA (A20-6) – VPA (E3-18)	Below 1 Ω
EPA (A20-5) – EPA (E3-20)	Below 1 Ω
VCPA (A20-4) – VCPA (E3-26)	Below 1 Ω
VPA2 (A20-3) – VPA2 (E3-19)	Below 1 Ω
EPA2 (A20-2) – EPA2 (E3-21)	Below 1 Ω
VCP2 (A20-1) – VCP2 (E3-27)	Below 1 Ω
VPA (A20-6) or VPA (E3-18) – Body ground	10 k Ω or higher
EPA (A20-5) or EPA (E3-20) – Body ground	10 k Ω or higher
VCPA (A20-4) or VCPA (E3-26) – Body ground	10 k Ω or higher
VPA2 (A20-3) or VPA2 (E3-19) – Body ground	10 k Ω or higher
EPA2 (A20-2) or EPA2 (E3-21) – Body ground	10 k Ω or higher
VCP2 (A20-1) or VCP2 (E3-27) – Body ground	10 k Ω or higher

NG

Repair or replace harness and connector.

OK

3 Check voltage between terminals VCPA and EPA, and VCP2 and EPA2 of ECM terminals.

PREPARATION:

- (a) Turn the ignition switch ON.
- (b) Disconnect the A20 accelerator pedal position sensor connector.

CHECK:

Measure the voltage between the specified terminals of the E3 ECM connector.

OK:

Standard:

Tester Connection	Specified Condition
VCPA (E3-26) - EPA (E3-20)	4.5 to 5.5 V
VCP2 (E3-27) - EPA2 (E3-21)	4.5 to 5.5 V

NG Replace ECM (See page [SF-82](#)).

OK

4 Replace accelerator pedal assembly (See page [SF-80](#)).

5	Check whether DTC output recurs (DTC P2120, P2122, P2123, P2125, P2127, P2128 or P2138)
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Disconnect the battery terminals or remove the EFI No. 1 fuse and ETCS fuse (Clear DTCs).
- (c) Start the engine.
- (d) Drive the engine at idle for 15 seconds or more.
- (e) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

CHECK:

Read the DTC output.

RESULT:

Display (DTC Output)	Proceed To
P2120, P2122, P2123, P2125, P2127, P2128 or P2138	A
No output	B

B

System is OK.

A

Replace ECM (See page [SF-82](#)).

DTC	P2121	Throttle/Pedal Position Sensor/Switch "D" Circuit Range/Performance
------------	--------------	--

HINT:

This is repair procedure for the "accelerator pedal position sensor".

CIRCUIT DESCRIPTION

Refer to DTC P2120 on page [DI-794](#).

DTC No.	DTC Detecting Condition	Trouble Area
P2121	Conditions (a) and (b) continue for 0.5 seconds: (a) Difference between VPA and VPA2 exceeds the threshold (b) IDL is OFF	<ul style="list-style-type: none"> • Accelerator pedal position sensor circuit • Accelerator pedal position sensor • ECM

MONITOR DESCRIPTION

The accelerator pedal position sensor is mounted on the accelerator pedal bracket. The accelerator pedal position sensor has 2 sensor elements/signal outputs: VPA1 and VPA2. VPA1 is used to detect the actual accelerator pedal angle (used for engine control) and VPA2 is used to detect malfunctions in VPA1. When the difference between the voltage outputs of VPA1 and VPA2 deviates from the standard, the ECM concludes the accelerator pedal position sensor has a malfunction. The ECM turns on the MIL and a DTC is set.

FAIL SAFE

The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the remaining circuit is used to calculate the accelerator pedal opening to allow the vehicle to continue driving.

If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal to be fully closed. In this case, the throttle valve will remain closed as if the engine is idling.

If a "pass" condition is detected and then the ignition switch is turned OFF, the fail-safe operation will stop and the system will return to normal condition.

MONITOR STRATEGY

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the hand-held tester. Freeze frame data records the engine conditions when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, as well as other data from the time when a malfunction occurred.

1	Connect hand-held tester, and read the voltage for accelerator pedal position sensor data.
----------	---

PREPARATION:

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch ON and push the hand-held tester main switch ON.
- Enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / ACCEL POS #1 and ACCEL POS #2.

CHECK:

Read the voltage for the accelerator pedal position sensor data.

OK:

Standard:

Accelerator pedal	ACCEL POS #1	ACCEL POS #2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.3 V

OK

Replace ECM (See page [SF-82](#)).

NG

2 Check for open and short in harness and connector between accelerator pedal position sensor and ECM.

PREPARATION:

- (a) Disconnect the A20 accelerator pedal position sensor connector.
- (b) Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard (Check for open):

Tester Connection	Specified Condition
VPA (A20-6) – VPA (E3-18)	Below 1 Ω
EPA (A20-5) – EPA (E3-20)	Below 1 Ω
VCPA (A20-4) – VCPA (E3-26)	Below 1 Ω
VPA2 (A20-3) – VPA2 (E3-19)	Below 1 Ω
EPA2 (A20-2) – EPA2 (E3-21)	Below 1 Ω
VCP2 (A20-1) – VCP2 (E3-27)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
VPA (A20-6) or VPA (E3-18) – Body ground	10 kΩ or higher
EPA (A20-5) or EPA (E3-20) – Body ground	10 kΩ or higher
VCPA (A20-4) or VCPA (E3-26) – Body ground	10 kΩ or higher
VPA2 (A20-3) or VPA2 (E3-19) – Body ground	10 kΩ or higher
EPA2 (A20-2) or EPA2 (E3-21) – Body ground	10 kΩ or higher
VCP2 (A20-1) or VCP2 (E3-27) – Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace accelerator pedal pedal assembly.

DTC	P2195	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)
------------	--------------	--

DTC	P2196	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)
------------	--------------	--

DTC	P2197	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)
------------	--------------	--

DTC	P2198	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)
------------	--------------	--

HINT:

- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

CIRCUIT DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor, in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are narrower than the conventional type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: Value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted to a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

DTC No.	DTC Detection Conditions	Trouble Areas
P2195 P2197	While fuel-cut operation (during vehicle deceleration), air-fuel ratio sensor current is 3.6 mA or more for 3 seconds.	<ul style="list-style-type: none"> • A/F sensor (sensor 1) • ECM
P2195	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) Air-Fuel Ratio (A/F) sensor voltage more than 3.8 V (b) Heated Oxygen (HO2) sensor voltage 0.15 V or more	<ul style="list-style-type: none"> • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor (sensor 1) heater • EFI relay • A/F sensor heater and relay circuits • Air induction system • Fuel pressure • Injector • ECM
P2196 P2198	While fuel-cut operation (during vehicle deceleration), air-fuel ratio sensor current is less than 1.4 mA for 3 seconds.	<ul style="list-style-type: none"> • A/F sensor (sensor 1) • ECM
P2196	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) A/F sensor voltage less than 2.8 V (b) HO2 sensor voltage less than 0.85 V	<ul style="list-style-type: none"> • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor (sensor 1) heater • EFI relay • A/F sensor heater and relay circuits • Air induction system • Fuel pressure • Injector • ECM

HINT:

- When any of these DTCs are set, check the A/F sensor voltage output by selecting the following menu items on a hand-held tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / AFS B1S1.
- Short-term fuel trim values can also be read using a hand-held tester.
- The ECM regulates the voltage at the A1A+ and A1A- terminals of the ECM at a constant level. Therefore, the A/F sensor voltage output cannot be confirmed without using a hand-held tester.
- If the A/F sensor functional malfunction is detected, the ECM sets this DTC.

MONITOR DESCRIPTION

- Sensor voltage detection monitor:
Under the air-fuel ratio feedback control, if the A/F sensor voltage output indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and sets a DTC.

Example:

If the A/F sensor voltage output is less than 2.8 V (very rich condition) for 10 seconds, despite the HO2 sensor voltage output being less than 0.85 V, the ECM sets DTC P2196. Alternatively, if the A/F sensor voltage output is more than 3.8 V (very lean condition) for 10 seconds, despite the HO2 sensor voltage output being 0.15 V or more, DTC P2195 or P2197 is set.

- Sensor current detection monitor:**
 A rich air-fuel mixture causes a low air-fuel ratio sensor current, and a lean air fuel mixture causes a high air-fuel ratio sensor current. Therefore, the sensor output becomes high during acceleration, and the sensor becomes low during deceleration.
 The ECM monitors the air-fuel ratio sensor current during fuel-cut and detects unusual current value. If the cumulative time the sensor output is out of range exceeds 3 seconds, the ECM interprets a malfunction in the air-fuel ratio sensor and sets a DTC.

Double Cab:

C

CONFIRMATION DRIVING PATTERN

HINT:

This confirmation driving pattern is used in steps 2, 4, 7, 17 and 21 of the following diagnostic troubleshooting procedure when using a hand-held tester.

- (a) Connect the hand-held tester to DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Clear DTCs (see page [DI-462](#)).
- (d) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
- (e) On the hand-held tester, select the following menu items: DIAGNOSIS/ENHANCED OBD II/DATA LIST/FC IDL.
- (f) Drive the vehicle at 40 mph (64 km/h) or more for at least 10 minutes.
- (g) Change the transmission to 2nd gear.
- (h) Drive the vehicle at an appropriate speed to perform fuel-cut operation.

HINT:

Fuel-cut is performed when the following conditions met:

- Accelerator pedal is fully released.
 - Engine speed is 2,500 rpm or more (fuel injection returns at 1,000 rpm).
- (i) Accelerate the vehicle to 30 mph (48 km/h) or more by depressing the accelerator pedal for at least 10 seconds.
 - (j) Soon after performing step (8) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
 - (k) Stop the vehicle and allow the engine to idle for 10 seconds or more.
 - (l) Allow the vehicle to decelerate until the vehicle speed declines to less than 6 mph (10 km/h).
 - (m) Repeat steps from (8) through (10) above at least 3 times in one driving cycle.

HINT:

Completing all A/F sensor monitors are required to change the value in TEST RESULT.

CAUTION:

Strictly observe the posted speed limits, traffic laws, and road conditions when performing these driving patterns.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air–Fuel Ratio (A/F) sensor, Heated Oxygen (HO₂) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand–held tester.

- (1) Connect a hand–held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO₂ sensors (AFS B1S1 (AFS B2S1) and OS2 B1S2 (O2S B2S2)) displayed on the tester.

HINT:

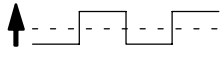

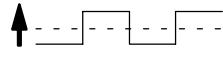

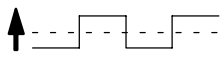

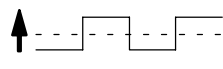

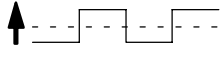

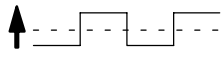

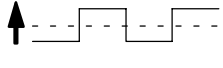

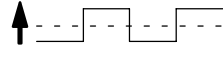

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	–12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO ₂)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO ₂)	–12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0 V	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	—
2	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	<ul style="list-style-type: none"> ● A/F sensor ● A/F sensor heater ● A/F sensor circuit
3	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0V	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> ● HO2 sensor ● HO2 sensor heater ● HO2 sensor circuit
4	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> ● Injector ● Fuel pressure ● Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- Read freeze frame data using a hand-held tester or OBD II scan tool. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1 Check any other DTCs output (in addition to DTC P2195, P2196, P2197 or P2198).

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- (a) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
P2195, P2196, P2197 or P2198 and other DTCs	B

HINT:

If any DTCs other than P2195, P2196, P2197 or P2198 are output, troubleshoot those DTCs first.

B Go to relevant DTC chart (See page [DI-477](#)).

A

2 Check A/F sensor output current.

PREPARATION:

- (a) Connect a hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON and turn the tester ON.
- (c) Clear DTCs (see page [DI-462](#)).
- (d) On the hand-held tester, select the following menu items: DIAGNOSIS/ENHANCED OBD II/MONITOR INFO/MONITOR STATUS.
- (e) Check that the status of O2S MON is COMPL.
- (f) On the hand-held tester, select the following menu items: DIAGNOSIS/ENHANCED OBD II/MONITOR INFO/TEST RESULT/RANGE B1S1 and B2S1.
- (g) Check the test value of the air-fuel ratio sensor output current during fuel-cut.

RESULT:

Test Value	Proceed to
Out of normal range (1.4 mA or more, and less than 3.6 mA)	A
Within normal range (Less than 1.4 mA, or 3.6 mA or more)	B

B Go to step 20.

A

3	Read value output voltage of A/F sensor.
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Start the engine and turn the scan tool ON.
- (c) Warm up the Air-Fuel Ratio (A/F) sensor at an engine speed of 2,500 rpm for 90 seconds.

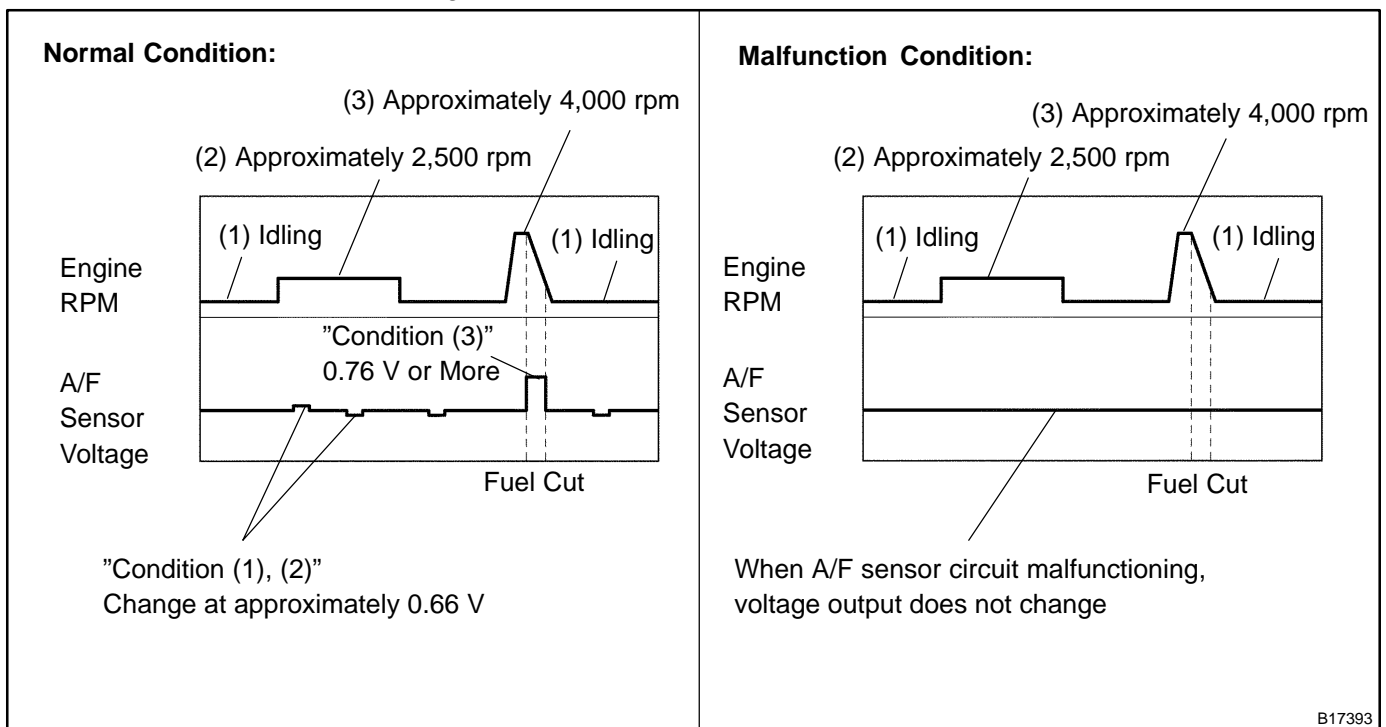

CHECK:

- (a) Using the scan tool, check the A/F sensor voltage 3 times, once when the engine is in each of the following conditions:
 - (1) While idling (check for at least 30 seconds)
 - (2) At an engine speed of approximately 2,500 rpm (without any sudden changes in engine speed)
 - (3) Raise the engine speed to 4,000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.

Standard:

Conditions	A/F Sensor Voltage Variations	Reference
(1) and (2)	Changes at approx 0.66 V	Between 0.62 V and 0.7 V
(3)	Increases to 0.76 V or more	This occurs during engine deceleration (when fuel-cut performed)

For more information, see the diagrams below.

B17393

HINT:

- If the output voltage of the A/F sensor remains at approximately 0.66 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)
- If the output voltage of the A/F sensor remains at either approximately 0.76 V or more, or 0.56 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.
- The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.

- The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 10 mph (16 km/h) to allow the ECM to learn the closed throttle valve position.
- When the vehicle is driven:
The output voltage of the A/F sensor may be below 0.56 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.

NG Go to step 9.

OK

4 Perform confirmation driving pattern.

NEXT

5 Check whether DTC output recurs (DTC P2195, P2196, P2197 or P2198)

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
No output	B

B Go to step 5.

A

6 Replace air fuel ratio sensor.

NEXT

7 Perform confirmation driving pattern.

NEXT

8 Check whether DTC output recurs (DTC P2195, P2196, P2197 or P2198)

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
 (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
No output	B

B

Go to step 5.

A

9 Confirm whether vehicle has run out of fuel in past.

NO

Check for intermittent problems
(See page [DI-430](#)).

YES

DTC caused by running out of fuel.

10 Check resistance of air-fuel ratio (A/F) sensor heater.

PREPARATION:

Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Tester Connection	Specified Condition
HT (1) - +B (2)	Between 1.8 Ω and 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

NG Replace air-fuel ratio (A/F) sensor.

OK

11 Check A/F relay.

PREPARATION:

Remove the A/F relay from the engine room J/B.

CHECK:

Inspect the A/F relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 KΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace EFI relay.

OK

12 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

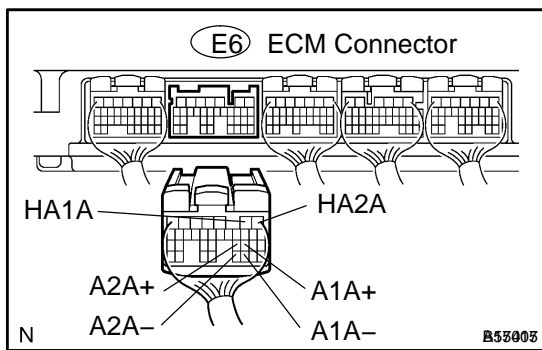

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

Standard:

Tester Connections	Specified Conditions
+B (2) - Body ground	Between 9 V and 14 V

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E6 ECM connector.

CHECK:

- (a) Check the resistance.

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω
AF+ (A10-3) - A1A+ (E6-22) AF+ (A30-3) - A2A+ (E6-23)	Below 1 Ω
AF- (A10-4) - A1A- (E6-30) AF- (A30-4) - A2A- (E6-31)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher
AF+ (A10-3) or A1A+ (E6-22) - Body ground AF+ (A30-3) or A2A+ (E6-23) - Body ground	10 kΩ or higher
AF- (A10-4) or A1A- (E6-30) - Body ground AF- (A30-4) or A2A- (E6-31) - Body ground	10 kΩ or higher

NG

Replace or replace harness or connector.

OK

13 Check air induction system (See page [SF-1](#)).**CHECK:**

Check the air induction system for vacuum leaks.

NG

Repair or replace air induction system.

OK

14 Check fuel pressure (See page [SF-7](#)).**CHECK:**

Check the fuel pressure (high or low pressure).

NG

Check and replace fuel pump, pressure regulator, fuel pipe line and filter (See page [SF-1](#)).

OK

15 Check injector injection (See page [SF-29](#)).

NG

Replace injector.

OK

16 **Replace air fuel ratio sensor.**

NEXT

17 **Perform confirmation driving pattern.**

NEXT

18 **Check whether DTC output recurs (DTC P2195, P2196, P2197 or P2198)**

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
 (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2195, P2196, P2197 or P2198	A
No output	B

B

Replace ECM (See page [SF-82](#)) and perform confirmation driving pattern.

A

19 **Confirm whether vehicle has run out of fuel in past.**

NO

Check for intermittent problems (See page [DI-430](#)).

YES

DTC caused by running out of fuel.

20	Replace air fuel ratio sensor.
-----------	---------------------------------------

NEXT

21	Perform confirmation driving pattern.

MONITOR DESCRIPTION

The Air–Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air–fuel ratio. If the A/F sensor impedance (alternating current resistance) or voltage output deviates greatly from the standard range, the ECM determines that there is an open or short malfunction in the A/F sensor circuit.

MONITOR STRATEGY

A/F- terminal voltage	More than 4.5 V

WIRING DIAGRAM

Refer to DTC P2195 on page [DI-806](#).

INSPECTION PROCEDURE

HINT:

Hand-held tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- (1) Connect a hand-held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 (AFS B2S1) and OS2 B1S2 (O2S B2S2)) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

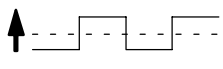

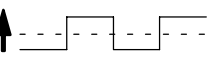

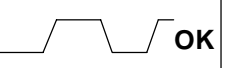

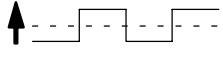

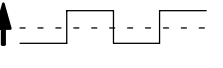

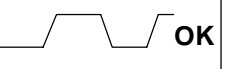

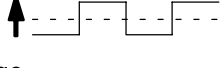

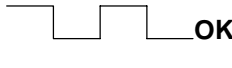

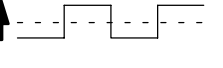

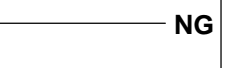

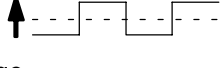

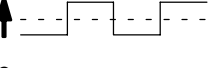

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 % ↑ -12.5 %  Output voltage More than 3.35 V Less than 3.0 V  OK	Injection volume +25 % ↑ -12.5 %  Output voltage More than 0.55 V Less than 0.4V  OK	—
2	Injection volume +25 % ↑ -12.5 %  Output voltage Almost no reaction  NG	Injection volume +25 % ↑ -12.5 %  Output voltage More than 0.55 V Less than 0.4V  OK	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 % ↑ -12.5 %  Output voltage More than 3.35 V Less than 3.0V  OK	Injection volume +25 % ↑ -12.5 %  Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 % ↑ -12.5 %  Output voltage Almost no reaction  NG	Injection volume +25 % ↑ -12.5 %  Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

HINT:

Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 Check resistance of air-fuel ratio (A/F) sensor heater.

PREPARATION:

Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Tester Connection	Specified Condition
HT (1) - +B (2)	Between 1.8 Ω and 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 kΩ or higher

NG Replace air-fuel ratio (A/F) sensor.

OK

2 Check A/F relay.

PREPARATION:

Remove the A/F relay from the engine room J/B.

CHECK:

Inspect the A/F relay.

OK:

Terminal No.	Condition	Specified Condition
1 - 2	Constant	Continuity
	Usually	No Continuity
3 - 5	Apply B+ between terminals 1 and 2	Continuity

NG Replace EFI relay.

OK

3 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

OK:

Standard:

Tester Connections	Specified Conditions
+B (2) - Body ground	Between 9 V and 14 V

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E6 ECM connector.

CHECK:

- (a) Check the resistance.

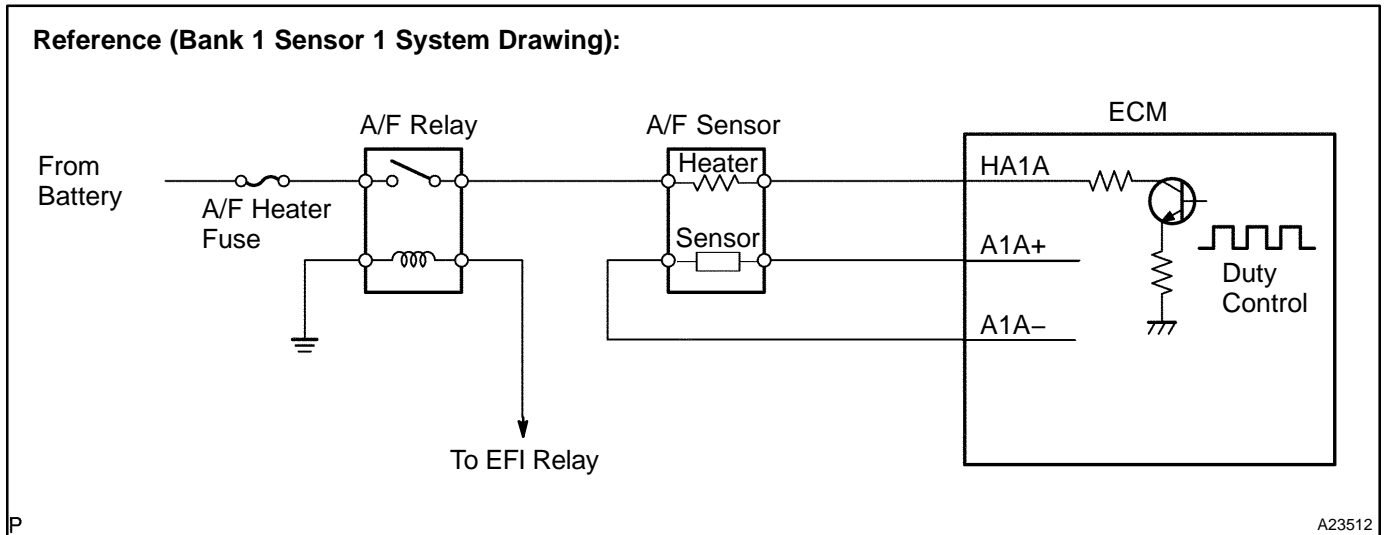

OK:

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω
AF+ (A10-3) - A1A+ (E6-22) AF+ (A30-3) - A2A+ (E6-23)	Below 1 Ω
AF- (A10-4) - A1A- (E6-30) AF- (A30-4) - A2A- (E6-31)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher
AF+ (A10-3) or A1A+ (E6-22) - Body ground AF+ (A30-3) or A2A+ (E6-23) - Body ground	10 kΩ or higher
AF- (A10-4) or A1A- (E6-30) - Body ground AF- (A30-4) or A2A- (E6-31) - Body ground	10 kΩ or higher

NG

Replace or replace harness or connector.

OK

Replace ECM (See page [SF-82](#)).

DTC	P2401	Evaporative Emission System Leak Detection Pump Control Circuit Low
------------	--------------	--

DTC	P2402	Evaporative Emission System Leak Detection Pump Control Circuit High
------------	--------------	---

CIRCUIT DESCRIPTION

Refer to EVAP Inspection Procedure (see page [DI-884](#)).

DTCs	Monitoring Item	DTC Detection Condition	Trouble Areas	Detection Timing	Detection Logic
P2401	Vacuum pump stuck OFF	One of following conditions are met: <ul style="list-style-type: none"> • 0.02 inch orifice low-flow • 0.02 inch orifice high-low • Vacuum pump ON stuck • Vacuum pump OFF stuck • Vent valve ON (Closed) stuck 	<ul style="list-style-type: none"> • Pump module • Connector / Wire harness (Pump module – ECM) • ECM 	While ignition switch OFF	2 trips
P2402	Vacuum pump stuck ON	NOTE: P043E, P043F, P2401, P2402 and P2419 have same DTC detection conditions.			

WIRING DIAGRAM

Refer to EVAP Inspection Procedure (see page [DI-884](#)).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
–	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	–
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure is not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	Leak check is performed after second 0.02 inch leak pressure standard is measured. If stabilized system pressure higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	–

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

In sequence B and E, to determine the leak criterion, the vacuum pump creates negative pressure in the canister pump module through the 0.02 inch orifice. If the pressure is out of specified range or is not saturated, the ECM illuminates the MIL and sets DTCs P043E, P043F, P2401, P2402 and P2419 (2-trip detection logic).

WIRING DIAGRAM

Refer to the EVAP Inspection Procedure (see page [DI-884](#)).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure is not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	Leak check is performed after second 0.02 inch leak pressure standard is measured. If stabilized system pressure higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

(a) P2419: Vent valve stuck ON (Closed)

In sequence B and E, to determine the leak criterion, the vacuum pump creates negative pressure in the canister pump module through the 0.02 inch orifice. If the pressure is out of specified range or is not saturated, the ECM illuminates the MIL and sets DTCs P043E, P043F, P2401, P2402 and P2419 (2-trip detection logic).

(b) P2420: Vent valve stuck OFF (vent)

In sequence C, the vent valve turns ON (closes) and the EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the pressure sensor, to conduct an EVAP leak check. If the pressure does not increase when the vent valve turned ON (closed), the ECM interprets this as the vent valve being stuck OFF (vent). The ECM illuminates the MIL and sets the DTC.

P2433	While the engine is running, if voltage output of the pressure sensor remains above 4.815 V. (1 trip detection logic)	

MONITOR DESCRIPTION

The ECM observes the pressure in the secondary air passage using the pressure sensor located on the air switching valve in the secondary air injection system.

If there is a defect in the sensor or the sensor circuit, the voltage level will deviate from the normal operating range, the ECM interprets this deviation as a defect in the pressure sensor circuit and sets a DTC.

WIRING DIAGRAM

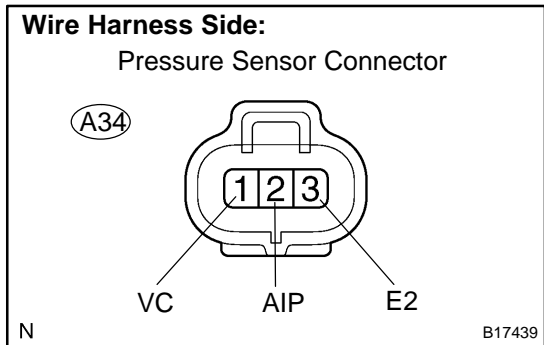

N

A23557

INSPECTION PROCEDURE

- 1 Check for open and short in harness and connector between pressure sensor and ECM (See page IN-30).**

PREPARATION:

- Remove the intake manifold (see page EM-36).
- Disconnect the A34 pressure sensor connector.
- Disconnect the E7 ECM connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VC (A34-1) - VC (E7-23) AIP (A34-2) - AIP (E7-32) E2 (A34-3) - E2 (E7-28)	Below 1 Ω
VC (A34-1) or VC (E7-23) - Body ground AIP (A34-2) or AIP (E7-32) - Body ground	10 kΩ or higher

NG **Repair or replace harness and connector.**

OK

2 Inspect pressure sensor.

PREPARATION:

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Connect the pressure gauge to the pressure sensor as shown in the illustration.
- (c) Connect the hand-held tester to the DLC3 on the vehicle.
- (d) Turn the ignition switch ON and push the hand-held tester main switch ON (Do not start engine).
- (e) Select the following items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / 2ND AIR PRESS.

CHECK:

Check that the pressure displayed on the hand-held tester fluctuates when applying the pressure to the pressure sensor with the pressure gauge.

OK:

Pressure fluctuates in response to the pressure applied with pressure gauge.

NG

Replace pressure sensor (See page [EC-20](#)).

OK

Replace ECM (See page [SF-82](#)).

DTC	P2444	Secondary Air Injection System Pump Stuck On Bank 1
------------	--------------	--

DTC	P2445	Secondary Air Injection System Pump Stuck Off Bank 1
------------	--------------	---

CIRCUIT DESCRIPTION

Refer to DTC P0412 on page [DI-656](#).

DTC No.	DTC Detection Condition	Trouble Area
P2444	<p>Air pump stuck ON.</p> <p>The secondary air pressure is more than 2.5 kPa (19 mmHg) despite the ECM ordering the air pump to turn off. (2 trip detection logic)</p>	<ul style="list-style-type: none"> • Short in air pump circuit • Air injection driver • Pressure sensor • Open or short in pressure sensor circuit • ECM
P2445	<p>Air pump stuck OFF or air injection volume is insufficient.</p> <p>The amount of air flow is below the criteria. (The secondary air pressure is less than specified value despite the ECM ordering the air pump turn ON.) (2 trip detection logic)</p>	<ul style="list-style-type: none"> • Air pump fuse • Vacuum hose • Air pump assembly • Air injection driver • Open in air pump circuit • Air injection system piping • Pressure sensor • Open or short in pressure sensor circuit • ECM

MONITOR DESCRIPTION

P2444:

The ECM observes the pressure in the secondary air passage using the pressure sensor located on the air switching valve in the secondary air injection system. The sensor measures the pressure in the secondary air passage and sends a signal to the ECM.

If the pressure level from the sensor exceed a certain level despite the ECM turning off the air pump, the ECM interprets this as a fault in the secondary air injection system and sets a DTC.

P2445:

The ECM calculates the amount of air flow within the secondary air system based on the output values of the pressure sensor and Mas air flow meter.

The ECM determines whether the amount of air flow is normal or not according to the calculated value. When the amount of air flow is below the criteria the ECM stores the DTC and illuminates the MIL.

MONITOR STRATEGY

Related DTCs	P2444	Air pump is stuck ON (case 1)
	P2445	Air pump is stuck OFF (case 2)

MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-437	
Conditions for case 1, case 2 and case 3:		
Atmospheric pressure	45 kPa (338 mmHg)	–
Battery voltage	11.5 V	–
Sequence 1 to 6 are performed to monitor AIR	–	
Sequence 1	–	
AIR	In operation	
AIR pump	ON	
AIR valve (Electric type)	ON	
Either of the following conditions is met:	Condition 1 or 2	
1. Both of the following conditions are met:	Condition (a) and (b)	
(a) AIR valve (vacuum type) bank 1	ON	
(b) AIR valve (vacuum type) bank 2	OFF	
2. Both of the following conditions are met:	Condition (c) and (d)	
(c) AIR valve (vacuum type) bank 1	OFF	
(d) AIR valve (vacuum type) bank 2	ON	
Idle	ON	
Sequence 2	–	
AIR valve (Electric type)	ON	
AIR valve (vacuum type) bank 1	ON	
AIR valve (vacuum type) bank 2	ON	
Idle	ON	
Sequence 3	–	
AIR pump	ON	
AIR valve (Electric type)	ON	
AIR valve (vacuum type) bank 1	ON	
AIR valve (vacuum type) bank 2	ON	
Engine RPM	–	3750 rpm
Sequence 4 (This sequence is run when AIR pressure is no change at monitor)	–	

AIR	Not operating	
AIR pump	ON	
AIR valve (Electric type)	ON	
Either of the following conditions is met:	Condition 1 or 2	
1. Both of the following conditions are met:	Condition (a) and (b)	
(a) AIR valve (vacuum type) bank 1	ON	
(b) AIR valve (vacuum type) bank 2	OFF	
2. Both of the following conditions are met:	Condition (c) and (d)	
(c) AIR valve (vacuum type) bank 1	OFF	
(d) AIR valve (vacuum type) bank 2	ON	
Engine RPM	-	3750 rpm
Sequence 5	-	
AIR	Not operating	
AIR pump	OFF	
AIR valve (Electric type)	OFF	
AIR valve (vacuum type) bank 1	OFF	
AIR valve (vacuum type) bank 2	OFF	
Engine RPM	-	3750 rpm
Sequence 6	-	
AIR status	Not operating	
AIR pump	OFF	
AIR valve (Electric type)	ON	
AIR valve (vacuum type) bank 1	OFF	
AIR valve (vacuum type) bank 2	OFF	
Engine RPM	-	3750 rpm
Conditions for case 4:		
ECT at engine start	-	5°C (41°F)
IAT at engine start	-15°C (5°F)	-
Time after ECT is 80°C (176°F) or more	10 to 60 minutes	
Cumulative intake air amount	172 g/sec.	-
Monitor sequence 3 (during AIR: ON)	Completed	
One of the following condition is met:	Condition (a), (b) or (c)	
(a) Vehicle speed	49.7 mph (80 km/h)	-
(b) Engine RPM	0 rpm	-
(c) Throttle position	0 deg	-
AIR valve	OFF	
AIR VSV bank 1	OFF	
AIR VSV bank 2	OFF	
AIR pressure sensor malfunction (open circuit, out of range)	Not detected	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Thresholds for case 1	
AIR pressure during monitor sequence 6	5 kPa (37.5 mmHg) or more
Thresholds for case 2	
AIR pressure during monitor sequence 3	Less than 1 kPa (7.5 mmHg)
Thresholds for case 3	
AIR amount	100 L/min. or less
Thresholds for case 4	
AIR pressure change	5 kPa (37.5 mmHg) or more

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (refer to "Confirmation Monitor").

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

Secondary air injection (AIR) system

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$71	\$E1	Multiply by 0.01 (g/s)	Test value of AIR amount insufficient	Minimum test limit	Maximum test limit
\$71	\$E2	Multiply by 0.01 (kPa)	Test value of AIR pump stuck ON	Minimum test limit	Maximum test limit
\$71	\$E3	Multiply by 0.01 (kPa)	Test value of AIR pump stuck OFF	Minimum test limit	Maximum test limit
\$71	\$E4	Multiply by 0.01 (kPa)	Test value of AIR control valve ON	Minimum test limit	Maximum test limit
\$71	\$E5	Multiply by 0.01 (kPa)	Test value of AIR control valve OFF	Minimum test limit	Maximum test limit
\$71	\$E6	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR valve	Minimum test limit	Maximum test limit
\$71	\$E7	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR VSV bank 1	Minimum test limit	Maximum test limit
\$71	\$E8	Multiply by 0.01 (kPa)	Test value of AIR pressure change for AIR VSV bank 2	Minimum test limit	Maximum test limit
\$71	\$E9	Multiply by 0.01 (kPa)	Test value of AIR pressure pulsation for AIR VSV when AIR pressure is low	Minimum test limit	Maximum test limit

WIRING DIAGRAM

Refer to DTC P0412 on page [DI-656](#).

INSPECTION PROCEDURE

HINT:

To check the pressure condition in the secondary air passage, the hand-held tester is available.

1	Is the DTC P2444 and P2445 being output.
----------	---

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) Enter the following menu: DIAGNOSIS/ENHANCED OBD II/DTC INFO/CURRENT CODES.

CHECK:

Read the DTCs.

RESULT:

Display (DTC output)	Proceed to
P2445	A
P2444	B
P2444 and P2445	B
"P2444 and P2445" and other DTCs	C

HINT:

If any other codes besides P2444 or P2445 is output, perform the troubleshooting for those DTCs first.

2 Check air injection system pressure.

```

AIR INJ CHECK
AIR PUMP.....ON
EASV .....OPEN
ASV1. ....OPEN
ASV2.....OPEN
A/F BANK1.....19.05
A/F BANK2.....14.5
PRESSURE.....17 kPa
PULSATION.....25.39 kPa
AI STATUS.....OK
Remaining Time 05 sec.

Press [EXIT] to quit

```

A16555

PREPARATION:

- (a) Start the engine and warm it up.
- (b) Turn the ignition switch to OFF.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to ON and push the hand-held tester main switch ON.
- (e) Start the engine.

CHECK:

- (a) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/ AIR INJ CHECK/ MANUAL OPERATION/OPERATION 1 and 6

HINT:

OPERATION 1: AP:OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE

OPERATION 2: AP:ON, EASV:OPEN, ASV1:OPEN, ASV2:OPEN

- (b) Check that the PRESSURE on the hand-held tester.

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:

Tester operation	PRESSURE
Operation 1	Less than 2.5 kPa
Operation 2	5 to 8 kPa or more

NG → **Go to step 4.**

OK

3	Check whether DTC output recurs.
----------	---

PREPARATION:

- (a) Start the engine and warm it up.
- (b) Turn the ignition switch OFF.
- (c) Connect a hand-held tester to the DLC3.
- (d) Turn the ignition switch to ON and turn the tester ON.
- (e) Clear the DTCs (see page [DI-462](#)).
- (f) Start the engine.

CHECK:

- (a) Perform ACTIVE TEST to operate the air injection system.
Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/AIR INJ CHECK/AUTOMATIC OPERATION
- (b) After operating the secondary air injection system, confirm the pending codes for the secondary air injection system by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (c) Read DTC and check DTC.

OK:

DTC P2444 or P2445 for the secondary air injection system is not output.

NG	Go to step 4.
-----------	----------------------

OK

Check for intermittent problems (See page DI-430).

4	Check vacuum hose.
----------	---------------------------

**CHECK:**

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Check the vacuum hose connection between the pressure sensor and air switching valve.

OK:

The vacuum hose is securely connected.

CHECK:

- (a) Inspect the vacuum hose for blockage or damage.

OK:

The vacuum hoses no blockages and damages.

NG	Repair or replace vacuum hose.
-----------	---------------------------------------

OK

5 Inspect ECM (air voltage).

PREPARATION:

- Remove the intake manifold (see page [EM-36](#)).
- Connect the pressure gauge to the pressure sensor as shown in the illustration.
- Connect the hand-held tester to the DLC3 on the vehicle.
- Turn the ignition switch ON and push the hand-held tester main switch ON (Do not start engine).
- Select the following items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / AIR PUMP PRS.

CHECK:

Check that the pressure displayed on the hand-held tester fluctuates when applying the pressure to the pressure sensor with the pressure gauge.

OK:

Pressure fluctuates in response to the pressure applied with pressure gauge.

NG

Replace pressure sensor.

OK

6 Check connection of all air injection system piping and hoses.

CHECK:

- Remove the intake manifold (see page [EM-36](#)).
- Check that all the pipes and hoses between the air pump and air switching valve are securely connected.

OK:

The all air injection pipes and hoses are securely connected.

CHECK:

- Check the pipe and hoses for blockage or damage.

OK:

The air injection system pipes and hoses has no blockages and damages.

NG

Repair or replace air injection system piping.

OK

7 Inspect air injection driver power source circuit.

Wire Harness Side:

Air Injection Driver Connector

N

B17444

PREPARATION:

- Remove the intake manifold (see page EM-36).
- Disconnect the A32 and A33 air injection driver connector.
- Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminals A32-5 (+B) and A33-1 (BATT) of the air injection driver and body ground.

OK:

Standard:

Tester Connection	Specified Condition
A32-5 (+B) - Body ground	10 V or more
A33-1 (BATT) - Body ground	10 V or more

CHECK:

Measure the resistance between the terminal A32-1 (E) of the air injection driver and body ground.

OK:

Standard:

Tester Connection	Specified Condition
A32-1 (E) - Body ground	Below 1 Ω

Wire Harness Side:

Air Injection Driver Connector

N

B17443

NG

Repair or replace harness or connector.

OK

8 Check voltage between AIRP and AIRV terminal of ECM and body ground.

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and turn the tester ON.

CHECK:

- (a) When the air pump and air switching valve are operated using hand-held tester, measure voltage between terminal E3-25 (AIRP) and E3-4 (AIRV) of the air injection driver connector and body ground.
- (b) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/AIR INJ CHECK/MANUAL OPERATION/OPERATION 1 and 2

HINT:

OPERATION 1: AP:OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE

OPERATION 2: AP:ON, EASV:OPEN, ASV1:OPEN, ASV2:OPEN

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:

Standard:

Air pump operation	Tester Connection	Specified Condition
ON	E3-25 (AIRP) – Body ground	10 V or more
OFF	E3-25 (AIRP) – Body ground	3.5 to 7.7 V*
ASV operation (EASV)	Tester Connection	Specified Condition
OPEN	E3-4 (AIRV) – Body ground	10 V or more
CLOSE	E3-4 (AIRV) – Body ground	3.5 to 7.7 V*

*: 35 to 55 % of the +B voltage.

NG Replace ECM (See page [SF-82](#)).

OK

9 Check voltage between SIV and SIP terminal of air injection driver and body ground.

PREPARATION:

- (a) Disconnect the A32 air injection driver connector.
- (b) Connect the hand-held tester to the DLC3.
- (c) Turn the ignition switch ON and turn the tester ON.

CHECK:

- (a) When the air pump and air switching valve are operated using hand-held tester, measure voltage between terminal A32-3 (SIV) and A32-4 (SIP) of the air injection driver connector and body ground.
- (b) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/AIR INJ CHECK/MANUAL OPERATION/OPERATION 1 and 2

HINT:

OPERATION 1: AP:OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE

OPERATION 2: AP:ON, EASV:OPEN, ASV1:OPEN, ASV2:OPEN

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again.

OK:

Standard:

Air pump operation	Tester Connection	Specified Condition
ON	A32-4 (SIP) - Body ground	10 V or more
OFF	A32-4 (SIP) - Body ground	3.5 to 7.7 V*
ASV operation (EASV)	Tester Connection	Specified Condition
OPEN	A32-3 (SIV) - Body ground	10 V or more
CLOSE	A32-3 (SIV) - Body ground	3.5 to 7.7 V*

*: 35 to 55 % of the +B voltage.

NG **Repair or replace harness or connector between air injection driver and ECM.**

OK

10 Check voltage between terminal 2 of air pump and body ground.

Wire Harness Side:

A35

Air Pump Connector

N

B17438

PREPARATION:

- (a) Remove the intake manifold (see page EM-36).
- (b) Disconnect the A35 air pump connector.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch ON and turn the tester ON.

CHECK:

- (a) When the air pump is operated using the hand-held tester, measure voltage between terminal A35-2 of the air injection driver connector and body ground.
- (b) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/ AIR INJ CHECK/ MANUAL OPERATION/OPERATION 1 and 2

HINT:

OPERATION 1: AP:OFF, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE

OPERATION 2: AP:ON, EASV:OPEN, ASV1:OPEN, ASV2:OPEN

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:

Standard:

Air pump operation	Tester Connection	Specified Condition
ON	A35-2 - Body ground	10 V or more
OFF	A35-2 - Body ground	Below 1.0 V

NG Go to step 14.

11 Check for open in harness and connector between air pump and body ground.

PREPARATION:

- (a) Remove the intake manifold (see page [EM-36](#)).
- (b) Disconnect the A35 air pump connector.

CHECK:

Measure the resistance between the wire harness side connectors and body ground.

OK:

Standard:

Tester Connection	Specified Condition
A35-1 - Body ground	Below 1 Ω

NG **Repair or replace harness or connector.**

OK

12	Check air pump operation.
-----------	----------------------------------

PREPARATION:

- (a) Connect the pressure gauge to the air switching valve as shown in the illustration.
- (b) Connect the hand-held tester to the DLC3.
- (c) Turn the ignition switch ON and turn the tester ON.
- (d) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/ACTIVE TEST/AIR INJ CHECK/MANUAL OPERATION/OPERATION 3

CHECK:

- (a) When the air pump is operated using the hand-held tester, measure the air injection system pressure.

HINT:

OPERATION 2: AP:ON, EASV:CLOSE, ASV1:CLOSE, ASV2:CLOSE

NOTICE:

This test only allows technicians to operate the AI system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.

While the AI system operation using the hand-held tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If the ERROR (AI STATUS NG) is displayed on the tester, stop the engine for 10 minutes and then try again..

OK:

Standard:

25 to 30 kPa or more

NG	Replace air pump.
-----------	--------------------------

OK

13	Check whether DTC output recurs.
-----------	---

PREPARATION:

- (a) Start the engine and warm it up.
- (b) Turn the ignition switch OFF.
- (c) Connect a hand-held tester to the DLC3.
- (d) Turn the ignition switch to ON and turn the tester ON.
- (e) Clear the DTCs (see page [DI-462](#)).
- (f) Start the engine.

CHECK:

- (a) Perform ACTIVE TEST to operate the air injection system.
Select the following menu items: DIAGNOSIS/ENHANCED OBD II/SYSTEM CHECK/AIR INJ CHECK/AUTOMATIC OPERATION
- (b) After operating secondary air injection system, confirm the pending codes of the secondary air injection system by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (c) Read DTC and check no DTC.

OK:

DTC P2444 or P2445 for the secondary air injection system is not output.

NG

Check for intermittent problems
(See page [DI-430](#)).

OK**END**

14 Check for open and short in harness and connector between air injection driver and air pump.

PREPARATION:

- (a) Remove the intake manifold (see page EM-36).
- (b) Disconnect the A33 air injection driver connector.
- (c) Disconnect the A35 air pump connector.

CHECK:

Measure the resistance between the wire harness side connectors.

OK:

Standard:

Tester Connection	Specified Condition
VP (A33-2) - A35-2	Below 1 Ω
VP (A33-2) or A35-2 - Body ground	10 kΩ or higher

NG Repair or replace harness or connector.

OK

Replace air injection driver.

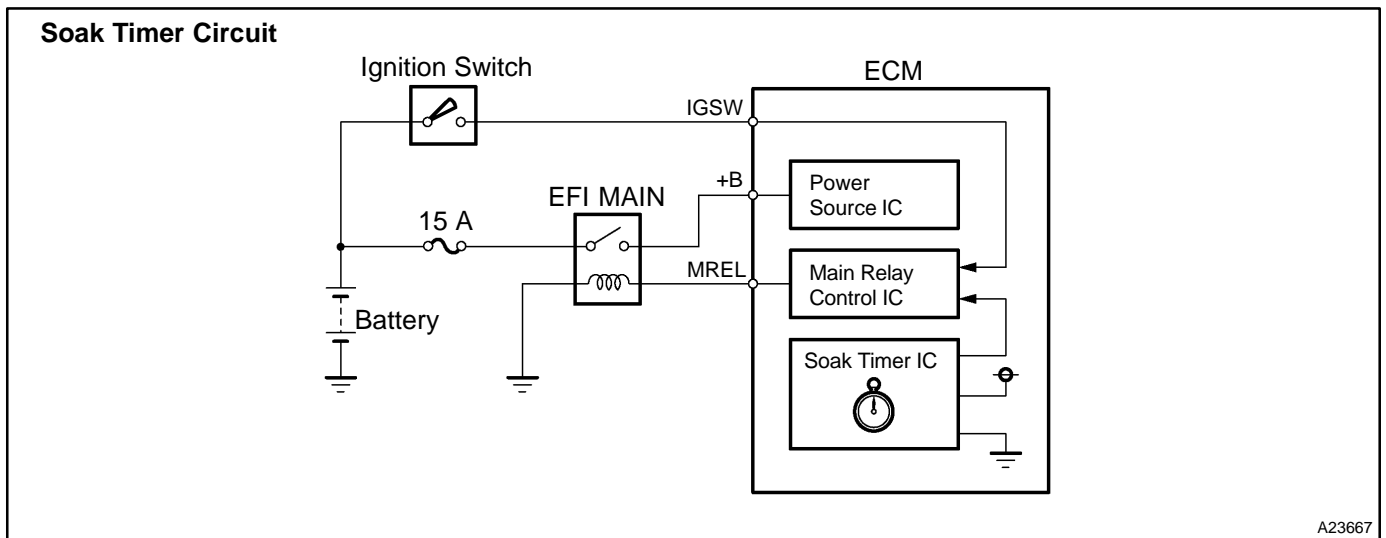

DTC	P2610	ECM/PCM Internal Engine OFF Timer Performance
------------	--------------	--

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2610	Soak timer (built into ECM)	ECM internal malfunction	ECM	Engine running	2 trip

CIRCUIT DESCRIPTION

To ensure the accuracy of the EVAP (Evaporative Emission) monitor values, the soak timer, which is built into the ECM, measures 5 hours (± 15 minutes) from when the ignition switch is turned OFF, before the monitor is run. This allows the fuel to cool down, which stabilizes the Fuel Tank Pressure (FTP). When 5 hours have elapsed, the ECM turns on.

MONITOR DESCRIPTION

5 hours after the ignition switch is turned OFF, the soak timer activates the ECM to begin the EVAP system monitor. While the engine is running, the ECM monitors the synchronization of the soak timer and the CPU clock. If these two are not synchronized, the ECM interprets this as a malfunction, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Related DTCs	P2610	Soak timer (built into ECM)
Required sensors/components	ECM	
Frequency of operation	Once per driving cycle	
Duration	10 min.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-437	
Battery voltage	8 V	-
Ignition switch	ON	
Starter	OFF	
Engine	Running	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Soak time measurement when ECM CPU clock counts 10 min.	Less than 7 min., or more than 13 min.

INSPECTION PROCEDURE

HINT:

- DTC P2610 is set if an internal ECM problem is detected. Diagnostic procedures are not required. ECM replacement is required.
- Read freeze frame data using a hand-held tester. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Replace ECM (See page SF-82).
----------	--

Check whether DTC output recurs.

- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON.
- Clear DTCs (see page [DI-462](#)).
- Start the engine and wait for 10 minutes or more.
- On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- If no pending DTC is displayed, the repair has been successfully completed.

DTC	P043E	Evaporate Emission System Reference Orifice Clog Up
------------	--------------	--

DTC	P043F	Evaporate Emission System Reference Orifice High Flow
------------	--------------	--

CIRCUIT DESCRIPTION

Refer to the EVAP Inspection Procedure (see page [DI-884](#)).

DTC	Monitoring Item	Detection Conditions	Trouble Areas	Detection Timing	Detection Logic
P043E	0.02 inch orifice clogged	One of following conditions are met: <ul style="list-style-type: none"> • 0.02 inch orifice low-flow • 0.02 inch orifice high-flow • Vacuum pump ON stuck • Vacuum pump OFF stuck • Vent valve ON (Closed) stuck 	<ul style="list-style-type: none"> • Pump module • Connector / Wire harness (Pump module – ECM) • ECM 	While ignition switch OFF	2 trips
P043F	0.02 inch orifice high-flow	NOTE: P043E, P043F, P2401, P2402 and P2419 have same DTC detection conditions.			

WIRING DIAGRAM

Refer to the EVAP Inspection Procedure (see page [DI-884](#)).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the electric vacuum pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) after 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
–	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after ignition switch turned to OFF.	–
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If EVAP pressure is not between 70 kPa and 110 kPa (525 mmHg and 825 mmHg), ECM cancels EVAP system monitor.	10 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down the measured value as it will be used in the leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	Leak check is performed after second 0.02 inch leak pressure standard is measured. If stabilized system pressure higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	–

* If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

In sequence B and E, to determine the leak criterion, the vacuum pump creates negative pressure in the canister pump module through the 0.02 inch orifice. If the pressure is out of specified range or is not saturated, the ECM illuminates the MIL and sets DTCs P043E, P043F, P2401, P2402 and P2419 (2-trip detection logic).

MONITOR STRATEGY

Related DTCs	P043E	0.02 inch orifice clog (built-in pump module)
	P043F	0.02 inch orifice high-flow (built-in pump module)
Required sensors/components	Pump module	
Frequency of operation	Once per driving cycle	
Duration	Within 2 min. (varies with amount of fuel in tank)	
MIL operation	2 driving cycle	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-437	
Atmospheric pressure	70 to 110 kPa (525 to 825 mmHg)	
Battery voltage	10.5 V	–
Vehicle speed	–	2.5 mph (4 km/h)
Ignition switch	OFF	
Time after key off	5 or 7 or 9.5 hours	
EVAP pressure sensor malfunction (P0450, P0452, P0453)	Not detected	
EVAP canister purge valve	Not operated by scan tool	
EVAP canister vent valve	Not operated by scan tool	
EVAP leak detection pump	Not operated by scan tool	
Both of the following conditions 1 and 2 set before key off	–	
1. Duration that vehicle has been driven	5 min.	–
2. EVAP purge operation	Performed	
ECT	4.4 to 35°C (40 to 95°F)	
IAT	4.4 to 35°C (40 to 95°F)	
Key-off monitor sequence	1 to 8	
1. Atmospheric pressure	–	
Next sequence is run if the following condition is set	–	
Atmospheric pressure change	–	0.3 kPa (2.25 mmHg)
2. First reference pressure measurement	–	
Next sequence is run if the following conditions are set	Condition 1, 2 and 3	
1. EVAP pressure just after reference pressure measurement start	–	–1 kPa (–7.5 mmHg)
2. Reference pressure	–4.85 to –1.057 kPa (–36.38 to –7.93 mmHg)	
3. Reference pressure	Saturated within 60 seconds	

DIAGNOSTICS – ENGINE (2UZ-FE)

3. EVAP canister vent valve close stuck check	-	
Next sequence is run if the following condition is set	-	
EVAP pressure change after vent valve is ON	0.3 kPa (2.25 mmHg)	-
4. Vacuum introduction	-	
Next sequence is run if the following condition is set	-	
EVAP pressure	Saturated within 15 minutes	
5. EVAP canister purge valve close stuck check	-	
Next sequence is run if the following condition is set	-	
EVAP pressure change after purge valve is open	0.3 kPa (2.25 mmHg)	-
6. Second reference pressure measurement	-	
Next sequence is run if the following conditions are set	Condition 1, 2, 3 and 4	
1. EVAP pressure just after reference pressure	-	-1 kPa (-7.5 mmHg)
2. Reference pressure	-4.85 to -1.057 kPa (-36.38 to -7.93 mmHg)	
3. Reference pressure	Saturated within 60 seconds	
4. Difference between first reference pressure and second reference pressure	-	0.7 kPa (5.25 mmHg)
7. Leak check	-	
Next sequence is run if the following condition is set	-	
EVAP pressure when vacuum introduction is complete	-	Second reference pressure
8. Atmospheric pressure measurement	-	
EVAP monitor is complete if the following condition is set	-	
Atmospheric pressure difference between sequence 1 and 8	-	0.3 kPa (2.25 mmHg)

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
One of the following conditions is met	Condition 1, 2, 3, 4 or 5
1. EVAP pressure just after reference pressure measurement start	More than -1 kPa (-7.5 mmHg)
2. Reference pressure	Less than -4.85 kPa (-36.38 mmHg)
3. Reference pressure	-1.057 kPa (-7.93 mmHg) or more
4. Reference pressure	Not saturated
5. Difference between first reference pressure and second reference pressure	0.7 kPa (5.3 mmHg) or more

MONITOR RESULT (MODE 06 DATA)

Refer to page [DI-445](#) for detailed information.

INSPECTION PROCEDURE

Refer to the EVAP Inspection Procedure (see page [DI-884](#)).

DTC	P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)
------------	--------------	---

DTC	P2A03	A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)
------------	--------------	---

CIRCUIT DESCRIPTION

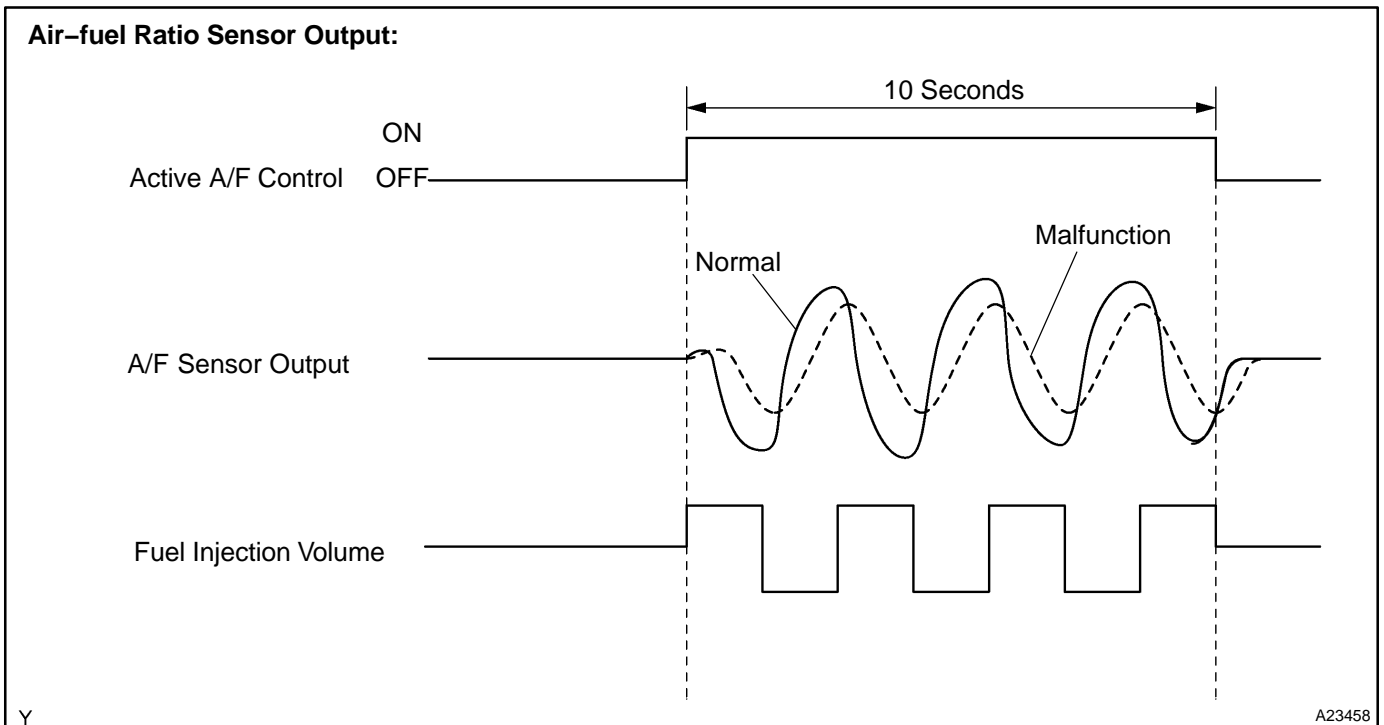

Refer to DTC P2195 on page [DI-806](#).

DTC No.	DTC Detection Conditions	Trouble Areas
P2A00 P2A03	Calculated test value for A/F sensor response rate deterioration level is less than threshold.	<ul style="list-style-type: none"> • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • ECM

MONITOR DESCRIPTION

After engine is warmed up, the ECM performs air-fuel ratio feedback control to regulate the air-fuel ratio at stoichiometric ratio. In addition, this vehicle performs Active A/F Ratio Control for approximately 10 seconds after preconditions met in order to measure the A/F sensor response rate. During active air-fuel ratio control, the ECM forcibly increases and decreases the injection volume for certain amount based on learned stoichiometric air-fuel ratio during usual air-fuel feedback control, and measures the A/F sensor response rate. The ECM calculates the signal from the A/F sensor while value for A/F sensor response rate deterioration level.

If the test value for A/F sensor response rate deterioration level is less than threshold, ECM interprets this as a malfunction, and sets the DTC.

CONFIRMATION DRIVING PATTERN

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch to ON.
- (c) Turn the hand-held tester ON.
- (d) Clear DTCs.
- (e) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/MONITOR INFO/MONITOR RESULT.
- (f) Check that RES RATE B1 S1 is INCOMPL.
- (g) Start the engine and warm it up.
- (h) Drive the vehicle at between 25 mph and 75 mph (40 km/h and 120km/h) for 3 minutes. However, the vehicle should be driven at constant-speed.
- (i) When detection is complete, Response rate of MONITOR RESULT changes. If the value does not change, perform step (g) once more.
- (j) Notes the value of the Monitor Result.
- (k) Select the following menu items: DIAGNOSIS/ENHANCED OBD II/DTC INFO/ PENDING CODES.
- (l) Check if any DTCs (any pending DTCs) are set.

MONITOR STRATEGY

Related DTCs	P2A00	A/F sensor (Bank 1) slow response
	P2A03	A/F sensor (Bank 2) slow response
Required sensors/components	A/F sensor	
Frequency of operation	Once per driving cycle	
Duration	10 to 15 sec.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-437	
Active A/F control	Performing	
Active A/F control is performed when the following conditions are met:	-	
Battery voltage	11 V	-
ECT	75°C (167°F)	-
Idle	OFF	
Engine RPM	-	4,000 rpm
A/F sensor status	Activated	
Fuel cut	OFF	
Engine load	10 to 70%	
Shift position	2nd	-
Catalyst monitor	Not executing	
Intake air amount	2.5 to 12 g/sec	

TYPICAL MALFUNCTION THRESHOLDS

Detection Criteria	Threshold
Response rate deterioration level	Less than 0.2 V

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (refer to "Confirmation Monitor").

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

A/F sensor bank 1 sensor 1

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$01	\$8E	Multiply by 0.0003 (no dimension)	Response rate deterioration level for A/F sensor	Malfunction criterion	FF

A/F sensor bank 2 sensor 1

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$05	\$8E	Multiply by 0.0003 (no dimension)	Response rate deterioration level for A/F sensor	Malfunction criterion	FF

WIRING DIAGRAM

Refer to DTC P2195 on page [DI-806](#).

INSPECTION PROCEDURE

HINT:

Hand-held tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using a hand-held tester.

- (1) Connect a hand-held tester to the DLC3.
- (2) Start the engine and turn the tester ON.
- (3) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
- (5) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (6) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1S1 (AFS B2S1) and OS2 B1S2 (O2S B2S2)) displayed on the tester.

HINT:

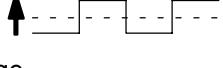

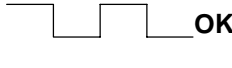

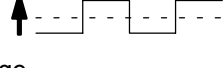

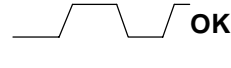

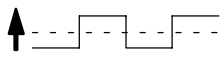

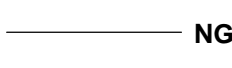

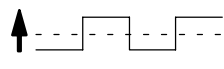

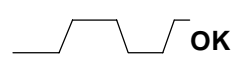

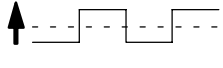

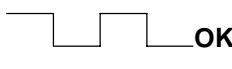

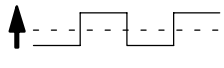

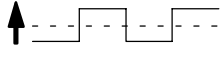

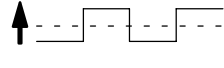

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1S1 (AFS B2S1) (A/F)	+25 %	Rich	Less than 3.0
AFS B1S1 (AFS B2S1) (A/F)	-12.5 %	Lean	More than 3.35
O2S B1S2 (O2S B2S2) (HO2)	+25 %	Rich	More than 0.55
O2S B1S2 (O2S B2S2) (HO2)	-12.5 %	Lean	Less than 0.4

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Areas
1	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0 V	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	—
2	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage More than 0.55 V  OK Less than 0.4V	<ul style="list-style-type: none"> • A/F sensor • A/F sensor heater • A/F sensor circuit
3	Injection volume +25 %  -12.5 % Output voltage More than 3.35 V  OK Less than 3.0V	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	Injection volume +25 %  -12.5 % Output voltage Almost no reaction  NG	<ul style="list-style-type: none"> • Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)

- Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2, and press the YES button and then the ENTER button followed by the F4 button.

HINT:

- DTC P2A00 may be also set, when the air-fuel ratio is stuck rich or lean.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.
- Read freeze frame data using a hand-held tester or OBD II scan tool. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1 Check any other DTCs output (in addition to DTC P2A00 or P2A03).

PREPARATION:

- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON and turn the tester ON.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

CHECK:

- Read DTCs.

Result:

Display (DTC Output)	Proceed To
P2A00 and/or P2A03	A
P2A00 and/or P2A03 and other DTCs	B

HINT:

If any DTCs other than P2A00 and/or P2A03 are output, troubleshoot those DTCs first.

B

Go to relevant DTC chart (See page [DI-477](#)).

A

2 Check resistance of air-fuel ratio (A/F) sensor heater.

Component Side:

PREPARATION:

Disconnect the air-fuel ratio (A/F) sensor connector.

CHECK:

Measure resistance between the terminals of the A/F sensor connector.

OK:

Standard:

Tester Connection	Specified Condition
HT (1) - +B (2)	Between 1.8 Ω and 3.4 Ω at 20°C (68°F)
HT (1) - AF- (4)	10 k Ω or higher

NG

Replace air-fuel ratio (A/F) sensor.

OK

3 Check for open and short in harness and connector between ECM and A/F sensor.

PREPARATION:

- (a) Disconnect the A10 or A30 A/F sensor connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between the +B terminal of the A/F sensor connector and body ground.

OK:

Standard:

Tester Connections	Specified Conditions
+B (2) - Body ground	Between 9 V and 14 V

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the E6 ECM connector.

CHECK:

- (a) Check the resistance.

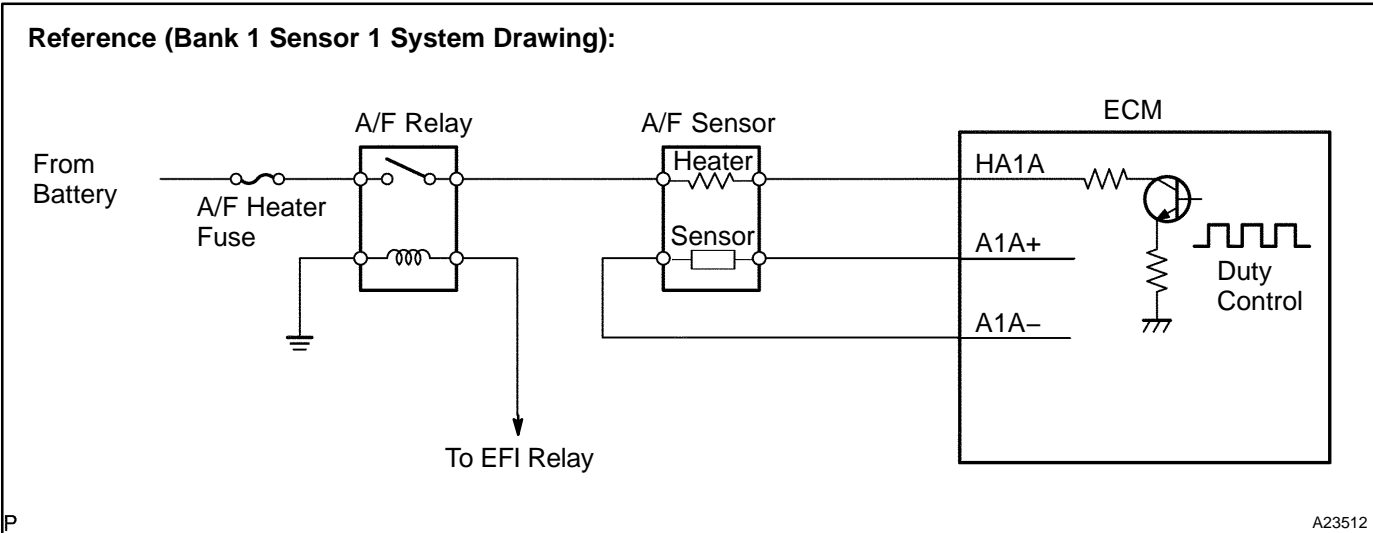

OK:

Standard (Check for open):

Tester Connections	Specified Conditions
HT (A10-1) - HA1A (E6-2) HT (A30-1) - HA2A (E6-1)	Below 1 Ω
AF+ (A10-3) - A1A+ (E6-22) AF+ (A30-3) - A2A+ (E6-23)	Below 1 Ω
AF- (A10-4) - A1A- (E6-30) AF- (A30-4) - A2A- (E6-31)	Below 1 Ω

Standard (Check for short):

Tester Connections	Specified Conditions
HT (A10-1) or HA1A (E6-2) - Body ground HT (A30-1) or HA2A (E6-1) - Body ground	10 kΩ or higher
AF+ (A10-3) or A1A+ (E6-22) - Body ground AF+ (A30-3) or A2A+ (E6-23) - Body ground	10 kΩ or higher
AF- (A10-4) or A1A- (E6-30) - Body ground AF- (A30-4) or A2A- (E6-31) - Body ground	10 kΩ or higher

NG

Replace or replace harness or connector.

OK

4 Perform confirmation driving pattern.

NEXT

5 Check whether DTC output recurs (DTC P2A00 or P2A03)

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2A00 or P2A03	A
No output	B

B

Check for intermittent problems
(See page [DI-430](#)).

A

6 Replace air fuel ratio sensor.

NEXT

7 Perform confirmation driving pattern.

NEXT

8	Check whether DTC output recurs (DTC P2A00 or P2A03)
----------	---

CHECK:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
- (b) Read DTCs.

RESULT:

Display (DTC Output)	Proceed To
P2A00 or P2A03	A
No output	B

EVAP (Evaporative Emission) Inspection Procedure

DTCS RELATING TO EVAP SYSTEM

DTCs	Monitoring Items	See Page
P043E	0.02 inch orifice clogged (built into pump module)	DI-869
P043F	0.02 inch orifice high-flow (built into pump module)	DI-869

NOTICE:

If the 0.02 inch reference pressure difference between the first and second checks is greater than the specification, the DTCs corresponding to the reference pressure (P043E, P043F, P0441, P0455, P0456, P2401, P2420) will be all stored.

CIRCUIT DESCRIPTION

HINT:
 The canister is located near the fuel tank, underneath the body.

While the engine is running, if a predetermined condition (closed-loop, etc.) is met, the purge VSV is opened by the ECM and stored fuel vapors in the canister are purged to the intake manifold. The ECM changes the duty cycle ratio of the purge VSV to control purge flow volume. The purge flow volume is also determined by the intake manifold pressure. Atmospheric pressure is allowed into the canister through the vent valve to ensure that the purge flow is maintained when the negative pressure (vacuum) is applied to the canister. The following two monitors run to confirm appropriate EVAP system operation.

Key-off monitor

This monitor checks for EVAP (Evaporative Emission) system leaks and pump module malfunctions. The monitor starts 5 hours* after the ignition switch is turned OFF. More than 5 hours are required to allow enough time for the fuel to cool down to stabilize the Fuel Tank Pressure (FTP), thus making the EVAP system monitor more accurate.

The electric vacuum pump creates negative pressure (vacuum) in the EVAP system and the pressure is measured. Finally, the ECM monitors for leaks from the EVAP system, and malfunctions in both the pump module and purge VSV, based on the EVAP pressure.

HINT:

*:If the engine coolant temperature is not below 35°C 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

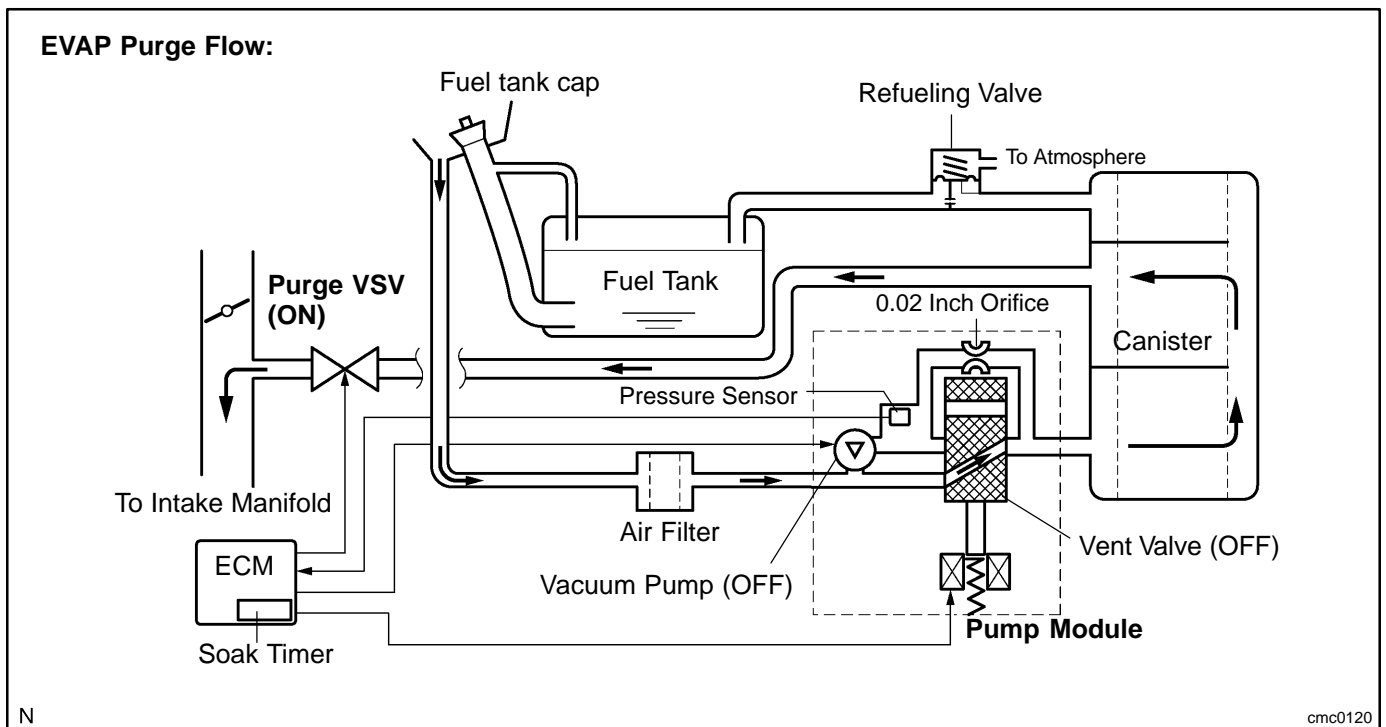

Purge flow monitor

The purge flow monitor consists of the two monitors. The 1st monitor is always conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
The vent valve is turned ON (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kpa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:

In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

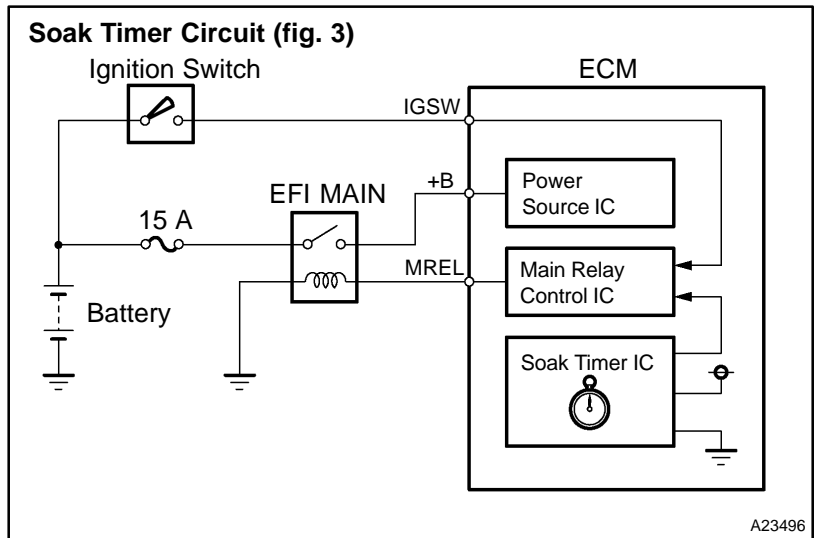

DIAGNOSTICS – ENGINE (2UZ-FE)

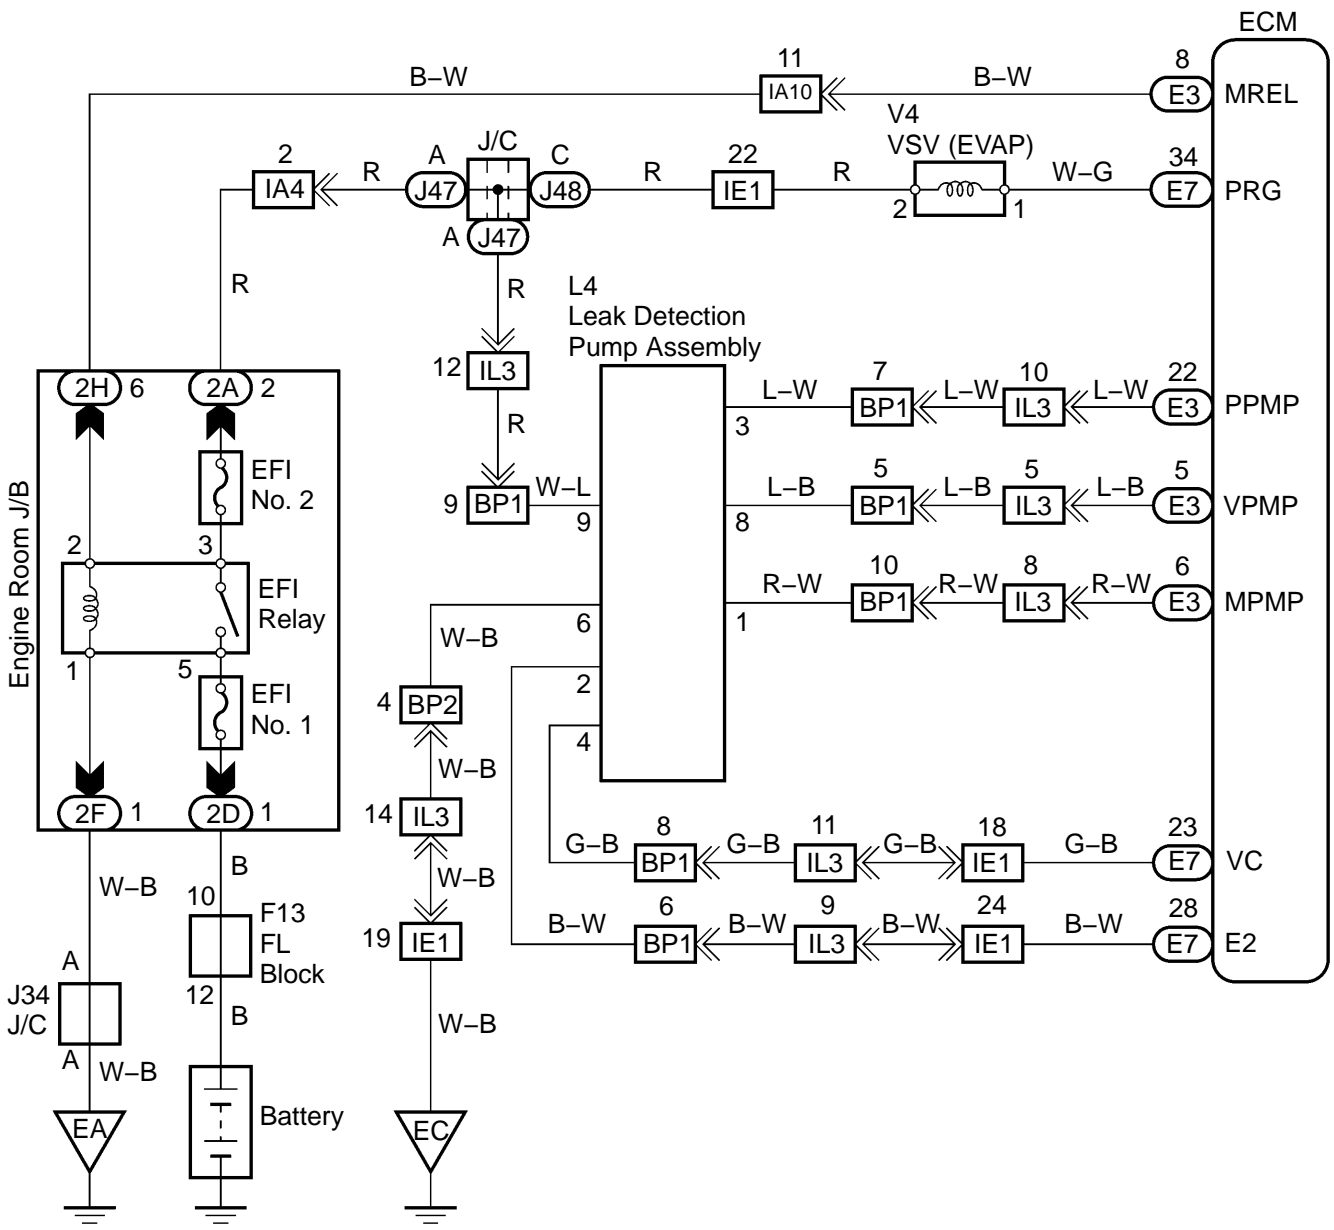

Components	Operations
Canister	Contains activated charcoal to absorb EVAP (Evaporative Emissions) generated in fuel tank.
Cut-off valve	Located in fuel tank. Valve floats and closes when fuel tank is 100 % full.
Purge VSV (Vacuum Switching Valve)	Opens or closes line between canister and intake manifold. ECM uses purge VSV to control EVAP purge flow. In order to discharge EVAP absorbed by canister to intake manifold, ECM opens purge VSV. EVAP discharge volume to intake manifold controlled by purge VSV duty cycle ratio (current-carrying time). (Open: ON, Close: OFF)
Refueling valve	Controls EVAP pressure from fuel tank to canister. Valve consists of diaphragm, spring and restrictor (diameter: 0.08 inch). When fuel vapor and pressure inside fuel tank increase, valve opens. While EVAP purged, valve closes and restrictor prevents large amount of vacuum from affecting pressure in fuel tank. Valve opened while refueling. When valve open, adding fuel into fuel tank possible.
Roll-over valve	Located in fuel tank. Valve closes by its own weight when vehicle overturns to prevent fuel from spilling out.
Service port	Used for connecting vacuum gauge for inspecting EVAP system.
Soak timer	Built into ECM. To ensure accurate EVAP monitor, measures 5 hours* after ignition switch turned to OFF. This allows fuel to cool down, stabilizing Fuel Tank Pressure (FTP). When approx. 5 hours* elapsed, ECM activates.
Pump module	Consists of (a) to (d) below. Pump module cannot be disassembled.
(a) Vent valve	Vents and closes EVAP system. When ECM turns valve ON, EVAP system closed. When, ECM turns valve OFF, EVAP system vented. Negative pressure (vacuum) created in EVAP system to check for EVAP leaks by closing purge VSV, turning on vent valve (closed) and operating vacuum pump (refer to fig. 1).
(b) Pressure sensor	Indicates pressure as voltages. ECM supplies regulated 5 V to pressure sensor, and uses feedback from sensor to monitor EVAP system pressure (refer to fig 2).
(c) Vacuum pump	Creates negative pressure (vacuum) in EVAP system for leak check.
(d) 0.02 inch orifice	Has opening with 0.02 inch diameter. Vacuum produced through orifice by closing purge VSV, turning off vent valve and operating vacuum pump, to monitor 0.02 inch leak pressure. 0.02 inch leak pressure indicates small leak of EVAP.

HINT:

*:If the engine coolant temperature is not below 35°C after 5 hours after the ignition switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C 7 hours after the ignition switch is turned off, the monitor check starts 2.5 hours later.

Double Cab:

C

INSPECTION PROCEDURE

NOTICE:

A hand-held tester is required to conduct the following diagnostic troubleshooting procedure.

HINT:

- Using hand-held tester monitor results enables the EVAP (Evaporative Emission) system to be confirmed.
- Read freeze frame data using a hand-held tester Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data, from the time the malfunction occurred.

1	Confirm DTC.
----------	---------------------

- Turn the ignition switch to OFF and wait for 10 seconds.
- Turn the ignition switch to ON.
- Turn the ignition switch to OFF and wait for 10 seconds.
- Connect a hand-held tester to the DLC3.
- Turn the ignition switch to ON and turn the tester ON.
- Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
- Confirm DTCs and freeze frame data.

If any EVAP system DTCs are set, the malfunctioning area can be determined using the table below.

Malfunctioning Areas	DTCs											
	P043E P043F	P0441	P0450	P0451	P0452	P0453	P0455	P0456	P2401 P2402	P2419	P2420

NOTICE:

If the 0.02 inch reference pressure difference between the first and second checks is greater than the specification, the DTCs corresponding to the reference pressure (P043E, P043F, P0441, P0455, P0456, P2401, P2420) will be all stored.

2	Perform EVAP system check.
----------	-----------------------------------

NOTICE:

- In the EVAP SYSTEM CHECK (AUTO OPERATION), the series of 5 EVAP SYSTEM CHECK steps is performed automatically by the hand-held tester. It takes a maximum of approximately 18 minutes.
 - Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.
 - Do not run the engine in this step.
 - When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).
- (a) Clear DTCs (see page [DI-462](#)).
- (b) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.
- (c) After the EVAP SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

HINT:

If no pending DTC is displayed, perform the Monitor Confirmation after this repair is completed. After this confirmation, check for pending DTCs. If no DTC is displayed, the EVAP system is normal.

3 Perform EVAP system manual operation check.

NOTICE:

- In the EVAP SYSTEM CHECK (MANUAL OPERATION), the series of 5 EVAP SYSTEM CHECK steps is performed manually by the hand-held tester.
 - Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.
 - Do not run the engine in this step.
 - When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).
- (a) Clear DTCs (see page DI-462).
 - (b) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / MANUAL OPERATION.

NEXT

5 Perform EVAP system step 1/5 to 2/5 check.

(a) Check the EVAP pressure in step 1/5 and 2/5.

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	Virtually no variation in EVAP pressure during step 1/5. Then decreases to 0.02 inch leak pressure standard*	Not yet determined	A
P2402	Small difference between EVAP pressures during steps 1/5 and 2/5	Vacuum pump stuck ON	B

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

HINT:

The 0.02 inch leak pressure standard is the value determined in step 2/5.

B Go to step 23.

A

6 Perform EVAP system step 2/5 check.

HINT:

Make a note of the pressures checked in steps (a) and (b) below.

- (a) Check the EVAP pressure 4 seconds after the vacuum pump is activated*.
- (b) Check the EVAP pressure again when it has stabilized. This pressure is the 0.02 inch leak pressure standard.

*: The vacuum pump begins to operate as step 1/5 is proceeded to step 2/5.

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure in step (b) between -4.85 kPa and -1.06 kPa (-36.38 mmHg and -7.95 mmHg)	Not yet determined	A
P043F and P2401	EVAP pressure in step (b) -1.06 kPa (-7.95 mmHg) or more	<ul style="list-style-type: none"> • 0.02 inch orifice high-flow • Vacuum pump stuck OFF 	B
P043E	EVAP pressure in step (b) below -4.85 kPa (-36.38 mmHg)	0.02 inch orifice clogged	C
P2419	EVAP pressure in step (a) more than -1.06 kPa (-7.95 mmHg)	Vent valve stuck closed	D

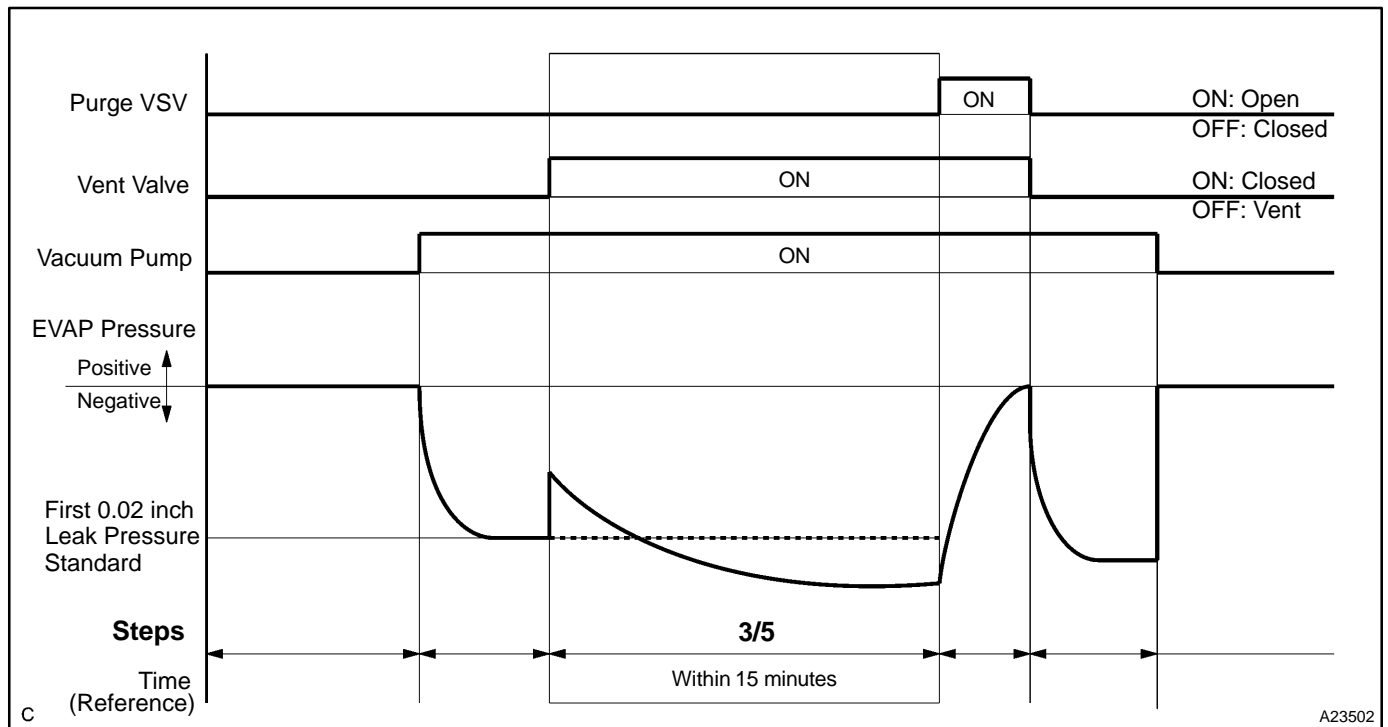

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

B Go to step 11

C Go to step 30

D Go to step 19

8 Perform EVAP system step 3/5 check.

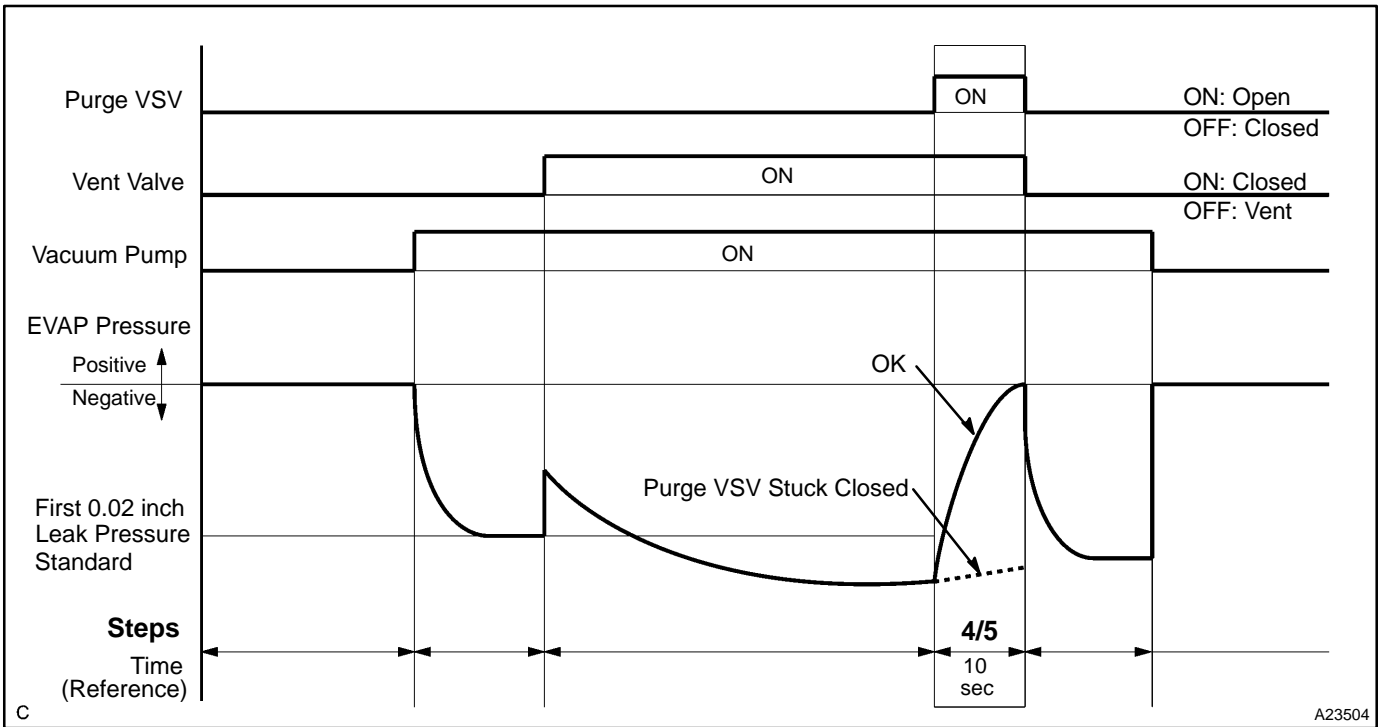

- (a) Wait until the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) for 30 seconds.
 (b) Measure the EVAP pressure and record it.

HINT:

A few minutes are required for the EVAP pressure to become saturated. When there is little fuel in the fuel tank, it takes up to 12 minutes.

NEXT

9 Perform EVAP system step 4/5 check.

(a) Check the EVAP pressure in step 4/5.

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Not yet determined	A
P0441	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Problems in EVAP hose between pure VSV and throttle body	B
P0441	Variation in EVAP pressure is less than 0.3 kPa (2.25 mmHg) for 10 seconds, after proceeding from step 3/5 to step 4/5	Purge VSV stuck closed	C

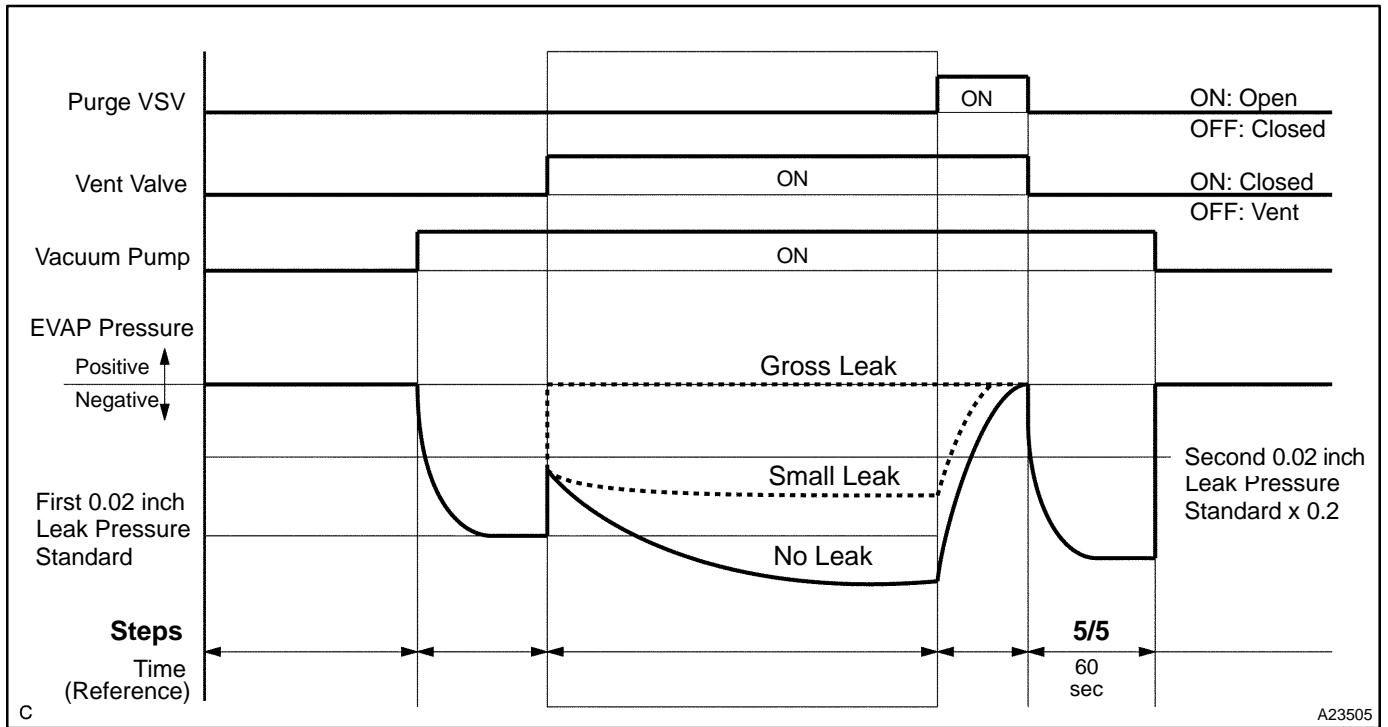

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

B Go to step 15.

C Go to step 12.

A

10 Perform EVAP system step 5/5 check.

- (a) Check the EVAP pressure in step 5/5.
- (b) Compare the EVAP pressure in step 3/5 and the second 0.02 inch leak pressure standard (step 5/5).

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure (step 3/5) lower than the second 0.02 inch leak pressure standard (step 5/5)	Not yet determined (no leakage from EVAP system)	A
P0441 and P0455	EVAP pressure (step 3/5) higher than [second 0.02 inch leak pressure standard (step 5/5) x 0.2]	<ul style="list-style-type: none"> • Purge VSV stuck open • EVAP gross leak 	B
P0456	EVAP pressure (step 3/5) higher than second 0.02 inch leak pressure standard (step 5/5)	EVAP small leak	B

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

11 Perform EVAP system step 3/5 check.

(a) Check the EVAP pressure in step 3/5.

Result:

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
—	EVAP pressure less than [0.02 inch leak pressure standard x 0.2]	0.02 inch orifice high-flow	A
—	EVAP pressure more than [0.02 inch leak pressure standard x 0.2]	Vacuum pump stuck OFF	B

*: The DTCs relating to the EVAP system displayed on a hand-held tester when checking.

HINT:

The 0.02 inch leak pressure standard is the value determined in step 2/5.

A	Go to step 30.
B	Go to step 23.

12 Perform active test of purge VSV.

PREPARATION:

- (a) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II/ ACTIVE TEST / EVAP VSV.
- (b) Disconnect the hose (connected to the canister) from the purge VSV.
- (c) Start the engine.

CHECK:

- (a) On the tester, turn off the purge VSV (EVAP VSV: OFF).
- (b) Use your finger to confirm that the purge VSV has no suction.
- (c) Using the tester, turn on the purge VSV (EVAP VSV: ON).
- (d) Use your finger to confirm that the purge VSV has suction.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
No suction when purge VSV turned OFF, and suction applied when tuned ON	Purge VSV normal	A
Suction applied when purge VSV turned OFF	Purge VSV stuck open	B
No suction when purge VSV turned ON	<ul style="list-style-type: none"> • Purge VSV stuck closed • Problems with EVAP hose between purge VSV and throttle body 	C

B Go to step 14.

C Go to step 15.

A

13	Check fuel tank cap.
-----------	-----------------------------

CHECK:

(a) Check that the fuel tank cap is correctly installed and confirm the fuel tank cap meets OEM specification.

HINT:

If an EVAP tester is available, check the fuel tank cap using the tester.

- (1) Tighten the fuel tank cap.
- (2) Remove the fuel tank cap and install it onto a fuel tank cap adaptor.
- (3) Connect an EVAP tester pump hose to the adaptor, and pressurize to 3.2 to 3.7 kPa (24 to 28 mmHg) using an EVAP tester pump.
- (4) Seal the adaptor and wait for 2 minutes.
- (5) Check the pressure. If the pressure is 2 kPa (15 mmHg) or more, the fuel tank cap is normal.

PREPARATION:

Test Results	Suspected Trouble Areas	Proceed To
Fuel tank cap correctly installed	—	A
Fuel tank cap loose	<ul style="list-style-type: none"> • Fuel tank cap improperly installed • Defective fuel tank cap • Fuel tank cap does not meet OEM specifications 	B
No fuel tank cap	—	C

14 Inspect EVAP VSV.

PREPARATION:

- (a) Turn the ignition switch to OFF.
- (b) Disconnect the V4 purge VSV connector.
- (c) Disconnect the hose (connected to the canister) from the purge VSV.
- (d) Start the engine.

CHECK:

Use your finger to confirm that the purge VSV has no suction.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
No suction	ECM	A
Suction applied	Purge VSV	B

A Go to step 34.

B Go to step 30.

15 Check EVAP hose between purge VSV and throttle body.

PREPARATION:

- (a) Disconnect the hose (connected to the throttle body) from the purge VSV.
- (b) Start the engine.

CHECK:

- (a) Use your finger to confirm that the hose has suction.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between purge VSV and throttle body normal	A
No suction	<ul style="list-style-type: none"> • Throttle body • EVAP hose between purge VSV and throttle body 	B

B Go to step 26.

A

16 Inspect EVAP VSV.

PREPARATION:

- (a) Remove the purge VSV.
- (b) Apply battery voltage to the terminals of the purge VSV.

CHECK:

Using an air gun, confirm that air flows from port A to port B.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between purge VSV and throttle body normal	A
No suction	<ul style="list-style-type: none"> • Throttle body • EVAP hose between purge VSV and throttle body 	B

B → **Go to step 31.**

A

17 Measure purge VSV terminal voltage.

PREPARATION:

- (a) Disconnect the V4 purge VSV connector.
- (b) Turn the ignition switch to ON.

CHECK:

- (a) Measure the voltage between terminal 1 of the purge VSV connector and the body ground.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Between 11 V and 14 V	Normal	A
Other than result above	Wire harness or connectors between purge VSV and ECM	B

B → **Go to step 32.**

A

18 Check for open and short circuit in harness and connector between purge VSV and ECM.

PREPARATION:
Disconnect the E7 ECM connector and the V4 purge VSV connector.

CHECK:
Check the resistance.

OK:
Standard:

Tester Connections	Specified Conditions
E7-34 (PRG) - V4-1	Below 1 Ω
E7-34 (PRG) - Body ground	10 kΩ or higher
V4-1 - Body ground	10 kΩ or higher

OK → Go to step 35.

NG → Go to step 32.

19 Perform active test for vent valve.

PREPARATION:
(a) Turn the ignition switch to ON.
(b) On the hand-held tester, select the following menu items: DIAGNOSIS/ ENHANCED OBD II/ ACTIVE TEST/ VENT VALVE (ALONE).

CHECK:
Measure the voltage between terminal VPMP of the ECM connector and the body ground when the vent valve is turned ON (close) and OFF (vent) using the tester.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V when OFF Below 3 V when ON	Vent valve	A
Below 3 V when OFF and ON	ECM	B

A → Go to step 22.

B → Go to step 35.

20 Perform active test for vent valve.

PREPARATION:

- (a) Turn the ignition switch to ON.
- (b) On the hand-held tester, select the following menu items:
DIAGNOSIS/ ENHANCED OBD II/ ACTIVE TEST/ VENT VALVE (ALONE).

CHECK:

Measure the voltage between terminal VPMP of the ECM connector and the body ground when the vent valve is turned ON (close) and OFF (vent) using the tester.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Below 3 V when OFF and ON	Power source of vent valve	A
Between 9 V and 14 V when OFF Below 3 V when ON	Vent valve	B
Between 9 V and 14 V when OFF and ON	ECM	C

B Go to step 24.

C Go to step 35.

A

21 Inspect pump module power source circuit.

PREPARATION:

- Turn the ignition switch to OFF.
- Disconnect the L4 canister connector.
- Turn the ignition switch to ON.

CHECK:

Measure the voltage between terminal 9 of the canister connector and the body ground.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V	Normal	A
Between 0 V and 3 V	Power source wire harness of vent valve	B

B
Go to step 32.
A

22 Inspect vent valve operation of pump module.

PREPARATION:

- (a) Disconnect the L4 canister connector.
- (b) Turn the ignition switch to OFF.
- (c) Apply the battery voltage to terminals 9 and 8 of the pump module.

CHECK:

Touch the pump module to confirm the vent valve operation.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Operating	Wire harness between vent valve and ECM	A
Not operating	Vent valve	B

A

Go to step 32.

B

Go to step 30.

23 Perform active test for vacuum pump.

PREPARATION:

On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP (ALONE).

CHECK:

Measure the voltage between terminal MPMP of the ECM connector and the body ground when the vacuum pump is turned ON and OFF using the tester.

Result:

Tests Results	Suspected Trouble Areas	Proceed To
Between 0 V and 3 V when OFF Between 9 V and 14 V when ON	ECM normal	A
Between 9 V and 14 V when OFF Between 0 V and 3 V when ON	ECM	B

B

Go to step 35.

A

24 Check for open and short circuit in harness and connector between pump module and ECM.
**PREPARATION:**

- Turn the ignition switch to OFF.
- Disconnect the L4 canister connector.
- Turn the ignition switch to ON.
- On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP (ALONE).
- Turn the vacuum pump ON.

CHECK:

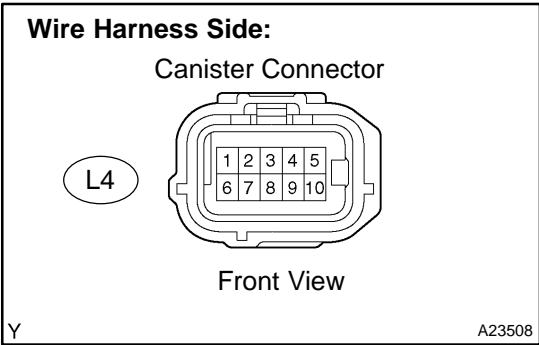

Measure the voltage between terminal 1 of the canister connector and the body ground.

**RESULT:**

Test Results	Suspected Trouble Areas	Proceed To
Between 9 V and 14 V	Normal	A
Between 0 V and 3 V	Wire harness between ECM and vacuum pump	B

B**Go to step 32.****A**

25 Check for open and short in harness and connector between pump module and ECM.

PREPARATION:

- (a) Disconnect the L4 canister connector.
- (b) Turn the ignition switch to OFF.

CHECK:

Check the resistance between terminal 6 of the canister connector and the body ground.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Below 1 Ω	Vacuum pump	A
10 kΩ or more	Wire harness between vacuum pump and body ground	B

A

Go to step 30.

B

Go to step 32.

26 Inspect throttle body.

PREPARATION:

- (a) Stop the engine.
- (b) Disconnect the EVAP hose from the throttle body.
- (c) Start the engine.

CHECK:

- (a) Use your finger to confirm that the port of the throttle body has suction.

RESULT:

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between throttle body and purge VSV	A
No suction	Throttle body	B

A

Go to step 33.

B

Go to step 34.

27 Correctly reinstall or replace fuel tank cap.

HINT:

- When reinstalling the fuel tank cap, tighten it until a few click sounds are heard.
- When replacing the fuel tank cap, use a fuel tank cap that meets OEM specifications, and install it until a few click sounds are heard.

NEXT**Go to step 37.****28 Replace fuel tank cap.**

HINT:

When installing the fuel tank cap, tighten it until a few click sounds are heard.

NEXT**Go to step 37.****29 Locate EVAP leak.**

(a) Disconnect the vent hose.

- (b) Connect the EVAP pressure tester tool to the canister with the adapter.

- (c) Pressurize the EVAP system by 3.2 to 3.7 kPa (24 to 28 mmHg).
 (d) Apply soapy water to the piping and the connecting parts of the EVAP system.
 (e) Look for areas where bubbles appear. This indicates leak point.
 (f) Repair or replace the leak point.

NEXT

Go to step 37.

30 Replace charcoal canister.

NEXT

Go to step 37.

31 Replace EVAP VSV (See page [SF-64](#)).

- (a) Disconnect the connector and the hoses from the purge VSV.
 (b) Remove the purge VSV.
 (c) Install a new purge VSV.
 (d) Reconnect the connector and hoses.

NEXT

Go to step 37.

32 Repair or replace wire harness or connector.

NEXT

Go to step 37.

33	Replace EVAP hose between EVAP VSV and throttle body.
-----------	--

NEXT **Go to step 37.**

34	Inspect throttle body.
-----------	-------------------------------

- (a) Remove the throttle body (see page [SF-44](#)).
- (b) Check that the EVAP purge port of the throttle body is not clogged. If necessary, replace the throttle body.

NEXT **Go to step 37.**

35	Replace ECM (See page SF-82)
-----------	---

NEXT **Go to step 37.**

36	Repair or replace parts and components indicated by output DTCs.
-----------	---

- (a) Repair the malfunctioning areas indicated by the DTCs that had been confirmed when the vehicle was brought in.

NEXT **Go to step 37.**

37	Perform EVAP system auto operation check.
-----------	--

NOTICE:

- In the EVAP SYSTEM CHECK (AUTO OPERATION), the series of 4 EVAP SYSTEM CHECK steps is performed automatically by the hand-held tester. It takes a maximum of approximately 15 minutes.
 - Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90 % full because the cut-off valve may be closed and making the leak check of the fuel tank unavailable.
 - Do not run the engine in this step.
 - When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing an EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).
- (a) Clear DTCs (see page [DI-462](#)).
 - (b) On the hand-held tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.
 - (c) After the SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

HINT:

If no pending DTC is found, the repair has been successfully completed.

NEXT

Completed

Monitor Confirmation

HINT:

After a repair, check Monitor Status by performing the Key–Off Monitor Confirmation and Purge Flow Monitor Confirmation described below.

1. KEY–OFF MONITOR CONFIRMATION

(a) Preconditions

The monitor will not run unless:

- The vehicle has been driven for 10 minutes or more (in a city area or on a free way)
- The fuel tank is less than 90 % full
- The altitude is less than 8,000 ft (2,400 m)
- The Engine Coolant Temperature (ECT) is between 4.4°C and 35°C (40°F and 95°F)
- The Intake Air Temperature (IAT) is between 4.4°C and 35°C (40°F and 95°F)
- The vehicle remains stationary (the vehicle speed is 0 mph [0 km/h])

(b) Monitor Conditions

- (1) Allow the engine to idle for at least 5 minutes.
- (2) Turn the ignition switch to OFF and wait for 6 hours (8 or 10.5 hours).

HINT:

Do not start the engine until checking MONITOR STATUS. If the engine is started, the steps described above must be repeated.

(c) Monitor Status

- (1) Connect a hand–held tester to the DLC3.
- (2) Turn the ignition switch to ON and turn the tester ON.
- (3) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
- (4) Check the Monitor Status displayed on the tester.

HINT:

If INCMP is displayed, the monitor is not completed. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

2. PURGE FLOW MONITOR CONFIRMATION (P0441)

HINT:

Perform this monitor confirmation after the Key–Off Monitor Confirmation shows COMPL (complete).

(a) Preconditions

The monitor will not run unless:

- The vehicle has been driven for 10 minutes or more (in a city area or on a free way)
- The ECT is between 4.4°C and 35°C (40°F and 95°F)
- The IAT is between 4.4°C and 35°C (40°F and 95°F)

(b) Monitor Conditions

- (1) Release the pressure from the fuel tank by removing and reinstalling the fuel tank cap.
- (2) Warm the engine up until the ECT reaches more than 75°C (167°F).
- (3) Increase the engine speed to 3,000 rpm once.
- (4) Allow the engine to idle and turn A/C ON for 1 minute.

(c) Monitor Status

- (1) Turn the ignition switch to OFF (where ON or the engine is running).
- (2) Connect a hand-held tester to the DLC3.
- (3) Turn the ignition switch to ON and turn the tester ON.
- (4) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
- (5) Check the Monitor Status displayed on the tester.

HINT:

If INCMP is displayed, the monitor is not completed. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

MONITOR RESULT

Refer to page [DI-445](#) for detailed information.

The test value and test limit information are described as shown in the following table. Check the monitor result and test values after performing the monitor drive pattern (refer to "Confirmation Monitor").

- MID (Monitor Identification Data) is assigned to each emissions-related component.
- TID (Test Identification Data) is assigned to each test value.
- Scaling is used to calculate the test value indicated on generic OBD II scan tools.

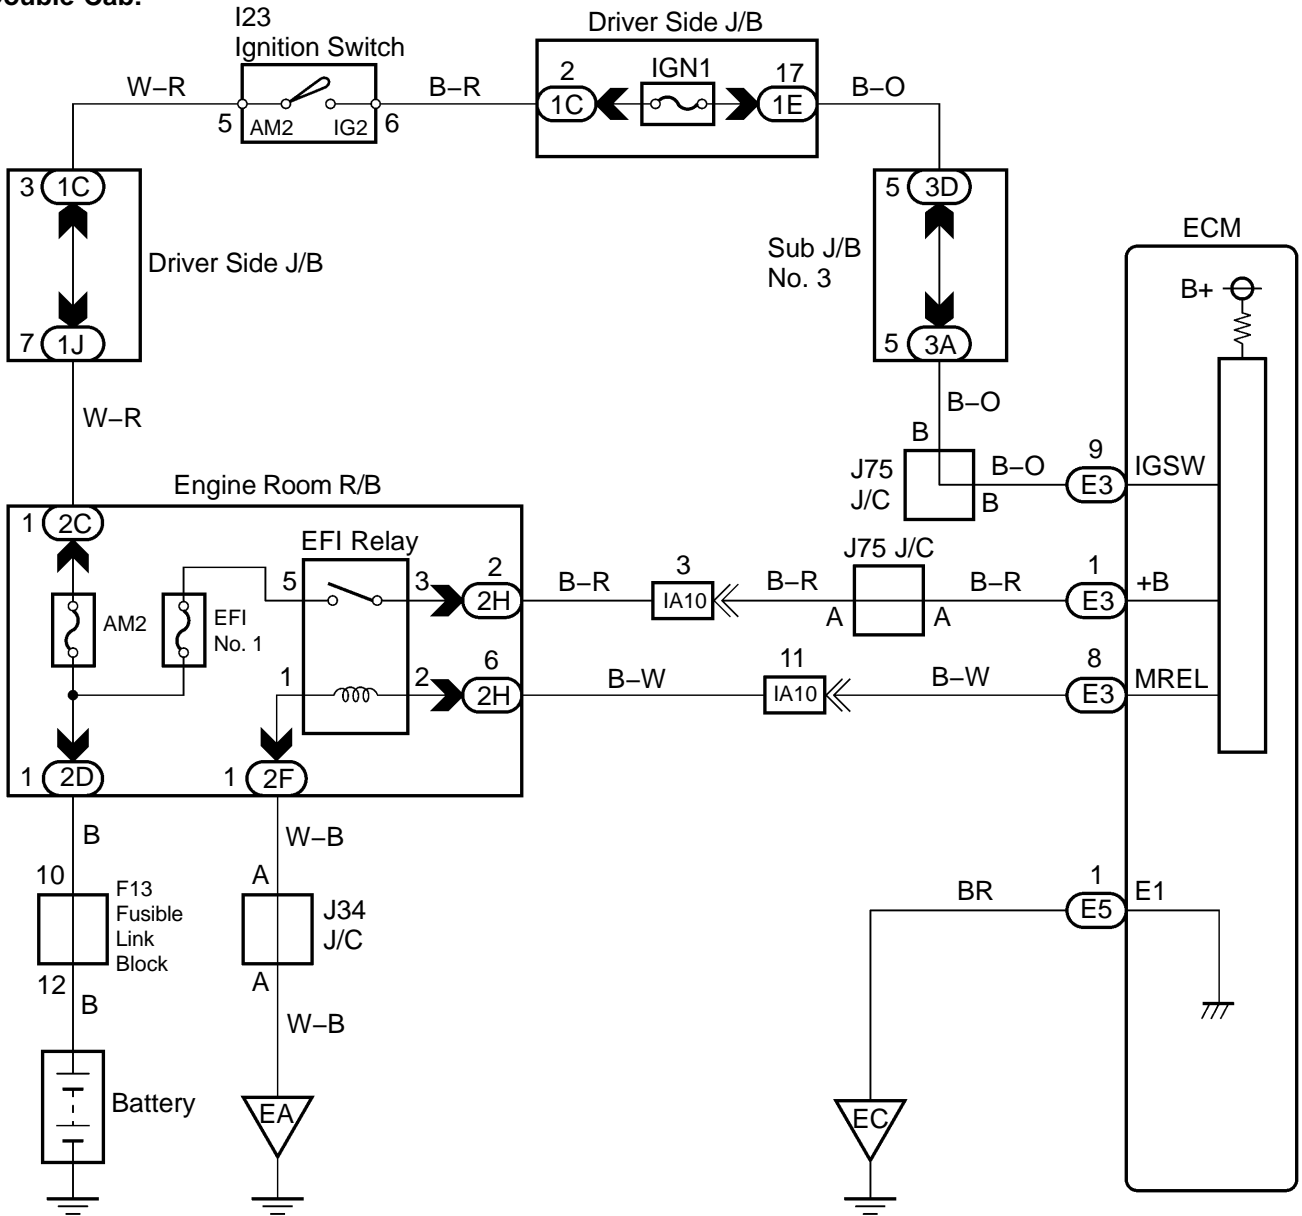

EVAP-Key-off monitor

MID	TID	Scaling	Description of Test Value	Minimum Test Limit	Maximum Test Limit
\$3D	\$C9	Multiply by 0.01 (kPa)	Test value for small leak (P0456): Refer to pressure D*.	Minimum test limit for small leak	Maximum test limit for small leak
\$3D	\$CA	Multiply by 0.01 (kPa)	Test value for gross leak (P0455): Refer to pressure E*.	Minimum test limit for gross leak	Maximum test limit for gross leak
\$3D	\$CB	Multiply by 0.01 (kPa)	Test value for vacuum pump stuck OFF (P2401): Refer to pressure A*.	Minimum test limit for vacuum pump stuck OFF	Maximum test limit for vacuum pump stuck OFF
\$3D	\$CD	Multiply by 0.01 (kPa)	Test value for vacuum pump stuck ON (P2402): Refer to pressure A*.	Minimum test limit for vacuum pump stuck ON	Maximum test limit for vacuum pump stuck ON
\$3D	\$CE	Multiply by 0.01 (kPa)	Test value for vent valve stuck OFF (vent) (P2420): Refer to pressure C*.	Minimum test limit for vent valve stuck ON	Maximum test limit for vent valve stuck ON
\$3D	\$CF	Multiply by 0.01 (kPa)	Test value for vent valve stuck ON (closed) (P2419): Refer to pressure A*.	Minimum test limit for vent valve stuck OFF	Maximum test limit for vent valve stuck OFF
\$3D	\$D0	Multiply by 0.01 (kPa)	Test value for 0.02 inch orifice low flow (P043E): Refer to pressure B*.	Minimum test limit for 0.02 inch orifice low flow	Maximum test limit for 0.02 inch orifice low flow
\$3D	\$D1	Multiply by 0.01 (kPa)	Test value for 0.02 inch orifice high flow (P043F): Refer to pressure A*.	Minimum test limit for 0.02 inch orifice high flow	Maximum test limit for 0.02 inch orifice high flow
\$3D	\$D4	Multiply by 0.01 (kPa)	Test value for purge VSV stuck close (P0441): Refer to pressure F*.	Minimum test limit for purge VSV stuck close	Maximum test limit for purge VSV stuck close
\$3D	\$D5	Multiply by 0.01 (kPa)	Test value for purge VSV stuck open (P0441): Refer to pressure E*.	Minimum test limit for purge VSV stuck open	Maximum test limit for purge VSV stuck open
\$3D	\$D7	Multiply by 0.01 (kPa)	Test value for purge flow (P0441): Refer to pressure G*.	Minimum test limit for purge flow	Maximum test limit for purge flow

* Pressure A to G are indicated as shown in the diagram below.

Double Cab:

INSPECTION PROCEDURE

- 1 Check voltage between terminals +B and E1 of ECM connector.

**PREPARATION:**

Turn the ignition switch ON.

CHECK:

Measure the voltage between terminals +B and E1 of the ECM connectors.

OK:

Standard: 9 to 14 V

OK

Proceed to next circuit inspection shown in the Problem symptoms table (See page [DI-452](#)).

NG

- 2 Check for open in harness and connector between terminal E1 of ECM and body ground (See page [IN-30](#)).

NG

Repair or replace harness or connector.

OK

- 3 Check voltage between terminal IGSW of ECM connector and body ground.

**PREPARATION:**

Turn the ignition switch ON.

CHECK:

Measure the voltage between terminal IGSW of the ECM connector and body ground.

OK:

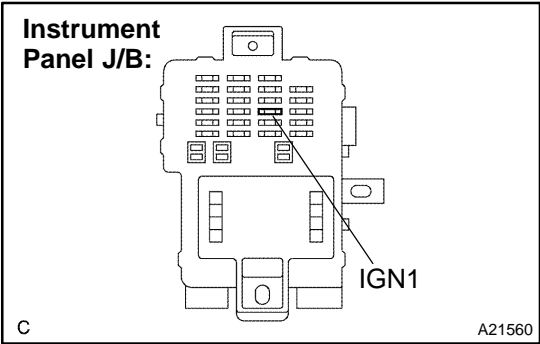

Standard: 9 to 14 V

OK

Go to step 6.

NG

4 Check IGN1 fuse.

PREPARATION:
Remove the IGN1 fuse from the instrument panel J/B.

CHECK:
Check the resistance of the IGN1 fuse.

OK:
Below 1 Ω

NG Check for short in all harness and components connected to IGN1 fuse.

OK

5 Check ignition switch (See page BE-37).

PREPARATION:
(a) Remove the lower finish panel.
(b) Disconnect the ignition switch connector.

CHECK:
Check resistance between terminals.

OK:

Standard:

Switch Position	Terminal Condition	Specified Condition
LOCK	Always	10 kΩ or more
ACC	1 - 3	Below 1 Ω
ON	1 - 2 - 3 5 - 6	Below 1 Ω
START	1 - 2 4 - 5 - 6	Below 1 Ω

NG Replace ignition switch.

OK

Check and repair harness and connector between IGN fuse and ECM.

6 Check voltage between terminal MREL of ECM connector and body ground.

**PREPARATION:**

Turn the ignition switch ON.

CHECK:

Measure the voltage between terminal MREL of the ECM connector and body ground.

OK:

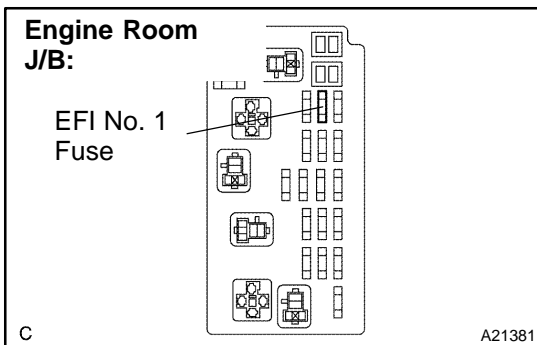

Standard: 9 to 14 V

NG

Replace ECM (See page [SF-82](#)).

OK

7 Check EFI No. 1 fuse of engine room J/B.

**PREPARATION:**

Remove the EFI No. 1 fuse from the engine room J/B.

CHECK:

Check resistance of EFI No. 1 fuse.

OK:

Below 1 Ω

NG

Check for short in all harness and components connected to EFI No. 1 fuse.

OK

8 Check EFI relay.

PREPARATION:

Remove the EFI relay from the engine room J/B.

CHECK:

Inspect the EFI relay.

OK:

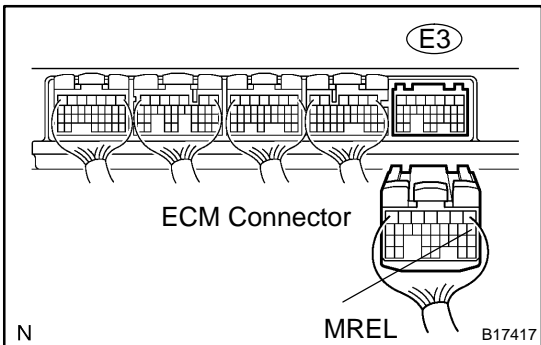

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 K Ω or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG Replace EFI relay.

OK

9 Check for open and short in harness and connector between terminal MREL of ECM and body ground.

PREPARATION:

Disconnect the E3 ECM connector.

CHECK:

Measure the resistance between the wire harness side connector and body ground.

OK:

Standard:

Tester Connection	Specified Condition
MREL (E3-8) - Body ground	Below 1 Ω

NG Repair or replace harness or connector.

OK

Check for intermittent problems (See page [DI-430](#)).

IACV Control Circuit

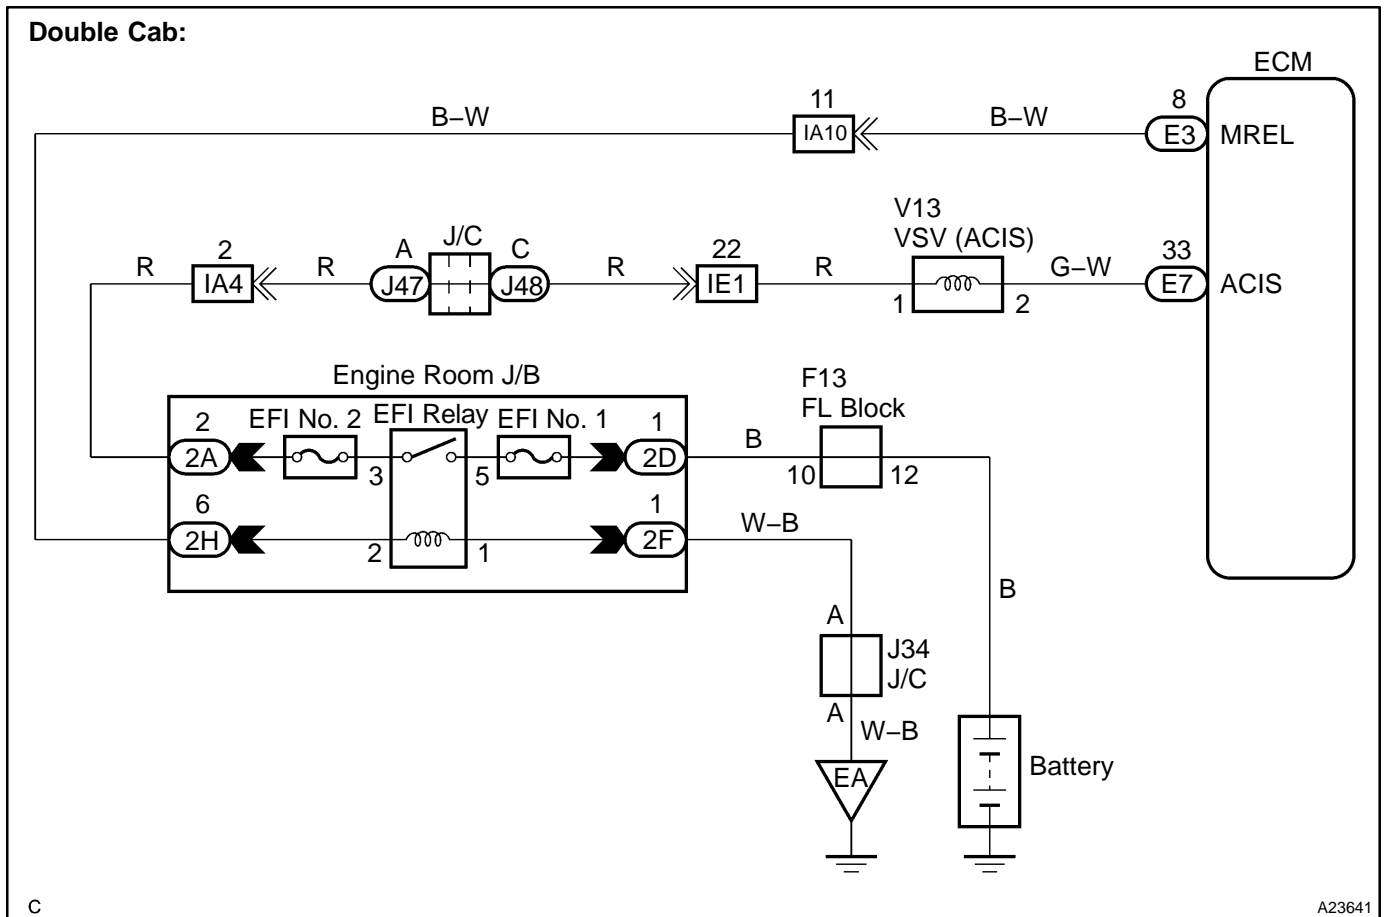

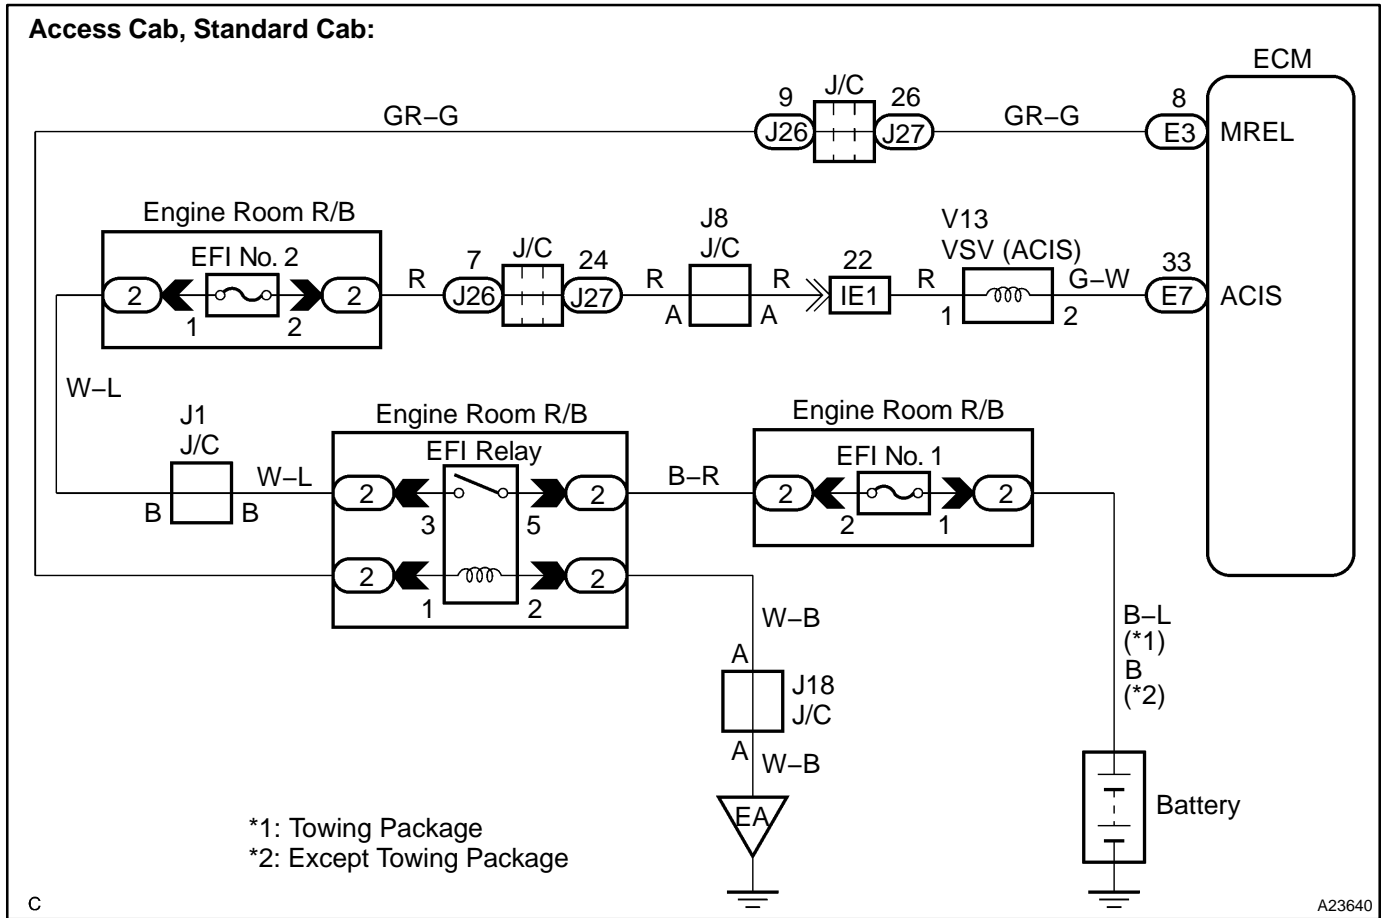

CIRCUIT DESCRIPTION

This circuit opens and closes the Intake Air Control Valve (IACV) in response to the engine load in order to increase the intake efficiency (ACIS: Acoustic Control Induction System).

When the engine speed is 4,700 rpm or more and the throttle valve opening angle is 60° or more, the VSV is OFF, so the IACV is open. All the other times, the ECM turns the VSV ON and closes the IACV.

WIRING DIAGRAM

INSPECTION PROCEDURE

1 Connect hand-held tester, and check operation of VSV for ACIS.

**PREPARATION:**

- Connect the hand-held tester to the DLC3.
- Turn the ignition switch ON and push the hand-held tester main switch ON.
- Select the ACTIVE TEST mode on the hand-held tester.

CHECK:

Check the operation of the VSV when the VSV is operated by the hand-held tester.

OK:

VSV is ON:

Air from port E flows out through port F.

VSV is OFF:

Air from port E flows out through the air filter.

OK

Check for vacuum tank (See page [SF-56](#)).

NG

2 Check VSV for ACIS (See page [SF-51](#)).

NG

Replace VSV for ACIS.

OK

3 Check for open and short in harness and connector between EFI main relay (Marking: EFI) and ECM (See page IN-30).

- (a) Check the wire harness between the VSV for ACIS and connector the ECM connector.
 - (1) Disconnect the VSV for ACIS connector.
 - (2) Disconnect the E5 and E7 ECM connector.
 - (3) Check for resistance between the wire harness side connectors.

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
VSV for ACIS (V13-2) - ACIS (E7-33)	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
VSV for ACIS (V13-2) or ACIS (E7-33) - E1 (E5-1)	10 kΩ or higher

- (b) Check the wire harness between the VSV for ACIS connector and the EFI relay.
 - (1) Disconnect the VSV for ACIS connector.
 - (2) Remove the EFI relay from the engine room R/B.
 - (3) Check for resistance between the wire harness side connectors.

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
VSV for ACIS (V13-1) - EFI relay terminal 3 of R/B	Below 1 Ω

NG	Repair or replace harness or connector.
-----------	--

OK

Replace ECM (See page SF-82).

Cranking Hold Function Circuit

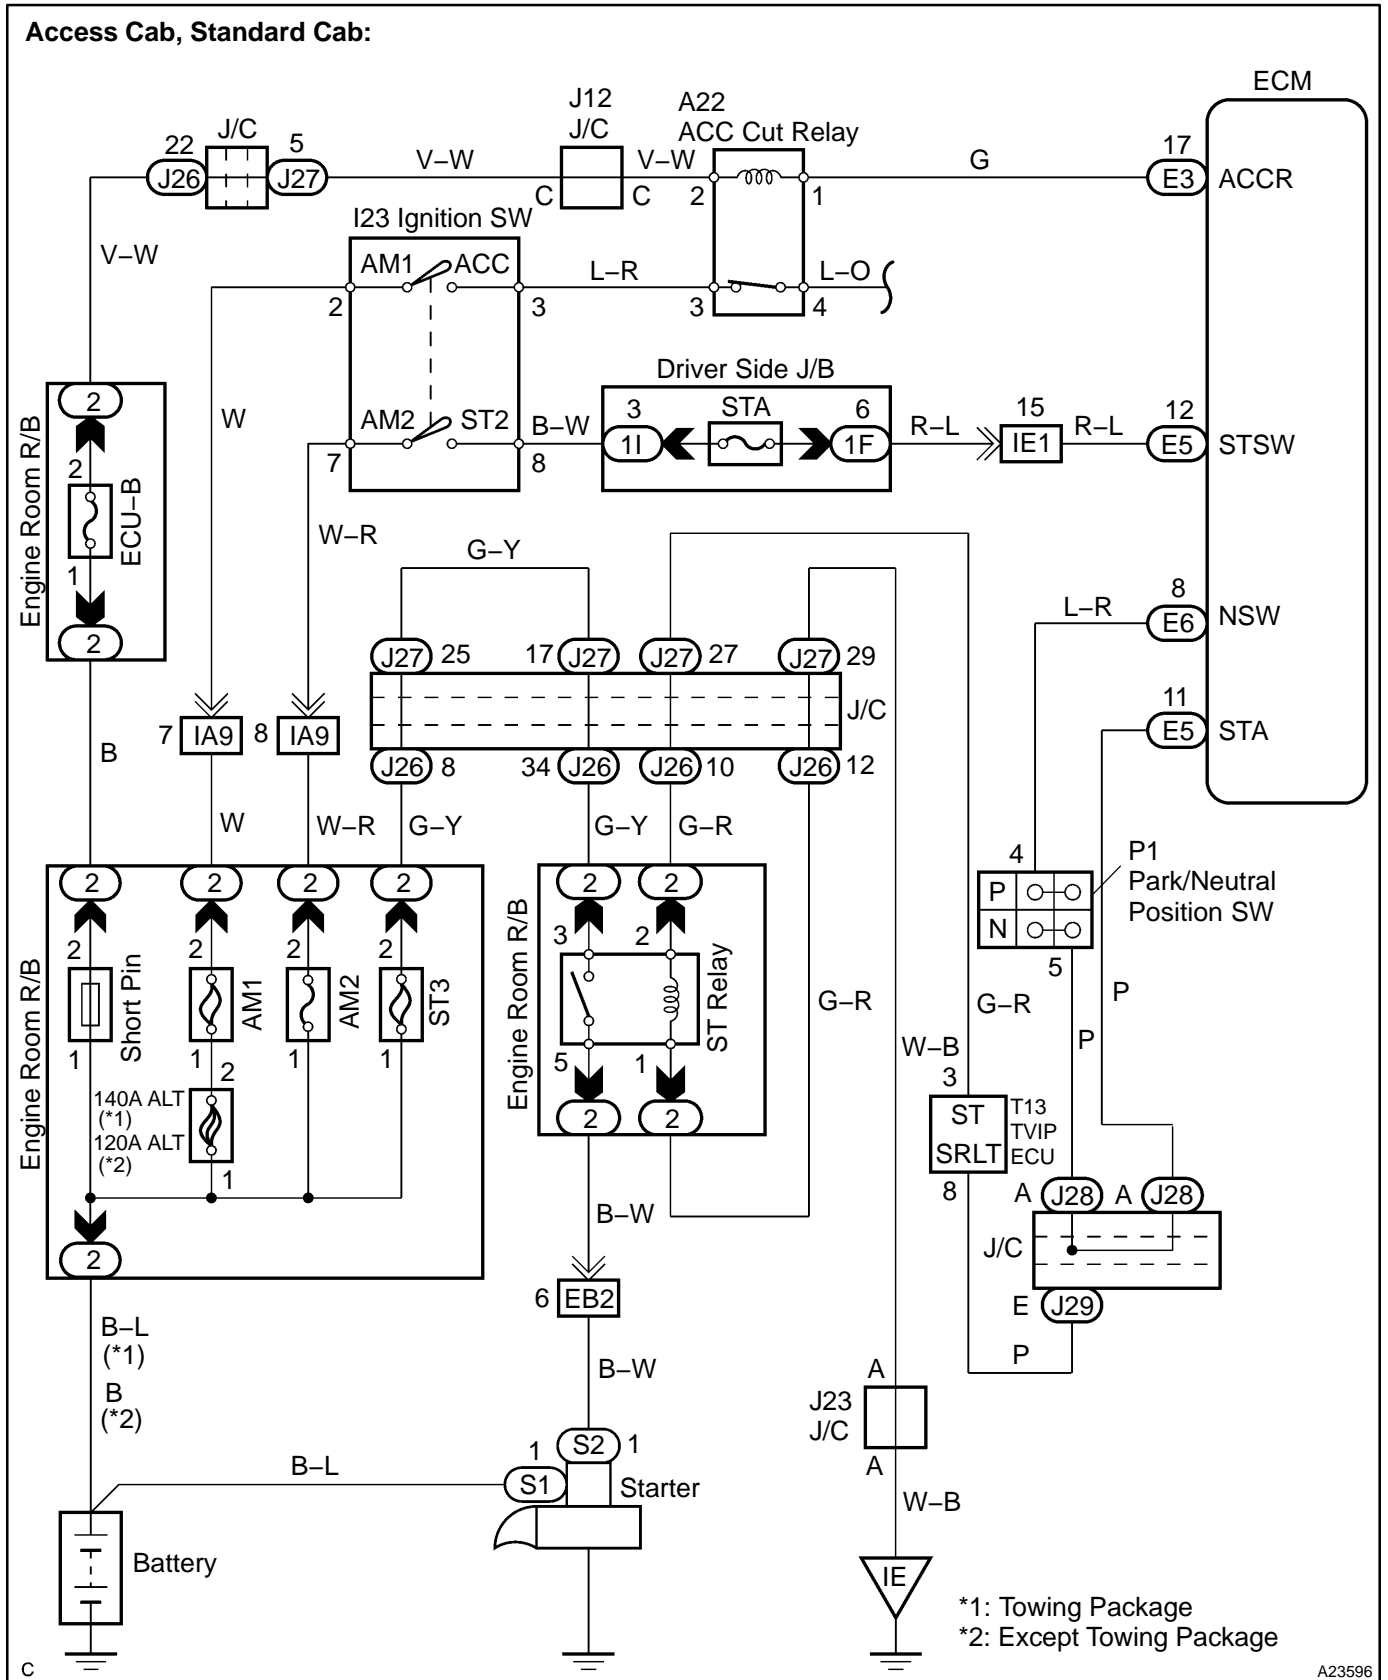

CIRCUIT DESCRIPTION

The starter is controlled by the ECM, when the ECM detects a start signal (STSW) from the ignition switch, this system monitors the engine speed (NE) and continues to operate the starter until it has determined that the engine has started (engine speed reaches approximately 500 rpm). If the engine is already running and the ignition switch is turned to START, the ECM will not operate the starter.

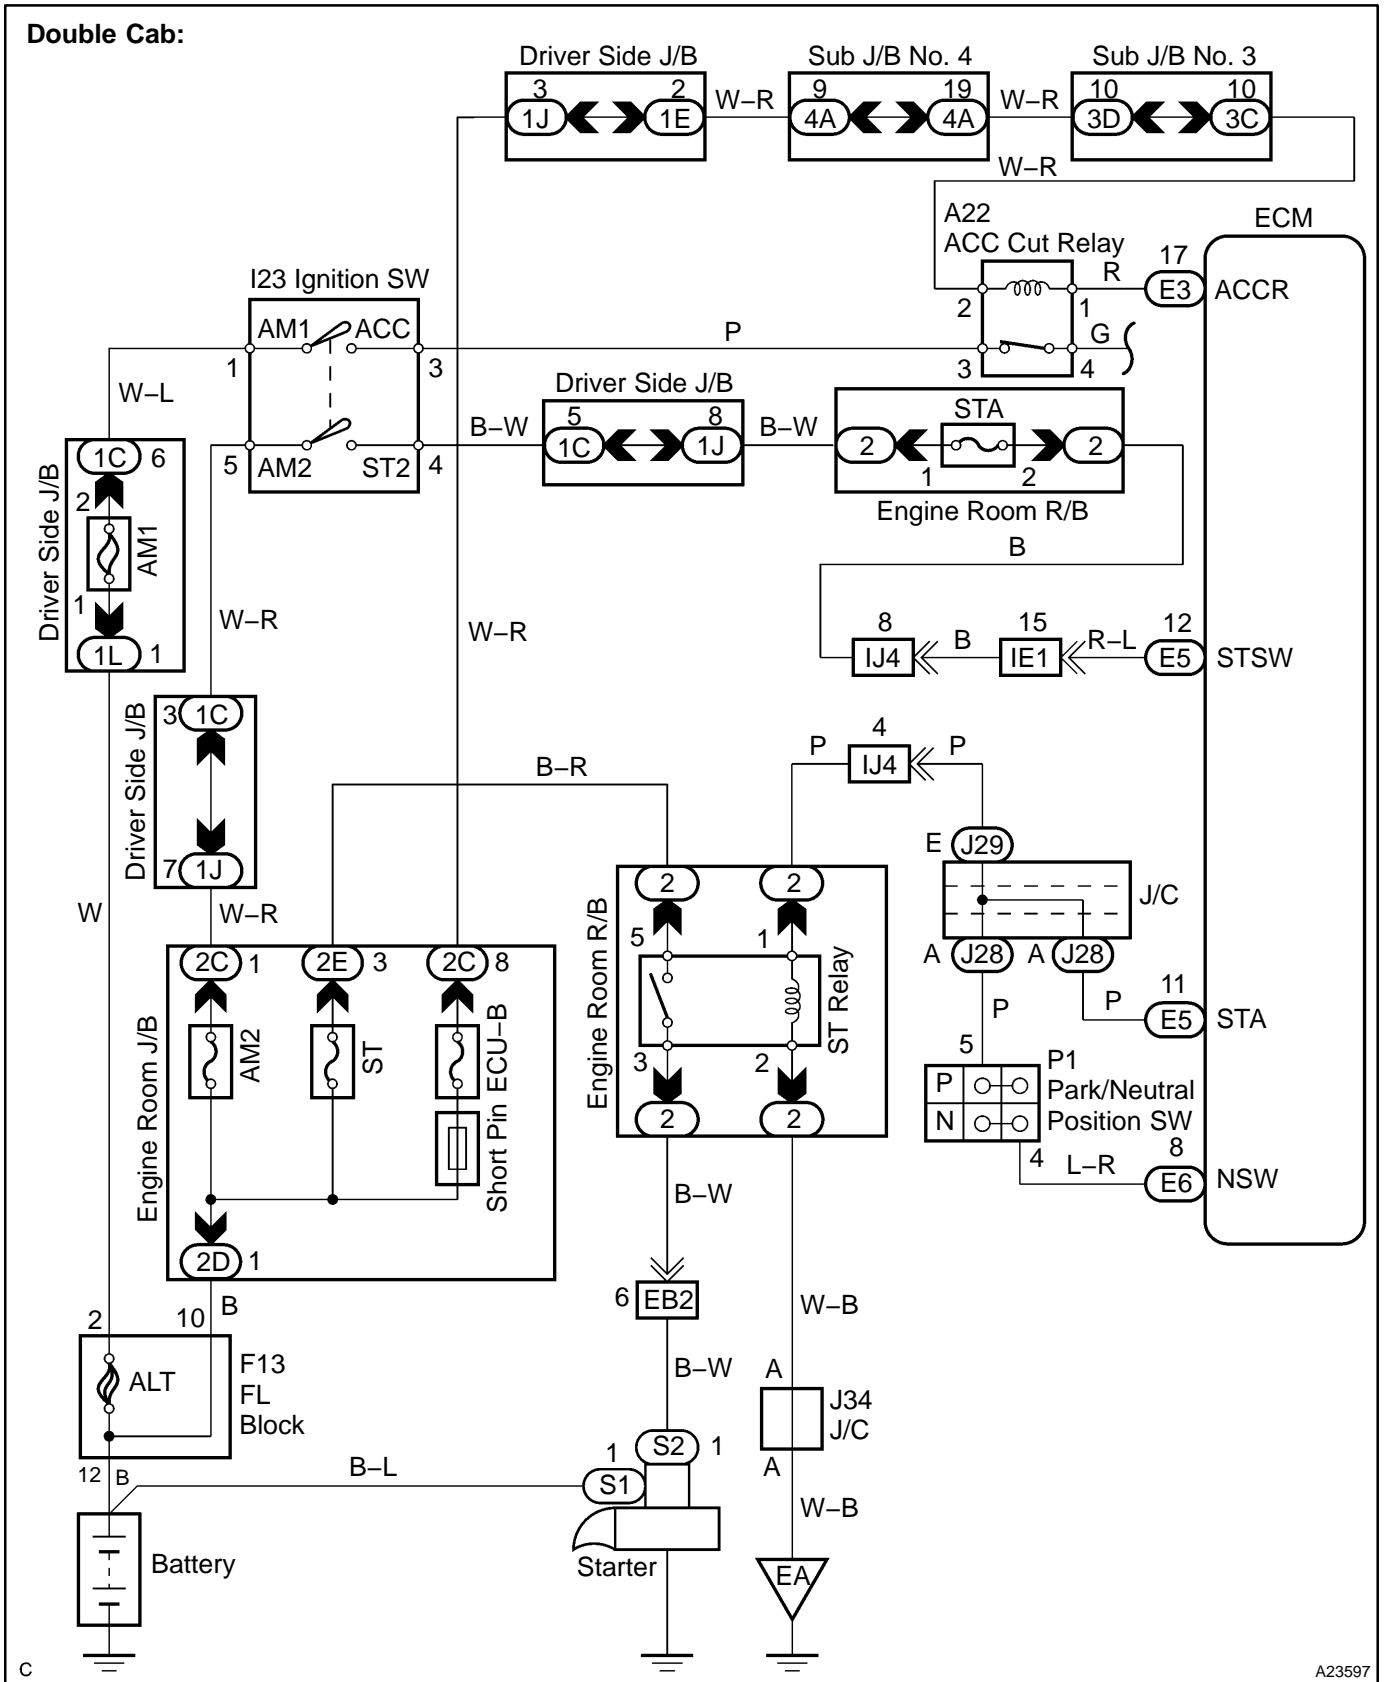

WIRING DIAGRAM

Access Cab, Standard Cab:

c

INSPECTION PROCEDURE

Hand-held tester:

1	Check operation of engine cranking.
----------	--

CHECK:

When turning the ignition switch to the START position, check whether the starter motor starts.

OK:

Starter motor starts.

OK	Check for intermittent problems (See page DI-430).
-----------	---

NG

2	Connect hand-held tester, and check STA signal.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON, and push the hand-held tester main switch ON.
- (c) Enter the following menu: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / STARTER SIG.

CHECK:

Read the STA signal on the hand-held tester while the starter operates.

OK:

Ignition Switch Position	ON	START
STARTER SIG	OFF	ON

NG	Go to step 5.
-----------	----------------------

OK

3 Check voltage between terminal STAR, STSW and E1 of ECM connector.

CHECK:

Measure the voltage between the terminals of the E5 ECM connectors, while cranking the engine (ignition switch START position).

OK:

Standard:

Tester Connection	Specified Condition
STA (E5-11) - E1 (E5-1)	9 to 14 V
STSW (E5-12) - E1 (E5-1)	9 to 14 V

RESULT:

Terminal STAR	Terminal STSW	Proceed to
9 to 14 V	9 to 14 V	A
0 V	9 to 14 V	B
0 V	0 V	C

B Replace ECM (See page SF-82).

C Go to step 9.

A

4 Check park/neutral position switch.

Component Side:

P

D14154

PREPARATION:

Remove the P1 park/neutral position switch connector.

CHECK:

Check resistance between each terminal shown below when the shift lever is moved to each range.

Shift range	Terminal No. to continuity	
P	1 - 3	6 - 9
R	2 - 3	-
N	3 - 5	6 - 9
D	3 - 7	-
2	3 - 4	-
L	3 - 8	-

OK:

Below 1 Ω

NG → **Replace the park/neutral position switch.**

OK

Check and repair harness and connector between park/neutral position switch and ECM.

5 Check starter relay.

A19288

- (a) Remove the starter relay from the engine room R/B.
- (b) Inspect the starter relay.

Standard:

Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

NG → **Replace starter relay.**

OK

6 Check for open and short in harness and connector between park/neutral position switch and starter relay.

Wire Harness Side

Park/Neutral position switch Connector
A23563

- (a) Check the harness and the connector between the park/neutral position switch connector and the starter relay.
- (1) Disconnect the park/neutral position switch connector.
 - (2) Remove the starter relay from the engine room R/B.
 - (3) Check for resistance between the wire harness side connectors.

Standard (Check for open):

Symbols (Terminal No.)	Specified condition
Park/Neutral position switch (P1-6) – Starter relay (1)	Below 1 Ω

Standard (Check for short):

Symbols (Terminal No.)	Specified condition
Park/Neutral position switch (P1-6) or Starter relay (1) – Body ground	10 k Ω or higher

Engine Room R/B No.2

Starter Relay
A27559

- (b) Check the harness and the connector between the starter relay and the body ground.
- (1) Remove the starter relay from the engine room R/B.
 - (2) Check for resistance between the starter relay and the body ground.

Standard (Check for open):

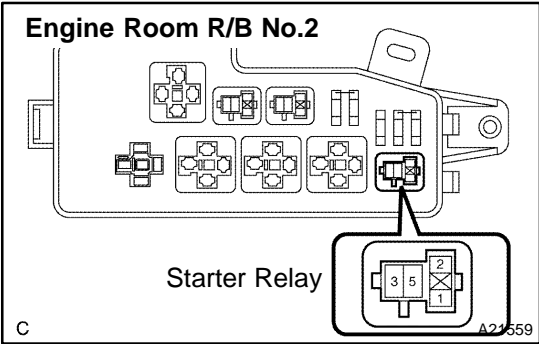

Symbols (Terminal No.)	Specified condition
Starter relay (2) – Body ground	Below 1 Ω

NG

Repair or replace harness or connector.

OK

7 Check engine room R/B No.2 (Starter relay voltage).

PREPARATION:

Remove the starter relay from the engine room R/B No.2.

CHECK:

Measure the voltage between the terminal of the engine room R/B and body ground.

OK:

Standard:

Tester Connection	Specified Condition
Starter relay (5) - Body ground	9 to 14 V

NG Check and repair harness and connector between starter relay and battery.

OK

8 Check starter (See page ST-18).

NG Repair or replace starter.

OK

9 Check ignition switch.**PREPARATION:**

- Remove the lower finish panel.
- Disconnect the ignition switch connector.

CHECK:

Check resistance between terminals.

OK:**Standard:**

Switch Position	Terminal Condition	Specified Condition
LOCK	Always	10 k Ω or more
ACC	1 - 3	Below 1 Ω
ON	1 - 2 - 3 5 - 6	Below 1 Ω
START	1 - 2 4 - 5 - 6	Below 1 Ω

NG**Replace ignition switch.****OK**

Check for open in harness and connector between ECM and ignition switch, ignition switch and battery (See page [IN-30](#)).

Fuel Pump Control Circuit

CIRCUIT DESCRIPTION

Refer to DTC P0230 on page [DI-600](#).

WIRING DIAGRAM

Refer to DTC P0230 on page [DI-600](#).

INSPECTION PROCEDURE

1	Check fuel pump operation (See page SF-7).
----------	---

2	Connect hand-held tester, and check operation of fuel pump relay.
----------	--

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) Enter the following menu: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL PUMP SPD.

CHECK:

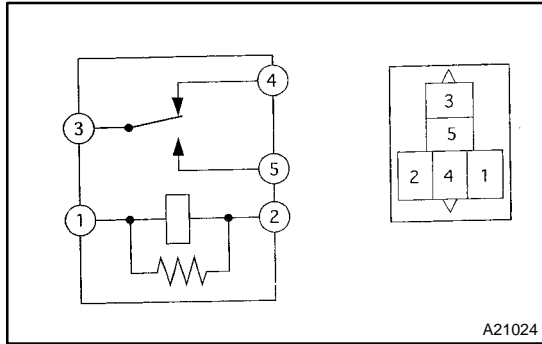

Check the operation of the fuel pump relay when it is switched ON and OFF by the hand-held tester.

OK:

Operating noise can be heard from the relay.

3 Check operation of fuel pump relay.

PREPARATION:

Remove the fuel pump relay from the engine room R/B.

CHECK:

Inspect the fuel pump relay.

OK:

Terminal No.	Condition	Specified Condition
3 - 4	Apply B+ between terminals 1 and 2	10 KΩ or higher
3 - 4	Always	Below 1 Ω
3 - 5	Always	10 KΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG → Replace fuel pump relay.

OK

4 Check fuel pump (See page SF-15).

NG → Repair or replace fuel pump.

OK

5 Check circuit opening relay).

PREPARATION:

Remove the C/OPN relay from the engine room J/B.

CHECK:

Inspect the C/OPN relay.

OK:

Standard:

Terminal No.	Condition	Specified Condition
3 - 5	Always	10 KΩ or higher
3 - 5	Apply B+ between terminals 1 and 2	Below 1 Ω

NG → Replace circuit opening relay.

OK

6 Check for open in harness and connector between circuit opening relay and fuel pump, and fuel pump and body ground (See page [IN-30](#)).

NG Repair or replace harness or connector.

OK

7 Check voltage between terminal FC and E1 of ECM connector.

PREPARATION:
Turn the ignition switch ON.

CHECK:
Measure the voltage between terminal FC of the ECM connector and body ground.

OK:
Voltage: 9 to 14 V

NG Check for open in harness and connector between battery and FC terminal of ECM (See page [IN-30](#)).

OK

Proceed to problem symptoms table (See page [DI-452](#)).

8 Check fuel pump resistor (See page [SF-63](#)).

NG Replace fuel pump resistor.

OK

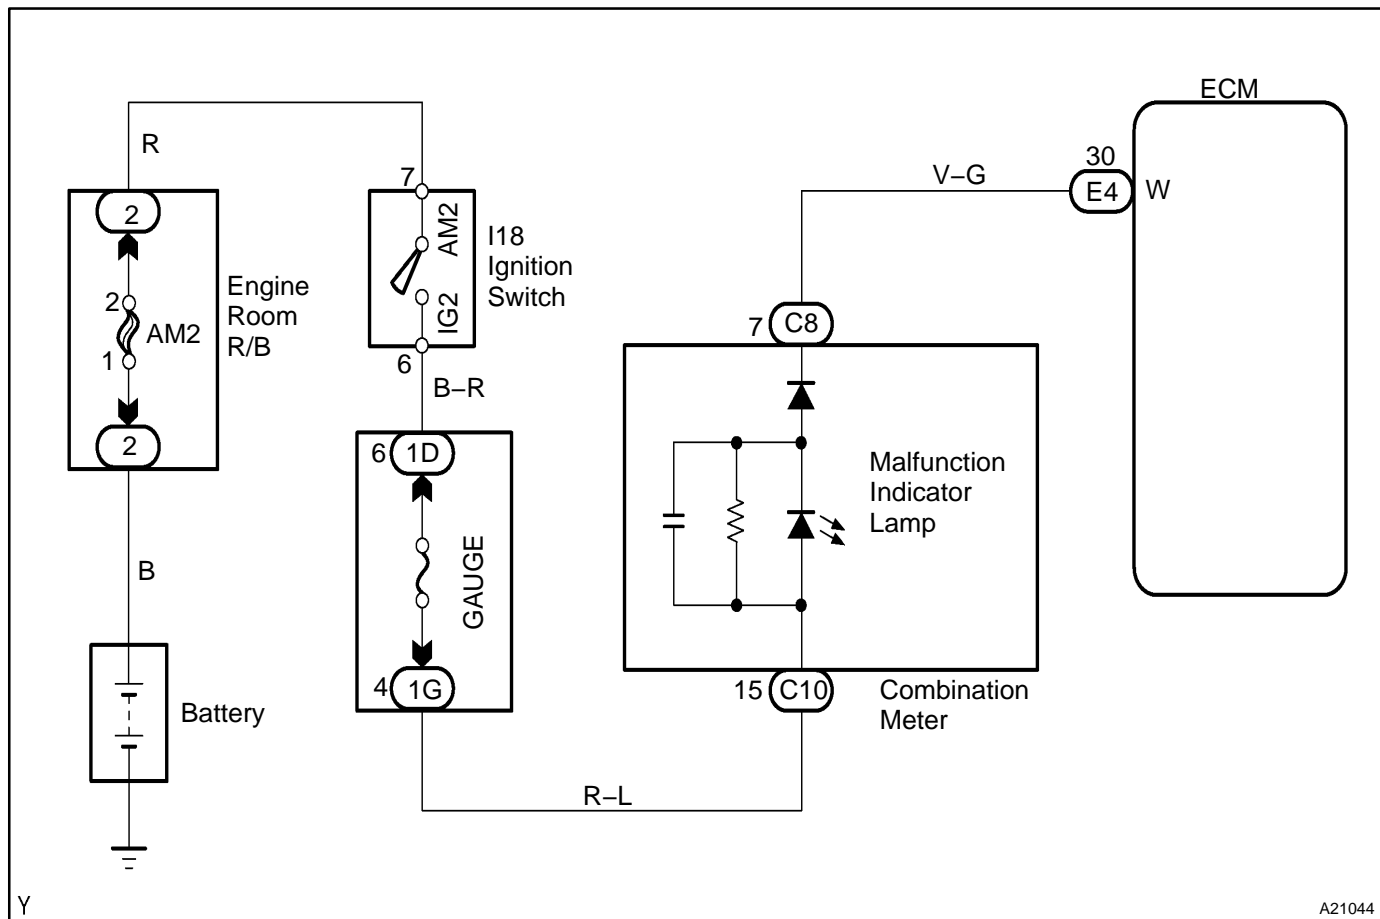

Check for open in harness and connector between circuit opening relay and fuel pump resistor, and fuel pump resistor and fuel pump (See page [IN-30](#)).

MIL Circuit

CIRCUIT DESCRIPTION

If the ECM detects a trouble, the MIL lights up. At this time, the ECM records a DTC in the memory.

WIRING DIAGRAM

Y

A21044

INSPECTION PROCEDURE

HINT:

Troubleshoot each trouble symptom in accordance with the chart below .

MIL remains on	Start inspection from step 1
MIL does not light up	Start inspection from step 3

1	Clear DTC.
----------	-------------------

PREPARATION:

- (a) Connect the hand-held tester to the DLC3.
- (b) Turn the ignition switch ON and push the hand-held tester main switch ON.
- (c) Read the DTC (See page DI-462).
- (d) Clear DTCs (see page DI-462).

CHECK:

- (a) Check that MIL does not light up.

OK:

Standard: MIL does not light up

OK	Repair circuit indicated by output code (See page DI-477).
-----------	---

NG

2	Check Harness and connector (Check for short in wire harness).
----------	---

PREPARATION:

- (a) Disconnect the E4 ECM connector.
- (b) Turn the ignition switch ON.

CHECK:

- (a) Check that MIL does not light up.

OK:

Standard: MIL does not light up

OK	Replace ECM (See page SF-82).
-----------	--------------------------------------

NG

Check and repair harness and connector between combination meter and ECM.

3	Check that MIL lights up.
----------	----------------------------------

CHECK:

Check that MIL lights up when turning the ignition switch ON.

OK:

Standard: MIL lights up

4	Inspect combination meter assy (MIL circuit).
----------	--

See the combination meter troubleshooting on page [BE-86](#).

Check and repair harness and connector between combination meter and ECM.

AUTOMATIC TRANSMISSION (A750E for 1GR-FE)

DIDUK-01

PRECAUTION

NOTICE:

Perform the **RESET MEMORY (AT initialization)** when replacing the automatic transmission assy, engine assy or ECM (See page [DI-961](#)).

HINT:

RESET MEMORY cannot be completed by only disconnecting the battery terminal.

DEFINITION OF TERMS

Term	Definition
Monitor description	Description of what the ECM monitors and how it detects malfunctions (monitoring purpose and its details).
Related DTCs	A group of diagnostic trouble codes that are output by the ECM based on the same malfunction detection logic.
Typical enabling condition	Preconditions that allow the ECM to detect malfunctions. With all preconditions satisfied, the ECM sets the DTC when the monitored value(s) exceeds the malfunction threshold(s).
Sequence of operation	The priority order that is applied to monitoring, if multiple sensors and components are used to detect the malfunction. While another sensor is being monitored, the next sensor or component will not be monitored until the previous monitoring has concluded.
Required sensor/components	The sensors and components that are used by the ECM to detect malfunctions.
Frequency of operation	The number of times that the ECM checks for malfunctions per driving cycle. "Once per driving cycle" means that the ECM detects malfunction only one time during a single driving cycle. "Continuous" means that the ECM detects malfunction every time when enabling condition is met.
Duration	The minimum time that the ECM must sense a continuous deviation in the monitored value(s) before setting a DTC. This timing begins after the "typical enabling conditions" are met.
Malfunction thresholds	Beyond this value, the ECM will conclude that there is a malfunction and set a DTC.
MIL operation	MIL illumination timing after a defect is detected. "Immediately" means that the ECM illuminates MIL the instant the ECM determines that there is a malfunction. "2 driving cycle" means that the ECM illuminates MIL if the same malfunction is detected again in the 2nd driving cycle.
Component operating range	Normal operation range of sensors and solenoids under normal driving conditions. Use these ranges as a reference. They cannot be used to judge if a sensor or solenoid is defective or not.

TOYOTA PART AND SYSTEM NAME LIST

This reference list indicates the part names used in this manual along with their definitions.

Part and system name	Definition
Toyota HCAC system, Hydrocarbon adsorptive Catalyst (HCAC) system, HC adsorptive three-way catalyst	HC adsorptive three-way catalytic converter
Variable Valve Timing sensor, VVT sensor	Camshaft position sensor
Variable valve timing system, VVT system	Camshaft timing control system
Camshaft timing oil control valve, Oil control valve OCV, VVT, VSV	Camshaft timing oil control valve
Variable timing and lift, VVTL	Camshaft timing and lift control
Crankshaft position sensor "A"	Crankshaft position sensor
Engine speed sensor	Crankshaft position sensor
THA	Intake air temperature
Knock control module	Engine knock control module
Knock sensor	Engine knock sensor
Mass or volume air flow circuit	Mass air flow sensor circuit
Vacuum sensor	Manifold air pressure sensor
Internal control module, Control module, Engine control ECU, PCM	Power train control module
FC idle	Deceleration fuel cut
Idle air control valve	Idle speed control
VSV for CCV, Canister close valve VSV for canister control	Evaporative emissions canister vent valve
VSV for EVAP, Vacuum switching valve assembly No. 1, EVAP VAV, Purge VSV	Evaporative emissions canister purge valve
VSV for pressure switching valve, Bypass VSV	Evaporative emission pressure switching valve
Vapor pressure sensor, EVAP pressure sensor, Evaporative emission control system pressure sensor	Fuel tank pressure sensor
Charcoal canister	Evaporative emissions canister
ORVR system	On-board refueling vapor recovery system
Intake manifold runner control	Intake manifold tuning system
Intake manifold runner valve, IMRV, IACV (runner valve)	Intake manifold tuning valve
Intake control VSV	Intake manifold tuning solenoid valve
AFS	Air fuel ratio sensor
O2 sensor	Heater oxygen sensor
Oxygen sensor pumping current circuit	Oxygen sensor output signal
Oxygen sensor reference ground circuit	Oxygen sensor signal ground
Accel position sensor	Accelerator pedal position sensor
Throttle actuator control motor, Actuator control motor, Electronic throttle motor, Throttle control motor	Electronic throttle actuator
Electronic throttle control system, Throttle actuator control system	Electronic throttle control system
Throttle/pedal position sensor, Throttle/pedal position switch, Throttle position sensor/switch	Throttle position sensor
Turbo press sensor	Turbocharger pressure sensor
Turbo VSV	Turbocharger pressure control solenoid valve
P/S pressure switch	Power-steering pressure switch
VSV for ACM	Active control engine mount
Speed sensor, Vehicle speed sensor "A", Speed sensor for skid control ECU	Vehicle speed sensor
ATF temperature sensor, Trans. fluid temp. sensor, ATF temperature sensor "A"	Transmission fluid temperature sensor
Electronic controlled automatic transmission, ECT	Electronically controlled automatic
Intermediate shaft speed sensor "A"	Counter gear speed sensor

Output speed sensor	Output shaft speed sensor
Input speed sensor, Input turbine speed sensor "A", Speed sensor (NT), Turbine speed sensor	Input turbine speed sensor
PNP switch, NSW	Park/neutral position switch
Pressure control solenoid	Transmission pressure control solenoid
Shift solenoid	Transmission shift solenoid valve
Transmission control switch, Shift lock control unit	Shift lock control module
Engine immobilizer system, Immobilizer system	Vehicle anti-theft system

SYSTEM DIAGRAM

The configuration of the electronic control system in the A750E automatic transmission is as shown in the following chart.

SYSTEM DESCRIPTION

SYSTEM DESCRIPTION

The ECT (Electronic controlled automatic transmission) is an automatic transmission that electronically controls shift timing using the ECM. The ECM detects electrical signals that indicate engine and driving conditions, and controls the shift point, based on driver habits and road conditions. As a result, fuel efficiency and power transmission performance are improved.

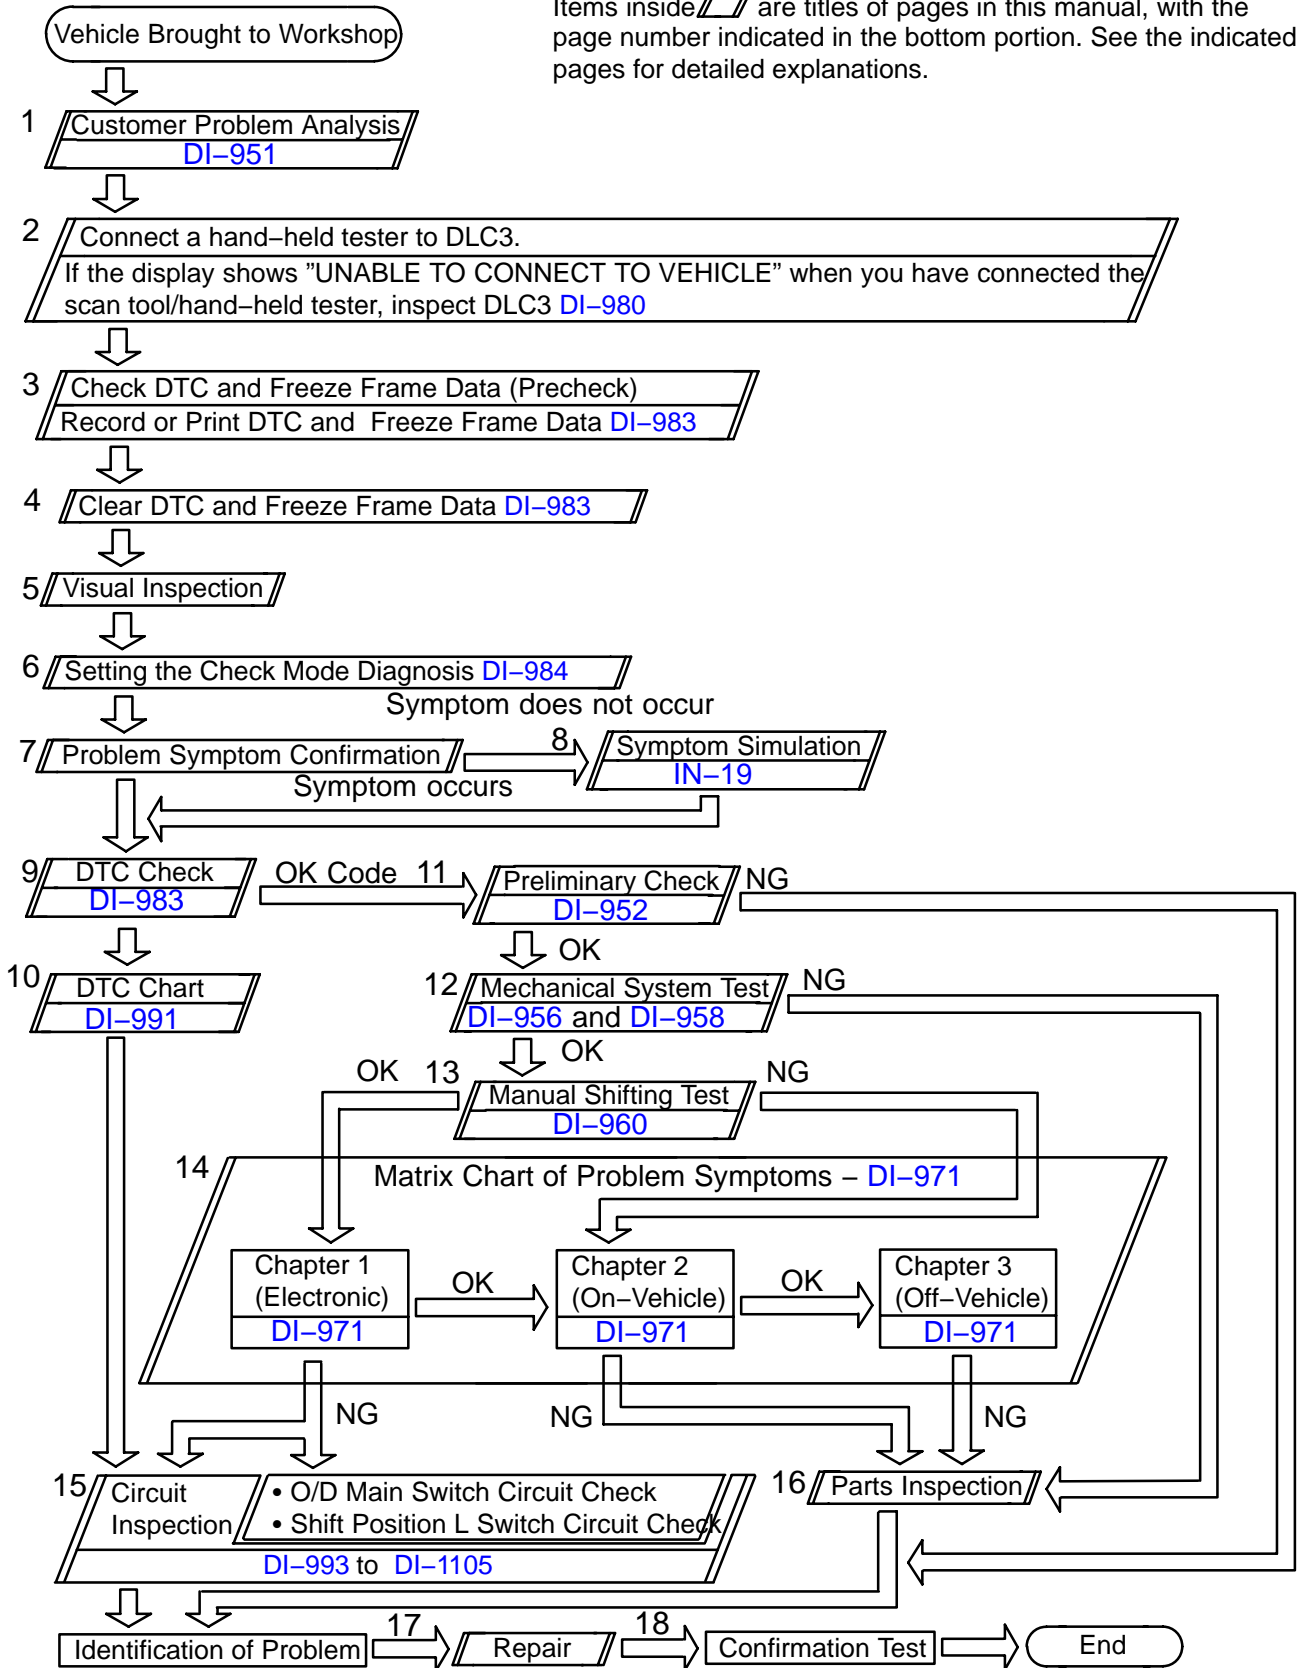

Shift shock has been reduced by controlling the engine and transmission simultaneously.

In addition, the ECT has features such as follows:

- Diagnostic function.
- Fail-safe function when a malfunction occurs.

HOW TO PROCEED WITH TROUBLESHOOTING

Items inside  are titles of pages in this manual, with the page number indicated in the bottom portion. See the indicated pages for detailed explanations.

BASIC INSPECTION

1. INSPECT AND ADJUST SHIFT LEVER POSITION

- (a) When shifting the shift lever from the N position to other positions, check that the lever can be shifted smoothly and accurately to each position and that the position indicator comes on in accordance with the shift lever position.

If the indicator and shift lever position do not match, carry out the following adjustment procedures.

- (1) Remove the nut and disconnect the shift control cable from the control shaft lever.
- (2) Move the control shaft fully rearward.
- (3) Return the control shaft lever 2 notches to the N position.
- (4) Set the shift lever to the N position.
- (5) Connect the shift control cable and temporarily install the control shaft lever nut.
- (6) While holding the shift lever lightly toward the R position side, tighten the control shaft lever nut.

Torque: 14.5 N·m (148 kgf·cm, 11 ft·lbf)

- (7) Start the engine and make sure that the vehicle moves forward when shifting the lever from the N to the D position and reverses when shifting it to the R position.

2. INSPECT AND ADJUST PARK/NEUTRAL POSITION

- (a) Check that the engine can be started when the shift lever is in the N or P position, but cannot be started in other positions.

If operation cannot be done as stated above, carry out the following adjustment procedures.

- Loosen the park/neutral position switch bolt and set the shift lever to the N position.
- Align the groove with the neutral basic line.
- Hold in position and tighten the bolt.

Torque: 13 N·m (130 kgf·cm, 9 ft·lbf)

- (b) For continuity inspection of the park/neutral position switch, see page [DI-993](#).

3. CHECK IDLE SPEED

Idle speed (In N position and air conditioner OFF):
700 ± 50 rpm

ROAD TEST

1. PROBLEM SYMPTOM CONFIRMATION

Based on the result of the customer problem analysis, try to reproduce the symptoms. If the problem is that the transaxle does not shift up, shift down, or the shift point is too high or too low, conduct the following road test referring to the automatic shift schedule and simulate the problem symptoms.

2. ROAD TEST

NOTICE:

Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature: 50 to 80 °C (122 to 176 °F).

(a) D position test:

Shift into the D position and fully depress the accelerator pedal and check the following points.

(1) Check up-shift operation.

Check that 1 → 2, 2 → 3, 3 → 4 and 4 → 5th up-shifts take place, and that the shift points conform to the automatic shift schedule (See page [SS-50](#)).

HINT:

5th Gear Up-shift Prohibition Control

- Engine coolant temperature is 55 °C (131 °F) or less and vehicle speed is at 51 km/h (32 mph) or less.

4th Gear Up-shift Prohibition Control

- Engine coolant temperature is 47 °C (117 °F) or less and vehicle speed is at 49 km/h (30 mph) or less.

3rd Gear Up-shift Prohibition Control

- Engine coolant temperature is 40 °C (104 °F) or less and vehicle speed is at 45 km/h (28 mph) or less.

5th Gear Lock-up Prohibition Control

- Brake pedal is depressed.
- Accelerator pedal is released.
- Engine coolant temperature is 60 °C (140 °F) or less.

(2) Check for shift shock and slip.

Check for shock and slip at the 1 → 2, 2 → 3, 3 → 4 and 4 → 5th up-shifts.

(3) Check for abnormal noise and vibration.

Check for abnormal noise and vibration when up-shifting from 1 → 2, 2 → 3, 3 → 4 and 4 → 5 while driving with the shift lever in the D position, and check while driving in the lock-up condition.

HINT:

The check for the cause of abnormal noise and vibration must be done thoroughly as it could also be due to loss of balance in the differential, torque converter clutch, etc.

(4) Check kick-down operation.

Check vehicle speeds when the 2nd to 1st, 3rd to 2nd, 4th to 3rd, and 5th to 4th kick-downs take place while driving with the shift lever in the D position. Confirm that each speed is within the applicable vehicle speed range indicated in the automatic shift schedule (See page [SS-50](#)).

(5) Check abnormal shock and slip at kick-down.

(6) Check the lock-up mechanism.

- Drive in the D position (5th gear), at a steady speed (lock-up ON).
- Lightly depress the accelerator pedal and check that the engine speed does not change abruptly.

HINT:

If there is a big jump in engine speed, there is no lock-up.

(b) 4 (O/D OFF) position test:

Shift into the 4 (O/D OFF) position and fully depress the accelerator pedal and check the following points.

(1) Check up-shift operation.

Check that the 1 → 2, 2 → 3 and 3 → 4 up-shifts take place and that the shift point conforms to the automatic shift schedule (See page [SS-50](#)).

HINT:

- There is no 5th up-shift in the 4 position.
- 4th Gear Lock-up Prohibition Control
 - Brake pedal is depressed.
 - Accelerator pedal is released.
 - Engine coolant temperature is 60 °C (140 °F) or less.
- (2) Check engine braking.
While driving in the 4 position and 4th gear, release the accelerator pedal and check the engine braking effect.
- (3) Check for abnormal noises during acceleration and deceleration, and for shock at up-shift and down-shift.
- (4) Check the lock-up mechanism.
 - Drive in 4 position 4th gear, at a steady speed (lock-up ON).
 - Lightly depress the accelerator pedal and check that the engine speed does not change abruptly.

HINT:

If there is a big jump in engine speed, there is no lock-up.

(c) 3 position test:

Shift into the 3 position and fully depress the accelerator pedal and check the following points.

(1) Check up-shift operation.

Check that the 1 → 2 and 2 → 3 up-shifts takes place and that the shift point conforms to the automatic shift schedule (See page [SS-50](#)).

HINT:

- There is no 4th up-shift and lock-up in the 3 position.
- When the 2nd start switch is ON, there is no 1 → 2 up-shift and 2 → 1 down-shift.
- (2) Check engine braking.
While running in the 3 position and 3rd gear, release the accelerator pedal and check the engine braking effect.
- (3) Check for abnormal noises during acceleration and deceleration, and for shock at up-shift and down-shift.

(d) 2 position test:

Shift into the 2 position and fully depress the accelerator pedal and check the following points.

(1) Check up-shift operation.

Check that the 1 → 2 up-shift takes place and that the shift point conforms to the automatic shift schedule (See page [SS-50](#)).

HINT:

- There is no 3rd up-shift and lock-up in the 2 position.
- When the 2nd start switch is ON, there is no 1 → 2 up-shift and 2 → 1 down-shift.

- (2) Check engine braking.
While running in the 2 position and 2nd gear, release the accelerator pedal and check the engine braking effect.
 - (3) Check for abnormal noises during acceleration and deceleration, and for shock at up-shift and down-shift.
- (e) L position test:
Shift into the L position and fully depress the accelerator pedal and check the following points.
- (1) Check no up-shift.
While running in the L position, check that there is no up-shift to 2nd gear.
 - (2) Check engine braking.
While running in the L position, release the accelerator pedal and check the engine braking effect.
 - (3) Check for abnormal noises during acceleration and deceleration.
- (f) R position test:
Shift into the R position, lightly depress the accelerator pedal, and check that the vehicle moves backward without any abnormal noise or vibration.
- CAUTION:**
Before conducting this test, ensure that the test area is free from people and obstruction.
- (g) P position test:
Stop the vehicle on a grade (more than 5°) and after shifting into the P position, release the parking brake. Then, check that the parking lock pawl holds the vehicle in place.

MECHANICAL SYSTEM TESTS

1. PERFORM MECHANICAL SYSTEM TESTS

(a) Measure the stall speed.

The object of this test is to check the overall performance of the transmission and engine by measuring the stall speeds in the D positions.

NOTICE:

- **Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature 50 to 80°C (122 to 176°F).**
- **Do not continuously run this test for longer than 5 seconds.**
- **To ensure safety, do this test in a wide, clear level area which provides good traction.**
- **The stall test should always be carried out in pairs. One technician should observe the conditions of wheels or wheel stoppers outside the vehicle while the other is doing the test.**
 - (1) Chock all 4 wheels.
 - (2) Connect a hand-held tester to DLC3.
 - (3) Fully apply the parking brake.
 - (4) Using your left foot, keep the brake pedal firmly depressed.
 - (5) Start the engine.
 - (6) Shift into the D position. Press all the way down on the accelerator pedal with your right foot.
 - (7) Quickly read the stall speed at this time.

Stall speed: 2,400 ± 150 rpm

Evaluation:

Problem	Possible cause
(a) Stall engine speed is low in D position	<ul style="list-style-type: none"> • Engine power output may be insufficient • Stator one-way clutch is not operating properly <p>HINT: If the value is less than the specified value by 600 rpm or more, the torque converter could be faulty.</p>
(b) Stall engine speed is high in D position	<ul style="list-style-type: none"> • Line pressure is too low • Clutch No.1 (C₁) slipping • One-way clutch No.3 (F₃) is not operating properly • Improper fluid level

- (b) Measure the time lag.
 When the shift lever is shifted while the engine is idling, there will be a certain time lapse or lag before the shock can be felt. This is used for checking the condition of the direct clutch, forward clutch, and 1st and reverse brake.

NOTICE:

- Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature: 50 to 80°C (122 to 176°F).
- Be sure to allow for a 1 minute interval between tests.
- Perform the test three times, and measure the time lags. Calculate the average value of the three time lags.
 - (1) Connect a hand-held tester to DLC3.
 - (2) Fully apply the parking brake.
 - (3) Start and warm up the engine and check idle speed.

Idle speed: approx. 700 rpm (In N position and A/C OFF)

- (4) Shift the lever from the N to D position. Using a stop watch, measure the time from when the lever is shifted until the shock is felt.

Time lag:

N → D Less than 1.2 seconds

- (5) In the same manner, measure the time lag for N → R.

Time lag:

N → R Less than 1.5 seconds

Evaluation (If N → D time or N → R time lag is longer than the specified):

Problem	Possible cause
N → D time lag is longer than specified	<ul style="list-style-type: none"> • Line pressure is too low • Clutch No.1 (C₁) worn • One-way clutch No.3 (F₃) is not operating properly
N → R time lag is longer than specified	<ul style="list-style-type: none"> • Line pressure is too low • Clutch No.3 (C₃) worn • Brake No.4 (B₄) worn • One-way clutch No.1 (F₁) is not operating properly

HYDRAULIC TEST

1. PERFORM HYDRAULIC TEST

Measure the line pressure.

NOTICE:

- Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature: 50 to 80°C (122 to 176°F).
- The line pressure test should always be carried out in pairs. One technician should observe the conditions of wheels or wheel stoppers outside the vehicle while the other is performing the test.
- Be careful to prevent SST hose from interfering with the exhaust pipe.
- This check must be conducted after checking and adjusting engine.
- Perform under condition that A/C is OFF.
- When conducting stall test, do not continue more than 10 seconds.

- (1) Warm up the ATF (Automatic Transmission Fluid).
- (2) Lift the vehicle up.
- (3) Remove the test plug on the transmission case center right side and connect SST.

SST 09992-00095 (09992-00231, 09992-00271)

- (4) Fully apply the parking brake and chock the 4 wheels.
- (5) Start the engine and check idling speed.
- (6) Keep your left foot pressing firmly on the brake pedal and shift into D position.
- (7) Measure the line pressure when the engine is idling.
- (8) Depress the accelerator pedal all the way down. Quickly read the highest line pressure when engine speed reaches stall speed.
- (9) In the same manner, do the test in R position.

Specified line pressure:

Condition	D position kPa (kgf / cm ² , psi)	R position kPa (kgf / cm ² , psi)
Idling	363 to 423 kPa (3.7 to 4.3 kgf/cm ² , 53 to 61 psi)	484 to 564 kPa (4.9 to 5.8 kgf/cm ² , 70 to 82 psi)
Stall test	1,282 to 1,381 kPa (13.1 to 14.1 kgf/cm ² , 186 to 200 psi)	1,218 to 1,338 kPa (12.4 to 13.6 kgf/cm ² , 177 to 194 psi)

Evaluation

Problem	Possible cause
Measured values are higher than specified in all positions	<ul style="list-style-type: none"> • Shift solenoid valve (SLT) defective • Regulator valve defective
Measured values are lower than specified in all positions	<ul style="list-style-type: none"> • Shift solenoid valve (SLT) defective • Regulator valve defective • Oil pump defective
Pressure is low in the D position only	<ul style="list-style-type: none"> • D position circuit fluid leak • Clutch No.1 (C₁) defective
Pressure is low in the R position only	<ul style="list-style-type: none"> • R position circuit fluid leak • Clutch No.3 (C₃) defective • Brake No.4 (B₄) defective

MANUAL SHIFTING TEST

1. MANUAL SHIFTING TEST

HINT:

- With this test, it can be determined whether the trouble occurs in the electrical circuit or is a mechanical problem in the transmission.
- If any abnormalities are found in the following test, the problem is in the transmission itself.

(a) Disconnect the connector of the transmission wire.

(b) Drive with the transmission wire disconnected.

Shifting the shift lever to the L, 2, 3, 4 and D position to check whether the shifting condition changes the table below.

Shift Position	Shifting Condition
L ↔ 2	No Shift (Not Change)
2 ↔ 3	Down Shift ↔ Up Shift
3 ↔ 4	Down Shift ↔ Up Shift
4 ↔ D	No Shift (Not Change)

HINT:

When driving with the transmission wire disconnected, the gear position will be as follows:

- When the shift lever is in the L or the 2 position, the gear is held in the 1st position.
- When the shift lever is in the 3rd position, the gear is held in the 3rd position.
- When the shift lever is in the 4 or the D position, the gear is held in the 4th position.
- When the shift lever is in the R or the P position, the gear is also in the R or the P position respectively.

(c) Connect the connector of the transmission wire.

(d) Clear the DTC (See page [DI-983](#)).

INITIALIZATION

1. RESET MEMORY

NOTICE:

- **Perform the RESET MEMORY (AT initialization) when replacing the automatic transmission assy or ECM.**
- **The RESET MEMORY can be performed only with the Hand-held tester.**

HINT:

The ECM memorizes the condition that the ECT controls the automatic transmission assy and engine assy according to those characteristics. Therefore, when the automatic transmission assy, engine assy, or ECM has been replaced, it is necessary to reset the memory so that the ECM can memorize the new information.

Reset procedure is as follows.

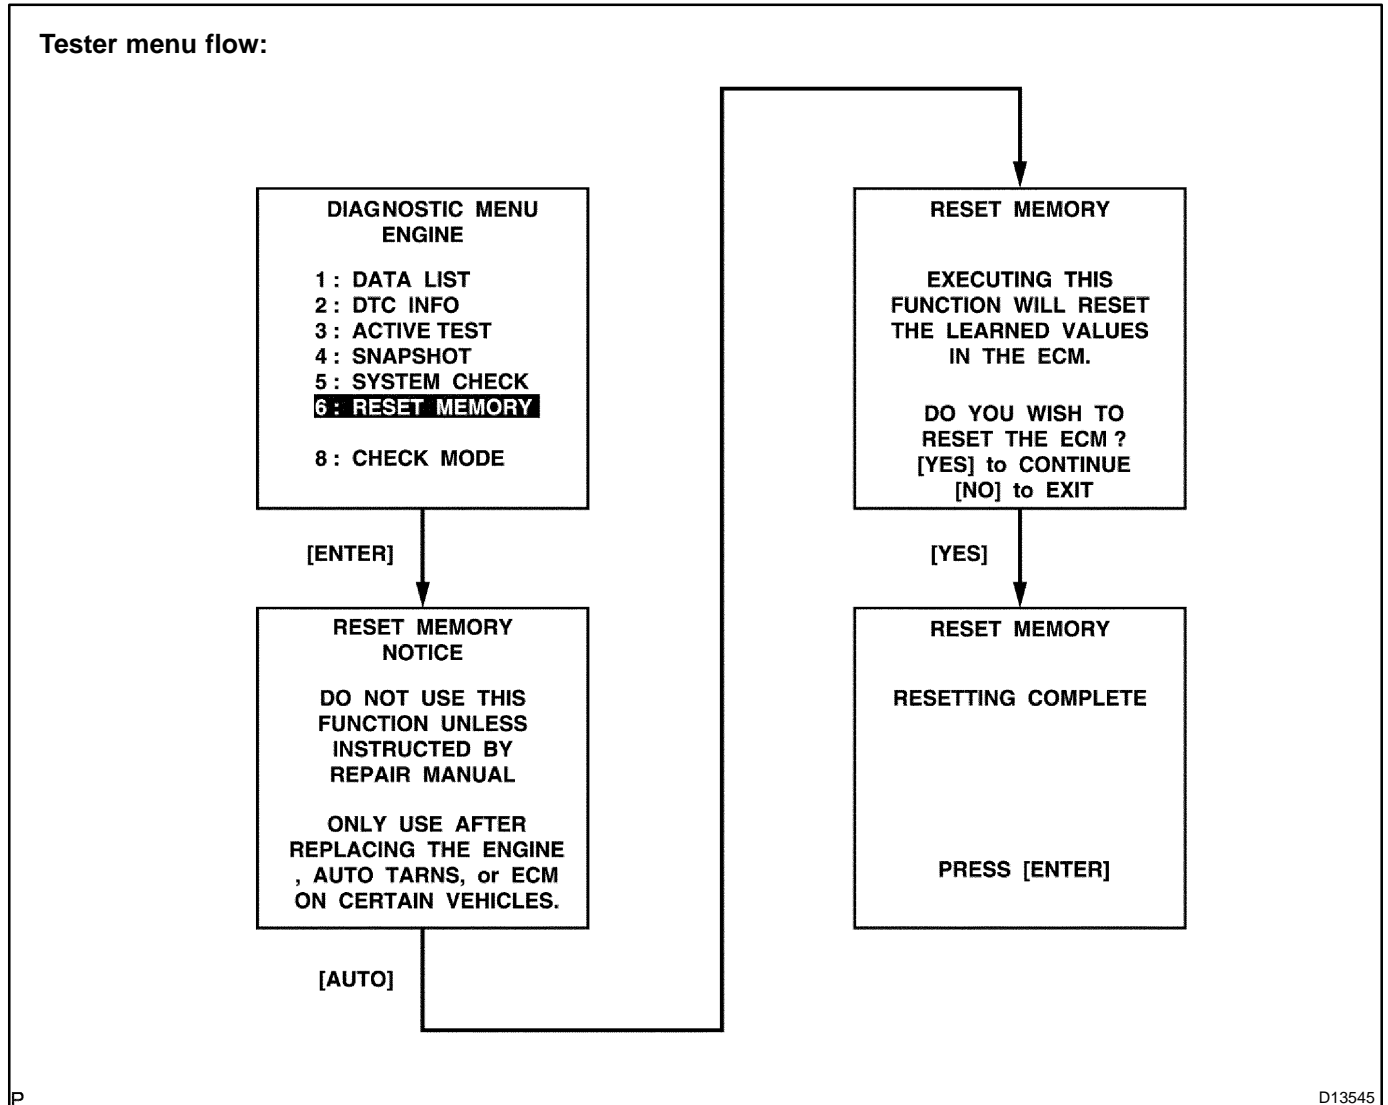

- (a) Turn the ignition switch off.
- (b) Connect the hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn the hand-held tester main switch on.
- (e) Select the item "DIAGNOSIS/ENHANCED OBD II".
- (f) Perform the reset memory procedure from the ENGINE menu.

NOTICE:

After performing the RESET MEMORY, be sure to perform the ROAD TEST (See page [DI-953](#)) described earlier.

HINT:

The ECM learns through use of the ROAD TEST.

LIST OF DISABLE A MONITOR

HINT:

This table indicates ECM monitoring status for the items in the upper columns if the DTCs in each line on the left are being set.

As for the "X" mark, when the DTC on the left is stored, detection of the DTC in the upper column is not performed.

Monitor detected malfunction	Fault code		Component/system		Monitor disablement (X - disabled)																																
	Upper	Lower	Upper	Lower	P0010,P0020	P0011	P0012	P0016,P0018	P0021	P0022	P0030,50	P0031,32,51,52	P0033,56	P0037,38,57,58	P0043,44,63,64	P0100	P0101	P0105	P0106	P0110	P0115	P0116	P0120,P0121	P0125	P0128	P0130-P0153	P0134,P0154	P0136,P0156	P0142,P0162	P0171,P0172	P0300-P0308

MONITOR DRIVE PATTERN

1. MONITOR DRIVE PATTERN FOR ECT TEST

- (a) Perform this drive pattern as one method to simulate the detection conditions of the ECT malfunctions. (The DTCs may not be detected due to the actual driving conditions. And some codes may not be detected through this drive pattern.)

HINT:

Preparation for driving

- Warm up the engine sufficiently. (Engine coolant temperature is 60 °C (140 °F) or higher).
- Drive the vehicle when the atmospheric temperature is –10 °C (14 °F) or higher. (Malfunction is not detected when the atmospheric temperature is –10 °C (14 °F) or less).

Notice in driving

- Drive the vehicle through all gears.
Stop → 1st → 2nd → 3rd → 4th → 5th → 5th (lock-up ON).
- Repeat the above driving pattern three times or more.

NOTICE:

- **The monitor status can be checked using the OBD II scan tool. When using the hand-held tester, monitor status can be found in the "ENHANCED OBD II / DATA LIST" or under "CARB OBD II".**
- **In the event that the drive pattern must be interrupted (possibly due to traffic conditions or other factors), the drive pattern can be resumed and, in most cases, the monitor can be completed.**
- **Perform this drive pattern on a level road as much as possible and strictly observe the posted speed limits and traffic laws while driving.**

**HINT:**

*1: Drive at such a speed in the uppermost gear, to engage lock-up. The vehicle can be driven at a speed lower than that in the above diagram under the lock-up condition.

NOTICE:

It is necessary to drive the vehicle for approximately 30 minutes to detect DTC P0711 (ATF temperature sensor malfunction).

PROBLEM SYMPTOMS TABLE

HINT:

If a normal code is displayed during the diagnostic trouble code check although the trouble still occurs, check the electrical circuits for each symptom in the order given in the charts on the following pages and proceed to the page given for troubleshooting.

The Matrix Chart is divided into 3 chapters.

1. Chapter 1: Electronic Circuit Matrix Chart

- Refer to the table below when the trouble cause is considered to be electrical.
- If the instruction "Proceed to next circuit inspection shown on matrix chart" is given in the flow chart of each circuit, proceed to the circuit with the next highest number in the table to continue the check.
- If the trouble still occurs even though there are no abnormalities in any of the other circuits, check and replace the ECM.

HINT:

*1: When the circuit on which mark *1 is attached is defective, DTC could be output (see page [DI-991](#)).

Symptom	Suspect Area	See page
No up-shift (A particular gear, from 1st to 4th gear, is not up-shifted)	1. Shift solenoid valve (S1) circuit *1 2. Shift solenoid valve (S2) circuit *1 3. ECM	DI-1058 DI-1063 IN-30
No up-shift (4th → 5th)	1. O/D main switch circuit 2. Engine coolant temp. sensor circuit *1 3. Speed sensor NT circuit *1 4. Shift solenoid valve (SL1) circuit *1 5. Shift solenoid valve (SL2) circuit *1 6. Shift solenoid valve (SR) circuit *1 7. ECM	DI-1102 DI-57 DI-1008 DI-1020 DI-1048 DI-1068 IN-30
No up-shift (3rd → 4th)	1. Engine coolant temp. sensor circuit *1 2. Shift solenoid valve (S2) circuit *1 3. ECM	DI-57 DI-1063 IN-30
No up-shift (1st → 2nd)	1. Shift position L switch circuit 2. Shift solenoid valve (S2) circuit *1 3. ECM	DI-1105 DI-1063 IN-30
No down-shift (5th → 4th)	1. O/D main switch circuit 2. Shift solenoid valve (SL1) circuit *1 3. Shift solenoid valve (SL2) circuit *1 4. Shift solenoid valve (SR) circuit *1 5. ECM	DI-1102 DI-1020 DI-1048 DI-1068 IN-30
No down-shift (2nd → 1st)	1. Shift position L switch circuit 2. Shift solenoid valve (S2) circuit *1 3. ECM	DI-1105 DI-1063 IN-30
No down-shift (A particular gear, from 1st to 4th gear, is not down-shifted)	1. Shift solenoid valve (S1) circuit *1 2. Shift solenoid valve (S2) circuit *1 3. ECM	DI-1058 DI-1063 IN-30
No lock-up	1. ATF temperature sensor circuit *1 2. Stop light switch circuit *1 3. Speed sensor NT circuit *1 4. Shift solenoid valve (SLU) circuit *1 5. Engine coolant temp. sensor circuit *1 6. ECM	DI-999 DI-1017 DI-1008 DI-1097 DI-57 IN-30
No lock-up off	1. Shift solenoid valve (SLU) circuit *1 2. ECM	DI-1097 IN-30

Shift point too high or too low	1. Shift solenoid valve (SLT) circuit *1 2. Speed sensor NT circuit *1 3. Speed sensor SP2 circuit *1 4. Throttle position sensor circuit *1 5. ATF temperature sensor circuit *1 7. ECM	DI-1079 DI-1008 DI-1013 DI-57 DI-999 IN-30
Up-shift to 5th from 4th while shift lever is in 4 position	1. O/D main switch circuit 2. ECM	DI-1102 IN-30
Up-shift to 5th from 4th while engine is cold	1. Engine coolant temp. sensor circuit *1 2. ECM	DI-57 IN-30
Up-shift to 4th from 3rd while shift lever is in 3 position	1. Park/neutral position switch circuit *1 2. ECM	DI-993 IN-30
Up-shift to 3rd from 2nd while shift lever is in 2 position	1. Park/neutral position switch circuit *1 2. ECM	DI-993 IN-30
Up-shift to 2nd from 1st while shift lever is in L position	1. Shift position L switch circuit 2. ECM	DI-1105 IN-30
Harsh engagement (N → D)	1. Speed sensor NT circuit *1 2. Shift solenoid valve (SL1) circuit *1 3. Shift solenoid valve (SLT) circuit *1 4. ECM	DI-1008 DI-1020 DI-1079 IN-30
Harsh engagement (Lock-up)	1. Speed sensor NT circuit *1 2. Speed sensor SP2 circuit *1 3. Shift solenoid valve (SLU) circuit *1 4. ECM	DI-1008 DI-1013 DI-1097 IN-30
Harsh engagement (Any driving position)	ECM	IN-30
Poor acceleration	1. ATF temperature sensor No.2 circuit *1 2. Engine coolant temp. sensor circuit *1 3. Shift solenoid valve (SLT) circuit *1 4. ECM	DI-1083 DI-57 DI-1079 IN-30
No engine braking	ECM	IN-30
No kick-down	ECM	IN-30
Engine stalls when starting off or stopping	1. Shift solenoid valve (SLU) circuit *1 2. ECM	DI-1079 IN-30
AT Oil Temp. warning light remains on	1. ATF temperature sensor No.2 circuit *1	DI-1083
Lock-up at 3rd gear	2. Engine coolant temp. sensor circuit *1	DI-57
Shift point too high	3. ECM	IN-30
Malfunction in shifting	1. Park/neutral position switch circuit *1 2. ECM	DI-993 IN-30

TERMINALS OF ECM

1. ECM

D14145

HINT:

Each ECM terminal's standard voltage is shown in the table below.

In the table, first follow the information under "Condition". Look under "Symbols (Terminal No.)" for the terminals to be inspected. The standard voltage between the terminals is shown under "Specific Condition".

Use the illustration above as a reference for the ECM terminals.

Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	Specified Condition
LMS (E4-9) – E1 (E5-1)	V-W – BR	L shift position switch signal	IG switch ON	10 to 14 V
↑	↑	↑	IG switch ON and Press continuously shift position L switch	Below 1 V
2 (E4-10) – E1 (E5-1)	P-L – BR	2 shift position switch signal	IG switch ON and shift lever 2 and L position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except 2 and L position	Below 1 V
R (E4-11) – E1 (E5-1)	G-R – BR	R shift position switch signal	IG switch ON and shift lever R position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except R position	Below 1 V
D (E4-21) – E1 (E5-1)	W-R – BR	D shift position switch signal	IG switch ON and shift lever D position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except D position	Below 1 V
3 (E4-19) – E1 (E5-1)	G-W – BR	3 shift position switch signal	IG switch ON and shift lever 3 position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except 3 position	Below 1 V
ODMS (E3-12) – E1 (E5-1)	R – BR	O/D main switch signal	IG switch ON	10 to 14 V
↑	↑	↑	IG switch ON and press continuously O/D main switch	Below 1 V
STP (E3-15) – E1 (E5-1)	G-W – BR	Stop lamp switch signal	Brake pedal is depressed	7.5 to 14 V
↑	↑	↑	Brake pedal is released	Below 1.5 V
SLU+ (E6-15) – SLU- (E6-14)	G – L-B	SLU solenoid signal	5th (lock-up) gear	Pulse generation (See waveform 2)
S2 (E6-10) – E1 (E5-1)	W-L – BR	S2 solenoid signal	2nd or 3rd gear	10 to 14 V
↑	↑	↑	1st, 4th or 5th gear	Below 1 V
S1 (E6-11) – E1 (E5-1)	P-L – BR	S1 solenoid signal	1st or 2nd gear	10 to 14 V
↑	↑	↑	3rd, 4th or 5th gear	Below 1 V

SLT+ (E6-13) – SLT- (E6-12)	B-R – G-W	SLT solenoid signal	Engine idle speed	Pulse generation (See waveform 1)
SR (E6-9) – E1 (E5-1)	W-G – BR	SR solenoid signal	5th gear	10 to 14 V
↑	↑	↑	1st gear	Below 1 V
SL2+ (E6-17) – SL2- (E6-16)	B – W	SL2 solenoid signal	Engine idle speed	Pulse generation (See waveform 3)
SL1+ (E6-19) – SL1- (E6-18)	R-W – GR	SL1 solenoid signal	Engine idle speed	Pulse generation (See waveform 4)
THO1 (E6-24) – E2 (E7-28)	R-L – B-W	No.1 ATF temperature sensor signal	No.1 ATF temperature: 115 °C (239 °F) or more	Below 1.5 V
THO2 (E6-32) – E2 (E7-28)	V – B-W	No.2 ATF temperature sensor signal	No.2 ATF temperature: 115 °C (239 °F) or more	Below 1.5 V
SP2+ (E6-34) – SP2- (E6-26)	Y-R – W-R	Speed sensor (SP2) signal	Vehicle speed 20 km/h (12 mph)	Pulse generation (See waveform 6)
NT+ (E6-35) – NT- (E6-27)	G – R	Speed sensor (NT) signal	Engine idle speed	Pulse generation (See waveform 5)
STAR/NSW (E6-8) – E1 (E5-1)	L-R – BR	Park neutral switch signal	IG switch ON and shift lever P and N position	Below 2 V
↑	↑	↑	IG switch ON and shift lever except P and N position	10 to 14 V

Waveform 1

Reference:

Terminal	SLT+ – SLT-
Tool setting	5V/DIV, 1ms/DIV
Vehicle condition	Engine idle speed

Waveform 2

Reference:

Terminal	SLU+ – SLU-
Tool setting	5V/DIV, 1ms/DIV
Vehicle condition	5th (lock-up) or 6th (lock-up) gear

Waveform 3

Reference:

Terminal	SL2+ - SL2-
Tool setting	5V/DIV, 1ms/DIV
Vehicle condition	Engine idle speed

Waveform 4

Reference:

Terminal	SL1+ - SL1-
Tool setting	5V/DIV, 1ms/DIV
Vehicle condition	Engine idle speed

Waveform 5

Reference:

Terminal	NT+ - NT-
Tool setting	1V/DIV, 2ms/DIV
Vehicle condition	Engine idle speed (P or N position)

Waveform 6

Reference:

Terminal	SP2+ - SP2-
Tool setting	2V/DIV, 20ms/DIV
Vehicle condition	Vehicle speed 20 km/h (12 mph)

DIAGNOSIS SYSTEM

DESCRIPTION

When troubleshooting On-Board Diagnostic (OBD II) vehicles, the vehicle must be connected to the OBD II scan tool (complying with SAE J1987). Various data output from the vehicle's ECM can then be read.

OBD II regulations require that the vehicle's on-board computer illuminates the Malfunction Indicator Lamp (MIL) on the instrument panel when the computer detects a malfunction in:

- 1) The emission control system/components
- 2) The powertrain control components (which affect vehicle emissions)
- 3) The computer

In addition, the applicable Diagnostic Trouble Codes (DTCs) prescribed by SAE J2012 are recorded in the ECM memory. If the malfunction does not reoccur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain recorded in the ECM memory.

To check DTCs, connect the scan tool to the Data Link Connector 3 (DLC3) of the vehicle. The scan tool displays DTCs, the freeze frame data and a variety of the engine data.

The DTCs and freeze frame data can be erased with the scan tool (See page [DI-983](#)).

NORMAL MODE AND CHECK MODE

The diagnosis system operates in "normal mode" during normal vehicle use. In normal mode, "2-trip detection logic" is used to ensure accurate detection of malfunctions. "Check mode" is also available to technicians as an option. In check mode, "1-trip detection logic" is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent malfunctions.

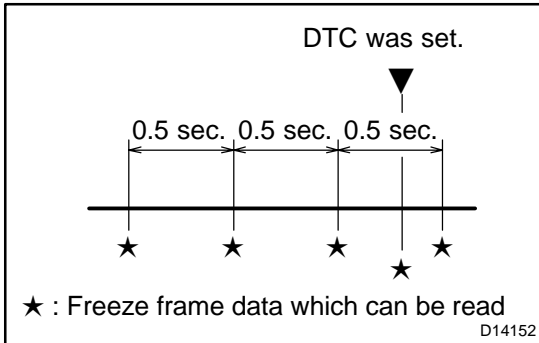

2-TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the ignition switch is turned OFF and then ON again, and the same malfunction is detected again, the MIL will illuminate.

FREEZE FRAME DATA

Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air/fuel ratio was Lean or Rich, and other data from the time the malfunction occurred.

The hand-held tester records freeze frame data in five different instances: 1) 3 times before the DTC is set, 2) once when the DTC is set, and 3) once after the DTC is set. These data can be used to simulate the vehicle's condition around the time when the malfunction occurred. The data may help find the cause of the malfunction, or judge if the DTC is being caused by a temporary malfunction or not.

DLC3 (Data Link Connector 3)

The vehicle's ECM uses the ISO 15765-4 for communication protocol. The terminal arrangement of the DLC3 complies with SAE J1962 and matches the ISO 15765-4 format.

HINT:

Connect the cable of the hand-held tester to the DLC3, turn the ignition switch ON and attempt to use the hand-held tester. If the screen displays UNABLE TO CONNECT TO VEHICLE, a problem exists in the vehicle side or the tester side.

If the communication is normal when the tool is connected to another vehicle, inspect the DLC3 on the original vehicle.

If the communication is still impossible when the tool is connected to another vehicle, the problem is probably in the tool itself. Consult the Service Department listed in the tool's instruction manual.

Symbol	Terminal No.	Name	Reference terminal	Result	Condition
SIL	7	Bus "+" line	5 – Signal ground	Pulse generation	During transmission
CG	4	Chassis ground	Body ground	Below 1 Ω	Always
SG	5	Signal ground	Body ground	Below 1 Ω	Always
BAT	16	Battery positive	Body ground	11 to 14 V	Always
CANH	6	HIGH-level CAN bus line	CANL	54 to 69 Ω	IG switch OFF
CANH	6	HIGH-level CAN bus line	Battery positive	1 MΩ or higher	IG switch OFF
CANH	6	HIGH-level CAN bus line	CG	1 kΩ or higher	IG switch OFF
CANL	14	LOW-level CAN bus line	Battery positive	1 MΩ or higher	IG switch OFF
CANL	14	LOW-level CAN bus line	CG	1 kΩ or higher	IG switch OFF

CHECK BATTERY VOLTAGE**Battery voltage: 11 to 14 V**

If voltage is below 11 V, replace the battery before proceeding.

CHECK MIL

- (a) Check that the MIL illuminates when turning the ignition switch ON.

If the MIL does not illuminate, there is a problem in the MIL circuit (refer to MIL CIRCUIT on page [DI-417](#))

- (b) When the engine is started, the MIL should turn off.

ALL READINESS

For this vehicle, using the hand-held tester allows readiness codes corresponding to all DTCs to be read. When diagnosis (normal or malfunctioning) has been complete, readiness codes are set. Enter the following menus: ENHANCED OBD II / MONITOR STATUS on the hand-held tester.

DTC CHECK / CLEAR

1. CHECK DTC

DTCs which are stored in the ECM can be displayed with the hand-held tester or generic OBD II scan tool.

These scan tools can display pending DTCs and current DTCs. Some DTC aren't stored if the ECM doesn't detect a malfunction during consecutive driving. However, the detected malfunction during once driving is stored as pending DTC.

- (a) Connect the hand-held tester to the Controller Area Network Vehicle Interface Module (CAN VIM). Then connect the CAN VIM to the Data Link Connector 3 (DLC3).
- (b) Turn the ignition switch ON.
- (c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES (or PENDING CODE).
- (d) Confirm the DTCs and freeze frame data and then write them down.
- (e) See page [DI-991](#) to confirm the details of the DTCs.

NOTICE:

When simulating a symptom with the scan tool to check for DTCs, use normal mode. For codes on DIAGNOSTIC TROUBLE CODE CHART subject to "2-trip detection logic", perform the following actions.

Turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again. When the problem has been simulated twice, the MIL illuminates and the DTCs are recorded in the ECM.

2. CLEAR DTC

- (a) Connect the hand-held tester to the CAN VIM. Then connect the CAN VIM to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CLEAR CODES and press YES.

CHECK MODE PROCEDURE

DESCRIPTION

Check mode has a higher sensitivity to malfunctions and can detect malfunctions that normal mode cannot detect. Check mode can also detect all the malfunctions that normal mode can detect. In check mode, DTCs are detected with 1-trip detection logic.

CHECK MODE PROCEDURE

- (a) Make sure that the items below are true:
 - (1) Battery positive voltage 11 V or more
 - (2) Throttle valve fully closed
 - (3) Transmission in the P or N position
 - (4) A/C switched OFF
- (b) Turn the ignition switch OFF.
- (c) Connect the hand-held tester together with the Controller Area Network Vehicle Interface Module (CAN VIM) to the DLC3.
- (d) Turn the ignition switch ON.
- (e) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / CHECK MODE.

- (f) Change the ECM to check mode. Make sure the MIL flashes as shown in the illustration.

NOTICE:

All DTCs and freeze frame data recorded will be erased if:

- 1) the hand-held tester is used to change the ECM from normal mode to check mode or vice-versa; or
- 2) during check mode, the ignition switch is turned from ON to ACC or LOCK.

Before check mode, make notes of the DTCs and freeze frame data.

- (g) Start the engine. The MIL should turn off after the engine starts.
- (h) Perform "MONITOR DRIVE PATTERN" for the ECT test (See page [DI-969](#)).
(Or, simulate the conditions of the malfunction described by the customer).
- (i) After simulating the malfunction conditions, use the hand-held tester diagnosis selector to check the DTC and freeze frame data.

FAIL-SAFE CHART

1. FAIL-SAFE

This function minimizes the loss of the ECT functions when any malfunction occurs in a sensor or solenoid.

Malfunction Part	Function
Output Speed Sensor (SP2)	During an output speed sensor malfunction, shift control is effected through the input speed sensor signal (NT).
ATF Temp. Sensor No. 1	During an ATF temperature sensor No. 1 malfunction, up-shift to the 5th and flex lock-up clutch control are prohibited.
Shift Solenoid Valve S1, S2 and SR	The current to the failed solenoid valve is cut off and control is effected by operating the other solenoid valves with normal operation. Shift control is effected depending on the failed solenoid as described in the table on the next page.
Shift Solenoid Valve SL1 and SL2	During a solenoid valve SL1 or SL2 malfunction, up-shift to the 5th is prohibited.
Shift Solenoid Valve SLU	During a solenoid valve SLU malfunction, the current to the solenoid valve is stopped. This stops lock-up control and flex lock-up control, fuel economy decreases.
Shift Solenoid Valve SLT	During a solenoid valve SLT malfunction, the current to the solenoid valve is stopped. This stops line pressure optimal control, the shift shock increases. However, shifting is effected through normal clutch pressure control.

Fail Safe Function:

If either of the shift solenoid valve circuits has an open or short failure, the ECM turns the other shift solenoid "ON" and "OFF" in order to shift into the gear positions shown in the table below.

In case of a short circuit, the ECM stops sending current to the short circuited solenoid.

Even if starting the engine again in the fail-safe mode, the gear position remains in the same position.

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition	Diagnostic Note

AT FLUID TEMP 2	ATF Temp. Sensor No.2 Value/ min.: –40°C (–40°F) max.: 215°C (419°F)	<ul style="list-style-type: none"> • After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when cold soak 	If the value is "–40°C (–40°F)" or "215°C (419°F)", ATF temp. sensor No.2 circuit is open or shorted.
SPD (SP2)	Output shaft Speed/ min.: 0 km/h (0 mph) max.: 255 km/h (158 mph)	Vehicle stopped: 0 km/h (0 mph) [HINT] Equal to vehicle speed	–
SPD (NT)	Input Turbine Speed/ display: 50 r/min	[HINT] <ul style="list-style-type: none"> • Lock-up ON (After warming up the engine); Input Turbine speed (NT) equal to the engine speed. • Lock-up OFF (Idling at N posi- tion); Input Turbine speed (NT) nearly equal to the engine speed. 	–

2. ACTIVE TEST

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on the tester, perform the "ACTIVE TEST".

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.
LOCK UP	[Test Details] Control the shift solenoid SLU to set the automatic transmission to the lock-up condition. [Vehicle Condition] • Throttle valve opening angle: Less than 35 % • Vehicle Speed: 60 km/h (37 mph) or more	Possible to check the SLU operation.
LINE PRESS UP *	[Test Details] Operate the shift solenoid SLT and raise the line pressure. [Vehicle Condition] • Vehicle Stopped. • IDL: ON [HINT] OFF: Line pressure up (When the active test of "Control the Line Pressure Up" is performed, the ECM commands the SLT solenoid to turn off). ON: No action (normal operation)	–

*: "LINE PRESS UP" in the ACTIVE TEST is performed to check the line pressure changes by connecting the SST to the automatic transaxle, which is used in the HYDRAULIC TEST (See page [DI-958](#)) as well.

HINT:

The pressure values in ACTIVE TEST and HYDRAULIC TEST are different from each other.

DIAGNOSTIC TROUBLE CODE CHART

If a DTC is displayed during the DTC check, check the parts listed in the table below and proceed to the page given.

HINT:

- *1 : ● ... The MIL (Malfunction Indicator Lamp) lights up
- *2 : ○ ... The ECM memorizes the trouble code if the ECM detects the DTC detection condition.
- This DTC may be output when the clutch, brake and gear components etc. inside the automatic transmission are damaged.

CIRCUIT INSPECTION

DTC	P0705	Transmission Range Sensor Circuit Malfunction (PRNDL Input)
------------	--------------	--

CIRCUIT DESCRIPTION

The park/neutral position switch detects the shift lever position and sends signals to the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P0705	(2-trip detection logic) • All switches are OFF simultaneously for NSW, R, N, D, 3 and 2 positions. • 2 or more switches are ON simultaneously for NSW, R, D, 3 and 2 positions.	• Open or short in park/neutral position switch circuit • Park/neutral position switch • ECM

MONITOR DESCRIPTION

These DTCs indicate a problem with the park/neutral position switch and the wire harness in the park/neutral position switch circuit.

The park/neutral position switch detects the shift lever position and sends a signal to the ECM.

For security, the park/neutral position switch detects the shift lever position so that engine can be started only when the shift lever is in the P or N position.

The park/neutral position switch sends a signal to the ECM according to the shift position (NSW, R, D, 3 or 2).

The ECM determines that there is a problem with the switch or related parts if it receives more than 1 position signal simultaneously. The ECM will turn on the MIL and store the DTC.

MONITOR STRATEGY

Related DTCs	P0705	Park/neutral position switch/Verify switch input
Required sensors/Components	Park/neutral position switch	
Frequency of operation	Continuous	
Duration	Condition (A)	2 sec.
	Condition (B)	60 sec.
MIL operation	2 driving cycle	
Sequence of operation	None

2 switch	
Condition (B)	
All of following conditions are met	
NSW switch	OFF
R switch	
D switch	
3 switch	
2 switch	

COMPONENT OPERATING RANGE

Parameter	Standard value
Park/neutral position switch	The park/neutral position switch sends only one signal to the ECM.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition	Diagnostic Note
PNP SW [NSW]	PNP SW Status/ ON or OFF	Shift lever position is; P and N: ON Except P and N: OFF	When the shift lever position displayed on the hand-held tester differs from the actual position, adjustment of the PNP switch or the shift cable may be incorrect.
LOW	PNP SW Status/ ON or OFF	• Shift lever position is 2: OFF ↓ • Shift position L switch Push: ON ↓ • Shift position L switch Push: OFF	↑
2ND	PNP SW Status/ ON or OFF	Shift lever position is; 2 and L: ON Except 2 and L: OFF	↑
3RD	PNP SW Status/ ON or OFF	Shift lever position is; 3: ON Except 3: OFF	↑
DRIVE	PNP SW Status/ ON or OFF	Shift lever position is; D: ON Except D: OFF	↑
REVERSE	PNP SW Status/ ON or OFF	Shift lever position is; R: ON Except R: OFF	↑

1 Inspect park/neutral position switch.

Switch Side:
(Connector Front View):

P

D14154

PREPARATION:

- Jack up the vehicle.
- Disconnect the park/neutral position switch connector.

CHECK:

Measure the resistance according to the value(s) in the table below when the shift lever is moved to each position.

OK:

Shift Position	Tester Connection	Specified Condition
P	2 - 6 and 4 - 5	Below 1 Ω
Except P	\uparrow	10 k Ω or higher
R	2 - 1	Below 1 Ω
Except R	\uparrow	10 k Ω or higher
N	2 - 9 and 4 - 5	Below 1 Ω
Except N	\uparrow	10 k Ω or higher
D	2 - 7	Below 1 Ω
Except D	\uparrow	10 k Ω or higher
3	2 - 3	Below 1 Ω
Except 3	\uparrow	10 k Ω or higher
2	2 - 8	Below 1 Ω
Except 2	\uparrow	10 k Ω or higher

NG

Replace park/neutral position switch
(See page [AT-11](#)).

OK

2 Check harness and connector (Park/neutral position switch – ECM).

PREPARATION:

- (a) Connect the park/neutral position switch connector.
- (b) Turn the ignition switch ON.

CHECK:

Measure the voltage according to the value(s) in the table below when the shift lever is moved to each position.

OK:

Shift Position	Tester connection	Specified condition
P and N	E6 – 8 (STAR/NSW) – Body ground	Below 2 V
Except P and N	↑	10 to 14 V
R	E4 – 11 (R) – Body ground	10 to 14 V*
Except R	↑	Below 1 V
D	E4 – 21 (D) – Body ground	10 to 14 V
Except D	↑	Below 1 V
3	E4 – 19 (3) – Body ground	10 to 14 V
Except 3	↑	Below 1 V
2 and L	E4 – 10 (2) – Body ground	10 to 14 V
Except 2 and L	↑	Below 1 V

HINT:

*: The voltage will drop slightly due to lighting up of the back up light.

NG

Repair or replace the harness or connector (See page IN-30).

OK

Replace the ECM (See page SF-66).

DTC	P0710	Transmission Fluid Temperature Sensor "A" Circuit
------------	--------------	--

DTC	P0712	Transmission Fluid Temperature Sensor "A" Circuit Low Input
------------	--------------	--

DTC	P0713	Transmission Fluid Temperature Sensor "A" Circuit High Input
------------	--------------	---

CIRCUIT DESCRIPTION

The ATF (Automatic Transmission Fluid) temperature sensor converts the fluid temperature into a resistance value which is input into the ECM.

The ECM applies a voltage to the temperature sensor through ECM terminal THO1.

The sensor resistance changes with the transmission fluid temperature. As the temperature becomes higher, the sensor resistance decreases.

One terminal of the sensor is grounded so that the sensor resistance decreases and the voltage goes down as the temperature becomes higher.

The ECM calculates the fluid temperature based on the voltage signal.

DTC No.	DTC Detection Condition	Trouble Area
P0710	(a) and (b) are detected momentarily within 0.5 sec. when neither P0712 nor P0713 is detected (1-trip detection logic) (a) ATF temperature sensor No.1 resistance is less than 79 Ω . (b) ATF temperature sensor No.1 resistance is more than 156 k Ω . HINT: Within 0.5 sec., the malfunction switches from (a) to (b) or from (b) to (a)	<ul style="list-style-type: none"> • Open or short in ATF temperature sensor No.1 circuit • Transmission wire (ATF temperature sensor No.1) • ECM
P0712	ATF temperature sensor No.1 resistance is less than 79 Ω for 0.5 sec. or more (1-trip detection logic)	<ul style="list-style-type: none"> • Short in ATF temperature sensor No.1 circuit • Transmission wire (ATF temperature sensor No.1) • ECM
P0713	ATF temperature No.1 sensor resistance is more than 156 k Ω when 15 minutes or more have elapsed after the engine start DTC is detected for 0.5 sec. or more (1-trip detection logic)	<ul style="list-style-type: none"> • Open in ATF temperature sensor No.1 circuit • Transmission wire (ATF temperature sensor No.1) • ECM

MONITOR DESCRIPTION

These DTCs indicate an open or short in the automatic transmission fluid (ATF) temperature sensor circuit. The automatic transmission fluid (ATF) temperature sensor converts ATF temperature to an electrical resistance value. Based on the resistance, the ECM determines the ATF temperature, and the ECM detects an open or short in the ATF temperature circuit. If the resistance value of the ATF temperature is less than 79 Ω ^{*1} or more than 156k Ω ^{*2}, the ECM interprets this as a fault in the ATF sensor or wiring. The ECM will turn on the MIL and store the DTC.

*1: 150°C (302°F) or more is indicated regardless of the actual ATF temperature.

*2: -40°C (-40°F) is indicated regardless of the actual ATF temperature.

HINT:

The ATF temperature can be checked on the OBD II scan tool or hand-held tester display.

MONITOR STRATEGY

Related DTCs	P0710	ATF temperature sensor/Range check (Fluttering)
	P0712	ATF temperature sensor/Range check (Low resistance)
	P0713	ATF temperature sensor/Range check (High resistance)
Required sensors/Components	ATF temperature sensor (TFT sensor)	
Frequency of operation	Continuous	
Duration	0.5 sec.	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present.	See page DI-963	
Range check (Fluttering, Low resistance)		
The typical enabling condition is not available.	-	
Range check (High resistance)		
Time after engine start	15 min. or more	-

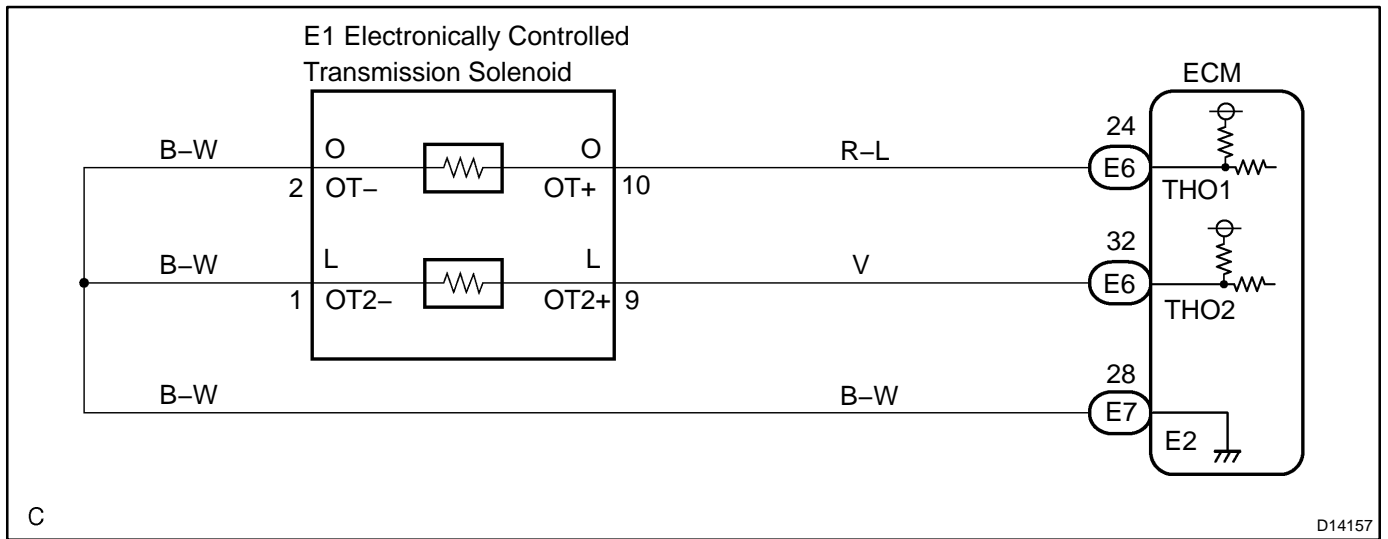

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
Range check (Fluttering)	
TFT (transmission fluid temperature) sensor resistance	Less than 79 Ω or More than 156 k Ω
Range check (Low resistance)	
TFT (transmission fluid temperature) sensor resistance	Less than 79 Ω
Range check (High resistance)	
TFT (transmission fluid temperature) sensor resistance	More than 156 k Ω

COMPONENT OPERATING RANGE

Parameter	Standard value
TFT (transmission fluid temperature) sensor	Atmospheric temperature to approx. 130°C (266°F)

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
AT FLUID TEMP 1	ATF Temp. Sensor Value/ min.: -40°C (-40°F) max.: 215°C (419°F)	<ul style="list-style-type: none"> • After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when cold soak

HINT:

When DTC P0712 is output and hand-held tester output is 150°C (302°F) or more, there is a short circuit. When DTC P0713 is output and hand-held tester output is -40°C (-40°F), there is an open circuit. Measure the resistance between terminal THO1 (OT) and body ground.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
150°C (302°F) or more	Short circuit

HINT:

If a circuit related to the ATF temperature sensor becomes open, P0713 is immediately set (in 0.5 second). When P0713 is set, P0711 cannot be detected. It is not necessary to inspect the circuit when P0711 is set.

1 Inspect transmission wire (ATF temperature sensor No.1).

**PREPARATION:**

Disconnect the transmission wire connector from the transmission.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
2 (OT-) – 10 (OT+)	79 Ω to 156 k Ω
2 (OT-) – Body ground	10 k Ω or higher
10 (OT+) – Body ground	10 k Ω or higher

HINT:

If the resistance is out of the specified range with either the ATF temperature shown in the table below, the driveability of the vehicle may decrease.

ATF Temperature	Specified Condition
20°C (68°F)	3 to 4 k Ω
110°C (230°F)	0.22 to 0.28 k Ω

NG

**Repair or replace the transmission wire (ATF temperature sensor No.1)
(See page [AT-9](#)).**

OK

2 Check harness and connector (Transmission wire – ECM).

PREPARATION:

- Connect the transmission wire connector.
- Disconnect the connector of the ECM.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 24 (THO1) – E7 – 28 (E2)	79 Ω to 156 k Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 24 (THO1) – Body ground	10 k Ω or higher
E7 – 28 (E2) – Body ground	↑

NG

Repair or replace the harness or connector (See page IN-30).

OK

Replace the ECM (See page SF-66).

DTC	P0711	Transmission Fluid Temperature Sensor "A" Performance
------------	--------------	--

CIRCUIT DESCRIPTION

See page [DI-999](#).

DTC No.	DTC Detection Condition	Trouble Area
P0711	Both (a) and (b) are detected: (2-trip detection logic) (a) Intake air and engine coolant temps. are more than -20°C (5°F) at engine start (b) After normal driving for over 22 min. and 9 km (6 mile) or more, ATF temp. is less than 10°C (68°F)	• Transmission wire (ATF temperature sensor No.1)

MONITOR DESCRIPTION

This DTC indicates that there is a problem with output from the automatic transmission fluid (ATF) temperature sensor and that the sensor itself is defective. The ATF temperature sensor converts the ATF temperature to an electrical resistance value. Based on the resistance, the ECM determines the ATF temperature and detects an open or short in the ATF temperature circuit or a fault in the ATF temperature sensor. After running the vehicle for a certain period, the ATF temperature should increase. If the ATF temperature is below 20°C (68°F) after running the vehicle for a certain period, the ECM interprets this as a fault, and turns on the MIL.

MONITOR STRATEGY

Related DTCs	P0711	ATF temperature sensor/Rationality check
Required sensors/Components	ATF temperature sensor (TFT sensor)	
Frequency of operation	Continuous	
Duration	3 sec.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present.	See page DI-963	
TFT (transmission fluid temperature) sensor circuit	Not circuit malfunction	
ECT (Engine coolant temperature) sensor circuit	Not circuit malfunction	
IAT (Intake air temperature) sensor circuit	Not circuit malfunction	
Time after engine start	21 min. and 40 sec.	
Driving distance after engine start	9 km (5.6 mile) or more	–
IAT (12 sec. after engine start)	-10°C (14°F) or more	–
ECT (12 sec. after engine start)	-10°C (14°F) or more	–

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
TFT (transmission fluid temperature)	Less than 20°C (68°F) (varies with TFT (transmission fluid temperature) at engine start)

WIRING DIAGRAM

See page [DI-999](#).

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- Warm up the engine.
- Turn the ignition switch off.
- Connect the OBD II scan tool or hand-held tester to the DLC3.
- Turn the ignition switch to the ON position.
- Push the "ON" button of the OBD II scan tool or the hand-held tester.
- When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
AT FLUID TEMP 1	ATF Temp. Sensor Value/ min.: -40°C (-40°F) max.: 215°C (419°F)	<ul style="list-style-type: none"> • After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when cold soak

HINT:

When DTC P0712 is output and hand-held tester output is 150°C (302°F) or more, there is a short circuit.
When DTC P0713 is output and hand-held tester output is -40°C (-40°F), there is an open circuit.
Measure the resistance between terminal THO1 (OT) and body ground.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
150°C (302°F) or more	Short circuit

HINT:

If a circuit related to the ATF temperature sensor becomes open, P0713 is immediately set (in 0.5 second).
When P0713 is set, P0711 cannot be detected.

It is not necessary to inspect the circuit when P0711 is set.

1	Check other DTCs output (in addition to DTC P0711).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0711" is output	A
"P0711" and other DTCs	B

HINT:

If any other codes besides "P0711" are output, perform troubleshooting for those DTCs first.

2	Check transmission fluid level (See page DI-952).
----------	--

OK:

Automatic transmission fluid level is correct.

**Replace the transmission wire
(ATF temperature sensor)
(See page AT-9).**

DTC	P0717	Input Speed Sensor Circuit No Signal
------------	--------------	---

CIRCUIT DESCRIPTION

This sensor detects the rotation speed of the turbine which shows the input revolution of transmission. By comparing the input turbine speed signal (NT) with the counter gear speed sensor signal (SP2), the ECM detects the shift timing of the gears and appropriately controls the engine torque and hydraulic pressure according to various conditions, thus, providing smooth gear shift.

P

D14162

DTC No.	DTC Detection Condition	Trouble Area
P0717	All conditions below are detected for 5 secs. or more (1-trip detection logic) (a) Gear change is not performed (b) Gear position: 4th or 5th (c) T/M input shaft rpm: 300 rpm or less (d) T/M output shaft rpm: 1,000 rpm or more (e) Park/neutral position switch: • NSW input signal is OFF • R input signal is OFF • L input signal is OFF (f) Shift solenoid valves and park/neutral position switch are in normal operation	<ul style="list-style-type: none"> • Open or short in speed sensor (NT) circuit • Speed sensor (NT) • ECM • Automatic transmission (clutch, brake or gear, etc.)

Reference (Using an oscilloscope):

Check the waveform between terminals NT+ and NT- of the ECM connector.

Standard: Refer to the illustration.

Terminal	NT+ - NT-
Tool setting	1V/DIV, 2ms/DIV
Vehicle condition	Engine idle speed (P or N position)

MONITOR DESCRIPTION

This DTC indicates that pulse is not output from the speed sensor NT (Turbine (input) speed sensor) or is output only little. The NT terminal of the ECM detects the revolving signal from the speed sensor (NT) (input RPM). The ECM outputs a gearshift signal comparing the input speed sensor (NT) with the output speed sensor (SP2).

While the vehicle is operating in the 4th or 5th gear position in the shift position of D, if the input shaft revolution is less than 300 rpm^{*1} although the output shaft revolution is more than 1000 rpm or more^{*2}, the ECM detects the trouble, illuminates the MIL and stores the DTC.

*1: Pulse is not output or is irregularly output.

*2: The vehicle speed is approx. 50 km/h (31 mph) or more.

MONITOR STRATEGY

Related DTCs	P0717	Speed sensor (NT)/Verify pulse input
Required sensors/Components	Main	Speed sensor (NT)
	Sub	Speed sensor (NO)
Frequency of operation	Continuous	
Duration	5 sec.	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present.	See page DI-963	
Shift change	Shift change is completed and before starting next shift change operation	
ECM selected gear	4th or 5th	
Output shaft rpm	1,000 rpm or more	–
NSW switch	OFF	
R switch	OFF	
L switch	OFF	
Engine	Running	
Ignition switch	ON	
Starter	OFF	
NSW switch fail	Not detected	
Battery voltage	8 V or more	

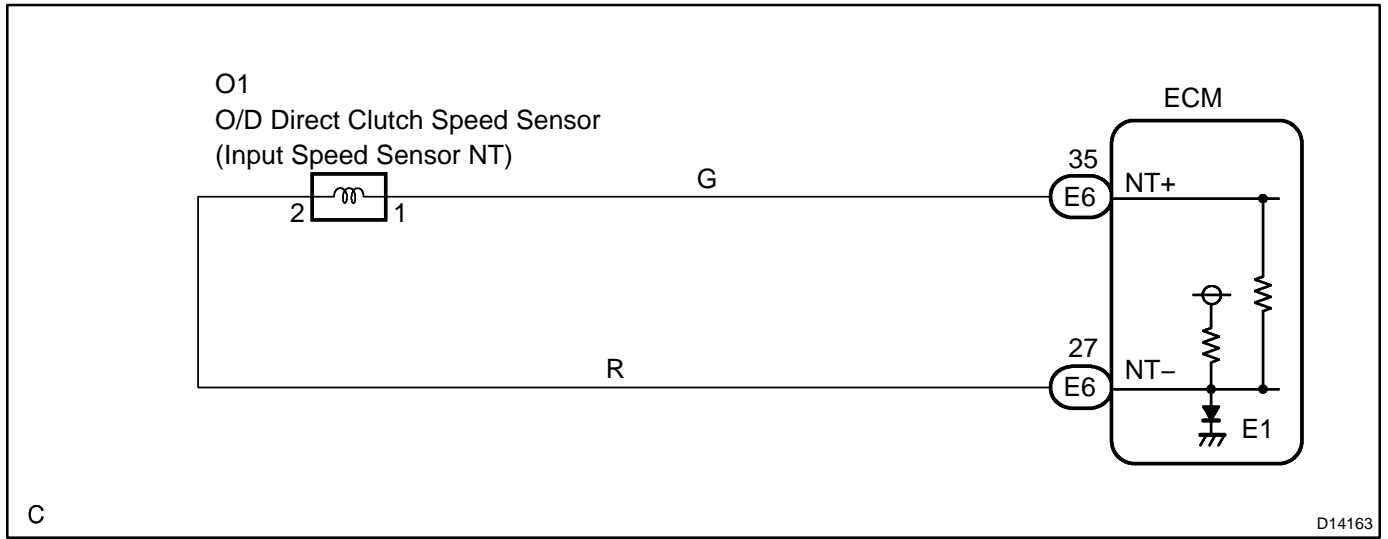

TYPICAL MALFUNCTION THRESHOLDS

Sensor signal rpm	Less than 300 rpm

COMPONENT OPERATING RANGE

Parameter	Standard value
Speed sensor (NT)	Input speed is equal to engine speed when lock-up ON.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
SPD (NT)	Input Turbine Speed/ display: 50 r/min	[HINT] • Lock-up ON (After warming up the engine); Input Turbine speed (NT) equal to the engine speed. • Lock-up OFF (Idling at N position); Input Turbine speed (NT) nearly equal to the engine speed.

HINT:

- SPD (NT) is always 0 while driving:
Open or short in the sensor or circuit.
- SPD (NT) is always more than 0 and less than 300 rpm while driving the vehicle at 50 km/h (31 mph) or more:
Sensor trouble, improper installation, or intermittent connection trouble of the circuit.

1 Inspect speed sensor installation.

PREPARATION:

Jack up the vehicle.

CHECK:

Check the speed sensor (NT) installation.

OK:

The installation bolt is tightened properly and there is no clearance between the sensor and transmission case.

Torque: 5.4 N·m (55 kgf-cm, 48 in.-lbf)

NG

Replace speed sensor NT (See page [AT-8](#)).

OK

2 Inspect speed sensor NT.

PREPARATION:

Disconnect the speed sensor connector from the transmission.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20 °C (68 °F)
1 - 2	560 to 680 Ω

NG

Replace speed sensor NT (See page [AT-8](#)).

OK

3 Check harness and connector (ECM – speed sensor NT).

PREPARATION:

- Connect the speed sensor connector.
- Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 – 35 (NT+) – E6 – 27 (NT-)	560 to 680 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 35 (NT+) – Body ground	10 kΩ or higher
E6 – 27 (NT-) – Body ground	↑

NG

**Repair or replace harness or connector
(See page IN-30).**

OK

Replace the ECM (See page SF-66).

DTC	P0722	Output Speed Sensor Circuit No Signal
------------	--------------	--

CIRCUIT DESCRIPTION

The speed sensor SP2 detects the rotation speed of the transmission output shaft and sends signals to the ECM. The ECM determines the vehicle speed based on these signals. An AC voltage is generated in the speed sensor SP2 coil as the parking gear mounted on the rear planetary gear assembly rotates, and this voltage is sent to the ECM. The parking gear on the rear planetary gear is used as the timing rotor for this sensor. The gear shift point and lock-up timing are controlled by the ECM based on the signals from this vehicle speed sensor and the throttle position sensor signal.

P

D14162

DTC No.	DTC Detection Condition	Trouble Area
P0722	<p>All conditions below are detected 500 times or more continuously (1-trip detection logic)</p> <p>(a) No signal from speed sensor (SP2) is input to ECM while 4 pulses of No. 1 vehicle speed sensor signal are sent</p> <p>(b) Vehicle speed is 9 km/h (6 mph) or more for at least 4 sec.</p> <p>(c) Park/neutral position switch is OFF.</p> <p>(d) Transfer position is except neutral (4WD).</p>	<ul style="list-style-type: none"> • Open or short in speed sensor (SP2) circuit • Speed sensor (SP2) • ECM • Automatic transmission (clutch, brake or gear, etc.)

C13480

D14149

Reference (Using an oscilloscope):

Check the waveform between terminals SP2+ and SP2- of the ECM connector.

Standard: Refer to the illustration.

Terminal	SP2+ - SP2-
Tool setting	2V/DIV, 20ms/DIV
Vehicle condition	Vehicle speed 20 km/h (12 mph)

MONITOR DESCRIPTION

The output speed sensor SP2 monitors the output shaft speed. The ECM controls the gearshift point and the lock up timing based on the signals from the output speed sensor SP2 and throttle position sensor. If the ECM detects no signal from the output shaft speed sensor SP2 even while the vehicle is moving, it will conclude that is a malfunction of the output speed sensor SP2. The ECM will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0722	Speed sensor SP2/Verify pulse input

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
SPD (SP2)	Output shaft Speed/ min.: 0 km/h (0 mph) max.: 255 km/h (158 mph)	Vehicle stopped: 0 km/h (0 mph) [HINT] Equal to vehicle speed

HINT:

- SPD (SP2) is always 0 while driving:
Open or short in the sensor or circuit.
- SPD (SP2) is always more than 0 and less than 300 rpm while driving the vehicle at 50 km/h (31 mph) or more:
Sensor trouble, improper installation, or intermittent connection trouble of the circuit.

1	Inspect speed sensor installation.
----------	---

PREPARATION:

Jack up the vehicle.

CHECK:

Check the speed sensor (SP2) installation.

OK:

The installation bolt is tightened properly and there is no clearance between the sensor and transmission case.

Torque: 5.4 N-m (55 kgf-cm, 48 in.-lbf)

NG

Replace speed sensor SP2 (See page AT-8).

OK

2 Inspect speed sensor SP2.

PREPARATION:

Disconnect the speed sensor connector from the transmission.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20 °C (68 °F)
1 – 2	560 to 680 Ω

NG → Replace speed sensor SP2 (See page [AT-8](#)).

OK

3 Check harness and connector (ECM – speed sensor SP2).

PREPARATION:

- (a) Connect the speed sensor connector.
- (b) Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 – 34 (SP2+) – E6 – 26 (SP2-)	560 to 680 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 34 (SP2+) – Body ground	10 kΩ or higher
E6 – 26 (SP2-) – Body ground	↑

NG → Repair or replace harness or connector (See page [IN-30](#)).

OK

Replace the ECM (See page [SF-66](#)).

DTC	P0724	Brake Switch "B" Circuit High
------------	--------------	--------------------------------------

CIRCUIT DESCRIPTION

The purpose of this circuit is to prevent the engine from stalling while driving in lock-up condition when brakes are suddenly applied.

When the brake pedal is depressed, this switch sends a signal to the ECM. Then the ECM cancels the operation of the lock-up clutch while braking is in progress.

DTC No.	DTC Detection Condition	Trouble Area
P0724	The stop light switch remains ON even when the vehicle is driven in a STOP (less than 3 km/h (2 mph)) and GO (30 km/h (19 mph) or more) fashion 5 times. (2-trip detection logic).	<ul style="list-style-type: none"> • Short in stop light switch signal circuit • Stop light switch • ECM

MONITOR DESCRIPTION

This DTC indicates that the stop light switch remains on. When the stop light switch remains ON during "stop and go" driving, the ECM interprets this as a fault in the stop light switch and the MIL comes on and the ECM stores the DTC. The vehicle must stop (less than 3 km/h (2 mph)) and go (30 km/h (19 mph) or more) ten times for two driving cycles in order to detect a malfunction.

MONITOR STRATEGY

Related DTCs	P0724	Stop light switch/Range check/Rationality
Required sensors/Components	Main	Stop light switch
	Sub	Vehicle speed sensor

1	Read value of DATA LIST (STP signal).
----------	--

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Standard:

Item	Measurement Item/ Range (display)	Normal Condition
Stop Light Switch	Stop light SW Status/ ON or OFF	<ul style="list-style-type: none"> • Brake Pedal is depressed: ON • Brake Pedal is released: OFF

NOTICE:

In the table above, the conditions listed under "Normal Condition" are reference conditions. Do not depend solely on these reference conditions when deciding whether a part is faulty or not.

OK:

Brake Pedal Condition	Specified Condition
Depressed	ON
Released	OFF

NG**Go to step 2.****OK****Go to step 3.**

2 Inspect stop light switch.

PREPARATION:

Remove the stop lamp switch assy.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Switch position	Tester Connection	Specified Condition
Switch pin free	1 – 2	Below 1 Ω
Switch pin pushed in	↑	10 k Ω or higher
Switch pin free	3 – 4	10 k Ω or higher
Switch pin pushed in	↑	Below 1 Ω

NG

Replace stop light switch.

OK

3 Check harness and connector (ECM – stop light switch).

PREPARATION:

Install the stop lamp switch assy.

CHECK:

Measure the voltage according to the value(s) in the table below when the brake pedal is depressed and released.

OK:

Condition	Tester Connection	Specified Condition
Brake pedal is depressed	E3 – 15 (STP) – Body ground	10 to 14 V
Brake pedal is released	↑	Below 1 V

NG

Repair or replace harness or connector
(See page [IN-30](#)).

OK

Replace the ECM (See page [SF-66](#)).

DTC	P0748	Pressure Control Solenoid "A" Electrical (Shift Solenoid Valve SL1)
------------	--------------	--

CIRCUIT DESCRIPTION

Shifting from 1st to 5th is performed in combination with "ON" and "OFF" operation of the shift solenoid valves SL1, SL2, S1, S2 and SR which are controlled by the ECM. If an open or short circuit occurs in either of the shift solenoid valves, the ECM controls the remaining normal shift solenoid valves to allow the vehicle to be operated smoothly (See page [DI-985](#)).

DTC No.	DTC Detection Condition	Trouble Area
P0748	ECM checks for an open or short circuit in shift solenoid valves SL1 (1-trip detection logic) (a) When solenoid, duty ratio equal to 100% (b) When solenoid is not energized, duty ratio is less than 3%	<ul style="list-style-type: none"> • Open or short in shift solenoid valve SL1 circuit • Shift solenoid valve SL1 • ECM

MONITOR DESCRIPTION

This DTC indicates an open or short in the shift solenoid valve SL1 circuit. The ECM commands gearshift by turning the shift solenoid valves "ON/OFF". When there is an open or short circuit in any shift solenoid valve circuit, the ECM detects the problem and illuminates the MIL and stores the DTC. And the ECM performs the fail-safe function and turns the other normal shift solenoid valves "ON/OFF". (In case of an open or short circuit, the ECM stops sending current to the circuit.)

While driving and shifting between 4th and 5th gears, if the ECM detects an open or short in the shift solenoid valve SL1 circuit, the ECM determines there is a malfunction (See page [DI-985](#)).

MONITOR STRATEGY

Related DTCs	P0748	Shift solenoid valve SL1/Range check

WIRING DIAGRAM

INSPECTION PROCEDURE**HINT:**

- The shift solenoid valve SL1 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve SL1	OFF	OFF	OFF	OFF	ON

1 Inspect transmission wire.**PREPARATION:**

Disconnect the transmission wire connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
12 (SL1+) – 4 (SL1-)	5.0 to 5.6 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
12 (SL1+) – Body ground	10 kΩ or higher
4 (SL1-) – Body ground	↑

NG**Go to step 3.****OK**

2

Check harness and connector (Transmission wire - ECM)**PREPARATION:**

- Connect the transmission wire connector.
- Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 - 19 (SL1+) - E6 - 18 (SL1-)	5.0 to 5.6 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 - 19 (SL1+) - Body ground	10 kΩ or higher
E6 - 18 (SL1-) - Body ground	↑

NG

Repair or replace the harness or connector (See page IN-30).

OK

Replace the ECM (See page SF-66).

3 Inspect shift solenoid valve SL1.

Shift Solenoid Valve SL1:

D12795

PREPARATION:

Remove the shift solenoid valve SL1 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 – 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (–) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG

**Replace the shift solenoid valve SL1
(See page [AT-12](#)).**

OK

**Repair or replace the transmission wire
(See page [AT-9](#)).**

DTC	P0751	Shift Solenoid "A" Performance (Shift Solenoid Valve S1)
------------	--------------	---

SYSTEM DESCRIPTION

The ECM uses signals from the output shaft speed sensor and input speed sensor to detect the actual gear position (1st, 2nd, 3rd, 4th or 5th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves, valve body or automatic transmission (clutch, brake or gear, etc.).

DTC No.	DTC Detection Condition	Trouble Area
P0751	The gear required by the ECM does not match the actual gear when driving (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve S1 remains open or closed • Valve body is blocked • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

This DTC indicates "stuck ON malfunction" or "stuck OFF malfunction" of the shift solenoid valve S1. The ECM commands gear shifts by turning the shift solenoid valves "ON/OFF". When the gear position commanded by the ECM and the actual gear position are not the same, the ECM illuminates the MIL and stores the DTC.

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
[OFF malfunction]	
All of the following conditions are met: Conditions (A), (B) and (C)	
2 detections are necessary per driving cycle 1st detection; temporary flag ON 2nd detection; pending fault code ON	
OFF malfunction (A)	
Turbine speed/Output speed	0.93 to 1.07
OFF malfunction (B)	
Turbine speed/Output speed	0.65 to 0.79
OFF malfunction (C)	
Output record from ECM for 4th → 5th upshifting	Recorded
[ON malfunction]	
Either of the following conditions is met:	
<ul style="list-style-type: none"> • ON malfunction (A) and (B) • ON malfunction (B) or (C), and ON malfunction (D) or (E) 	
ON malfunction (A) and (B)	
Turbine speed/Output speed	3.30 to 7.50
ON malfunction (C)	
Turbine speed/Output speed	1.91 to 2.35
ON malfunction (D)	
Turbine speed – Output speed x 4th gear ratio (NT – NO x 4th gear ratio)	1,000 rpm or more

ON malfunction (E)	
Turbine speed – Output speed x 5th gear ratio (NT – NO x 5th gear ratio)	1,000 rpm or more

INSPECTION PROCEDURE

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- Warm up the engine.
- Turn the ignition switch off.
- Connect the hand-held tester to the DLC3.
- Turn the ignition switch to the ON position.
- Turn on the tester.
- Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- According to the display on the tester, perform the "ACTIVE TEST".

HINT:

While driving, the shift position can be forcibly changed with the hand-held tester.

Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (See page [DI-985](#)).

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The 4th to 5th up-shiftings must be performed with the accelerator pedal released.
- The 5th to 4th down-shiftings must be performed with the accelerator pedal released.
- Do not operate the accelerator pedal for at least 2 seconds after shifting and do not shift successively.
- The shift position commanded by the ECM is shown in the DATA LIST (SHIFT) display on the hand-held tester.
- The shift solenoid valve S1 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve S1	ON	ON	OFF	OFF	OFF

1	Check other DTCs output (in addition to DTC P0751).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0751" is output	A
"P0751" and other DTCs	B

HINT:

If any other codes besides "P0751" are output, perform troubleshooting for those DTCs first.

2 Check shift solenoid valve S1 operation.

Shift solenoid S1:

PREPARATION:

Remove the shift solenoid valve S1 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
Solenoid Connector (S1) – Solenoid Body (S1)	11 to 15 Ω

CHECK:

Connect the positive (+) lead to the terminal of the solenoid connector, and the negative (-) lead to the solenoid body.

OK:

The solenoid makes an operating sound.

NG

Replace shift solenoid valve S1
(See page [AT-12](#)).

OK

3 Inspect valve body (See page [AT-12](#)).

OK:

There are no foreign objects on each valve.

NG

Repair or replace valve body.

OK

Repair or replace transmission (See page [AT-26](#)).

DTC	P0756	Shift Solenoid "B" Performance (Shift Solenoid Valve S2)
------------	--------------	---

SYSTEM DESCRIPTION

The ECM uses signals from the output shaft speed sensor and input speed sensor to detect the actual gear position (1st, 2nd, 3rd, 4th or 5th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves, valve body or automatic transmission (clutch, brake or gear, etc.).

DTC No.	DTC Detection Condition	Trouble Area
P0756	The gear required by the ECM does not match the actual gear when driving (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve S2 remains open or closed • Valve body is blocked • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

This DTC indicates "stuck ON malfunction" or "stuck OFF malfunction" of the shift solenoid valve S2. The ECM commands gear shifts by turning the shift solenoid valves "ON/OFF". When the gear position commanded by the ECM and the actual gear position are not the same, the ECM illuminates the MIL and stores the DTC.

Turbine speed – Output speed x 5th gear ratio (NT – NO x 5th gear ratio)	1,000 rpm or more

INSPECTION PROCEDURE

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on the tester, perform the "ACTIVE TEST".

HINT:

While driving, the shift position can be forcibly changed with the hand-held tester.

Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (See page [DI-985](#)).

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The 4th to 5th up-shiftings must be performed with the accelerator pedal released.
- The 5th to 4th down-shiftings must be performed with the accelerator pedal released.
- Do not operate the accelerator pedal for at least 2 seconds after shifting and do not shift successively.
- The shift position commanded by the ECM is shown in the DATA LIST (SHIFT) display on the hand-held tester.
- The shift solenoid valve S2 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve S2	OFF	ON	ON	OFF	OFF

1	Check other DTCs output (in addition to DTC P0756).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0756" is output	A
"P0756" and other DTCs	B

HINT:

If any other codes besides "P0756" are output, perform troubleshooting for those DTCs first.

2 Inspect shift solenoid valve S2 operation.

Shift solenoid S2:

PREPARATION:

Remove the shift solenoid valve S2 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
Solenoid Connector (S2) – Solenoid Body (S2)	11 to 15 Ω

CHECK:

Connect the positive (+) lead to the terminal of the solenoid connector, and the negative (-) lead to the solenoid body.

OK:

The solenoid makes an operating sound.

NG

Replace shift solenoid valve S2
(See page [AT-12](#)).

OK

3 Inspect valve body (See page [AT-12](#)).

OK:

There are no foreign objects on each valve.

NG

Repair or replace valve body.

OK

Repair or replace transmission (See page [AT-26](#)).

DTC	P0771	Shift Solenoid "E" Performance (Shift Solenoid Valve SR)
------------	--------------	---

SYSTEM DESCRIPTION

The ECM uses signals from the output shaft speed sensor and input speed sensor to detect the actual gear position (1st, 2nd, 3rd, 4th or 5th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves, valve body or automatic transmission (clutch, brake or gear, etc.).

DTC No.	DTC Detection Condition	Trouble Area
P0771	The gear required by the ECM does not match the actual gear when driving (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve SR remains open or closed • Shift solenoid valve SL1 remains open or closed • Valve body is blocked • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

This DTC indicates "stuck ON malfunction" or "stuck OFF malfunction" of the shift solenoid valve SR or SL1. The ECM commands gear shifts by turning the shift solenoid valves "ON/OFF". When the gear position commanded by the ECM and the actual gear position are not the same, the ECM illuminates the MIL and stores the DTC.

MONITOR STRATEGY

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
[OFF malfunction]	
All of the following conditions are met: OFF malfunctions (A), (B) and (C)	
2 detections are necessary per driving cycle 1st detection; temporary flag ON 2nd detection; temporary pending fault code ON	
OFF malfunction (A)	
Turbine speed/Output speed	0.93 to 1.07
OFF malfunction (B)	
Turbine speed/Output speed	Not change as follow 0.93 to 1.07 ↓ 0.65 to 0.79

OFF malfunction (C)	
Output record from ECM for 4th → 5th upshifting	Recorded
[ON malfunction]	
2 detections are necessary per driving cycle 1st detection; temporary flag ON 2nd detection; temporary pending fault code ON	
Turbine speed – Output speed x 1st gear ratio (NT – NO x 1st gear ratio)	150 rpm or more

INSPECTION PROCEDURE

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on the tester, perform the "ACTIVE TEST".

HINT:

While driving, the shift position can be forcibly changed with the hand-held tester.

Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (See page [DI-985](#)).

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The 4th to 5th up-shiftings must be performed with the accelerator pedal released.
- The 5th to 4th down-shiftings must be performed with the accelerator pedal released.
- Do not operate the accelerator pedal for at least 2 seconds after shifting and do not shift successively.
- The shift position commanded by the ECM is shown in the DATA LIST (SHIFT) display on the hand-held tester.
- The shift solenoid valve SR and SL1 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve SR	OFF	OFF	OFF	OFF	ON
Shift solenoid valve SL1	OFF	OFF	OFF	OFF	ON

1 Check other DTCs output (in addition to DTC P0771).

PREPARATION:

- Turn the ignition switch off.
- Connect the OBD II scan tool or hand-held tester to the DLC3.
- Turn the ignition switch to the ON position.
- Turn on the tester.
- Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0771" is output	A
"P0771" and other DTCs	B

HINT:

If any other codes besides "P0771" are output, perform troubleshooting for those DTCs first.

B

Go to DTC chart (See page [DI-991](#)).

A

2 Inspect shift solenoid valve SR operation.

Shift Solenoid Valve SR:

PREPARATION:

Remove the shift solenoid valve SR (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
Solenoid Connector (SR) – Solenoid Body (SR)	11 to 15 Ω

CHECK:

Connect the positive (+) lead to the terminal of the solenoid connector, and the negative (-) lead to the solenoid body.

OK:

The solenoid makes an operating sound.

NG

Replace shift solenoid valve SR
(See page [AT-12](#)).

OK

3 Inspect shift solenoid valve SL1.

Shift Solenoid Valve SL1:

D12795

PREPARATION:

Remove the shift solenoid valve SL1 (See page AT-12).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 - 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (-) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG Replace the shift solenoid valve SL1 (See page AT-12).

OK

4 Inspect valve body (See page AT-12).

OK:

There are no foreign objects on each valve.

NG Repair or replace valve body.

OK

Repair or replace transmission (See page AT-26).

DTC	P0776	Pressure Control Solenoid "B" Performance (Shift Solenoid Valve SL2)
------------	--------------	---

SYSTEM DESCRIPTION

The ECM uses signals from the output shaft speed sensor and input speed sensor to detect the actual gear position (1st, 2nd, 3rd, 4th or 5th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves, valve body or automatic transmission (clutch, brake or gear, etc.).

DTC No.	DTC Detection Condition	Trouble Area
P0776	The gear required by the ECM does not match the actual gear when driving (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve SL2 remains open or closed • Valve body is blocked • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

This DTC indicates "stuck ON malfunction" or "stuck OFF malfunction" of the shift solenoid valve SL2. The ECM commands gear shifts by turning the shift solenoid valves "ON/OFF". When the gear position commanded by the ECM and the actual gear position are not the same, the ECM illuminates the MIL and stores the DTC.

Vehicle speed	2 to 40 km/h (1.2 to 24.9 mph)	
Throttle valve opening angle	6.5% or more at 2,000 rpm (Conditions vary with engine speed)	–
ON malfunction (B)		
ECM selected gear	3rd	
Vehicle speed	2 km/h (1.2 mph) or more	–
Throttle valve opening angle	6.5% or more at 2,000 rpm (Conditions vary with engine speed)	–
ON malfunction (C)		
ECM selected gear	4th	
Vehicle speed	2 km/h (1.2 mph) or more	–
Throttle valve opening angle	6.5% or more at 2,000 rpm (Conditions vary with engine speed)	–
ON malfunction (D)		
Current ECM selected gear	5th	
Last ECM selected gear	4th	

Vehicle speed (During transition from 4th to 5th gear)	-	Less than 100 km/h (62.2 mph)
ON malfunction (E)		
ECM selected gear	5th	
Engine speed – Turbine speed (NE – NT) (After transition from 4th to 5th gear)	-	Less than 150 rpm
Vehicle speed (After transition from 4th to 5th gear)	-	Less than 100 km/h (62.2 mph)

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
Both of the following conditions are met:	
<ul style="list-style-type: none"> • ON malfunctions (A) and (B), or ON malfunction (C) • ON malfunction (D) or (E) 	
ON malfunction (A)	
Turbine speed/Output speed	3.30 to 7.50
ON malfunction (B)	
Turbine speed/Output speed	1.28 to 1.53
ON malfunction (C)	
Turbine speed/Output speed	0.93 to 1.07
ON malfunction (D)	
Turbine speed – Output speed x 4th gear ratio (NT – NO x 4th gear ratio)	1,000 rpm or more
ON malfunction (E)	
Turbine speed – Output speed x 5th gear ratio (NT – NO x 5th gear ratio)	1,000 rpm or more

INSPECTION PROCEDURE

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on the tester, perform the "ACTIVE TEST".

HINT:

While driving, the shift position can be forcibly changed with the hand-held tester.

Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (See page [DI-985](#)).

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The 4th to 5th up-shiftings must be performed with the accelerator pedal released.
- The 5th to 4th down-shiftings must be performed with the accelerator pedal released.
- Do not operate the accelerator pedal for at least 2 seconds after shifting and do not shift successively.
- The shift position commanded by the ECM is shown in the DATA LIST (SHIFT) display on the hand-held tester.
- The shift solenoid valve SL2 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve SL2	ON	ON	ON	ON	OFF

1	Check other DTCs output (in addition to DTC P0776).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0776" is output	A
"P0776" and other DTCs	B

HINT:

If any other codes besides "P0776" are output, perform troubleshooting for those DTCs first.

2 Inspect shift solenoid valve SL2.**Shift Solenoid Valve SL2:**

D12795

PREPARATION:

Remove the shift solenoid valve SL2 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 - 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (-) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG

Replace the shift solenoid valve SL2 (See page [AT-12](#)).

OK**3 Inspect valve body (See page [AT-12](#)).****OK:**

There are no foreign objects on each valve.

NG

Repair or replace valve body.

OK

Repair or replace transmission (See page [AT-26](#)).

DTC	P0778	Pressure Control Solenoid "B" Electrical (Shift Solenoid Valve SL2)
------------	--------------	--

CIRCUIT DESCRIPTION

Shifting from 1st to 5th is performed in combination with "ON" and "OFF" operation of the shift solenoid valves SL1, SL2, S1, S2 and SR which are controlled by the ECM. If an open or short circuit occurs in either of the shift solenoid valves, the ECM controls the remaining normal shift solenoid valves to allow the vehicle to be operated smoothly (See page [DI-985](#)).

DTC No.	DTC Detection Condition	Trouble Area
P0778	The ECM checks for an open or short in the shift solenoid valve SL2 circuit while driving and shifting gears. (1-trip detection logic) • Output signal duty equals to 100%. (NOTE: SL2 output signal duty is less than 100% under normal condition.)	<ul style="list-style-type: none"> • Open or short in shift solenoid valve SL2 circuit • Shift solenoid valve SL2 • ECM

MONITOR DESCRIPTION

This DTC indicates an open or short in the shift solenoid valve SL2 circuit. The ECM commands gear shift by turning the shift solenoid valves "ON/OFF". When there is an open or short circuit in any shift solenoid valve circuit, the ECM detects the problem and illuminates the MIL and stores the DTC. And the ECM performs the fail-safe function and turns the other normal shift solenoid valves "ON/OFF". (In case of an open or short circuit, the ECM stops sending current to the circuit.)

While driving and shifting gears, if the ECM detects an open or short in the shift solenoid valve SL2 circuit, the ECM determines there is a malfunction (See page [DI-985](#)).

MONITOR STRATEGY

Related DTCs	P0778	Shift solenoid valve SL2/Range check
Required sensors/Components	Shift solenoid valve SL2	
Frequency of operation	Continuous	
Duration	1 sec.

INSPECTION PROCEDURE

HINT:

- The shift solenoid valve SL2 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve SL2	ON	ON	ON	ON	OFF

1	Inspect transmission wire.
----------	-----------------------------------

PREPARATION:

Disconnect the transmission wire connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
11 (SL2+) – 3 (SL2-)	5.0 to 5.6 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
11 (SL2+) – Body ground	10 kΩ or higher
3 (SL2-) – Body ground	↑

NG

Go to step 3.

OK

2

Check harness and connector (Transmission wire - ECM)**PREPARATION:**

- (a) Connect the transmission wire connector.
- (b) Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 - 17 (SL2+) - E6 - 16 (SL2-)	5.0 to 5.6 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 - 17 (SL2+) - Body ground	10 kΩ or higher
E6 - 16 (SL2-) - Body ground	↑

NG

Repair or replace the harness or connector (See page IN-30).

OK

Replace the ECM (See page SF-66).

3 Check shift solenoid valve SL2.

Shift Solenoid Valve SL2:

D12795

PREPARATION:

Remove the shift solenoid valve SL2 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 – 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (–) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG

**Replace the shift solenoid valve SL2
(See page [AT-12](#)).**

OK

**Repair or replace the transmission wire
(See page [AT-9](#)).**

DTC	P0781	1-2 Shift (1-2 Shift Valve)
------------	--------------	------------------------------------

SYSTEM DESCRIPTION

The 1-2 shift valve performs shifting to 1st gear and other gears.

DTC No.	DTC Detection Condition	Trouble Area
P0781	The gear required by the ECM does not match the actual gear when driving (2-trip detection logic)	<ul style="list-style-type: none"> • Valve body is blocked up or stuck (1-2 shift valve) • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

This DTC indicates that the 1-2 shift valve in the valve body is locked in the direction the spring compresses. The ECM commands gear shifts by turning the shift solenoid valves "ON/OFF" and switching oil pressure to the valves in the valve body.

The ECM calculates the "actual" transmission gear by comparing the signals from the input speed sensor (NCO) and the output speed sensor (SP2). The ECM can detect many mechanical problems in the shift solenoids, valve body, and the transmission clutches, brakes, and gears. If the ECM detects that the actual gear position and the commanded gear position are different, it will illuminate the MIL and store the DTC .

MONITOR STRATEGY

Related DTCs	P0781	Valve body/Rationality check

INSPECTION PROCEDURE

1	Check other DTCs output (in addition to DTC P0781).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0781" is output	A
"P0781" and other DTCs	B

HINT:

If any other codes besides "P0781" are output, perform troubleshooting for those DTCs first.

2	Perform active test
----------	----------------------------

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on the tester, perform the "ACTIVE TEST".

HINT:

While driving, the shift position can be forcibly changed with the hand-held tester.

Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (See page [DI-985](#)).

Standard:

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The 4th to 5th up-shiftings must be performed with the accelerator pedal released.
- The 5th to 4th down-shiftings must be performed with the accelerator pedal released.
- Do not operate the accelerator pedal for at least 2 seconds after shifting and do not shift successively.
- The shift position commanded by the ECM is shown in the DATA LIST (SHIFT) display on the hand-held tester.

OK:

Gear position changes in accordance with the tester command.

NG

**Repair or replace valve body
(See page [AT-12](#)).**

OK

3	Clear the DTC and running test.
----------	--

CHECK:

Clear the DTC, and check DTC again after conducting the "MONITOR DRIVE PATTERN FOR ECT TEST" (See page [DI-969](#)).

OK:

No DTC code

DTC	P0973	Shift Solenoid "A" Control Circuit Low (Shift Solenoid Valve S1)
------------	--------------	---

DTC	P0974	Shift Solenoid "A" Control Circuit High (Shift Solenoid Valve S1)
------------	--------------	--

CIRCUIT DESCRIPTION

Shifting from 1st to 5th is performed in combination with "ON" and "OFF" operation of the shift solenoid valves SL1, SL2, S1, S2 and SR which are controlled by the ECM. If an open or short circuit occurs in either of the shift solenoid valves, the ECM controls the remaining normal shift solenoid valves to allow the vehicle to be operated smoothly (See page [DI-985](#)).

DTC No.	DTC Detection Condition	Trouble Area
P0973	ECM detects short in solenoid valve S1 circuit 2 times when solenoid valve S1 is operated (1-trip detection logic)	<ul style="list-style-type: none"> • Short in shift solenoid valve S1 circuit • Shift solenoid valve S1 • ECM
P0974	ECM detects open in solenoid valve S1 circuit 2 times when solenoid valve S1 is not operated (1-trip detection logic)	<ul style="list-style-type: none"> • Open in shift solenoid valve S1 circuit • Shift solenoid valve S1 • ECM

MONITOR DESCRIPTION

These DTCs indicate an open or short in the shift solenoid valve S1 circuit. When there is an open or short circuit in any shift solenoid valve circuit, the ECM detects the problem and illuminates the MIL and stores the DTC. When the shift solenoid valve S1 is on, if resistance is 8 Ω or less, the ECM determines there is a short in the shift solenoid valve S1 circuit.

When the shift solenoid valve S1 is off, if resistance is 100 k Ω or more, the ECM determines there is an open in the shift solenoid valve S1 circuit (See page [DI-985](#)).

INSPECTION PROCEDURE

HINT:

- The shift solenoid valve S1 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve S1	ON	ON	OFF	OFF	OFF

1	Check transmission wire.
----------	---------------------------------

PREPARATION:

Disconnect the transmission wire connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
8 – Body ground	11 to 15 Ω

NG

Go to step 3.

OK

2

Check harness and connector (Transmission wire - ECM)**PREPARATION:**

- (a) Connect the transmission wire connector.
- (b) Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 - 11 (S1) - Body ground	11 to 15 Ω

NG

**Repair or replace the harness or connector
(See page [IN-30](#)).**

OK

Replace the ECM (See page [SF-66](#)).

3 Check shift solenoid valve S1.

PREPARATION:

Remove the shift solenoid valve S1 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
Solenoid Connector (S1) – Solenoid Body (S1)	11 to 15 Ω

CHECK:

Connect the positive (+) lead to the terminal of the solenoid connector, and the negative (-) lead to the solenoid body.

OK:

The solenoid makes an operating sound.

NG

Replace the shift solenoid valve S1 (See page [AT-12](#)).

OK

Repair or replace the transmission wire (See page [AT-9](#)).

1	Check transmission wire.
----------	---------------------------------

**PREPARATION:**

Disconnect the transmission wire connector.

CHECK:

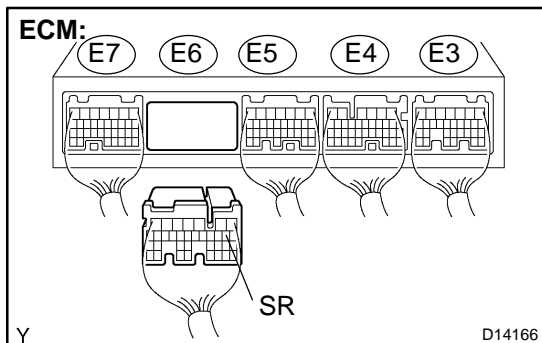

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
7 – Body ground	11 to 15 Ω

NG**Go to step 3.****OK**

2

Check harness and connector (Transmission wire - ECM)**PREPARATION:**

- Connect the transmission wire connector.
- Disconnect the connector of the ECM.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 - 9 (SR) - Body ground	11 to 15 Ω

NG

**Repair or replace the harness or connector
(See page [IN-30](#)).**

OK

Replace the ECM (See page [SF-66](#)).

3 Check shift solenoid valve SR.
Shift Solenoid Valve SR:

PREPARATION:

Remove the shift solenoid valve SR (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
Solenoid Connector (SR) – Solenoid Body (SR)	11 to 15 Ω

CHECK:

Connect the battery positive lead to the solenoid connector terminal and the battery negative lead to the solenoid body ground.

OK:

Solenoid sounds an operation noise.

NG

Replace the shift solenoid valve SR (See page [AT-12](#)).

OK

Repair or replace the transmission wire (See page [AT-9](#)).

DTC	P2714	Pressure Control Solenoid "D" Performance (Shift Solenoid Valve SLT)
------------	--------------	---

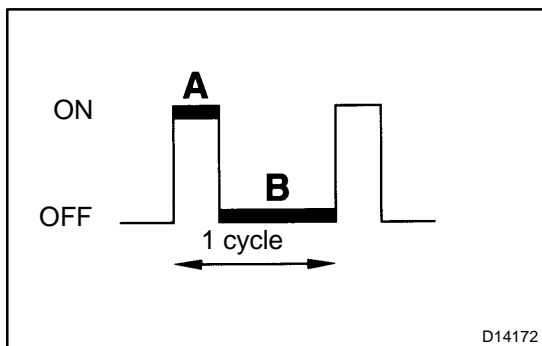

SYSTEM DESCRIPTION

The linear solenoid valve (SLT) controls the transmission line pressure for smooth transmission operation based on signals from the throttle position sensor and the vehicle speed sensor. The ECM adjusts the duty cycle of the SLT solenoid valve to control hydraulic line pressure coming from the primary regulator valve. Appropriate line pressure assures smooth shifting with varying engine outputs.

(*): Duty Ratio

The duty ratio is the ratio of the period of continuity in one cycle. For example, if A is the period of continuity in one cycle, and B is the period of non-continuity, then

$$\text{Duty Ratio} = \frac{A}{A + B} \times 100 (\%)$$

DTC No.	DTC Detection Condition	Trouble Area
P2714	ECM detects a malfunction on SLT (ON side) according to the revolution difference of the turbine and the output shaft, and also by the oil pressure. (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve SLT remains open or closed • Valve body is blocked • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

The ECM calculates the amount of heat absorbed by the friction material based on the difference in revolution (clutch slippage) between the turbine and output shaft. The ECM turns on the MIL and outputs this DTC when the amount of heat absorption exceeds the specified value.

When the shift solenoid valve SLT remains on, oil pressure goes down and clutch engagement force decreases.

NOTE: If you continue driving under these conditions, the clutch will burn out and the vehicle will no longer be drivable.

MONITOR STRATEGY

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on tester, perform the "ACTIVE TEST".

Item	Test Details	Diagnostic Note
LINE PRESS UP *	[Test Details] Operate the shift solenoid SLT and raise the line pressure. [Vehicle Condition] • Vehicle Stopped. • IDL: ON [HINT] OFF: Line pressure up (When the active test of "Control the Line Pressure Up" is performed, the ECM commands the SLT solenoid to turn off). ON: No action (normal operation)	-

*: "LINE PRESS UP" in the ACTIVE TEST is performed to check the line pressure changes by connecting the SST to the automatic transaxle, which is used in the HYDRAULIC TEST (See page [DI-958](#)) as well.

HINT:

- The pressure values in ACTIVE TEST and HYDRAULIC TEST are different from each other.
- Normally, the line pressure detected in the ACTIVE TEST is approximately half of the value detected in the HYDRAULIC TEST's stall test.

1	Check other DTCs output (in addition to DTC P2714).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P2714" is output	A
"P2714" and other DTCs	B

HINT:

If any other codes besides "P2714" are output, perform troubleshooting for those DTCs first.

2 Inspect shift solenoid valve SLT operation.

Shift Solenoid Valve SLT:

P

D11987

PREPARATION:

Remove the shift solenoid valve SLT (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 – 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (-) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG

Replace the shift solenoid valve SLT
(See page [AT-12](#)).

OK

3 Inspect valve body (See page [AT-12](#)).

OK:

There are no foreign objects on each valve.

NG

Repair or replace valve body.

OK

Repair or replace transmission (See page [AT-26](#)).

DTC	P2716	Pressure Control Solenoid "D" Electrical (Shift Solenoid Valve SLT)
------------	--------------	--

CIRCUIT DESCRIPTION

See page [DI-1073](#)

DTC No.	DTC Detection Condition	Trouble Area

1 – 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (-) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG

**Replace the shift solenoid valve SLT
(See page [AT-12](#)).**

OK

**Repair or replace the transmission wire
(See page [AT-9](#)).**

DTC	P2740	Transmission Fluid Temperature Sensor "B" Circuit
------------	--------------	--

DTC	P2742	Transmission Fluid Temperature Sensor "B" Circuit Low Input
------------	--------------	--

DTC	P2743	Transmission Fluid Temperature Sensor "B" Circuit High Input
------------	--------------	---

CIRCUIT DESCRIPTION

ATF (Automatic Transmission Fluid) temperature sensor No.2 is on the transmission and just in front of the oil cooler inlet pipeline.

If ECM detects the abnormally high temperature of ATF by this sensor, it draws driver's attention by illuminating the warning lamp.

HINT:

- The temperature of ATF easily rises when towing, climbing hills and in traffic, etc.
- If the ATF temperature sensor No.2 becomes short-circuited, the signal that indicates the ATF temperature is 150°C (302°F) or higher is input in ECM.

Vehicle conditions when the sensor is normal and when the sensor is short-circuited are indicated in the table below.

ATF temperature Sensor No.2 State	Detection Condition	Symptom	Recovery Condition
Sensor is normal	• AT fluid temp. more than 150°C (302°F).	• AT Oil Temp. warning light remains on	• AT fluid temp. less than 135°C (275°F). *2
	• AT fluid temp. more than 130°C (266°F).	• Shift point too high.	• AT fluid temp. less than 110°C (230°F).
	When the conditions (a) and (b) are satisfied. (a) AT fluid temp. more than 130°C (266°F). (b) Engine coolant temp. more than 95°C (203°F).	• Lock-up at 3rd gear. *1	• AT fluid temp. less than 110°C (230°F) *2 and engine coolant temp. less than 95°C (203°F).
Sensor is short-circuited	• Any conditions.	• AT Oil Temp. warning light remains on • Shift point too high.	• Symptoms still occur
	• Engine coolant temp. more than 95°C (203°F).	• Lock-up at 3rd gear. *1	• Symptoms still occur

HINT:

*1: When AT fluid temperature is normal, transmission locks up at 5th gear with the shift lever in D position and at 4th gear with the shift lever in 4 position.

*2: When AT fluid temperature is in normal range, it decreases to less than 135°C (275°F) within 5 minutes with the shift lever in P or N position in an idling state.

DTC No.	DTC Detecting Condition	Trouble Area
P2740	(a) and (b) are detected momentarily within 0.5 sec. when neither P2742 nor P2743 is detected (1-trip detection logic) (a) ATF temperature sensor No.2 resistance is less than 25 Ω (0.046 V) (b) ATF temperature sensor No.2 resistance is more than 156 k Ω (4.915 V) HINT: Within 0.5 sec. the malfunction switches from (a) to (b) or from (b) to (a)	<ul style="list-style-type: none"> • Open or short in ATF temperature sensor No.2 circuit • Transmission wire (ATF temperature sensor No.2) • ECM
P2742	ATF temperature sensor No.2 resistance is less than 25 Ω (0.046 V) for 0.5 sec. or more (1-trip detection logic)	<ul style="list-style-type: none"> • Short in ATF temperature sensor No.2 circuit • Transmission wire (ATF temperature sensor No.2) • ECM
P2743	ATF temperature No.2 sensor resistance is more than 156 k Ω (4.915 V) when 15 minutes or more after the engine start DTC is detected for 0.5 sec. or more (1-trip detection logic)	<ul style="list-style-type: none"> • Open in ATF temperature sensor No.2 circuit • Transmission wire (ATF temperature sensor No.2) • ECM

MONITOR DESCRIPTION

The Automatic Transmission Fluid (ATF) temperature sensor converts ATF temperature to an electrical resistance value. Based on the resistance, the ECM determines the ATF temperature, and the ECM detects an open or short in the AFT temperature circuit. If the resistance value of the ATF temperature is less than 25 Ω (0.046 V) or more than 156 k Ω (4.915 V), the ECM interprets this as a fault in the ATF sensor or wiring. The ECM will turn on the MIL and store the DTC.

MONITOR STRATEGY

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
AT FLUID TEMP 2	ATF Temp. Sensor Value/ min.: -40°C (-40°F) max.: 215°C (419°F)	<ul style="list-style-type: none"> • After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when cold soak

HINT:

When DTC P2742 is output and hand-held tester output is 150°C (302°F) or more, there is a short circuit.

When DTC P2743 is output and hand-held tester output is -40°C (-40°F), there is an open circuit.

Measure the resistance between terminal THO2 (OT2) and body ground.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
150°C (302°F) or more	Short circuit

1 Inspect transmission wire (ATF temperature sensor No.2)

PREPARATION:

Disconnect the transmission wire connector from the transmission.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
1 (OT2-) – 9 (OT2+)	25 Ω to 156 k Ω
1 (OT2-) – Body ground	10 k Ω or higher
9 (OT2+) – Body ground	10 k Ω or higher

HINT:

If the resistance is out of the specified range with either the ATF temperature shown in the table below, the driveability of the vehicle may decrease.

ATF Temperature	Specified Condition
20°C (68°F)	3 to 4 k Ω
110°C (230°F)	0.22 to 0.28 k Ω

NG

**Repair or replace the transmission wire (ATF temperature sensor No.2)
(See page [AT-9](#)).**

OK

2 Check harness and connector (Transmission wire – ECM)

PREPARATION:

- Connect the transmission wire connector.
- Disconnect the connector of the ECM.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 32 (THO2) – E7 – 28 (E2)	25 Ω to 156 k Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 32 (THO2) – Body ground	10 k Ω or higher
E7 – 28 (E2) – Body ground	↑

NG

Repair or replace the harness or connector (See page IN-30).

OK

Replace the ECM (See page SF-66).

DTC	P2757	Torque Converter Clutch Pressure Control Solenoid Performance(Shift Solenoid Valve SLU)
------------	--------------	--

SYSTEM DESCRIPTION

The ECM uses the signals from the throttle position sensor, Air-flow meter, turbine (input) speed sensor, output speed sensor and crankshaft position sensor to monitor the engagement condition of the lock-up clutch.

Then the ECM compares the engagement condition of the lock-up clutch with the lock-up schedule in the ECM memory to detect a mechanical problems of the shift solenoid valve SLU, valve body and torque converter clutch.

DTC No.	DTC Detection Condition	Trouble Area
P2757	Lock-up does not occur when driving in the lock-up range (normal driving at 80 km/h [50 mph]), or lock-up remains ON in the lock-up OFF range. (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve SLU remains open or closed • Valve body is blocked • Torque converter clutch • Automatic transmission (clutch, brake or gear, etc.) • Line pressure is too low

MONITOR DESCRIPTION

Torque converter lock-up is controlled by the ECM based on the turbine (input) speed sensor NT, output speed sensor SP2, engine rpm, engine load, engine temperature, vehicle speed, transmission temperature, and gear selection. The ECM determines the lock-up status of the torque converter by comparing the engine rpm (NE) to the input turbine rpm (NT). The ECM calculates the actual transmission gear by comparing input turbine rpm (NT) to output shaft rpm (SP2). When conditions are appropriate, the ECM requests "lock-up" by applying control voltage to the shift solenoid SLU. When the SLU is turned on, it applies pressure to the lock-up relay valve and locks the torque converter clutch.

If the ECM detects no lock-up after lock-up has been requested or if it detects lock-up when it is not requested, the ECM interprets this as a fault in the shift solenoid valve SLU or lock-up system performance. The ECM will turn on the MIL and store the DTC.

Example:

When any of the following is met, the system judges it as a malfunction.

- (a) There is a difference in rotation between the input side (engine speed) and output side (input turbine speed) of the torque converter when the ECM commands lock-up.
(Engine speed is at least 70 rpm greater than input turbine speed.)
- (b) There is no difference in rotation between the input side (engine speed) and output side (input turbine speed) of the torque converter when the ECM commands lock-up off.
(The difference between engine speed and input turbine speed is less than 35 rpm.)

INSPECTION PROCEDURE

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- Warm up the engine.
- Turn the ignition switch off.
- Connect the hand-held tester to the DLC3.
- Turn the ignition switch to the ON position.
- Turn on the tester.
- Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- According to the display on the tester, perform the "ACTIVE TEST".

Item	Test Details	Diagnostic Note
LOCK UP	[Test Details] Control the shift solenoid SLU to set the automatic transmission to the lock-up condition. [Vehicle Condition] <ul style="list-style-type: none"> • Throttle valve opening angle: Less than 35 % • Vehicle Speed: 60 km/h (37 mph) or more 	Possible to check the SLU operation.

HINT:

- This test can be conducted when the vehicle speed is 60 km/h (37 mph) or more.
- This test can be conducted in the 5th gear.
- Lightly depress the accelerator pedal and check that the engine speed does not change abruptly.

HINT:

- When changing the accelerator pedal opening angle while driving, if the engine speed does not change, lock-up is on.
- Slowly release, but not fully, the accelerator pedal in order to decelerate. (Fully releasing the pedal will close the throttle valve and lock-up may be turned off automatically.)

1	Check other DTCs output (in addition to DTC P2757).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P2757" is output	A
"P2757" and other DTCs	B

HINT:

If any other codes besides "P2757" are output, perform troubleshooting for those DTCs first.

2 Check shift solenoid valve SLU operation.

Shift Solenoid Valve SLU:

D12795

PREPARATION:

Remove the shift solenoid valve SLU (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 - 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (-) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG

Replace the shift solenoid valve SLU
(See page [AT-12](#)).

OK

3 Inspect valve body (See page [AT-12](#)).

OK:

There are no foreign objects on each valve.

NG

Repair or replace valve body.

OK

4	Check torque converter clutch (See page AT-39).
---	--

OK:

The torque converter clutch operates normally.

DTC	P2759	Torque Converter Clutch Pressure Control Solenoid Control Circuit Electrical(Shift Solenoid Valve SLU)
------------	--------------	---

CIRCUIT DESCRIPTION

The amount of current flow to the solenoid is controlled by the (*) duty ratio of the ECM output signal. The higher the duty ratio becomes, the higher the lock-up hydraulic pressure becomes during the lock-up operation.

(*) Duty Ratio

The duty ratio is the ratio of the period of continuity in one cycle. For example, if A is the period of continuity in one cycle, and B is the period of non-continuity, then

$$\text{Duty Ratio} = \frac{A}{A + B} \times 100 (\%)$$

BE4056

D00160

DTC No.	DTC detection condition	Trouble Area
P2759	Open or short is detected in shift solenoid valve SLU circuit for 1 second or more while driving (1-trip detection logic).	<ul style="list-style-type: none"> • Open or short in shift solenoid valve SLU circuit • Shift solenoid valve SLU • ECM

MONITOR DESCRIPTION

When an open or short in a shift solenoid valve (SLU) circuit is detected, the ECM determines there is a malfunction. The ECM will turn on the MIL and store this DTC.

MONITOR STRATEGY

Related DTCs	P2759	Shift solenoid valve SLU/Range check
Required sensors/Components	Shift solenoid valve SLU	
Frequency of operation	Continuous	
Duration	1 sec.	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present	See page DI-973	
Case 1:		
Battery voltage	12 V or more	-
Ignition switch	ON	
Starter	OFF	
Case 2:		
Battery voltage	10 V or more	Less than 12 V
CPU commanded duty	-	Less than 75%
Ignition switch	ON	
Starter	OFF	

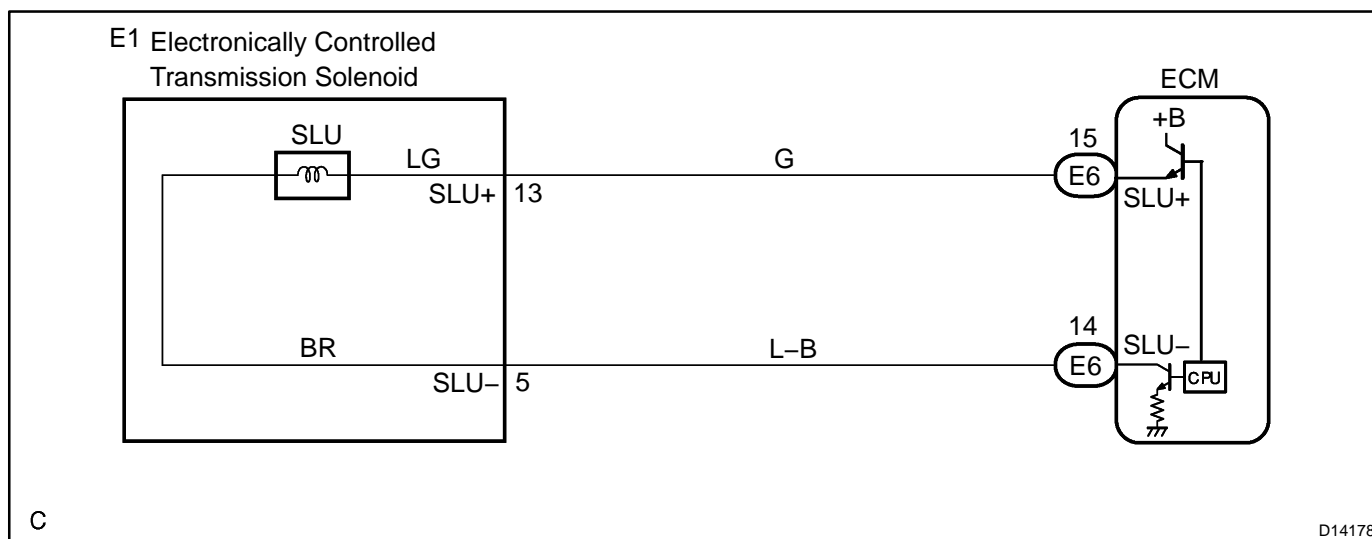

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
Case 1:	
Output signal duty	100%
Case 2:	
Output signal duty	100%

COMPONENT OPERATING RANGE

Parameter	Standard value
Output signal duty	Less than 100%

WIRING DIAGRAM

INSPECTION PROCEDURE

1 **Inspect transmission wire.**

PREPARATION:

Disconnect the transmission wire connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
13 (SLU+) - 5 (SLU-)	5.0 to 5.6 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
13 (SLU+) - Body ground	10 kΩ or higher
5 (SLU-) - Body ground	↑

NG **Go to step 3.**

OK

2 Check harness and connector (Transmission wire – ECM)

PREPARATION:

- Connect the transmission wire connector.
- Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 – 15 (SLU+) – E6 – 14 (SLU-)	5.0 to 5.6 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 15 (SLU+) – Body ground	10 kΩ or higher
E6 – 14 (SLU-) – Body ground	↑

NG

**Repair or replace the harness or connector
(See page IN-30).**

OK

Replace the ECM (See page SF-66).

3 Inspect shift solenoid valve SLU.

Shift Solenoid Valve SLU:

D12795

PREPARATION:

Remove the shift solenoid valve SLU (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 - 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (-) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG

**Replace the shift solenoid valve SLU
(See page [AT-12](#)).**

OK

**Repair or replace the transmission wire
(See page [AT-9](#)).**

O/D Main Switch Circuit

CIRCUIT DESCRIPTION

The O/D main switch (transmission control switch) is a momentary type switch. When pressing the O/D main switch once, the O/D OFF indicator light comes on and the ECM prohibits shifting into O/D. When pressing it once again, the O/D OFF indicator light goes off and the ECM allows shifting into O/D. Turning the IG switch OFF will reset the O/D OFF indicator light.

WIRING DIAGRAM

INSPECTION PROCEDURE

1 Check harness and connector (O/D main switch – body ground)

Wire Harness Side:
(Connector Front View):

O4

N

D14181

PREPARATION:

Disconnect the O/D main switch connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
1 – Body ground	Below 1 Ω

NG

Repair or replace the harness or connector
(See page [IN-30](#)).

OK

2 Inspect O/D main switch.

Switch Side:
(Connector Front View):

O4

N

D14182

CHECK:

Measure the resistance according to the value(s) in the table below.

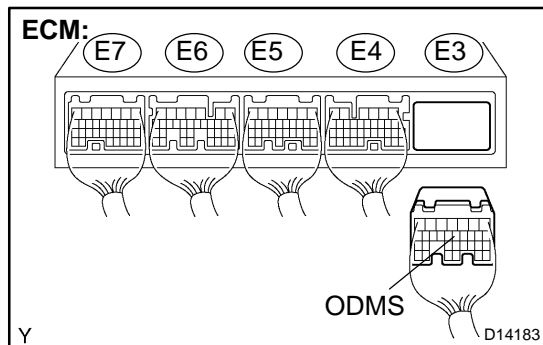

OK:

Switch Condition	Tester Connection	Specified Condition
O/D main switch pressed and held	1 – 3	Below 1 Ω
O/D main switch released	\uparrow	10 k Ω or higher

NG

Replace O/D main switch (See page [AT-19](#)).

OK

3 Check harness and connector (O/D main switch – ECM).
**PREPARATION:**

- Connect the O/D main switch connector.
- Disconnect the connector from the ECM.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Switch Condition	Tester Connection	Specified Condition
O/D main switch pressed and held	E3 – 12 (ODMS) – Body ground	Below 1 Ω
O/D main switch released	\uparrow	10 k Ω or higher

NG

Repair or replace the harness or connector (See page IN-30).

OK

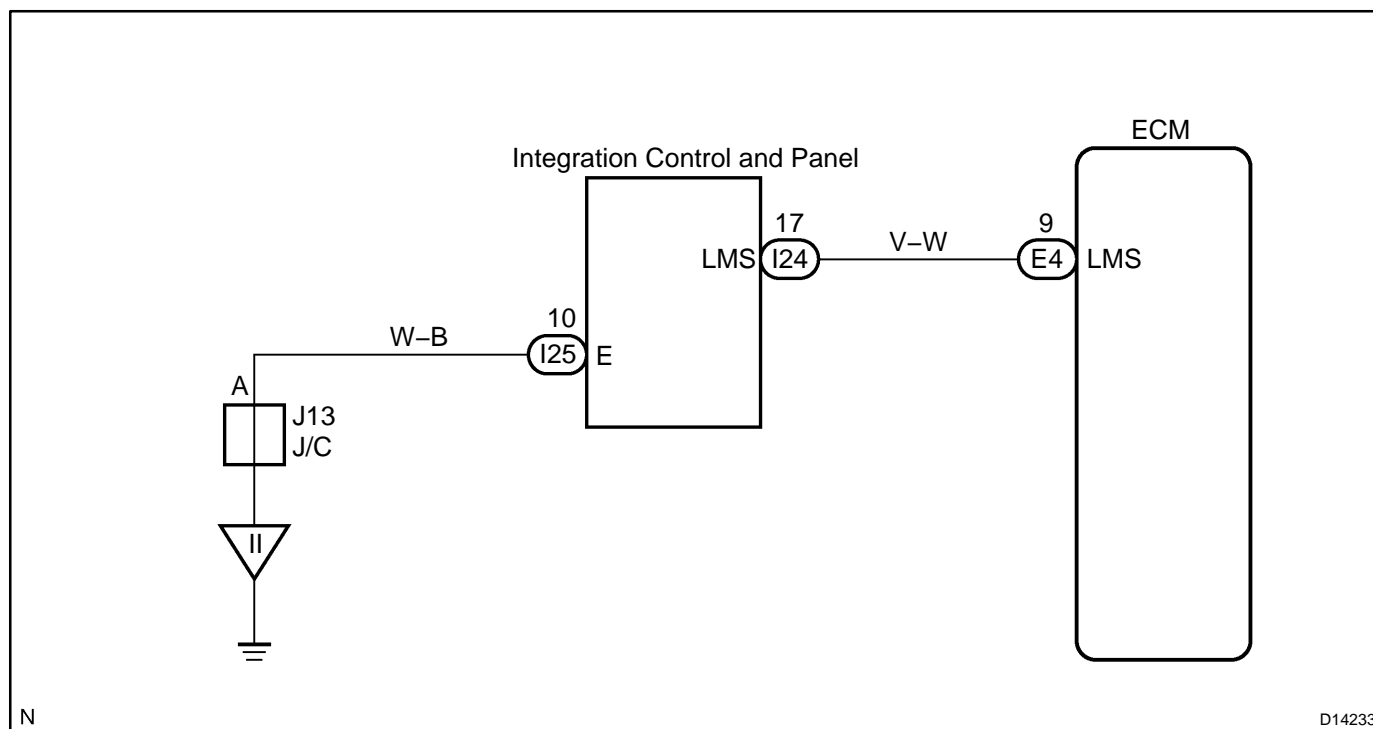

Proceed to next circuit inspection shown on matrix chart (See page DI-971).

Shift Position L Switch Circuit

CIRCUIT DESCRIPTION

The shift position L switch is a momentary type switch. When the shift position L switch is pressed while driving with the shift lever in the 2 position, the L position indicator on the combination meter comes on and the transmission is locked in 1st gear. When the switch is pressed again, the indicator goes off and the transmission is released.

WIRING DIAGRAM

INSPECTION PROCEDURE

1 Check harness and connector (shift position L switch – body ground).

**Wire Harness Side:
(Connector Front View):**

N

D14179

PREPARATION:

Remove the center cluster integration panel assembly (shift position L switch).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
10 – Body ground	Below 1 Ω

NG

Repair or replace the harness or connector (See page IN-30).

OK

2 Inspect center cluster integration panel (shift position L switch).

P

D13886

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Switch Condition	Tester Connection	Specified Condition
Shift position L switch pressed and held	I24 – 17 (LMS) – I25 – 10 (E)	Below 1 Ω
Shift position L switch released	↑	10 kΩ or higher

NG

Replace center cluster integration panel (shift position L switch).

OK

3 Check harness and connector (shift position L switch - ECM).

PREPARATION:

- Install the center cluster integration panel assembly (shift position L switch).
- Disconnect the connector from the ECM.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Switch Condition	Tester Connection	Specified Condition
Shift position L switch pressed and held	E4 - 9 (LMS) - Body ground	Below 1 Ω
Shift position L switch released	↑	10 k Ω or higher

NG

Repair or replace the harness or connector (See page IN-30).

OK

Proceed to next circuit inspection shown on matrix chart (See page DI-971).

AUTOMATIC TRANSMISSION (A750E/A750F for 2UZ-FE)

DIDVV-01

PRECAUTION

NOTICE:

Perform the **RESET MEMORY (AT initialization)** when replacing the automatic transmission assy, engine assy or ECM (See page [DI-1126](#)).

HINT:

RESET MEMORY cannot be completed by only disconnecting the battery terminal.

DEFINITION OF TERMS

Term	Definition
Monitor description	Description of what the ECM monitors and how it detects malfunctions (monitoring purpose and its details).
Related DTCs	A group of diagnostic trouble codes that are output by the ECM based on the same malfunction detection logic.
Typical enabling condition	Preconditions that allow the ECM to detect malfunctions. With all preconditions satisfied, the ECM sets the DTC when the monitored value(s) exceeds the malfunction threshold(s).
Sequence of operation	The priority order that is applied to monitoring, if multiple sensors and components are used to detect the malfunction. While another sensor is being monitored, the next sensor or component will not be monitored until the previous monitoring has concluded.
Required sensor/components	The sensors and components that are used by the ECM to detect malfunctions.
Frequency of operation	The number of times that the ECM checks for malfunctions per driving cycle. "Once per driving cycle" means that the ECM detects malfunction only one time during a single driving cycle. "Continuous" means that the ECM detects malfunction every time when enabling condition is met.
Duration	The minimum time that the ECM must sense a continuous deviation in the monitored value(s) before setting a DTC. This timing begins after the "typical enabling conditions" are met.
Malfunction thresholds	Beyond this value, the ECM will conclude that there is a malfunction and set a DTC.
MIL operation	MIL illumination timing after a defect is detected. "Immediately" means that the ECM illuminates MIL the instant the ECM determines that there is a malfunction. "2 driving cycle" means that the ECM illuminates MIL if the same malfunction is detected again in the 2nd driving cycle.
Component operating range	Normal operation range of sensors and solenoids under normal driving conditions. Use these ranges as a reference. They cannot be used to judge if a sensor or solenoid is defective or not.

TOYOTA PART AND SYSTEM NAME LIST

This reference list indicates the part names used in this manual along with their definitions.

Part and system name	Definition
Toyota HCAC system, Hydrocarbon adsorptive Catalyst (HCAC) system, HC adsorptive three-way catalyst	HC adsorptive three-way catalytic converter
Variable Valve Timing sensor, VVT sensor	Camshaft position sensor
Variable valve timing system, VVT system	Camshaft timing control system
Camshaft timing oil control valve, Oil control valve OCV, VVT, VSV	Camshaft timing oil control valve
Variable timing and lift, VVTL	Camshaft timing and lift control
Crankshaft position sensor "A"	Crankshaft position sensor
Engine speed sensor	Crankshaft position sensor
THA	Intake air temperature
Knock control module	Engine knock control module
Knock sensor	Engine knock sensor
Mass or volume air flow circuit	Mass air flow sensor circuit
Vacuum sensor	Manifold air pressure sensor
Internal control module, Control module, Engine control ECU, PCM	Power train control module
FC idle	Deceleration fuel cut
Idle air control valve	Idle speed control
VSV for CCV, Canister close valve VSV for canister control	Evaporative emissions canister vent valve
VSV for EVAP, Vacuum switching valve assembly No. 1, EVAP VAV, Purge VSV	Evaporative emissions canister purge valve
VSV for pressure switching valve, Bypass VSV	Evaporative emission pressure switching valve
Vapor pressure sensor, EVAP pressure sensor, Evaporative emission control system pressure sensor	Fuel tank pressure sensor
Charcoal canister	Evaporative emissions canister
ORVR system	On-board refueling vapor recovery system
Intake manifold runner control	Intake manifold tuning system
Intake manifold runner valve, IMRV, IACV (runner valve)	Intake manifold tuning valve
Intake control VSV	Intake manifold tuning solenoid valve
AFS	Air fuel ratio sensor
O2 sensor	Heater oxygen sensor
Oxygen sensor pumping current circuit	Oxygen sensor output signal
Oxygen sensor reference ground circuit	Oxygen sensor signal ground
Accel position sensor	Accelerator pedal position sensor
Throttle actuator control motor, Actuator control motor, Electronic throttle motor, Throttle control motor	Electronic throttle actuator
Electronic throttle control system, Throttle actuator control system	Electronic throttle control system
Throttle/pedal position sensor, Throttle/pedal position switch, Throttle position sensor/switch	Throttle position sensor
Turbo press sensor	Turbocharger pressure sensor
Turbo VSV	Turbocharger pressure control solenoid valve
P/S pressure switch	Power-steering pressure switch
VSV for ACM	Active control engine mount
Speed sensor, Vehicle speed sensor "A", Speed sensor for skid control ECU	Vehicle speed sensor
ATF temperature sensor, Trans. fluid temp. sensor, ATF temperature sensor "A"	Transmission fluid temperature sensor
Electronic controlled automatic transmission, ECT	Electronically controlled automatic
Intermediate shaft speed sensor "A"	Counter gear speed sensor

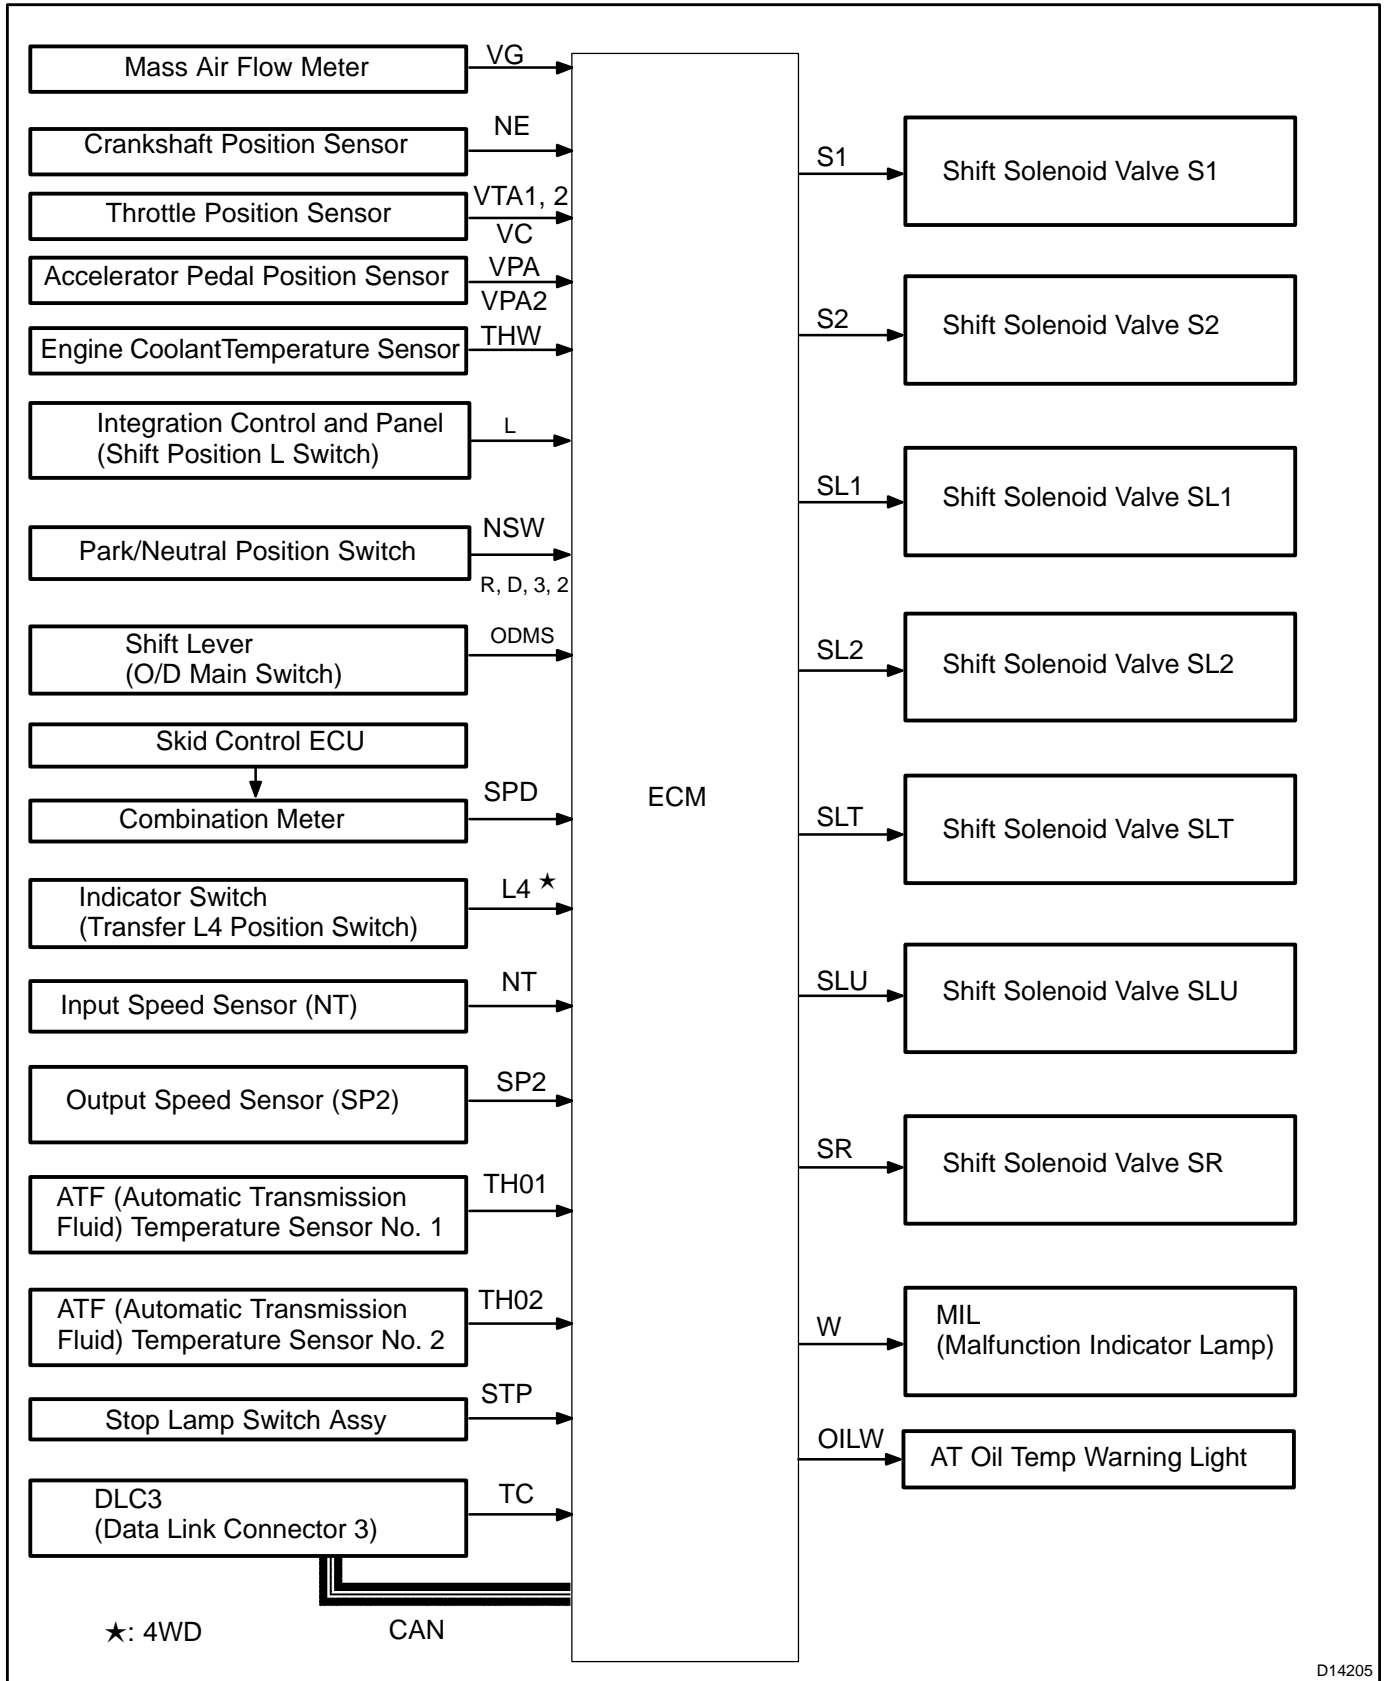

Output speed sensor	Output shaft speed sensor
Input speed sensor, Input turbine speed sensor "A", Speed sensor (NT), Turbine speed sensor	Input turbine speed sensor
PNP switch, NSW	Park/neutral position switch
Pressure control solenoid	Transmission pressure control solenoid
Shift solenoid	Transmission shift solenoid valve
Transmission control switch, Shift lock control unit	Shift lock control module
Engine immobilizer system, Immobilizer system	Vehicle anti-theft system

LOCATION

SYSTEM DIAGRAM

The configuration of the electronic control system in the A750E/A750F automatic transmission is as shown in the following chart.

SYSTEM DESCRIPTION

SYSTEM DESCRIPTION

The ECT (Electronic controlled automatic transmission) is an automatic transmission that electronically controls shift timing using the ECM. The ECM detects electrical signals that indicate engine and driving conditions, and controls the shift point, based on driver habits and road conditions. As a result, fuel efficiency and power transmission performance are improved.

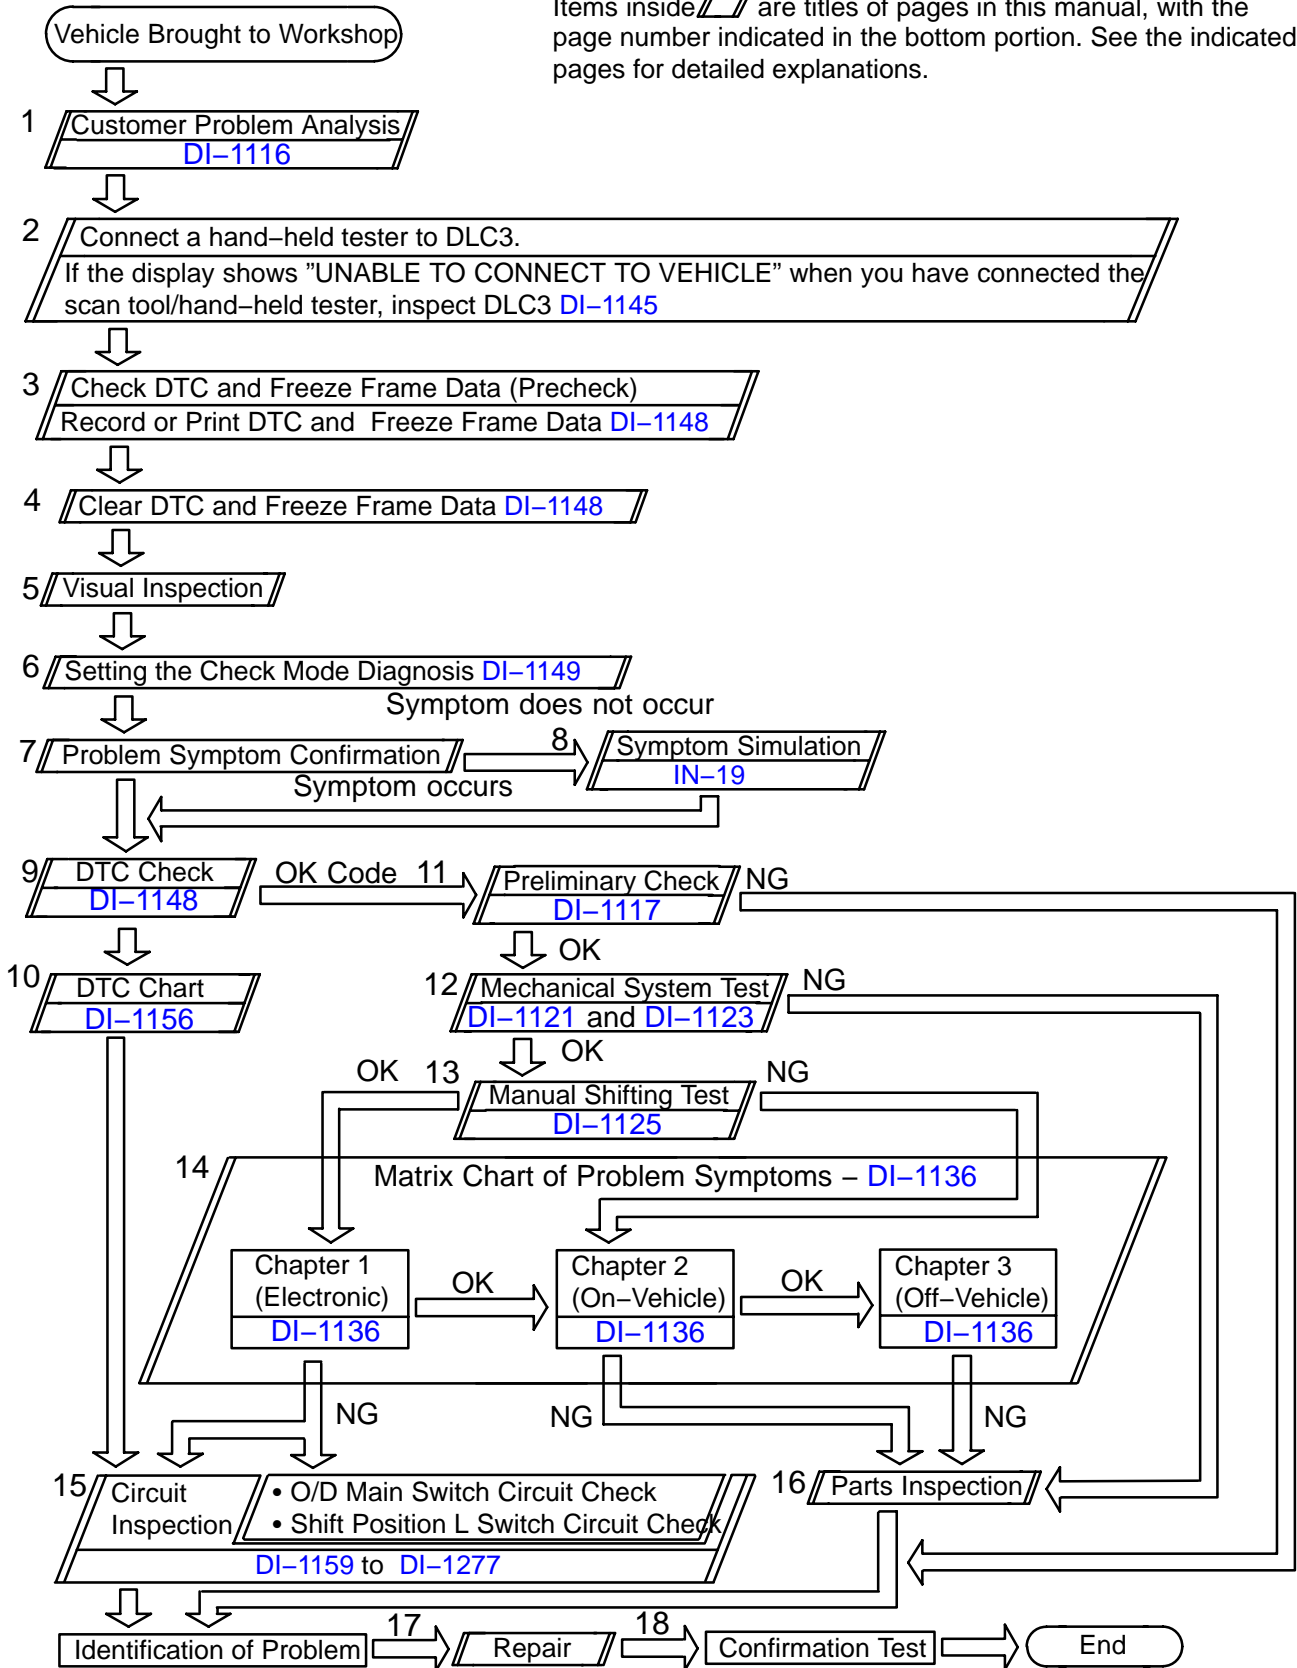

Shift shock has been reduced by controlling the engine and transmission simultaneously.

In addition, the ECT has features such as follows:

- Diagnostic function.
- Fail-safe function when a malfunction occurs.

HOW TO PROCEED WITH TROUBLESHOOTING

Items inside  are titles of pages in this manual, with the page number indicated in the bottom portion. See the indicated pages for detailed explanations.

CUSTOMER PROBLEM ANALYSIS CHECK

BASIC INSPECTION

1. INSPECT AND ADJUST SHIFT LEVER POSITION

- (a) When shifting the shift lever from the N position to other positions, check that the lever can be shifted smoothly and accurately to each position and that the position indicator comes on in accordance with the shift lever position.

If the indicator and shift lever position do not match, carry out the following adjustment procedures.

- (1) Remove the nut and disconnect the shift control cable from the control shaft lever.
- (2) Move the control shaft fully rearward.
- (3) Return the control shaft lever 2 notches to the N position.
- (4) Set the shift lever to the N position.
- (5) Connect the shift control cable and temporarily install the control shaft lever nut.
- (6) While holding the shift lever lightly toward the R position side, tighten the control shaft lever nut.

Torque: 14.5 N·m (148 kgf·cm, 11 ft·lbf)

- (7) Start the engine and make sure that the vehicle moves forward when shifting the lever from the N to the D position and reverses when shifting it to the R position.

2. INSPECT AND ADJUST PARK/NEUTRAL POSITION

- (a) Check that the engine can be started when the shift lever is in the N or P position, but cannot be started in other positions.

If operation cannot be done as stated above, carry out the following adjustment procedures.

- Loosen the park/neutral position switch bolt and set the shift lever to the N position.
- Align the groove with the neutral basic line.
- Hold in position and tighten the bolt.

Torque: 13 N·m (130 kgf·cm, 9 ft·lbf)

- (b) For continuity inspection of the park/neutral position switch, see page [DI-1159](#).

3. CHECK IDLE SPEED

Idle speed (In N position and air conditioner OFF):

700 ± 50 rpm

ROAD TEST

1. PROBLEM SYMPTOM CONFIRMATION

Based on the result of the customer problem analysis, try to reproduce the symptoms. If the problem is that the transaxle does not shift up, shift down, or the shift point is too high or too low, conduct the following road test referring to the automatic shift schedule and simulate the problem symptoms.

2. ROAD TEST

NOTICE:

Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature: 50 to 80 °C (122 to 176 °F).

(a) D position test:

Shift into the D position and fully depress the accelerator pedal and check the following points.

(1) Check up-shift operation.

Check that 1 → 2, 2 → 3, 3 → 4 and 4 → 5th up-shifts take place, and that the shift points conform to the automatic shift schedule (See page [SS-50](#)).

HINT:

5th Gear Up-shift Prohibition Control

- Engine coolant temperature is 55 °C (131 °F) or less and vehicle speed is at 51 km/h (32 mph) or less.

4th Gear Up-shift Prohibition Control

- Engine coolant temperature is 40 °C (104 °F) or less and vehicle speed is at 45 km/h (28 mph) or less.

5th Gear Lock-up Prohibition Control

- Brake pedal is depressed.
- Accelerator pedal is released.
- Engine coolant temperature is 60 °C (140 °F) or less.

(2) Check for shift shock and slip.

Check for shock and slip at the 1 → 2, 2 → 3, 3 → 4 and 4 → 5th up-shifts.

(3) Check for abnormal noise and vibration.

Check for abnormal noise and vibration when up-shifting from 1 → 2, 2 → 3, 3 → 4 and 4 → 5 while driving with the shift lever in the D position, and check while driving in the lock-up condition.

HINT:

The check for the cause of abnormal noise and vibration must be done thoroughly as it could also be due to loss of balance in the differential, torque converter clutch, etc.

(4) Check kick-down operation.

Check vehicle speeds when the 2nd to 1st, 3rd to 2nd, 4th to 3rd, and 5th to 4th kick-downs take place while driving with the shift lever in the D position. Confirm that each speed is within the applicable vehicle speed range indicated in the automatic shift schedule (See page [SS-50](#)).

(5) Check abnormal shock and slip at kick-down.

(6) Check the lock-up mechanism.

- Drive in the D position (5th gear), at a steady speed (lock-up ON).
- Lightly depress the accelerator pedal and check that the engine speed does not change abruptly.

HINT:

If there is a big jump in engine speed, there is no lock-up.

(b) 4 (O/D OFF) position test:

Shift into the 4 (O/D OFF) position and fully depress the accelerator pedal and check the following points.

(1) Check up-shift operation.

Check that the 1 → 2, 2 → 3 and 3 → 4 up-shifts take place and that the shift point conforms to the automatic shift schedule (See page [SS-50](#)).

HINT:

- There is no 5th up-shift in the 4 position.
- 4th Gear Lock-up Prohibition Control
 - Brake pedal is depressed.
 - Accelerator pedal is released.
 - Engine coolant temperature is 60 °C (140 °F) or less.
- (2) Check engine braking.
While driving in the 4 position and 4th gear, release the accelerator pedal and check the engine braking effect.
- (3) Check for abnormal noises during acceleration and deceleration, and for shock at up-shift and down-shift.
- (4) Check the lock-up mechanism.
 - Drive in 4 position 4th gear, at a steady speed (lock-up ON).
 - Lightly depress the accelerator pedal and check that the engine speed does not change abruptly.

HINT:

If there is a big jump in engine speed, there is no lock-up.

(c) 3 position test:

Shift into the 3 position and fully depress the accelerator pedal and check the following points.

(1) Check up-shift operation.

Check that the 1 → 2 and 2 → 3 up-shifts takes place and that the shift point conforms to the automatic shift schedule (See page [SS-50](#)).

HINT:

- There is no 4th up-shift and lock-up in the 3 position.
- When the 2nd start switch is ON, there is no 1 → 2 up-shift and 2 → 1 down-shift.
- (2) Check engine braking.
While running in the 3 position and 3rd gear, release the accelerator pedal and check the engine braking effect.
- (3) Check for abnormal noises during acceleration and deceleration, and for shock at up-shift and down-shift.

(d) 2 position test:

Shift into the 2 position and fully depress the accelerator pedal and check the following points.

(1) Check up-shift operation.

Check that the 1 → 2 up-shift takes place and that the shift point conforms to the automatic shift schedule (See page [SS-50](#)).

HINT:

- There is no 3rd up-shift and lock-up in the 2 position.
- When the 2nd start switch is ON, there is no 1 → 2 up-shift and 2 → 1 down-shift.

- (2) Check engine braking.
While running in the 2 position and 2nd gear, release the accelerator pedal and check the engine braking effect.
 - (3) Check for abnormal noises during acceleration and deceleration, and for shock at up–shift and down–shift.
- (e) L position test:
Shift into the L position and fully depress the accelerator pedal and check the following points.
- (1) Check no up–shift.
While running in the L position, check that there is no up–shift to 2nd gear.
 - (2) Check engine braking.
While running in the L position, release the accelerator pedal and check the engine braking effect.
 - (3) Check for abnormal noises during acceleration and deceleration.
- (f) R position test:
Shift into the R position, lightly depress the accelerator pedal, and check that the vehicle moves backward without any abnormal noise or vibration.
- CAUTION:**
Before conducting this test, ensure that the test area is free from people and obstruction.
- (g) P position test:
Stop the vehicle on a grade (more than 5°) and after shifting into the P position, release the parking brake. Then, check that the parking lock pawl holds the vehicle in place.

MECHANICAL SYSTEM TESTS

1. PERFORM MECHANICAL SYSTEM TESTS

(a) Measure the stall speed.

The object of this test is to check the overall performance of the transmission and engine by measuring the stall speeds in the D positions.

NOTICE:

- Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature 50 to 80°C (122 to 176°F).
- Do not continuously run this test for longer than 5 seconds.
- To ensure safety, do this test in a wide, clear level area which provides good traction.
- The stall test should always be carried out in pairs. One technician should observe the conditions of wheels or wheel stoppers outside the vehicle while the other is doing the test.
 - (1) Chock all 4 wheels.
 - (2) Connect a hand-held tester to DLC3.
 - (3) Fully apply the parking brake.
 - (4) Using your left foot, keep the brake pedal firmly depressed.
 - (5) Start the engine.
 - (6) Shift into the D position. Press all the way down on the accelerator pedal with your right foot.
 - (7) Quickly read the stall speed at this time.

Stall speed: 2,200 ± 150 rpm

Evaluation:

Problem	Possible cause
(a) Stall engine speed is low in D position	<ul style="list-style-type: none"> • Engine power output may be insufficient • Stator one-way clutch is not operating properly HINT: If the value is less than the specified value by 600 rpm or more, the torque converter could be faulty.
(b) Stall engine speed is high in D position	<ul style="list-style-type: none"> • Line pressure is too low • Clutch No.1 (C₁) slipping • One-way clutch No.3 (F₃) is not operating properly • Improper fluid level

(b) Measure the time lag.

When the shift lever is shifted while the engine is idling, there will be a certain time lapse or lag before the shock can be felt. This is used for checking the condition of the direct clutch, forward clutch, and 1st and reverse brake.

NOTICE:

- **Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature: 50 to 80°C (122 to 176°F).**
- **Be sure to allow for a 1 minute interval between tests.**
- **Perform the test three times, and measure the time lags. Calculate the average value of the three time lags.**

(1) Connect a hand-held tester to DLC3.

(2) Fully apply the parking brake.

(3) Start and warm up the engine and check idle speed.

Idle speed: approx. 700 rpm (In N position and A/C OFF)

(4) Shift the lever from the N to D position. Using a stop watch, measure the time from when the lever is shifted until the shock is felt.

Time lag:

N → D Less than 1.2 seconds

(5) In the same manner, measure the time lag for N → R.

Time lag:

N → R Less than 1.5 seconds

Evaluation (If N → D time or N → R time lag is longer than the specified):

Problem	Possible cause
N → D time lag is longer than specified	<ul style="list-style-type: none"> • Line pressure is too low • Clutch No.1 (C₁) worn • One-way clutch No.3 (F₃) is not operating properly
N → R time lag is longer than specified	<ul style="list-style-type: none"> • Line pressure is too low • Clutch No.3 (C₃) worn • Brake No.4 (B₄) worn • One-way clutch No.1 (F₁) is not operating properly

HYDRAULIC TEST

1. PERFORM HYDRAULIC TEST

Measure the line pressure.

NOTICE:

- Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature: 50 to 80°C (122 to 176°F).
- The line pressure test should always be carried out in pairs. One technician should observe the conditions of wheels or wheel stoppers outside the vehicle while the other is performing the test.
- Be careful to prevent SST hose from interfering with the exhaust pipe.
- This check must be conducted after checking and adjusting engine.
- Perform under condition that A/C is OFF.
- When conducting stall test, do not continue more than 10 seconds.

- (1) Warm up the ATF (Automatic Transmission Fluid).
- (2) Lift the vehicle up.
- (3) Remove the test plug on the transmission case center right side and connect SST.

SST 09992-00095 (09992-00231, 09992-00271)

- (4) Fully apply the parking brake and chock the 4 wheels.
- (5) Start the engine and check idling speed.
- (6) Keep your left foot pressing firmly on the brake pedal and shift into D position.
- (7) Measure the line pressure when the engine is idling.
- (8) Depress the accelerator pedal all the way down. Quickly read the highest line pressure when engine speed reaches stall speed.
- (9) In the same manner, do the test in R position.

Specified line pressure:

Condition	D position kPa (kgf / cm ² , psi)	R position kPa (kgf / cm ² , psi)
Idling	361 to 421 kPa (3.7 to 4.3 kgf/cm ² , 52 to 61 psi)	495 to 576 kPa (5.0 to 5.9 kgf/cm ² , 72 to 84 psi)
Stall test	1,236 to 1,332 kPa (12.6 to 13.6 kgf/cm ² , 179 to 193 psi)	1,229 to 1,349 kPa (12.5 to 13.8 kgf/cm ² , 178 to 196 psi)

Evaluation

Problem	Possible cause
Measured values are higher than specified in all positions	<ul style="list-style-type: none"> • Shift solenoid valve (SLT) defective • Regulator valve defective
Measured values are lower than specified in all positions	<ul style="list-style-type: none"> • Shift solenoid valve (SLT) defective • Regulator valve defective • Oil pump defective
Pressure is low in the D position only	<ul style="list-style-type: none"> • D position circuit fluid leak • Clutch No.1 (C₁) defective
Pressure is low in the R position only	<ul style="list-style-type: none"> • R position circuit fluid leak • Clutch No.3 (C₃) defective • Brake No.4 (B₄) defective

MANUAL SHIFTING TEST

1. MANUAL SHIFTING TEST

HINT:

- With this test, it can be determined whether the trouble occurs in the electrical circuit or is a mechanical problem in the transmission.
 - If any abnormalities are found in the following test, the problem is in the transmission itself.
- (a) Disconnect the connector of the transmission wire.
 (b) Drive with the transmission wire disconnected.
 Shifting the shift lever to the L, 2, 3, 4 and D position to check whether the shifting condition changes the table below.

Shift Position	Shifting Condition
L ↔ 2	No Shift (Not Change)
2 ↔ 3	Down Shift ↔ Up Shift
3 ↔ 4	Down Shift ↔ Up Shift
4 ↔ D	No Shift (Not Change)

HINT:

When driving with the transmission wire disconnected, the gear position will be as follows:

- When the shift lever is in the L or the 2 position, the gear is held in the 1st position.
 - When the shift lever is in the 3rd position, the gear is held in the 3rd position.
 - When the shift lever is in the 4 or the D position, the gear is held in the 4th position.
 - When the shift lever is in the R or the P position, the gear is also in the R or the P position respectively.
- (c) Connect the connector of the transmission wire.
 (d) Clear the DTC (See page [DI-1148](#)).

INITIALIZATION

1. RESET MEMORY

NOTICE:

- **Perform the RESET MEMORY (AT initialization) when replacing the automatic transmission assy or ECM.**
- **The RESET MEMORY can be performed only with the Hand-held tester.**

HINT:

The ECM memorizes the condition that the ECT controls the automatic transmission assy and engine assy according to those characteristics. Therefore, when the automatic transmission assy, engine assy, or ECM has been replaced, it is necessary to reset the memory so that the ECM can memorize the new information.

Reset procedure is as follows.

- (a) Turn the ignition switch off.
- (b) Connect the hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn the hand-held tester main switch on.
- (e) Select the item "DIAGNOSIS/ENHANCED OBD II".
- (f) Perform the reset memory procedure from the ENGINE menu.

NOTICE:

After performing the RESET MEMORY, be sure to perform the ROAD TEST (See page DI-1118) described earlier.

HINT:

The ECM learns through use of the ROAD TEST.

LIST OF DISABLE A MONITOR

HINT:

This table indicates ECM monitoring status for the items in the upper columns if the DTCs in each line on the left are being set.

As for the "X" mark, when the DTC on the left is stored, detection of the DTC in the upper column is not performed.

Monitor detected malfunction	Fault code		Component/system		Monitor disablement (X - disabled)

MONITOR DRIVE PATTERN

1. MONITOR DRIVE PATTERN FOR ECT TEST

- (a) Perform this drive pattern as one method to simulate the detection conditions of the ECT malfunctions. (The DTCs may not be detected due to the actual driving conditions. And some codes may not be detected through this drive pattern.)

HINT:

Preparation for driving

- Warm up the engine sufficiently. (Engine coolant temperature is 60 °C (140 °F) or higher).
- Drive the vehicle when the atmospheric temperature is –10 °C (14 °F) or higher. (Malfunction is not detected when the atmospheric temperature is –10 °C (14 °F) or less).

Notice in driving

- Drive the vehicle through all gears.
Stop → 1st → 2nd → 3rd → 4th → 5th → 5th (lock-up ON).
- Repeat the above driving pattern three times or more.

NOTICE:

- **The monitor status can be checked using the OBD II scan tool. When using the hand-held tester, monitor status can be found in the "ENHANCED OBD II / DATA LIST" or under "CARB OBD II".**
- **In the event that the drive pattern must be interrupted (possibly due to traffic conditions or other factors), the drive pattern can be resumed and, in most cases, the monitor can be completed.**
- **Perform this drive pattern on a level road as much as possible and strictly observe the posted speed limits and traffic laws while driving.**

D14144

HINT:

*1: Drive at such a speed in the uppermost gear, to engage lock-up. The vehicle can be driven at a speed lower than that in the above diagram under the lock-up condition.

NOTICE:

It is necessary to drive the vehicle for approximately 30 minutes to detect DTC P0711 (ATF temperature sensor malfunction).

PROBLEM SYMPTOMS TABLE

HINT:

If a normal code is displayed during the diagnostic trouble code check although the trouble still occurs, check the electrical circuits for each symptom in the order given in the charts on the following pages and proceed to the page given for troubleshooting.

The Matrix Chart is divided into 3 chapters.

1. Chapter 1: Electronic Circuit Matrix Chart

- Refer to the table below when the trouble cause is considered to be electrical.
- If the instruction "Proceed to next circuit inspection shown on matrix chart" is given in the flow chart of each circuit, proceed to the circuit with the next highest number in the table to continue the check.
- If the trouble still occurs even though there are no abnormalities in any of the other circuits, check and replace the ECM.

HINT:

*1: When the circuit on which mark *1 is attached is defective, DTC could be output (see page [DI-1156](#)).

TERMINALS OF ECM

1. ECM

D14145

HINT:

Each ECM terminal's standard voltage is shown in the table below.

In the table, first follow the information under "Condition". Look under "Symbols (Terminal No.)" for the terminals to be inspected. The standard voltage between the terminals is shown under "Specific Condition".

Use the illustration above as a reference for the ECM terminals.

Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	Specified Condition
LMS (E4-9) – E1 (E5-1)	V-W – BR	L shift position switch signal	IG switch ON	10 to 14 V
↑	↑	↑	IG switch ON and Press continuously shift position L switch	Below 1 V
2 (E4-10) – E1 (E5-1)	P-L*1 – BR L*2 – BR	2 shift position switch signal	IG switch ON and shift lever 2 and L position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except 2 and L position	Below 1 V
R (E4-11) – E1 (E5-1)	G-R*1 – BR R-B*2 – BR	R shift position switch signal	IG switch ON and shift lever R position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except R position	Below 1 V
D (E4-21) – E1 (E5-1)	W-R – BR	D shift position switch signal	IG switch ON and shift lever D position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except D position	Below 1 V
3 (E4-19) – E1 (E5-1)	G-W*1 – BR L-W*2 – BR	3 shift position switch signal	IG switch ON and shift lever 3 position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except 3 position	Below 1 V
ODMS (E3-12) – E1 (E5-1)	R*1 – BR B*2 – BR	O/D main switch signal	IG switch ON	10 to 14 V
↑	↑	↑	IG switch ON and press continuously O/D main switch	Below 1 V
STP (E3-15) – E1 (E5-1)	G-W – BR	Stop lamp switch signal	Brake pedal is depressed	7.5 to 14 V
↑	↑	↑	Brake pedal is released	Below 1.5 V
SLU+ (E6-15) – SLU- (E6-14)	G – L-B	SLU solenoid signal	5th (lock-up) gear	Pulse generation (See waveform 2)
S2 (E6-10) – E1 (E5-1)	W-L – BR	S2 solenoid signal	2nd or 3rd gear	10 to 14 V
↑	↑	↑	1st, 4th or 5th gear	Below 1 V
S1 (E6-11) – E1 (E5-1)	L – BR	S1 solenoid signal	1st or 2nd gear	10 to 14 V
↑	↑	↑	3rd, 4th or 5th gear	Below 1 V

SLT+ (E6-13) – SLT- (E6-12)	B-R – G-W	SLT solenoid signal	Engine idle speed	Pulse generation (See waveform 1)
SR (E6-9) – E1 (E5-1)	W-G – BR	SR solenoid signal	5th gear	10 to 14 V
↑	↑	↑	1st gear	Below 1 V
SL2+ (E6-17) – SL2- (E6-16)	B – W	SL2 solenoid signal	Engine idle speed	Pulse generation (See waveform 3)
SL1+ (E6-19) – SL1- (E6-18)	R-W – GR	SL1 solenoid signal	Engine idle speed	Pulse generation (See waveform 4)
THO1 (E6-24) – E2 (E7-28)	R-L – B-W	No.1 ATF temperature sensor signal	No.1 ATF temperature: 115 °C (239 °F) or more	Below 1.5 V
THO2 (E6-32) – E2 (E7-28)	V – B-W	No.2 ATF temperature sensor signal	No.2 ATF temperature: 115 °C (239 °F) or more	Below 1.5 V
SP2+ (E6-34) – SP2- (E6-26)	Y-R – W-R	Speed sensor (SP2) signal	Vehicle speed 20 km/h (12 mph)	Pulse generation (See waveform 6)
NT+ (E6-35) – NT- (E6-27)	G – R	Speed sensor (NT) signal	Engine idle speed	Pulse generation (See waveform 5)
STAR/NSW (E6-8) – E1 (E5-1)	L-R – BR	Park neutral switch signal	IG switch ON and shift lever P and N position	Below 2 V
↑	↑	↑	IG switch ON and shift lever except P and N position	10 to 14 V
L4* (E5-13) – E1 (E6-1)	L-R – BR	Transfer L position switch signal	IG switch ON and transfer L position	Below 1 V
↑	↑	↑	IG switch ON and transfer except L position	10 to 14 V

Tool setting	1V/DIV, 2ms/DIV
Vehicle condition	Engine idle speed (P or N position)

Waveform 6

Reference:

Terminal	SP2+ - SP2-
Tool setting	2V/DIV, 20ms/DIV
Vehicle condition	Vehicle speed 20 km/h (12 mph)

DIAGNOSIS SYSTEM

DESCRIPTION

When troubleshooting On-Board Diagnostic (OBD II) vehicles, the vehicle must be connected to the OBD II scan tool (complying with SAE J1987). Various data output from the vehicle's ECM can then be read.

OBD II regulations require that the vehicle's on-board computer illuminates the Malfunction Indicator Lamp (MIL) on the instrument panel when the computer detects a malfunction in:

- 1) The emission control system/components
- 2) The powertrain control components (which affect vehicle emissions)
- 3) The computer

In addition, the applicable Diagnostic Trouble Codes (DTCs) prescribed by SAE J2012 are recorded in the ECM memory. If the malfunction does not reoccur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain recorded in the ECM memory.

To check DTCs, connect the scan tool to the Data Link Connector 3 (DLC3) of the vehicle. The scan tool displays DTCs, the freeze frame data and a variety of the engine data. The DTCs and freeze frame data can be erased with the scan tool (See page [DI-1148](#)).

NORMAL MODE AND CHECK MODE

The diagnosis system operates in "normal mode" during normal vehicle use. In normal mode, "2-trip detection logic" is used to ensure accurate detection of malfunctions. "Check mode" is also available to technicians as an option. In check mode, "1-trip detection logic" is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent malfunctions.

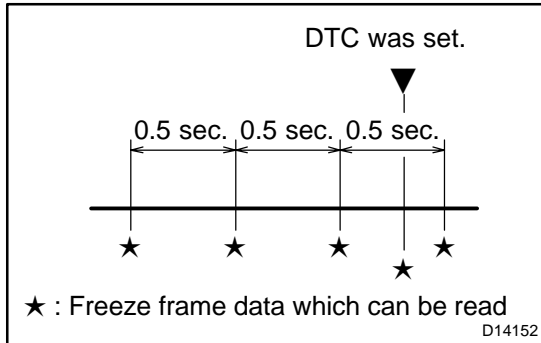

2-TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the ignition switch is turned OFF and then ON again, and the same malfunction is detected again, the MIL will illuminate.

FREEZE FRAME DATA

Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air/fuel ratio was Lean or Rich, and other data from the time the malfunction occurred.

The hand-held tester records freeze frame data in five different instances: 1) 3 times before the DTC is set, 2) once when the DTC is set, and 3) once after the DTC is set. These data can be used to simulate the vehicle's condition around the time when the malfunction occurred. The data may help find the cause of the malfunction, or judge if the DTC is being caused by a temporary malfunction or not.

DLC3 (Data Link Connector 3)

The vehicle's ECM uses the ISO 15765-4 for communication protocol. The terminal arrangement of the DLC3 complies with SAE J1962 and matches the ISO 15765-4 format.

HINT:

Connect the cable of the hand-held tester to the DLC3, turn the ignition switch ON and attempt to use the hand-held tester. If the screen displays UNABLE TO CONNECT TO VEHICLE, a problem exists in the vehicle side or the tester side.

If the communication is normal when the tool is connected to another vehicle, inspect the DLC3 on the original vehicle.

If the communication is still impossible when the tool is connected to another vehicle, the problem is probably in the tool itself. Consult the Service Department listed in the tool's instruction manual.

Symbol	Terminal No.	Name	Reference terminal	Result	Condition
SIL	7	Bus "+" line	5 – Signal ground	Pulse generation	During transmission
CG	4	Chassis ground	Body ground	Below 1 Ω	Always
SG	5	Signal ground	Body ground	Below 1 Ω	Always
BAT	16	Battery positive	Body ground	11 to 14 V	Always
CANH	6	HIGH-level CAN bus line	CANL	54 to 69 Ω	IG switch OFF
CANH	6	HIGH-level CAN bus line	Battery positive	1 MΩ or higher	IG switch OFF
CANH	6	HIGH-level CAN bus line	CG	1 kΩ or higher	IG switch OFF
CANL	14	LOW-level CAN bus line	Battery positive	1 MΩ or higher	IG switch OFF
CANL	14	LOW-level CAN bus line	CG	1 kΩ or higher	IG switch OFF

CHECK BATTERY VOLTAGE

Battery voltage: 11 to 14 V

If voltage is below 11 V, replace the battery before proceeding.

CHECK MIL

- (a) Check that the MIL illuminates when turning the ignition switch ON.

If the MIL does not illuminate, there is a problem in the MIL circuit (refer to MIL CIRCUIT on page [DI-940](#))

- (b) When the engine is started, the MIL should turn off.

ALL READINESS

For this vehicle, using the hand-held tester allows readiness codes corresponding to all DTCs to be read. When diagnosis (normal or malfunctioning) has been complete, readiness codes are set. Enter the following menus: ENHANCED OBD II / MONITOR STATUS on the hand-held tester.

DTC CHECK / CLEAR

1. CHECK DTC

DTCs which are stored in the ECM can be displayed with the hand-held tester or generic OBD II scan tool.

These scan tools can display pending DTCs and current DTCs. Some DTC aren't stored if the ECM doesn't detect a malfunction during consecutive driving. However, the detected malfunction during once driving is stored as pending DTC.

- (a) Connect the hand-held tester to the Controller Area Network Vehicle Interface Module (CAN VIM). Then connect the CAN VIM to the Data Link Connector 3 (DLC3).
- (b) Turn the ignition switch ON.
- (c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES (or PENDING CODE).
- (d) Confirm the DTCs and freeze frame data and then write them down.
- (e) See page [DI-1156](#) to confirm the details of the DTCs.

NOTICE:

When simulating a symptom with the scan tool to check for DTCs, use normal mode. For codes on DIAGNOSTIC TROUBLE CODE CHART subject to "2-trip detection logic", perform the following actions.

Turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again. When the problem has been simulated twice, the MIL illuminates and the DTCs are recorded in the ECM.

2. CLEAR DTC

- (a) Connect the hand-held tester to the CAN VIM. Then connect the CAN VIM to the DLC3.
- (b) Turn the ignition switch ON.
- (c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CLEAR CODES and press YES.

CHECK MODE PROCEDURE

DESCRIPTION

Check mode has a higher sensitivity to malfunctions and can detect malfunctions that normal mode cannot detect. Check mode can also detect all the malfunctions that normal mode can detect. In check mode, DTCs are detected with 1-trip detection logic.

CHECK MODE PROCEDURE

- (a) Make sure that the items below are true:
 - (1) Battery positive voltage 11 V or more
 - (2) Throttle valve fully closed
 - (3) Transmission in the P or N position
 - (4) A/C switched OFF
- (b) Turn the ignition switch OFF.
- (c) Connect the hand-held tester together with the Controller Area Network Vehicle Interface Module (CAN VIM) to the DLC3.
- (d) Turn the ignition switch ON.
- (e) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / CHECK MODE.

- (f) Change the ECM to check mode. Make sure the MIL flashes as shown in the illustration.

NOTICE:

All DTCs and freeze frame data recorded will be erased if:

- 1) the hand-held tester is used to change the ECM from normal mode to check mode or vice-versa; or
- 2) during check mode, the ignition switch is turned from ON to ACC or LOCK.

Before check mode, make notes of the DTCs and freeze frame data.

- (g) Start the engine. The MIL should turn off after the engine starts.
- (h) Perform "MONITOR DRIVE PATTERN" for the ECT test (See page [DI-1134](#)).
(Or, simulate the conditions of the malfunction described by the customer).
- (i) After simulating the malfunction conditions, use the hand-held tester diagnosis selector to check the DTC and freeze frame data.

FAIL-SAFE CHART

1. FAIL-SAFE

This function minimizes the loss of the ECT functions when any malfunction occurs in a sensor or solenoid.

Malfunction Part	Function
Output Speed Sensor (SP2)	During an output speed sensor malfunction, shift control is effected through the input speed sensor signal (NT).
ATF Temp. Sensor No. 1	During an ATF temperature sensor No. 1 malfunction, up-shift to the 5th and flex lock-up clutch control are prohibited.
Shift Solenoid Valve S1, S2 and SR	The current to the failed solenoid valve is cut off and control is effected by operating the other solenoid valves with normal operation. Shift control is effected depending on the failed solenoid as described in the table on the next page.
Shift Solenoid Valve SL1 and SL2	During a solenoid valve SL1 or SL2 malfunction, up-shift to the 5th is prohibited.
Shift Solenoid Valve SLU	During a solenoid valve SLU malfunction, the current to the solenoid valve is stopped. This stops lock-up control and flex lock-up control, fuel economy decreases.
Shift Solenoid Valve SLT	During a solenoid valve SLT malfunction, the current to the solenoid valve is stopped. This stops line pressure optimal control, the shift shock increases. However, shifting is effected through normal clutch pressure control.

Fail Safe Function:

If either of the shift solenoid valve circuits has an open or short failure, the ECM turns the other shift solenoid "ON" and "OFF" in order to shift into the gear positions shown in the table below.

In case of a short circuit, the ECM stops sending current to the short circuited solenoid.

Even if starting the engine again in the fail-safe mode, the gear position remains in the same position.

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition	Diagnostic Note

2. ACTIVE TEST

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on the tester, perform the "ACTIVE TEST".

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.
LOCK UP	[Test Details] Control the shift solenoid SLU to set the automatic transmission to the lock-up condition. [Vehicle Condition] • Throttle valve opening angle: Less than 35 % • Vehicle Speed: 60 km/h (37 mph) or more	Possible to check the SLU operation.
LINE PRESS UP *	[Test Details] Operate the shift solenoid SLT and raise the line pressure. [Vehicle Condition] • Vehicle Stopped. • IDL: ON [HINT] OFF: Line pressure up (When the active test of "Control the Line Pressure Up" is performed, the ECM commands the SLT solenoid to turn off). ON: No action (normal operation)	-

*: "LINE PRESS UP" in the ACTIVE TEST is performed to check the line pressure changes by connecting the SST to the automatic transaxle, which is used in the HYDRAULIC TEST (See page [DI-1123](#)) as well.

HINT:

The pressure values in ACTIVE TEST and HYDRAULIC TEST are different from each other.

DIAGNOSTIC TROUBLE CODE CHART

If a DTC is displayed during the DTC check, check the parts listed in the table below and proceed to the page given.

HINT:

- *1 : ● ... The MIL (Malfunction Indicator Lamp) lights up
- *2 : ○ ... The ECM memorizes the trouble code if the ECM detects the DTC detection condition.
- This DTC may be output when the clutch, brake and gear components etc. inside the automatic transmission are damaged.

DTC No. (See Page)	Detection Item	Trouble Area	MIL *1	Memory *2

CIRCUIT INSPECTION

DTC	P0705	Transmission Range Sensor Circuit Malfunction (PRNDL Input)
------------	--------------	--

CIRCUIT DESCRIPTION

The park/neutral position switch detects the shift lever position and sends signals to the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P0705	(2-trip detection logic) <ul style="list-style-type: none"> • All switches are OFF simultaneously for NSW, R, N, D, 3 and 2 positions. • 2 or more switches are ON simultaneously for NSW, R, D, 3 and 2 positions. 	<ul style="list-style-type: none"> • Open or short in park/neutral position switch circuit • Park/neutral position switch • ECM

MONITOR DESCRIPTION

These DTCs indicate a problem with the park/neutral position switch and the wire harness in the park/neutral position switch circuit.

The park/neutral position switch detects the shift lever position and sends a signal to the ECM.

For security, the park/neutral position switch detects the shift lever position so that engine can be started only when the shift lever is in the P or N position.

The park/neutral position switch sends a signal to the ECM according to the shift position (NSW, R, D, 3 or 2).

The ECM determines that there is a problem with the switch or related parts if it receives more than 1 position signal simultaneously. The ECM will turn on the MIL and store the DTC.

MONITOR STRATEGY

Related DTCs	P0705	Park/neutral position switch/Verify switch input
Required sensors/Components	Park/neutral position switch	
Frequency of operation	Continuous	
Duration	Condition (A)	2 sec.
	Condition (B)	60 sec.

2 switch	

COMPONENT OPERATING RANGE

Parameter	Standard value
Park/neutral position switch	The park/neutral position switch sends only one signal to the ECM.

WIRING DIAGRAM

Except Double Cab:

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition	Diagnostic Note
PNP SW [NSW]	PNP SW Status/ ON or OFF	Shift lever position is; P and N: ON Except P and N: OFF	When the shift lever position displayed on the hand-held tester differs from the actual position, adjustment of the PNP switch or the shift cable may be incorrect.
LOW	PNP SW Status/ ON or OFF	• Shift lever position is 2: OFF ↓ • Shift position L switch Push: ON ↓ • Shift position L switch Push: OFF	↑
2ND	PNP SW Status/ ON or OFF	Shift lever position is; 2 and L: ON Except 2 and L: OFF	↑
3RD	PNP SW Status/ ON or OFF	Shift lever position is; 3: ON Except 3: OFF	↑
DRIVE	PNP SW Status/ ON or OFF	Shift lever position is; D: ON Except D: OFF	↑
REVERSE	PNP SW Status/ ON or OFF	Shift lever position is; R: ON Except R: OFF	↑

1 Inspect park/neutral position switch.

Switch Side:
(Connector Front View):

P

D14154

PREPARATION:

- (a) Jack up the vehicle.
- (b) Disconnect the park/neutral position switch connector.

CHECK:

Measure the resistance according to the value(s) in the table below when the shift lever is moved to each position.

OK:

Shift Position	Tester Connection	Specified Condition
P	2 - 6 and 4 - 5	Below 1 Ω
Except P	\uparrow	10 k Ω or higher
R	2 - 1	Below 1 Ω
Except R	\uparrow	10 k Ω or higher
N	2 - 9 and 4 - 5	Below 1 Ω
Except N	\uparrow	10 k Ω or higher
D	2 - 7	Below 1 Ω
Except D	\uparrow	10 k Ω or higher
3	2 - 3	Below 1 Ω
Except 3	\uparrow	10 k Ω or higher
2	2 - 8	Below 1 Ω
Except 2	\uparrow	10 k Ω or higher

NG

Replace park/neutral position switch
(See page [AT-11](#)).

OK

2 Check harness and connector (Park/neutral position switch – ECM).

PREPARATION:

- (a) Connect the park/neutral position switch connector.
- (b) Turn the ignition switch ON.

CHECK:

Measure the voltage according to the value(s) in the table below when the shift lever is moved to each position.

OK:

Shift Position	Tester connection	Specified condition
P and N	E6 – 8 (STAR/NSW) – Body ground	Below 2 V
Except P and N	↑	10 to 14 V
R	E4 – 11 (R) – Body ground	10 to 14 V*
Except R	↑	Below 1 V
D	E4 – 21 (D) – Body ground	10 to 14 V
Except D	↑	Below 1 V
3	E4 – 19 (3) – Body ground	10 to 14 V
Except 3	↑	Below 1 V
2 and L	E4 – 10 (2) – Body ground	10 to 14 V
Except 2 and L	↑	Below 1 V

HINT:

*: The voltage will drop slightly due to lighting up of the back up light.

NG Repair or replace the harness or connector (See page [IN-30](#)).

OK

Replace the ECM (See page [SF-82](#)).

DTC	P0710	Transmission Fluid Temperature Sensor "A" Circuit
------------	--------------	--

DTC	P0712	Transmission Fluid Temperature Sensor "A" Circuit Low Input
------------	--------------	--

DTC	P0713	Transmission Fluid Temperature Sensor "A" Circuit High Input
------------	--------------	---

CIRCUIT DESCRIPTION

The ATF (Automatic Transmission Fluid) temperature sensor converts the fluid temperature into a resistance value which is input into the ECM.

The ECM applies a voltage to the temperature sensor through ECM terminal THO1.

The sensor resistance changes with the transmission fluid temperature. As the temperature becomes higher, the sensor resistance decreases.

One terminal of the sensor is grounded so that the sensor resistance decreases and the voltage goes down as the temperature becomes higher.

The ECM calculates the fluid temperature based on the voltage signal.

DTC No.	DTC Detection Condition	Trouble Area
P0710	(a) and (b) are detected momentarily within 0.5 sec. when neither P0712 nor P0713 is detected (1-trip detection logic) (a) ATF temperature sensor No.1 resistance is less than 79 Ω. (b) ATF temperature sensor No.1 resistance is more than 156 kΩ. HINT: Within 0.5 sec., the malfunction switches from (a) to (b) or from (b) to (a)	<ul style="list-style-type: none"> • Open or short in ATF temperature sensor No.1 circuit • Transmission wire (ATF temperature sensor No.1) • ECM
P0712	ATF temperature sensor No.1 resistance is less than 79 Ω for 0.5 sec. or more (1-trip detection logic)	<ul style="list-style-type: none"> • Short in ATF temperature sensor No.1 circuit • Transmission wire (ATF temperature sensor No.1) • ECM
P0713	ATF temperature No.1 sensor resistance is more than 156 kΩ when 15 minutes or more have elapsed after the engine start DTC is detected for 0.5 sec. or more (1-trip detection logic)	<ul style="list-style-type: none"> • Open in ATF temperature sensor No.1 circuit • Transmission wire (ATF temperature sensor No.1) • ECM

MONITOR DESCRIPTION

These DTCs indicate an open or short in the automatic transmission fluid (ATF) temperature sensor circuit. The automatic transmission fluid (ATF) temperature sensor converts ATF temperature to an electrical resistance value. Based on the resistance, the ECM determines the ATF temperature, and the ECM detects an open or short in the ATF temperature circuit. If the resistance value of the ATF temperature is less than 79Ω^{*1} or more than 156kΩ^{*2}, the ECM interprets this as a fault in the ATF sensor or wiring. The ECM will turn on the MIL and store the DTC.

*1: 150°C (302°F) or more is indicated regardless of the actual ATF temperature.

*2: -40°C (-40°F) is indicated regardless of the actual ATF temperature.

HINT:

The ATF temperature can be checked on the OBD II scan tool or hand-held tester display.

MONITOR STRATEGY

Related DTCs	P0710	ATF temperature sensor/Range check (Fluttering)
	P0712	ATF temperature sensor/Range check (Low resistance)
	P0713	ATF temperature sensor/Range check (High resistance)
Required sensors/Components	ATF temperature sensor (TFT sensor)	
Frequency of operation	Continuous	
Duration	0.5 sec.	
MIL operation	Immediate	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever these DTCs are not present.	See page DI-1128	
Range check (Fluttering, Low resistance)		
The typical enabling condition is not available.	–	
Range check (High resistance)		
Time after engine start	15 min. or more	–

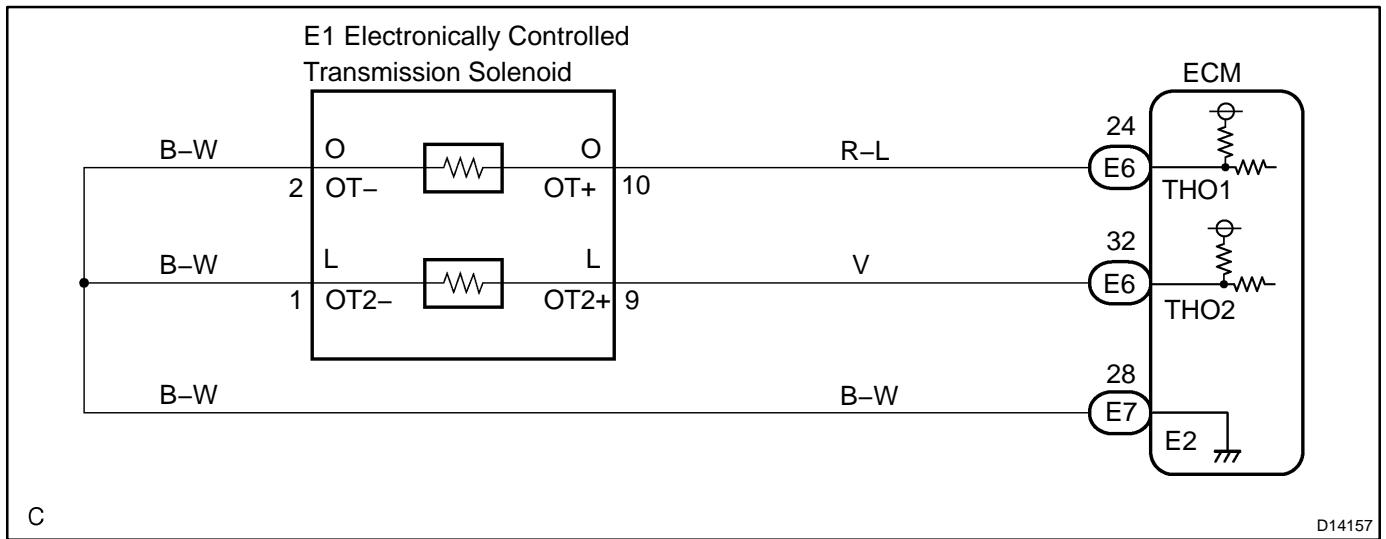

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
Range check (Fluttering)	
TFT (transmission fluid temperature) sensor resistance	Less than 79 Ω or More than 156 k Ω
Range check (Low resistance)	
TFT (transmission fluid temperature) sensor resistance	Less than 79 Ω
Range check (High resistance)	
TFT (transmission fluid temperature) sensor resistance	More than 156 k Ω

COMPONENT OPERATING RANGE

Parameter	Standard value
TFT (transmission fluid temperature) sensor	Atmospheric temperature to approx. 130°C (266°F)

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
AT FLUID TEMP 1	ATF Temp. Sensor Value/ min.: -40°C (-40°F) max.: 215°C (419°F)	<ul style="list-style-type: none"> • After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when cold soak

HINT:

When DTC P0712 is output and hand-held tester output is 150°C (302°F) or more, there is a short circuit. When DTC P0713 is output and hand-held tester output is -40°C (-40°F), there is an open circuit. Measure the resistance between terminal THO1 (OT) and body ground.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
150°C (302°F) or more	Short circuit

HINT:

If a circuit related to the ATF temperature sensor becomes open, P0713 is immediately set (in 0.5 second). When P0713 is set, P0711 cannot be detected. It is not necessary to inspect the circuit when P0711 is set.

1 Inspect transmission wire (ATF temperature sensor No.1).
**PREPARATION:**

Disconnect the transmission wire connector from the transmission.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
2 (OT-) – 10 (OT+)	79 Ω to 156 k Ω
2 (OT-) – Body ground	10 k Ω or higher
10 (OT+) – Body ground	10 k Ω or higher

HINT:

If the resistance is out of the specified range with either the ATF temperature shown in the table below, the driveability of the vehicle may decrease.

ATF Temperature	Specified Condition
20°C (68°F)	3 to 4 k Ω
110°C (230°F)	0.22 to 0.28 k Ω

NG

Repair or replace the transmission wire (ATF temperature sensor No.1)
(See page [AT-9](#)).

OK

2 Check harness and connector (Transmission wire – ECM).

PREPARATION:

- (a) Connect the transmission wire connector.
- (b) Disconnect the connector of the ECM.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 24 (THO1) – E7 – 28 (E2)	79 Ω to 156 kΩ

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 24 (THO1) – Body ground	10 kΩ or higher
E7 – 28 (E2) – Body ground	↑

NG → **Repair or replace the harness or connector (See page IN-30).**

OK

Replace the ECM (See page SF-82).

DTC	P0711	Transmission Fluid Temperature Sensor "A" Performance
------------	--------------	--

CIRCUIT DESCRIPTION

See page [DI-1166](#).

DTC No.	DTC Detection Condition	Trouble Area
P0711	Both (a) and (b) are detected: (2-trip detection logic) (a) Intake air and engine coolant temps. are more than -15°C (-4°F) at engine start (b) After normal driving for over 22 min. and 9 km (6 mile) or more, ATF temp. is less than 20°C (50°F)	• Transmission wire (ATF temperature sensor No.1)

MONITOR DESCRIPTION

This DTC indicates that there is a problem with output from the automatic transmission fluid (ATF) temperature sensor and that the sensor itself is defective. The ATF temperature sensor converts the ATF temperature to an electrical resistance value. Based on the resistance, the ECM determines the ATF temperature and detects an open or short in the ATF temperature circuit or a fault in the ATF temperature sensor. After running the vehicle for a certain period, the ATF temperature should increase. If the ATF temperature is below 20°C (68°F) after running the vehicle for a certain period, the ECM interprets this as a fault, and turns on the MIL.

MONITOR STRATEGY

Related DTCs	P0711	ATF temperature sensor/Rationality check
Required sensors/Components	ATF temperature sensor (TFT sensor)	
Frequency of operation	Continuous	
Duration	3 sec.	
MIL operation	2 driving cycles	
Sequence of operation	None	

TYPICAL ENABLING CONDITIONS

Item	Specification	
	Minimum	Maximum
The monitor will run whenever this DTC is not present.	See page DI-1128	
TFT (transmission fluid temperature) sensor circuit	Not circuit malfunction	
ECT (Engine coolant temperature) sensor circuit	Not circuit malfunction	
IAT (Intake air temperature) sensor circuit	Not circuit malfunction	
Time after engine start	21 min. and 40 sec.	
Driving distance after engine start	9 km (5.6 mile) or more	–
IAT (12 sec. after engine start)	-10°C (14°F) or more	–
ECT (12 sec. after engine start)	-10°C (14°F) or more	–

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
TFT (transmission fluid temperature)	Less than 20°C (68°F) (varies with TFT (transmission fluid temperature) at engine start)

WIRING DIAGRAM

See page [DI-1166](#).

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
AT FLUID TEMP 1	ATF Temp. Sensor Value/ min.: -40°C (-40°F) max.: 215°C (419°F)	<ul style="list-style-type: none"> • After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when cold soak

HINT:

When DTC P0712 is output and hand-held tester output is 150°C (302°F) or more, there is a short circuit.
When DTC P0713 is output and hand-held tester output is -40°C (-40°F), there is an open circuit.
Measure the resistance between terminal THO1 (OT) and body ground.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
150°C (302°F) or more	Short circuit

HINT:

If a circuit related to the ATF temperature sensor becomes open, P0713 is immediately set (in 0.5 second).
When P0713 is set, P0711 cannot be detected.
It is not necessary to inspect the circuit when P0711 is set.

1	Check other DTCs output (in addition to DTC P0711).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0711" is output	A
"P0711" and other DTCs	B

HINT:

If any other codes besides "P0711" are output, perform troubleshooting for those DTCs first.

B	Go to DTC chart (See page DI-1156).
----------	--

A

2	Check transmission fluid level (See page DI-1117).
----------	---

OK:

Automatic transmission fluid level is correct.

NG	Add fluid (See page DI-1117).
-----------	--

OK

Replace the transmission wire (ATF temperature sensor) (See page AT-9).
--

DTC	P0717	Input Speed Sensor Circuit No Signal
------------	--------------	---

CIRCUIT DESCRIPTION

This sensor detects the rotation speed of the turbine which shows the input revolution of transmission. By comparing the input turbine speed signal (NT) with the counter gear speed sensor signal (SP2), the ECM detects the shift timing of the gears and appropriately controls the engine torque and hydraulic pressure according to various conditions, thus, providing smooth gear shift.

P

D14162

DTC No.	DTC Detection Condition	Trouble Area
P0717	<p>All conditions below are detected for 5 secs. or more (1-trip detection logic)</p> <p>(a) Gear change is not performed</p> <p>(b) Gear position: 4th or 5th</p> <p>(c) T/M input shaft rpm: 300 rpm or less</p> <p>(d) T/M output shaft rpm: 1,000 rpm or more</p> <p>(e) Park/neutral position switch:</p> <ul style="list-style-type: none"> • NSW input signal is OFF • R input signal is OFF • L input signal is OFF <p>(f) Shift solenoid valves, park/neutral position switch and vehicle speed sensor are in normal operation</p>	<ul style="list-style-type: none"> • Open or short in speed sensor (NT) circuit • Speed sensor (NT) • ECM • Automatic transmission (clutch, brake or gear, etc.)

Reference (Using an oscilloscope):

Check the waveform between terminals NT+ and NT- of the ECM connector.

Standard: Refer to the illustration.

Terminal	NT+ – NT-
Tool setting	1V/DIV, 2ms/DIV
Vehicle condition	Engine idle speed (P or N position)

MONITOR DESCRIPTION

This DTC indicates that pulse is not output from the speed sensor NT (Turbine (input) speed sensor) or is output only little. The NT terminal of the ECM detects the revolving signal from the speed sensor (NT) (input RPM). The ECM outputs a gearshift signal comparing the input speed sensor (NT) with the output speed sensor (SP2).

While the vehicle is operating in the 4th or 5th gear position in the shift position of D, if the input shaft revolution is less than 300 rpm^{*1} although the output shaft revolution is more than 1000 rpm or more^{*2}, the ECM detects the trouble, illuminates the MIL and stores the DTC.

*1: Pulse is not output or is irregularly output.

*2: The vehicle speed is approx. 50 km/h (31 mph) or more.

MONITOR STRATEGY

Related DTCs	P0717	Speed sensor (NT)/Verify pulse input
Required sensors/Components	Main	Speed sensor (NT)
	Sub	Speed sensor (NO)
Frequency of operation	Continuous	
Duration	5 sec.	
MIL operation	Immediate

ECM selected gear	4th or 5th	
Output shaft rpm	1,000 rpm or more	–
NSW switch	OFF	
R switch	OFF	
L switch	OFF	
Engine	Running	
Ignition switch	ON	
Starter	OFF	

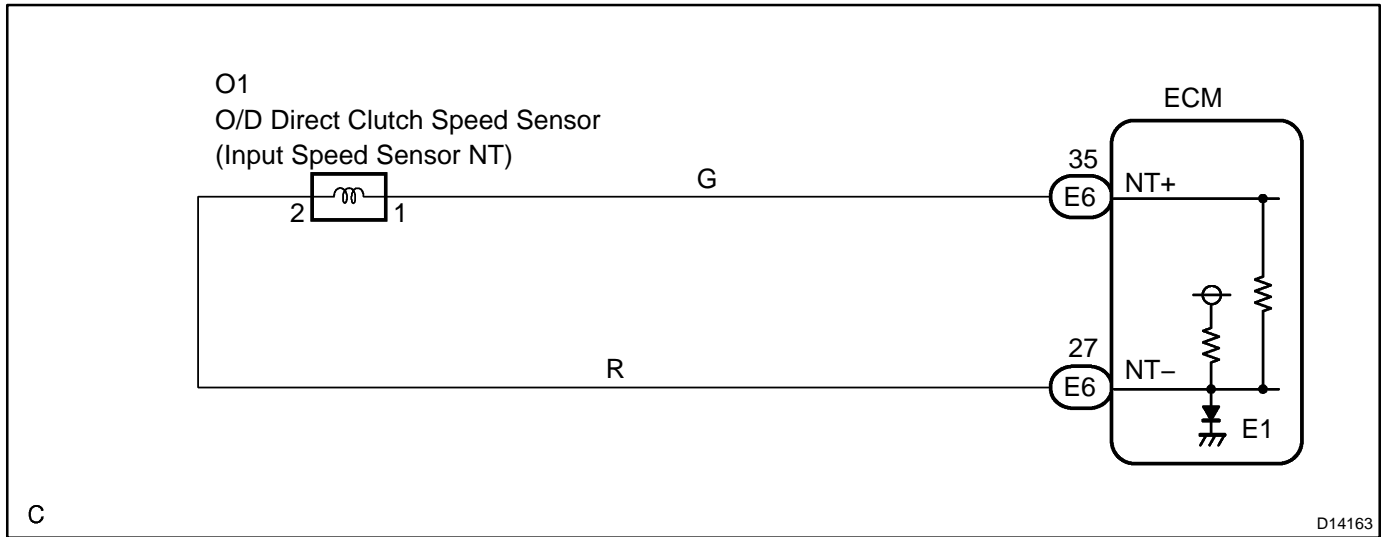

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
Sensor signal rpm	Less than 300 rpm

COMPONENT OPERATING RANGE

Parameter	Standard value
Speed sensor (NT)	Input speed is equal to engine speed when lock-up ON.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
SPD (NT)	Input Turbine Speed/ display: 50 r/min	[HINT] • Lock-up ON (After warming up the engine); Input Turbine speed (NT) equal to the engine speed. • Lock-up OFF (Idling at N position); Input Turbine speed (NT) nearly equal to the engine speed.

HINT:

- SPD (NT) is always 0 while driving:
Open or short in the sensor or circuit.
- SPD (NT) is always more than 0 and less than 300 rpm while driving the vehicle at 50 km/h (31 mph) or more:
Sensor trouble, improper installation, or intermittent connection trouble of the circuit.

1 Inspect speed sensor installation.

PREPARATION:

Jack up the vehicle.

CHECK:

Check the speed sensor (NT) installation.

OK:

The installation bolt is tightened properly and there is no clearance between the sensor and transmission case.

Torque: 5.4 N·m (55 kgf·cm, 48 in.-lbf)

NG → Replace speed sensor NT (See page AT-8).

OK

2 Inspect speed sensor NT.

PREPARATION:

Disconnect the speed sensor connector from the transmission.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20 °C (68 °F)
1 – 2	560 to 680 Ω

NG → Replace speed sensor NT (See page AT-8).

OK

3 Check harness and connector (ECM – speed sensor NT).

PREPARATION:

- (a) Connect the speed sensor connector.
- (b) Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 – 35 (NT+) – E6 – 27 (NT-)	560 to 680 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 35 (NT+) – Body ground	10 kΩ or higher
E6 – 27 (NT-) – Body ground	↑

NG → **Repair or replace harness or connector (See page IN-30).**

OK

Replace the ECM (See page SF-82).

DTC	P0722	Output Speed Sensor Circuit No Signal
------------	--------------	--

CIRCUIT DESCRIPTION

The speed sensor SP2 detects the rotation speed of the transmission output shaft and sends signals to the ECM. The ECM determines the vehicle speed based on these signals. An AC voltage is generated in the speed sensor SP2 coil as the parking gear mounted on the rear planetary gear assy rotates, and this voltage is sent to the ECM. The parking gear on the rear planetary gear is used as the timing rotor for this sensor. The gear shift point and lock-up timing are controlled by the ECM based on the signals from this vehicle speed sensor and the throttle position sensor signal.

DTC No.	DTC Detection Condition	Trouble Area
P0722	All conditions below are detected 500 times or more continuously (1-trip detection logic) (a) No signal from speed sensor (SP2) is input to ECM while 4 pulses of No. 1 vehicle speed sensor signal are sent (b) Vehicle speed is 9 km/h (6 mph) or more for at least 4 sec. (c) Park/neutral position switch is OFF. (d) Transfer position is except neutral (4WD).	<ul style="list-style-type: none"> • Open or short in speed sensor (SP2) circuit • Speed sensor (SP2) • ECM • Automatic transmission (clutch, brake or gear, etc.)

Reference (Using an oscilloscope):

Check the waveform between terminals SP2+ and SP2- of the ECM connector.

Standard: Refer to the illustration.

Terminal	SP2+ - SP2-
Tool setting	2V/DIV, 20ms/DIV
Vehicle condition	Vehicle speed 20 km/h (12 mph)

MONITOR DESCRIPTION

The output speed sensor SP2 monitors the output shaft speed. The ECM controls the gearshift point and the lock up timing based on the signals from the output speed sensor SP2 and throttle position sensor. If the ECM detects no signal from the output shaft speed sensor SP2 even while the vehicle is moving, it will conclude that is a malfunction of the output speed sensor SP2. The ECM will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0722	Speed sensor SP2/Verify pulse input
Required sensors/Components	Speed sensor SP2	
Frequency of operation	Continuous	
Duration	500 output shaft revolution	
MIL operation	Immediate

Detection criteria	Threshold
Output speed sensor pulse input	No input

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Item	Measurement Item/ Range (display)	Normal Condition
SPD (SP2)	Output shaft Speed/ min.: 0 km/h (0 mph) max.: 255 km/h (158 mph)	Vehicle stopped: 0 km/h (0 mph) [HINT] Equal to vehicle speed

HINT:

- SPD (SP2) is always 0 while driving:
Open or short in the sensor or circuit.
- SPD (SP2) is always more than 0 and less than 300 rpm while driving the vehicle at 50 km/h (31 mph) or more:
Sensor trouble, improper installation, or intermittent connection trouble of the circuit.

1	Inspect speed sensor installation.
----------	---

PREPARATION:

Jack up the vehicle.

CHECK:

Check the speed sensor (SP2) installation.

OK:

The installation bolt is tightened properly and there is no clearance between the sensor and transmission case.

Torque: 5.4 N-m (55 kgf-cm, 48 in.-lbf)

NG

Replace speed sensor SP2 (See page AT-8).

OK

2 Inspect speed sensor SP2.

PREPARATION:

Disconnect the speed sensor connector from the transmission.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20 °C (68 °F)
1 – 2	560 to 680 Ω

NG → **Replace speed sensor SP2 (See page AT-8).**

OK

3 Check harness and connector (ECM – speed sensor SP2).

PREPARATION:

- (a) Connect the speed sensor connector.
- (b) Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 – 34 (SP2+) – E6 – 26 (SP2-)	560 to 680 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 34 (SP2+) – Body ground	10 kΩ or higher
E6 – 26 (SP2-) – Body ground	↑

NG → **Repair or replace harness or connector (See page IN-30).**

OK

Replace the ECM (See page SF-82).

DTC	P0724	Brake Switch "B" Circuit High
------------	--------------	--------------------------------------

CIRCUIT DESCRIPTION

The purpose of this circuit is to prevent the engine from stalling while driving in lock-up condition when brakes are suddenly applied.

When the brake pedal is depressed, this switch sends a signal to the ECM. Then the ECM cancels the operation of the lock-up clutch while braking is in progress.

DTC No.	DTC Detection Condition	Trouble Area
P0724	The stop light switch remains ON even when the vehicle is driven in a STOP (less than 3 km/h (2 mph)) and GO (30 km/h (19 mph) or more) fashion 5 times. (2-trip detection logic).	<ul style="list-style-type: none"> • Short in stop light switch signal circuit • Stop light switch • ECM

MONITOR DESCRIPTION

This DTC indicates that the stop light switch remains on. When the stop light switch remains ON during "stop and go" driving, the ECM interprets this as a fault in the stop light switch and the MIL comes on and the ECM stores the DTC. The vehicle must stop (less than 3 km/h (2 mph)) and go (30 km/h (19 mph) or more) ten times for two driving cycles in order to detect a malfunction.

MONITOR STRATEGY

Related DTCs	P0724	Stop light switch/Range check/Rationality
Required sensors/Components	Main	Stop light switch
	Sub	Vehicle speed sensor
Frequency of operation	Continuous	
Duration	GO and STOP 5 times

Starter	OFF	
GO (Vehicle speed is 30 km/h (18.63 mph) or more)	Once	
STOP (Vehicle speed is less than 3 km/h (1.86 mph))	Once	

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
Brake switch	Remain ON during GO and STOP 5 times

WIRING DIAGRAM

See page [DI-706](#).

INSPECTION PROCEDURE

1	Read value of DATA LIST (STP signal).
---	--

HINT:

According to the DATA LIST displayed by the OBD II scan tool or hand-held tester, you can read the value of the switch, sensor, actuator and so on without parts removal. Reading the DATA LIST as the first step of troubleshooting is one method to shorten labor time.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Push the "ON" button of the OBD II scan tool or the hand-held tester.
- (f) When you use the hand-held tester:
Select the item "DIAGNOSIS / ENHANCED OBD II / DATA LIST".
- (g) According to the display on the tester, read the "DATA LIST".

Standard:

Item	Measurement Item/ Range (display)	Normal Condition
Stop Light Switch	Stop light SW Status/ ON or OFF	<ul style="list-style-type: none"> • Brake Pedal is depressed: ON • Brake Pedal is released: OFF

NOTICE:

In the table above, the conditions listed under "Normal Condition" are reference conditions. Do not depend solely on these reference conditions when deciding whether a part is faulty or not.

OK:

Brake Pedal Condition	Specified Condition
Depressed	ON
Released	OFF

NG

Go to step 2.

OK

Go to step 3.

2 Inspect stop light switch.

PREPARATION:

Remove the stop lamp switch assy.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Double Cab:

Switch position	Tester Connection	Specified Condition
Switch pin free	1 - 4	Below 1 Ω
Switch pin pushed in	↑	10 kΩ or higher

Except Double Cab:

Switch position	Tester Connection	Specified Condition
Switch pin free	1 - 2	Below 1 Ω
Switch pin pushed in	↑	10 kΩ or higher
Switch pin free	3 - 4	10 kΩ or higher
Switch pin pushed in	↑	Below 1 Ω

NG Replace stop light switch.

OK

3 Check harness and connector (ECM – stop light switch).

PREPARATION:

Install the stop lamp switch assy.

CHECK:

Measure the voltage according to the value(s) in the table below when the brake pedal is depressed and released.

OK:

Condition	Tester Connection	Specified Condition
Brake pedal is depressed	E3 – 15 (STP) – Body ground	10 to 14 V
Brake pedal is released	↑	Below 1 V

NG → **Repair or replace harness or connector (See page IN-30).**

OK

Replace the ECM (See page SF-82).

DTC	P0748	Pressure Control Solenoid "A" Electrical (Shift Solenoid Valve SL1)
------------	--------------	--

CIRCUIT DESCRIPTION

Shifting from 1st to 5th is performed in combination with "ON" and "OFF" operation of the shift solenoid valves SL1, SL2, S1, S2 and SR which are controlled by the ECM. If an open or short circuit occurs in either of the shift solenoid valves, the ECM controls the remaining normal shift solenoid valves to allow the vehicle to be operated smoothly (See page [DI-1150](#)).

DTC No.	DTC Detection Condition	Trouble Area
P0748	ECM checks for an open or short circuit in shift solenoid valves SL1 (1-trip detection logic) (a) When solenoid, duty ratio equal to 100% (b) When solenoid is not energized, duty ratio is less than 3%	<ul style="list-style-type: none"> • Open or short in shift solenoid valve SL1 circuit • Shift solenoid valve SL1 • ECM

MONITOR DESCRIPTION

This DTC indicates an open or short in the shift solenoid valve SL1 circuit. The ECM commands gearshift by turning the shift solenoid valves "ON/OFF". When there is an open or short circuit in any shift solenoid valve circuit, the ECM detects the problem and illuminates the MIL and stores the DTC. And the ECM performs the fail-safe function and turns the other normal shift solenoid valves "ON/OFF". (In case of an open or short circuit, the ECM stops sending current to the circuit.)

While driving and shifting between 4th and 5th gears, if the ECM detects an open or short in the shift solenoid valve SL1 circuit, the ECM determines there is a malfunction (See page [DI-1150](#)).

MONITOR STRATEGY

Related DTCs	P0748	Shift solenoid valve SL1/Range check

INSPECTION PROCEDURE**HINT:**

- The shift solenoid valve SL1 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve SL1	OFF	OFF	OFF	OFF	ON

1	Inspect transmission wire.
----------	-----------------------------------

**PREPARATION:**

Disconnect the transmission wire connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
12 (SL1+) – 4 (SL1-)	5.0 to 5.6 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
12 (SL1+) – Body ground	10 kΩ or higher
4 (SL1-) – Body ground	↑

NG**Go to step 3.****OK**

2 Check harness and connector (Transmission wire – ECM)

PREPARATION:

- (a) Connect the transmission wire connector.
- (b) Disconnect the ECM connector.

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
E6 – 19 (SL1+) – E6 – 18 (SL1-)	5.0 to 5.6 Ω

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition
E6 – 19 (SL1+) – Body ground	10 kΩ or higher
E6 – 18 (SL1-) – Body ground	↑

NG → **Repair or replace the harness or connector (See page IN-30).**

OK

Replace the ECM (See page SF-82).

3 Inspect shift solenoid valve SL1.

Shift Solenoid Valve SL1:

D12795

PREPARATION:

Remove the shift solenoid valve SL1 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 – 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (–) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG

**Replace the shift solenoid valve SL1
(See page [AT-12](#)).**

OK

**Repair or replace the transmission wire
(See page [AT-9](#)).**

DTC	P0751	Shift Solenoid "A" Performance (Shift Solenoid Valve S1)
------------	--------------	---

SYSTEM DESCRIPTION

The ECM uses signals from the output shaft speed sensor and input speed sensor to detect the actual gear position (1st, 2nd, 3rd, 4th or 5th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves, valve body or automatic transmission (clutch, brake or gear, etc.).

DTC No.	DTC Detection Condition	Trouble Area
P0751	The gear required by the ECM does not match the actual gear when driving (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve S1 remains open or closed • Valve body is blocked • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

This DTC indicates "stuck ON malfunction" or "stuck OFF malfunction" of the shift solenoid valve S1. The ECM commands gear shifts by turning the shift solenoid valves "ON/OFF". When the gear position commanded by the ECM and the actual gear position are not the same, the ECM illuminates the MIL and stores the DTC.

MONITOR STRATEGY

Last ECM selected gear		4th
Vehicle speed (During transition from 4th to 5th gear)	–	Less than 100 km/h (62.2 mph)
ON malfunction (E)		
ECM selected gear		5th
Engine speed – Turbine speed (NE – NT) (After transition from 4th to 5th gear)	–	Less than 150 rpm
Vehicle speed (After transition from 4th to 5th gear)	–	Less than 100 km/h (62.2 mph)

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
[OFF malfunction]	
All of the following conditions are met: Conditions (A), (B) and (C)	
2 detections are necessary per driving cycle 1st detection; temporary flag ON 2nd detection; pending fault code ON	
OFF malfunction (A)	
Turbine speed/Output speed	0.93 to 1.07
OFF malfunction (B)	
Turbine speed/Output speed	0.65 to 0.79
OFF malfunction (C)	
Output record from ECM for 4th → 5th upshifting	Recorded
[ON malfunction]	
Either of the following conditions is met:	
<ul style="list-style-type: none"> • ON malfunction (A) and (B) • ON malfunction (B) or (C), and ON malfunction (D) or (E) 	
ON malfunction (A) and (B)	
Turbine speed/Output speed	3.30 to 7.50
ON malfunction (C)	
Turbine speed/Output speed	1.91 to 2.35
ON malfunction (D)	
Turbine speed – Output speed x 4th gear ratio (NT – NO x 4th gear ratio)	1,000 rpm or more
ON malfunction (E)	
Turbine speed – Output speed x 5th gear ratio (NT – NO x 5th gear ratio)	1,000 rpm or more

INSPECTION PROCEDURE

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on the tester, perform the "ACTIVE TEST".

HINT:

While driving, the shift position can be forcibly changed with the hand-held tester.

Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (See page [DI-1150](#)).

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The 4th to 5th up-shiftings must be performed with the accelerator pedal released.
- The 5th to 4th down-shiftings must be performed with the accelerator pedal released.
- Do not operate the accelerator pedal for at least 2 seconds after shifting and do not shift successively.
- The shift position commanded by the ECM is shown in the DATA LIST (SHIFT) display on the hand-held tester.
- The shift solenoid valve S1 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve S1	ON	ON	OFF	OFF	OFF

1	Check other DTCs output (in addition to DTC P0751).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0751" is output	A
"P0751" and other DTCs	B

HINT:

If any other codes besides "P0751" are output, perform troubleshooting for those DTCs first.

B	Go to DTC chart (See page DI-1156).
----------	--

A

2 Check shift solenoid valve S1 operation.

Shift solenoid S1:

PREPARATION:

Remove the shift solenoid valve S1 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
Solenoid Connector (S1) – Solenoid Body (S1)	11 to 15 Ω

CHECK:

Connect the positive (+) lead to the terminal of the solenoid connector, and the negative (-) lead to the solenoid body.

OK:

The solenoid makes an operating sound.

NG

Replace shift solenoid valve S1
(See page [AT-12](#)).

OK

3 Inspect valve body (See page [AT-12](#)).

OK:

There are no foreign objects on each valve.

NG

Repair or replace valve body.

OK

Repair or replace transmission (See page [AT-34](#)).

DTC	P0756	Shift Solenoid "B" Performance (Shift Solenoid Valve S2)
------------	--------------	---

SYSTEM DESCRIPTION

The ECM uses signals from the output shaft speed sensor and input speed sensor to detect the actual gear position (1st, 2nd, 3rd, 4th or 5th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves, valve body or automatic transmission (clutch, brake or gear, etc.).

DTC No.	DTC Detection Condition	Trouble Area
P0756	The gear required by the ECM does not match the actual gear when driving (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve S2 remains open or closed • Valve body is blocked • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

This DTC indicates "stuck ON malfunction" or "stuck OFF malfunction" of the shift solenoid valve S2.

The ECM commands gear shifts by turning the shift solenoid valves "ON/OFF". When the gear position commanded by the ECM and the actual gear position are not the same, the ECM illuminates the MIL and stores the DTC.

MONITOR STRATEGY

TYPICAL MALFUNCTION THRESHOLDS

Detection criteria	Threshold
[OFF malfunction]	
All of the following conditions are met: OFF malfunctions (A), (B) and (C)	
2 detections are necessary per driving cycle 1st detection; temporary flag ON 2nd detection; temporary pending fault code ON	
OFF malfunction (A)	
Turbine speed/Output speed	0.93 to 1.07
OFF malfunction (B)	
Turbine speed/Output speed	Not change as follow 0.93 to 1.07 ↓ 0.65 to 0.79

OFF malfunction (C)	
Output record from ECM for 4th → 5th upshifting	Recorded
[ON malfunction]	
2 detections are necessary per driving cycle 1st detection; temporary flag ON 2nd detection; temporary pending fault code ON	
Turbine speed – Output speed x 1st gear ratio (NT – NO x 1st gear ratio)	150 rpm or more

INSPECTION PROCEDURE

HINT:

Performing the ACTIVE TEST using the hand-held tester allows the relay, VSV, actuator and so on to operate without parts removal. Performing the ACTIVE TEST as the first step of troubleshooting is one method to shorten labor time.

It is possible to display the DATA LIST during the ACTIVE TEST.

- (a) Warm up the engine.
- (b) Turn the ignition switch off.
- (c) Connect the hand-held tester to the DLC3.
- (d) Turn the ignition switch to the ON position.
- (e) Turn on the tester.
- (f) Select the item "DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST".
- (g) According to the display on the tester, perform the "ACTIVE TEST".

HINT:

While driving, the shift position can be forcibly changed with the hand-held tester.

Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (See page [DI-1150](#)).

Item	Test Details	Diagnostic Note
SHIFT	[Test Details] Operate the shift solenoid valve and set each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The 4th to 5th up-shiftings must be performed with the accelerator pedal released.
- The 5th to 4th down-shiftings must be performed with the accelerator pedal released.
- Do not operate the accelerator pedal for at least 2 seconds after shifting and do not shift successively.
- The shift position commanded by the ECM is shown in the DATA LIST (SHIFT) display on the hand-held tester.
- The shift solenoid valve SR and SL1 is turned on/off normally when the shift lever is in the D position:

ECM command gearshift	1st	2nd	3rd	4th	5th
Shift solenoid valve SR	OFF	OFF	OFF	OFF	ON
Shift solenoid valve SL1	OFF	OFF	OFF	OFF	ON

1	Check other DTCs output (in addition to DTC P0771).
----------	--

PREPARATION:

- (a) Turn the ignition switch off.
- (b) Connect the OBD II scan tool or hand-held tester to the DLC3.
- (c) Turn the ignition switch to the ON position.
- (d) Turn on the tester.
- (e) Select the item "DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES".

CHECK:

Read the DTCs using the OBD II scan tool or the hand-held tester.

RESULT:

Display (DTC output)	Proceed to
Only "P0771" is output	A
"P0771" and other DTCs	B

HINT:

If any other codes besides "P0771" are output, perform troubleshooting for those DTCs first.

B	Go to DTC chart (See page DI-1156).
----------	--

A

2	Inspect shift solenoid valve SR operation.
----------	---

PREPARATION:

Remove the shift solenoid valve SR (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
Solenoid Connector (SR) – Solenoid Body (SR)	11 to 15 Ω

CHECK:

Connect the positive (+) lead to the terminal of the solenoid connector, and the negative (-) lead to the solenoid body.

OK:

The solenoid makes an operating sound.

NG	Replace shift solenoid valve SR (See page AT-12).
-----------	--

OK

3 Inspect shift solenoid valve SL1.

Shift Solenoid Valve SL1:

D12795

PREPARATION:

Remove the shift solenoid valve SL1 (See page [AT-12](#)).

CHECK:

Measure the resistance according to the value(s) in the table below.

OK:

Tester Connection	Specified Condition 20°C (68°F)
1 – 2	5.0 to 5.6 Ω

CHECK:

Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (-) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating sound.

NG Replace the shift solenoid valve SL1 (See page [AT-12](#)).

OK

4 Inspect valve body (See page [AT-12](#)).

OK:

There are no foreign objects on each valve.

NG Repair or replace valve body.

OK

Repair or replace transmission (See page [AT-34](#)).

DTC	P0776	Pressure Control Solenoid "B" Performance (Shift Solenoid Valve SL2)
------------	--------------	---

SYSTEM DESCRIPTION

The ECM uses signals from the output shaft speed sensor and input speed sensor to detect the actual gear position (1st, 2nd, 3rd, 4th or 5th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves, valve body or automatic transmission (clutch, brake or gear, etc.).

DTC No.	DTC Detection Condition	Trouble Area
P0776	The gear required by the ECM does not match the actual gear when driving (2-trip detection logic)	<ul style="list-style-type: none"> • Shift solenoid valve SL2 remains open or closed • Valve body is blocked • Automatic transmission (clutch, brake or gear, etc.)

MONITOR DESCRIPTION

This DTC indicates "stuck ON malfunction" or "stuck OFF malfunction" of the shift solenoid valve SL2. The ECM commands gear shifts by turning the shift solenoid valves "ON/OFF". When the gear position commanded by the ECM and the actual gear position are not the same, the ECM illuminates the MIL and stores the DTC.
